- ice disintegration features
- glacial striae *discovered by warblers*
- relative ages known
- box line mark location
- clog and local features
- boulder indicator train
- with shaded (90% or greater of PF or QE) outside 10% m.t.s.
- multiple fill section
- fill depth to bedrock

LATE WISCONSINAN (PORT STANLEY?)

Till sheets believed to be contemporaneous although the QT, RT, ST sheets may have been formed from a later (earlier) influx from the drumlin (RT) Till.

should be placed on top of the pile generally being the youngest deposits.
