

FOREST RESEARCH REPORT

No. 35 February 1992

YIELDS OF SELECTED OLDER FOREST PLANTATIONS IN NOVA SCOTIA

INTRODUCTION

Tree planting for reforestation was limited in Nova Scotia until the Provincial Forest Nursery was established at Lawrencetown, Annapolis County in 1926. Trees from this nursery were supplied free of charge to Boy Scouts, schools, and private individuals interested in tree planting. In the mid-1930's, Otto Schierbeck, a Danish forester employed by the Department of Lands and Forests, initiated the establishment of small plantations throughout Nova Scotia to serve as demonstrations, and to test the suitability of a number of exotic species (Creighton, 1988). At the time of the 2nd World War, only a few individuals were establishing plantations in Nova Scotia. Of these, the most notable was the late Gordon MacKay of Pictou County. MacKay planted old field sites with native and exotic conifer species, the latter based on knowledge gained while travelling throughout Europe. These early plantings have provided valuable information about potential yields of forestry plantations.

During the 40's, 50's and 60's, plantations were being established sporadically throughout

the Province with most of the emphasis placed on fire barrens, abandoned fields, and wind-breaks.

It was not until 1964 that annual nursery production in the Province exceeded 1 million trees (Figure 1). Tree planting rapidly escalated thereafter and by 1984, the 100 millionth tree had been planted. This total included tree seedlings produced at the forest nurseries operated by the Province (Lawrencetown, Wittenburg, Strathlorne) and private nurseries operated by forest industry. In 1990, our forest nurseries produced approximately 25 million container seedlings.

Red pine was the preferred species to plant up until about 1970. Spruce has now become the dominant reforestation species in the Province. Norway spruce, in particular, is gaining popularity over native white, red, and black spruce due to its exceptional growth on a variety of sites (NSDLF, 1990).

Nova Scotia softwood plantations are projected to yield 179 m³/ha (32 cords/acre) in 40 years, assuming a seedling survival of 70%

Figure 1. Nova Scotia cumulative seedling production from government and industrial tree nurseries in millions (MM).

on average sites. This compares with present average yields from mature unmanaged forests of 88 m³/ha (16 cords/acre) at age 60 (Bailey, 1991). If sawlogs are desired, and one commercial thinning is carried out at age 30, plantations can be expected to yield 357 m³/ha (64 cords/acre, including the volume harvested during the

thinning) or 4 times the yield of average natural unmanaged softwood stands at 60 years.

The purpose of this report is to document the growth of some of the oldest plantations in the Province. These data are meant as an illustration of the yields realizable from forest plantations.

METHODS

Twenty of the oldest well stocked plantations of different species were selected from the records of the Nova Scotia Department of Natural Resources. A circular sample plot was located in a well stocked portion of each plantation surrounded by a buffer zone of similar stocking and equal in width to the average tree height. Each plot (excluding plantation #20) contained a minimum of 35 trees. All trees exceeding 1 cm diameter at breast height (1.35 m) were measured. Fifteen trees, representing the range of

diameters, but weighted towards the larger diameters, were selected and measured for height. An estimate of the capability was determined by measuring breast height age and height of the 5 tallest trees. Site evaluation included a description of the lesser vegetation, soil texture, moisture, depth, parent material, rock type, relief, topography, slope, and aspect. Definitions for stand attributes used in this report are found in Appendix I.

DISCUSSION

Many of the plantations measured in this study, were established on old fields and received little in the way of site preparation or follow-up treatments, such as weeding and thinning. The failure to carry out these treatments is reflected in lower yields, more time to reach breast height, slow diameter growth, and losses to mortality. In many of the older plantations, suppression and overcrowding has reduced

merchantable volume. Had a commercial thinning been done in these stands to salvage volume lost to mortality and suppression before they occurred, the yield could have been increased by roughly 25% (Nova Scotia Variable Density Growth and Yield Model, N.S. Dept. of Natural Resources, unpublished). Despite these facts, all of the 8 plantations exceeding 40 years of age (stump height) are yielding more than the

projected 32 cords/acre (Bailey,1991). Of the 12 remaining stands under 40 years of age, 7 also exceed this yield (Table 1). It should be noted that many of these plantations have not yet reached peak mean annual increment.

Table 1 summarizes the 20 surveyed plantations. By species, 7 are red pine, 6 Norway spruce, 3 red spruce, 2 white spruce, 1 white pine and 1 hybrid larch. They range in

age at stump height from 16-58 years: merchantable volume from 132 - 598 m³/ha (24-107 cords/acre): and total diameter from 12.4-23.4 cm. The detailed data as well as a photograph of each plantation are included in Appendix II. Although the yields reported here are actual, those from other plantations could vary, depending on factors such as species, site, competition, and survival.

Table 1. Selected growth parameters for 20 older forest plantations in Nova Scotia.

APPENDIX I

Glossary

- 1) *Total Height* = the average height in metres of all trees weighted by basal area.
- 2) *Stump Age* = the average age of the 5 tallest trees measured at a height of 0.3 m above the ground surface.
- 3) *Breast Height Age* = the average age of the 5 tallest trees measured at 1.35 m above the ground surface.
- 4) *Site Index (50)* = the projected average top height of the 5 tallest trees at a breast height age of 50.
- 5) *Total Frequency (TF)* = the number of trees per hectare ≥ 1.5 cm outside bark diameter at breast height (Dbhob).
- 6) *Merchantable Frequency (MF)* = the number of trees per hectare ≥ 9.1 cm (Dbhob).
- 7) *Total Basal Area (TBA)* = the cross-sectional area, measured at 1.35 m above ground level of all trees 1.5 cm Dbhob and greater, expressed in m^2/ha .
- 8) *Merchantable Basal Area (MBA)* = the cross-sectional area, measured at 1.35 m above ground level, of all trees 9.1 cm (Dbhob) and greater, expressed in m^2/ha .
- 9) *Total Diameter* = $\frac{TBA}{TF} \times .00007854$
- 10) *Merchantable Diameter* = $\frac{MBA}{MF} \times .00007854$
- 11) *Total Volume* = the volume inside bark of all tree boles, including the stump and top, ≥ 1.5 cm (Dbhob) based on volume equations derived by Honer(1967), expressed in solid m^3/ha .
- 12) *Merchantable Volume* = the volume inside bark of all tree boles ≥ 9.1 cm (Dbhob) based on Honer's volume equations expressed in solid m^3/ha . The merchantable bole excludes the stump (15 cm) and the top (7.6 cm inside bark diameter).
- 13) *Total Mean Annual Increment* = the total volume divided by the stump age and expressed as solid $m^3/ha/yr$.
- 14) *Merchantable Mean Annual Increment* = the merchantable volume divided by the stump age and expressed as solid $m^3/ha/yr$.
- 15) *Capability* = productivity expressed in terms of solid $m^3/ha/yr$ at a rotation age defined as peak mean annual increment in merchantable volume.

Plantation Description

- Ownership - Private
- Year Established - 1936
- Initial Spacing - 1.5 m x 1.7 m
- Site Preparation - Nil
- Area - 0.4 ha
- Stump Age - 56
- Breast Height Age - 52
- Year of Measurement- 1991

Plantation Growth and Yield Statistics

	Total	Merchantable
Frequency (trees/ha)	1739	1499
Diameter (cm)	15.2	16.0
Basal Area (m ² /ha)	31.7	30.5
Total Height (m)	11.2	11.3
Volume (m ³ /ha)	167	142
Volume (cords/acre)	–	25
Mean Annual Increment (m ³ /ha/yr)	4.9	4.2

Site Description

- Soil Series - Hebert
- Soil Texture - Sandy Loam
- Soil Moisture - Well Drained
- Site History - Old Field
- Capability - 7.8 m³/ha/yr
- Site Index - 20 m @ 50 yrs (BHA)

Plantation Description

- Ownership - Private
- Year Established - 1958
- Initial Spacing - 1.8 m x 2.1 m
- Site Preparation - Farm Plow
- Area - 0.25 ha
- Stump Age - 34
- Breast Height Age - 27
- Year of Measurement - 1991

Plantation Growth and Yield Statistics

	Total	Merchantable
Frequency (trees/ha)	3359	2559
Diameter (cm)	12.4	13.7
Basal Area (m ² /ha)	41.5	37.8
Total Height (m)	9.9	10.1
Volume (m ³ /ha)	194	148
Volume (cords/acre)	-	26
Mean Annual Increment (m ³ /ha/yr)	8.1	6.2

Site Description

- Soil Series - Thom
- Soil Texture - Sandy Loam
- Soil Moisture - Well Drained
- Site History - Old Field
- Capability - 8.2 m³/ha/yr
- Site Index - 21 m @ 50 yrs (BHA)

Plantation Description

- Ownership - Scott Maritimes
- Year Established - 1966
- Initial Spacing - 1.8 m x 1.8 m
- Site Preparation - Farm Plow
- Area - 1.0 ha
- Stump Age - 24
- Breast Height Age - 18
- Year of Measurement - 1989

<i>Plantation Growth and Yield Statistics</i>	<i>Total</i>	<i>Merchantable</i>
Frequency (trees/ha)	840	840
Diameter (cm)	19.6	19.6
Basal Area (m ² /ha)	25.1	25.1
Total Height (m)	12.5	12.5
Volume (m ³ /ha)	145	132
Volume (cords/acre)		24.0
Mean Annual Increment (m ³ /ha/yr)	9.1	8.3

Site Description

Soil Series	-	Pugwash
Soil Texture	-	Loam
Soil Moisture	-	Well Drained
Site History	-	Old Field
Capability	-	13.5 m ³ /ha/yr
Site Index	-	>30 m @ 50 yrs (BHA)
Year of Measurement	-	1990

Plantation Description

Ownership	-	Scott Maritimes
Year Established	-	1975
Initial Spacing	-	3.0 m x 3.0 m
Site Preparation	-	Nil
Area	-	0.2 ha
Stump Age	-	16
Breast Height Age	-	14
