The Canadian Community Health Survey (CCHS) is a new series of health surveys being conducted by Statistics Canada. The survey is based on two year cycle, with the first year consisting of a larger sample (about 125,000 respondents) and the second year consisting of a smaller sample (about 37,000 respondents). Its purpose is to provide regular and timely cross-sectional estimates of health determinants, health status, and health system utilization for 136 health regions across the country. Data for the second instalment of the CCHS, Cycle 1.2, were collected between May and December of 2002, and released in October, 2003. The survey collected information on Canadians aged 15 years and older in all provinces.

**Highlights**

- Forty five percent of Nova Scotians aged 15 years or older report having used cannabis in their lifetime and 13.6% report having used it in the past year.
- Cannabis use is significantly more prevalent among men than among women.
- Cannabis use decreases with age for both men and women.
- Single Nova Scotians are by far more likely to report cannabis use.
- Nova Scotians who self-report better physical health status but poorer mental health status also self-report higher cannabis use.
- Nova Scotians who are dissatisfied with life and who have thought about suicide are more likely to report cannabis use.
- An estimate of 1.5% of Nova Scotians report using drugs other than cannabis in the past year. Ecstasy is the most commonly used illicit drug after cannabis.
- The overall prevalence of alcohol dependence among Nova Scotians aged 15 years and over is 3.3%.

**Appendix I**

Statistics Canada Guidelines For Reporting of Estimates Based on Coefficient of Variation.

Bootstrapping techniques were used to produce the point estimate, the coefficient of variation (CV), and 95% confidence intervals (CIs). The CV’s and CIs were used to decide if a point estimate could be reported.

Data with a coefficient of variation (CV) from 16.6% to 33.3% should be interpreted with caution.

Data with a coefficient of variation (CV) greater than 33.3% were suppressed due to extreme sampling variability.

**References**

Cannabis use is found to be more prevalent among men than among women\(^1\).\(^2\). According to CCHS 1.2, significantly more men (19.3%) than women (8.4%) in Nova Scotia report using cannabis in the past 12 months. The proportion of cannabis use is higher among men than among women in all age groups. The percentage of Nova Scotians who report recent cannabis use also decreases with age (Figure 2). Cannabis use peaks among those aged 15 to 24 (41.9% for men, 29.8% for women, and 35.9% for both sexes). The lowest rate occurs among those aged 45 and up (6.9% for men, 2.2% for women, and 4.4% for both sexes).

Alcohol dependence is more common among those who are “very dissatisfied” or “dissatisfied” (12.0%) with life compared to those who are “satisfied” or “very satisfied” (2.4%) with life (Figure 15). Feeling dissatisfied with life places one at higher risk of also reporting alcohol dependence. When income and education are considered, alcohol dependence is associated with lower income and higher education levels, although the estimates are not significantly different.

Alcohol Dependence in Nova Scotia

Alcohol dependence is defined as tolerance, withdrawal, or loss of control of social or physical problems related to alcohol use. The alcohol dependence scale is based on a subset of items from the Composite International Diagnostic Interview (CIDI) developed by Kessler and Mroczek (University of Michigan)1,2. The CCHS 1.2 estimates an overall prevalence of alcohol dependence (in the past 12 months) in Nova Scotia among those aged 15 years and older to be 3.3%. The prevalence of alcohol dependence is significantly higher among men (5.8%) than among women (1.1%), (Figure 12). Alcohol dependence is most prevalent in the 25–34 years age group (9.5%), followed by the 15–24 years age group (7.5%). Only 1.9% of the 35–44 years age group report alcohol dependence (Figure 13).

Alcohol dependence is closely associated with marital status3. A significantly higher prevalence of alcohol dependence occurs among those whose marital status is single (9.2%) compared with those whose marital status is married or common law (1.1%) (Figure 14).

The relationship between cannabis use and marital status has been documented4. According CCHS 1.2, single Nova Scotians tend to have more experience with cannabis use than people who have or had partners. Almost thirty percent (28.9%) of single Nova Scotians report they have used cannabis in the past year, compared with only 9.2% of those who are married or common law, and 5.1% of those who are widowed, separated, or divorced, (Figure 4). One possible explanation for this finding is that people who are single may have less familial responsibilities and therefore are more likely to use cannabis compared to those who have or had partners. Or possibly, cannabis use is "preventive" of marriage or contributes to marriage breakdown.

Geographically, cannabis use in Nova Scotia is not evenly distributed among DHAs, ranging from a low of 10.7% in DHA8 (Cape Breton) to a high of 16.3% in DHA6 (Pictou County). DHA9 (Capital District) ranks the second highest (15.8%) after DHA6 (Pictou County), followed closely by DHA4 (Colchester – East Hants) (Figure 5). Understanding the negative consequences of cannabis use, or have a greater chance to avoid cannabis use due to their higher social and employment status; where as those with the lowest education level may be restricted to cannabis access due to age or financial reasons.
Cannabis Use and Self-Reported Health Status

Evidence exists regarding adverse health effects of cannabis use, especially chronic cannabis use. However, our results show that cannabis use increases with Nova Scotians’ self-reported physical health status (Figure 6). The proportion of Nova Scotians who report recent cannabis use increases from 6.7% among those who self-report “poor” physical health to 17.6% among those who self-report “excellent” physical health. As indicated by our previous estimates, higher levels of cannabis use are reported by males and those aged 15 to 24 years, who are more likely to also report being in good physical health compared to the rest of the population.

FIGURE 7  Regular/Non-regular Cannabis Users by self-reported Mental Health Status, Nova Scotia (CCHS 1.2)

Research has found that frequent cannabis use can significantly increase the risk of mental health problems such as depression, schizophrenia, and psychosis. The association between frequent cannabis use and mental health problems has also been shown by the CCHS in Nova Scotia (Figure 7). Among those who rate their mental health as poor or fair, 13.9% also report being regular cannabis users (use cannabis at least once a week), whereas among those who rate their mental health as very good or excellent, only 3.5% use cannabis regularly.

Self-reported Mental Health Status

Cannabis Use, Life Satisfaction, and Suicide

Nova Scotians who are not satisfied with their lives are more likely to initiate or continue using illicit drugs such as cannabis. A significantly greater proportion of Nova Scotians report recent cannabis use among those who report being “dissatisfied” or “very dissatisfied” with life (11.6%), (Figure 8). The estimate for “neither satisfied or dissatisfied” could not be reported according to Statistics Canada guidelines.

FIGURE 8  Cannabis Use by Self-reported Life Satisfaction, Nova Scotia (CCHS 1.2)

Cannabis Use and Alcohol Dependence

Cannabis use is associated with alcohol dependence. Cannabis users are over-represented in those who are alcohol dependent. Seventy-one percent of those who report alcohol dependence also report cannabis use in the past year, which is more than six times higher than those who do not report alcohol dependence (11.7%), (Figure 10).

FIGURE 10  Cannabis Use Among Those Who Did or Did Not Report Alcohol Dependence, Nova Scotia (CCHS 1.2)

Other Illicit Drug Use

The CCHS 1.2 also collected data on the use of seven other drugs: cocaine or crack cocaine, amphetamines, ecstasy, LSD and other hallucinogens, glue and other solvents, heroin, and steroids. Overall, 1.5% of Nova Scotians aged 15 or older report using at least one of these drugs in the past year. An estimated 0.3% had used ecstasy, making it the most commonly used drug other than cannabis, followed by hallucinogens (0.6%) and amphetamines (0.3%), (Figure 11). The estimates for cocaine/crack, solvents, heroin, and steroids could not be reported according to Statistics Canada guidelines (Please see Appendix 1).
Cannabis Use and Self-Reported Health Status

Evidence exists regarding adverse health effects of cannabis use, especially chronic cannabis use\(^1\). However, our results show that cannabis use increases with Nova Scotians’ self-reported physical health status (Figure 6). The proportion of Nova Scotians who report recent cannabis use increases from 6.7% among those who self-report “poor” physical health to 17.6% among those who self-report “excellent” physical health. As indicated by our previous estimates, higher levels of cannabis use are reported by males and those aged 15 to 24 years, who are more likely to also report being in good physical health compared to the rest of the population.

FIGURE 6 Cannabis Use by Self-reported Physical Health Status, Nova Scotia (CCHS 1.2)

Research has found that frequent cannabis use can significantly increase the risk of mental health problems such as depression, schizophrenia, and psychosis\(^2,3\). The association between frequent cannabis use and mental health problems has also been shown by the CCHS in Nova Scotia (Figure 7). Among those who rate their mental health as poor or fair, 13.9% also report being regular cannabis users (use cannabis at least once a week), whereas among those who rate their mental health as very good or excellent, only 3.5% use cannabis regularly.

FIGURE 7 Regular/Non-regular Cannabis Users by self-reported Mental Health Status, Nova Scotia (CCHS 1.2)

Cannabis Use, Life Satisfaction, and Suicide

Nova Scotians who are not satisfied with their lives are more likely to initiate or continue using illicit drugs such as cannabis. A significantly greater proportion of Nova Scotians report recent cannabis use among those who report being “dissatisfied” or “very dissatisfied” with life (21.9%) compared to those who report being “satisfied” or “very satisfied” with life (11.6%), (Figure 8). The estimate for “neither satisfied or dissatisfied” could not be reported according to Statistics Canada guidelines.

Self-reported Life Satisfaction

* Significantly different from “Excellent”.

Cannabis Use and Alcohol Dependence

Cannabis use is associated with alcohol dependence\(^4\). Cannabis users are over-represented in those who are alcohol dependent. Seventy-one percent of those who report alcohol dependence also report cannabis use in the past year, which is more than six times higher than those who do not report alcohol dependence (11.7%), (Figure 10).

FIGURE 10 Cannabis Use Among Those Who Did or Did Not Report Alcohol Dependence, Nova Scotia (CCHS 1.2)

Suicide ideation occurs more among cannabis users than among non-users\(^5,10\). Nova Scotians who report thinking about suicide in the past 12 months are significantly more likely to report recent cannabis use (29.0%) than those who have not thought about suicide (13.1%), (Figure 9).

FIGURE 9 Cannabis Use Among Those Who Have or Have Not Thought about Suicide in the Past 12 Months, Nova Scotia (CCHS 1.2)

* Significantly different from “Non Alcohol Dependence”.

Other Illicit Drug Use

The CCHS 1.2 also collected data on the use of seven other drugs: cocaine or crack cocaine, amphetamines, ecstasy, LSD and other hallucinogens, glue and other solvents, heroin, and steroids. Overall, 1.5% of Nova Scotians aged 15 or older report using at least one of these drugs in the past year. An estimated 0.7% had used ecstasy, making it the most commonly used drug other than cannabis, followed by hallucinogens (0.6%) and amphetamines (0.3%), (Figure 11). The estimates for cocaine/crack, solvents, heroin, and steroids could not be reported according to Statistics Canada guidelines (Please see Appendix I).
Alcohol Dependence in Nova Scotia

Alcohol dependence is defined as tolerance, withdrawal, or loss of control of social or physical problems related to alcohol use. The alcohol dependence scale is based on a subset of items from the Composite International Diagnostic Interview (CIDI) developed by Kessler and Mroczek (University of Michigan). The CCHS 1.2 estimates an overall prevalence (in the past 12 months) of alcohol dependence (7.5%). Only 1.9% of the 35-44 years age group report alcohol dependence (Figure 13). Alcohol dependence is most prevalent in the 25–34 years age group (9.5%), followed by the 15–24 years age group (7.5%). Only 1.9% of the 35–44 years age group report alcohol dependence (Figure 13).

Alcohol dependence is closely associated with marital status. A significantly higher prevalence of alcohol dependence occurs among those whose marital status is single (9.2%) compared with those whose marital status is married or common law (1.5%) (Figure 14). Alcohol dependence is significantly higher among men (5.8%) than among women (1.1%) (Figure 12). Alcohol dependence is most prevalent in the 25–34 years age group (9.5%), followed by the 15–24 years age group (7.5%). Only 1.9% of the 35–44 years age group report alcohol dependence (Figure 13).

The relationship between cannabis use and marital status has been documented. According CCHS 1.2, single Nova Scotians tend to have more experience with cannabis use than people who have or had partners. Almost thirty percent (28.9%) of single Nova Scotians report they have used cannabis in the past year, compared with only 9.2% of those who are married or common law, and 5.1% of those who are widowed, separated, or divorced (Figure 4). One possible explanation for this finding is that people who are single may have less familial responsibilities and therefore are more likely to use cannabis compared to those who have or had partners. Or possibly, cannabis use is “preventive” of marriage or contributes to marriage breakdown.

Geographically, cannabis use in Nova Scotia is not evenly distributed among DHAs, ranging from a low of 10.7% in DHA8 (Cape Breton) to a high of 16.3% in DHA6 (Pictou County). DHA9 (Capital District) ranks the second highest (15.8%) after DHA6 (Pictou County), followed closely by DHA4 (Colchester – East Hants) (Figure 5).
Cannabis use is found to be more prevalent among men than among women\(^1\)–\(^3\). According to CCHS 1.2, significantly more men (19.3%) than women (8.4%) in Nova Scotia report using cannabis in the past 12 months. The proportion of cannabis use is higher among men than among women in all age groups. The percentage of Nova Scotians who report recent cannabis use also decreases with age (Figure 2). Cannabis use peaks among those aged 15 to 24 (41.9% for men, 29.8% for women, and 35.9% for both sexes). The lowest rate occurs among those aged 45 and up (6.9% for men, 2.2% for women, and 4.4% for both sexes).

Alcohol dependence is more common among those who are “very dissatisfied” or “dissatisfied” (12.0%) with life compared to those who are “satisfied” or “very satisfied” (2.4%) with life (Figure 15). Feeling dissatisfied with life places one at higher risk of also reporting alcohol dependence. When income and education are considered, alcohol dependence is associated with lower income and higher education levels, although the estimates are not significantly different.
