INTRODUCTION

This represents the third reinventory of this subdivision, of the present inventory cycle, the other two were in 1965 and 1972-73. There was one other inventory in 1954.

The other two inventories were done using a strip cruise technique and the current one used a Three Stage Three Pee Sampling Design integrated with a wildlife habit inventory. The wildlife inventory results are not included in this report.

METHOD

The inventory technique is a three stage three pee (3P)* technique.

The first stage was the delineation and classification of the forest or non forest condition at the center of each air photo. If forested the stand was given an estimated cubic metres per hectare. This was compared to a random numbers table generated for the specific conditions. If the estimated cubic metres per hectare were equal or greater than the random number the stand was field sampled. If not then the stand was passed over and the next one done the same way.

Those stands chosen for the field sample were sampled using 3P point sample. The trees that qualified on the point sample have their total heights estimated and compared to a random number. If the estimated height is equal to or greater than the random number then the tree is measured with a Barr and Stroud Dendrometer. If not then the tree is passed over and the next tree's height is compared to the next random number etc.

The trees chosen for dendrometry are measured with a Barr and Stroud Dendrometer which measures the diameter and length between measurements from stump height to top of tree. The tree is also classified as to product and grade.

DEFINITIONS

Definitions of terms used in classification of data.

Ownership

Crownland - land owned by Provincial government.
Large Private - those owning 400+ ha of land.
Small Private - those owning less than 400 ha of land.

Cover Type

Softwood Cover - Stands containing 75% or more softwood species by volume.
Mixedwood Cover - Stands containing 25 to 74% softwood species by volume.
Hardwood Cover - Up to 25% softwood species by volume

Maturity Class

Regeneration Stand - Recent cutover to advance regeneration stage but less than cleaning age and/or height. (ie.) less than approximately 20 years and/or 5 m in height.

---

* - 3P is an Acronym for Probability Proportional to Prediction

DEFINITIONS (con't)

Maturity Class (con't)

Young Stand - Cleaning age and/or height, up to the stage where trees are approaching 9 cm in DBH but with little if any merchantable tree volume.

Immature - Stand conditions where most of the volume is in 10 - 12 cm DBH classes. Volume is usually less than 60 m^3/ha.

Pole Stand - Stand conditions where most of the trees are 14 cm+ DBH class and not mature based on species and size. A stand is harvestable but not mature.

Mature - Stand where condition is such that it should be cut in the next 5 - 10 years depending on species and site.

Overmature - Stand whose condition is such that it should be cut within 5 years depending on species and site.

Stand Type

Sawlog Stand - Stand containing a minimum of 40 m^3/ha of sawlog material. In softwood cover types only softwood will be used, in mixedwood cover type both softwood and hardwood will be used and in hardwood cover type only hardwood species will be considered in assessing sawlog volume.

Pulpwood Stand - Stand that does not qualify as a sawlog stand.

DATA AVAILABLE

The tables in the following list are available for any individual counties or combination of counties that have been reinventoried since 1981.

If you need any of these tables please order by Table Number and indicate the county(ies) you wish and if they are to be individual or combined or both.

Requests to be directed to Fred R. Wellings or Bill Barron, Forest Resources Planning and Mensuration Division, P.O. Box 68, Truro, Nova Scotia B2N 5B8. Phone 895-1591.

As of the date of this report Pictou, Antigonish, Guysborough East, Guysborough West and Hants counties are available.

RESULTS

The tables of volume that follow contain detail at the Subdivision level and lesser detail at the county level. The sheer number of combinations for tables make it impractical to include all the various combinations for all counties in this report.
