

Sealants—seal out tooth decay!

What are sealants?

Sealants are clear or shaded plastic that a dentist, dental hygienist or dental assistant puts on the chewing surfaces of back teeth— molars. This is where most decay happens. Sealing a tooth takes only a few minutes.

How do sealants help?

Molars often have deep grooves. Toothbrush bristles cannot reach into them. Because these grooves are hard to clean, plaque and food collect in them and cause tooth decay. Sealants fill the grooves and protect teeth from decay.

When's the best time to get sealants?

Sealants can be put on permanent molars with deep grooves. The best time is when the molars have come all the way in.

How long do sealants last?

Sealants usually last for several years. Once in a while, sealants may need to be replaced.

Will MSI pay for sealants?

Under the MSI Children's Oral Health Program, sealants are covered for all permanent molars that meet the program guidelines. Check with your dental office to see if your child qualifies for dental sealants paid for by MSI.

What causes cavities?

Sugar in food plus plaque in the mouth can lead to tooth decay.

Plaque is a thin, hard-to-see layer of germs that covers the teeth and gums.

These germs use the sugars in food and drink to make acid.

This acid eats away the hard outer layer of the teeth—called enamel—and causes tooth decay.

The longer food and sugary drinks stay on the teeth, the greater the risk of tooth decay.
