	Vancouver BC, Canada	2018-05-08	Doesn't anyone ever listen! Stop destroying our environment to save on costs.
	Newcastle, Canada	2018-05-08	Our natural resources must be protected!
	Hearst Ontario, Ontario, Canada	2018-05-08	I believe we need to clean up mother earth for all inhabitants with our Injury to the ecosystem.
	Mayne Island, Canada	2018-05-08	I'm signing because I think it's a TERRIBLE idea to dump tons of toxic effluent into the Northumberland Strait, with the consequent destructive impact on sea-life and marine eco-systems. It's

Name	Location	Date	Comment
			criminally stupid to believe this is an appropriate solution for dealing with the waste. Wake Up!
	Sangudo, Canada	2018-05-08	No! This is not good for anything but the mill. The oceans are already polluted with toxic chemicals, plastics and other wastes. Our marine life is already suffering, horribly. Already, in certain areas it's not safe to eat many kinds of seafoods. Adding more effluent is NOT a good idea. People are seriously being affected by environmental pollutants with all kinds of diseases from Autism to Cancer to MCS and many others that are not yet recognized as bring a result of toxic overload. Please say NO to this!
	Chambly, Canada	2018-05-08	This is just a completely terrible plan. It is inconceivable how any sane person or group of people (a company) could seriously consider such a proposal in the first place!
	London, Canada	2018-05-08	There are lots of issues of concern. World waters are already getting too warm impacting sea life and weather patterns globally. Adding pollutant is just crazy!
	Welland, Canada	2018-05-08	We absolutely must act to protect marine environments; this is NOT the way to do that!
	Surrey, Canada	2018-05-08	We are trying to do the same thing here in BC..Pacific wild salmon, orcas, and humpbacks. Oil pipelines..and spills will devastate our coast.
	Victoria, Canada	2018-05-08	quality over short term monetary gain!
s	Port Sydney, Canada	2018-05-08	There are more than enough pollutants poisoning our seas and oceans. We absolutely do not need to exacerbate an already critical and expanding problem. Stop poisoning our marine life.
	North Vancouver, British Columbia, Canada	2018-05-08	Keep the pollution in the Legislature. We are having running battles in BC over aquaculture, much as NS, and of course, the KM pipeline. It appears more and more that the effluent is the affluent.
	Vancouver, Canada	2018-05-08	Fish when gone are gone forever,no discharge into there home and habitatThank you.
	Victoria, Canada	2018-05-08	If we do not protect our ecosystem, at the moment, our prospect of living in 50 years is zero ...
	Oakville, Canada	2018-05-08	What’s happening today is just wrong. Oceans need protection. They are not a dump for our waste
	Hamilton, Canada	2018-05-08	I’m signing because i want to protect the fish
	Red Deer, Canada	2018-05-08	We have to STOP dumping crap in our waters.
	Calgary, Canada	2018-05-08	I am concerned about that much waste dumping into the Northumberland Strait and the effects to our oceans and sea life, not to mention the effects to our economy as a result of collapsed fisheries.

Name	Location	Date	Comment
	Ottawa, Canada	2018-05-08	It is essential we protect our ecosystems and food supply. Nature has created a delicate balance. Even a one or two degree change affects water species. ...ask anyone who owns a fishtank. Protect our environment.
	Maple Ridge, Canada	2018-05-08	We only have one world and everything on it is in fine balance...it's worth protecting!
	Kelowna, B. C., Canada	2018-05-08	Again, I can't believe what I am reading: to deliberately dump pulp mill effluent into pristine waters where the ice is melting alread so that polar bears have no chance for survival as no food can be caught. Does this take a moment of consideration to say? STOP THIS IMMEDIATELY . There is no end to what damage we are doing to our waters. They can store the effluent - pay for it - and find ways to detoxify it. Are the people we elect into government not thinking but bowing to big business? This cannot continue . We already have nuclear waste being pumped into the waters non-stop . There is no hope for humans and other life if not stopped.
	Caledon, Canada	2018-05-08	The oceans are getting more and more polluted we need to protect it bfore its all destroyed
	Vancouver, Canada	2018-05-08	Without food - we die. Food resources before energy money.
	Ottawa, Canada	2018-05-08	This home to thousands of species. Would anyone of us agree t toxins being pumped into our homes because it is seen as the only viable alternative?
	Burlington, Canada	2018-05-08	Stop screwing with our planet!!!
	Brantford, Canada	2018-05-08	This pipe should not even be a consideration for very obvious reasons. It is pathetic that we must have a petition to protect an integral part of our eco system.
	Montreal, Canada	2018-05-08	We need to more towards environmentally CLEAN waste practices. The ocean is not a toilet bowl !
	Grafton, Canada	2018-05-08	This is not possible that in today's world with all the technology we have that we have governments that are even thinking of dumping effluents in our marine ecosystems. Not possible and not on my watch.
	Saskatoon SK, Canada	2018-05-08	It is completely shocking to me that any company would propose such a damaging effluent pipe. If the toxic effluent is too corrosive for their machinery, it is certainly too toxic for the sea waters. I am totally opposed to it.
	Collingwood, Canada	2018-05-08	Please do not destroy any more of our natural environment with money being the main reason.
	Montague, Canada	2018-05-08	if they think the pipe is such a great idea to pump effluent waste into our precious strait.....why not put the pipe into a retaining pond on the CEO's property? it's safe, isn't it? and would be great for his or her's backyard!

Name	Location	Date	Comment
	Richmond Hill, Canada	2018-05-08	It's an ecological disaster
	Victoria, Canada	2018-05-08	Short term profits to a company is a concept from the dark ages. The effluent must be cleaned of toxic materials as is the law and policy in other jurisdictions in this country
	Calgary, Canada	2018-05-08	I am a fisherman who likes trout & salmon, and even pikes. PLEASE Don't destroy the strait for Greed!
	Edmonton, Alberta, Canada	2018-05-08	We need water, everyone needs water and we need to stop destroying our precious water and everything in our waters. Please no pipe.
	VERNON, British Columbia, Canada	2018-05-08	Time is NOW to start looking after our enviorment.
	Burlington, Canada	2018-05-08	we must protect our environment before profits and ignorance
	Sainte Marie De Kent, Canada	2018-05-08	Save the world before it's too late. Maybe it already is. But don't make life harder for the remain of humanity and our children,
	St. John's, Canada	2018-05-08	I care for our earth, it’s ridiculous how is as humans treat it
	Winnipeg, Canada	2018-05-08	We need to start treating all our water with care and respect. Dilution is NOT the solution!
	St Margaret's Bay, Canada	2018-05-08	To be clear, we are not promoting the closing of the mill; the smart thing instead would be to pursue other options to deal with the Pulp waste versus polluting this valuable Marine ecosystem. Once this effluent changes the Strait, it is likely changed for dozens if not hundreds of years, and will be difficult if not impossible to clean up. Do the right thing for Nova Scotia and our ocean waters!
	Toronto, Ontario, Canada	2018-05-08	No pipelines! We can and have lived without it!!
	Montreal, Canada	2018-05-08	It is unacceptable to endanger local fish populations and compromise the environment, not to mention tourist industry for the entire region, for the sake of one company’s profit.
	CONSTANCE LAKE, Canada	2018-05-08	Have to stop all pollution cause we won't have a future when we are destroying the environment.
	Edmonton, Canada	2018-05-08	1 earth humans as it's keepers, and all we managed to do is cash in on the oil and it's not paid off oil spills killed off parts of one fertile sea beds , all it took is is 1 major oil spill, i ask you why... is it worth it once the oil is all tapped out add, over population, go green technology, that will save this world pain and suffering.
	Victoria, British Columbia, Canada	2018-05-08	NO pipes
	Gabriola, Canada	2018-05-08	If marine life survives- we humans survive

Name	Location	Date	Comment
	Calgary, Alberta, Canada	2018-05-08	Dumping effluent in the ocean is not good for any one or any thing on this planet. Please stop this.
	calgary, Canada	2018-05-08	protect our water and ocean
	Halifax, Canada	2018-05-08	This is an outrage. There must be a better way to dispose of the waste.
	Vankleek Hill, Canada	2018-05-08	This is wrong..there has to be a better solution...we cannot continue to pollute and destroy Mother Earth and her Creatures. Please stop
	Pickering, Canada	2018-05-08	An operation which requires this kind of an easement to survive should not go ahead. The environment is not something simply "nice to have".
	Coaldale, Canada	2018-05-08	People have to stop polluting our planet and start healing it. Be it land, sea, or air
	Courtenay, Canada	2018-05-08	The earth shakes & unless the “pipe” (assuming it’s metal) expands with an earth quack, there’s too much potential for damage.
	Hamilton, Canada	2018-05-08	REMEMBER BP OIL!!! NEVER FORGET!
	Kingston, Canada	2018-05-08	Protect the species; find another way to deal with effluent (there are lots of other ways).
	Saint John's, Canada	2018-05-08	gross.
	St. Albert, Canada	2018-05-08	If they can't treat their waste then they should not be able to operate. GO GREEN EXCUSE ME !!!!!!!!!!!!
	Dundas ON, Canada	2018-05-09	To protect the trout and salmon.
	Winlaw, Canada	2018-05-09	What they are planning is not acceptable.
	Halton Hills, Canada	2018-05-09	Canada has the means to do the right thing.
	Goderich, Canada	2018-05-09	My husband, Leon, and I oppose unnecessary pollution of any kind that puts the health of our planet at further risk.
	Nobleton, Ontario, Canada	2018-05-09	We have got to start making better decisions before it is too late?
	Campbell River, Canada	2018-05-09	Because it's messed up!!!
	Abbotsford, British Columbia, Canada	2018-05-09	The oceans are not dump sites
	Halifax, NS, Canada	2018-05-09	

Name	Location	Date	Comment
	Rigaud, Canada	2018-05-09	I was so happy when I heard Pictou was getting sewage treatment, now this set-back. Why?
	Union Bay, Canada	2018-05-09	I"m signing because I believe our environment needs protecting and we have to find alternate ways of dealing with toxic waste from the pulp mill.
	Saint Thomas, Canada	2018-05-09	Short term gain for privately owned mills to dump effluent the cheapest way = screwing over everyone and everything else. Is that really the legacy policy makers want?
	Quesnel, Canada	2018-05-09	Ok by now , in this century ,you should be able to figure it out this can only be bad for the environment enough already
	Nanaimo, Canada	2018-05-09	Our children have inherited a disaster, the state of Mother Earth is treacherous.
	London, Canada	2018-05-09	It is extremely stupid for an elected official to allow a for-profit corporation to dump its toxic waste into a sensitive environment in this way. The mill is responsible for ensuring that the toxic by-products of its manufacturing process do not pollute the environment and the government of Nova Scotia should be intelligent enough to recognize this.
	Vancouver, Canada	2018-05-09	Water is life. Why are you destroying life?
	Dartmouth, Canada	2018-05-09	Please stop this effluent pipe from being put there. Our fish and turtles deserve our protection!
	Edmonton, Canada	2018-05-09	This is absolutely ridiculous!! I definitely oppose the Northern Pulp's Effluent Pipe to Dump this in the Northumberland Strait. There must be other ways to deal with effluent!!
	Winnipeg, Canada	2018-05-09	I'm signing because all sewage should be treated before it is discharged anywhere in Canada.
	Chemainus, Canada	2018-05-09	This precious habitat and it’s wildlife will be irreversibly destroyed by dispensing tons of toxic effluent into it. STOP IT!
	Port Moody, Canada	2018-05-09	We have to fight for our earth everyday. It is so tiring to see that people do not know if they don't protect the water they will have nothing.
	Sidney, Canada	2018-05-09	Step up and defend the strait from toxic pollution.
	Salt Spring Island BC, Canada	2018-05-09	It is just totally insane what unconscious Corporations will try and do, without regulation and control they won’t stop their drive for profit.
	Leduc, Canada	2018-05-09	This just seems like a silly thing to allow
	Georgetown, Canada	2018-05-09	This is ascenine pumping toxic chemicals STRAIGHT INTO a body of water WITHOUT TREATING THE WATER first. Why do companies only think about their bottom line? What about the future Earth? Do they even care? It doesn’t sound like they do.

Name	Location	Date	Comment
	Brantford, Canada	2018-05-09	Too much crap going into the water now!
	Hamilton, Canada	2018-05-09	We must save this main passage for the sake of our Trout and Atlantic Salmon.
	Foxhole, England, UK	2018-05-09	This is not the way forward.
	Vaughan, Canada	2018-05-09	I don’t want my country to become more polluted.
	Halifax, Canada	2018-05-09	Poisoning our precious water is ridiculous and unnecessary!!
	Montreal, Quebec, Canada	2018-05-09	Petrolium extraction is dirty, on all aspects.
	Québec, Quebec, Canada	2018-05-09	Il faut protéger les cours d'eau, une ressource inestimable.
	Peterborough, Canada	2018-05-09	Pipelines are passe. Invest in renewables!
	Kentville, Canada	2018-05-09	The Mill was a con, and it continues to be a crime against the planet. It must be shut down, not extended.
	Ottawa, Canada	2018-05-09	Let’s move forward with our energy choices, not backward!
	Ottawa, Canada	2018-05-09	Please do not allow the effluent to be pumped into the strait. Sea Trout and Atlantic Salmon will soon be an endangered species.
	Halifax, Canada	2018-05-09	The Ocean, the Atlantic Salmon are part of our culture and History in Atlantic Canada we should cherish them not crush them.Nova Scotia Canada Ocean playground , let’s keep it that way
	Victoria, Canada	2018-05-09	Save our planet &#xFFFD;, and stop harming it.
	Montréal, Canada	2018-05-09	We have to transition away from oil. There is simply no safe way to continue using it.
	Fort Erie, Canada	2018-05-09	They have the technology to clean without destruction to the environment. I heard of a technology years ago, created or experimented with, by a large company in Southern Ontario who did sheet metal and ironwork. It was a type of incinerator where everything that went into it the waste product produced was nontoxic and mostly water. From what I was told by a person who worked for them, the tests were successful. It was hushed up because it was not a money maker. True or false? is there someone who could find out?
	Brampton, Canada	2018-05-09	Our marine life deserve better.
	Glen Haven, Canada	2018-05-09	#nopipe
	pictou, Canada	2018-05-09	I am signing this because I am deeply concerned that there has not been enough research done in order to allow this to take place.

Name	Location	Date	Comment
			We have seen what the effluent has done to Boat Harbour and I fear it will be the same for the Strait as the treatment process they are planning will not remove such toxins as Cadmium and Mercury. I have seen soil tests from the exit point of Boat Harbour that were privately done and Cadmium levels are well above the allowable limit and in case you do not know Cadmium is known for its damaging effects on DNA. Unless you want to be know for taking part in a national disaster I would strongly suggest you look at this issue very closely and give a directive for a Class 2 Assessment. You are calling for one on the Clean up, so thinking there should be one for what caused it in the first place.
	HALIBURTON, Canada	2018-05-09	Zero carbon emissions are needed to save the people of this planet. Wasting money on pipelines is ludicrous.
	Maple Ridge, Canada	2018-05-09	This is ridiculous. We know how damaging this kind of dumping is. Stop now!
	Canada	2018-05-09	It will kill our water and all the fish
	Kelowna, Canada	2018-05-09	Fish first - please! Forget the profits for sake of ou environment please!
	Surrey, Canada	2018-05-09	I value our natural wildlife of trout and salmon. These are keystone species being put at risk.
	NEW GLASGOW, Canada	2018-05-09	there is no reason for this pipe to to ever exist except for greed
	NEW GLASGOW, Canada	2018-05-09	the N.S. Gov .has to pay for the new effluent system & they want the cheapest & easiest way to get rid of the effluents ,where as they signed to own the effluents,also, that is why they have been trying to fast track the asessment & approval
	Ashcroft, Canada	2018-05-09	I worry about the effects on the rivers in the area
	Oakville, Canada	2018-05-09	The mill owners made a profit from producing the effluent and it is their responsibility to clean it up and only put clean water back into the sea. Why should the general public and Nature suffer because of a Corporations greed and having no community feelings.
	Oakville, Canada	2018-05-09	The mill owners made a profit from producing the effluent and it is their responsibility to clean it up and only put clean water back into the sea. Why should the general public and Nature suffer because of a Corporations greed and having no community feelings.
	Surrey, Canada	2018-05-09	Make them create a pond for the effluent and process it!
	Belleville, Canada	2018-05-09	Because I do care
	Fredericton, Canada	2018-05-09	We need to keep the wild we still have!
	Pictou, Canada	2018-05-09	We need to stand up and protect our environment and fishing industries!!!

Name	Location	Date	Comment
	Houston, Texas, US	2018-05-09	I’m a fan of a pristine NE Passage.
	Hamilton, Canada	2018-05-09	Enough of pipelines!! how many more areas need to be ruined?
	Moncton, Canada	2018-05-09	This has to be the dumbest idea since the Tar Ponds.
	Desable, Canada	2018-05-09	No, find another way. Polluting is never an option.
	Fort Erie, Canada	2018-05-10	Negative things keep happening to this planet, where do you think it is going to lead us. Before it is too late do the right thing.
	Calgary, Canada	2018-05-10	I'm signing because the environment in this area is under siege. It is critical that the regulations not be tampered with or allowances made for anyone.
	Canada	2018-05-10	I know the Mill is a major employer here in Pictou county, all the spin off jobs through out the province and beyond. But to discharge the "treated" effluent into the Northumberland Strait.....That's just insane!
	Westville, Canada	2018-05-10	I completely oppose the plan to pump pulp mill effluent into our Strait. There has been zero scientific studies and decisions are being made from an economic and engineering standpoint only. This is wrong!
	St. John's, Canada	2018-05-10	Our beautiful ocean is NOT WORTH the risks. Not worth the money to be made. Not worth it.
	Strathmore, Canada	2018-05-10	If the mill can’t afford to dispose of their byproduct then they shouldn’t exist
	High River, Canada	2018-05-10	stop this pollution & thoughtless cruelty/ destruction now.. has to be a better way.
	Bow Island, Canada	2018-05-10	This is unacceptable - we should be trying to protect what’s left of our already damaged habitat, not destroy it. Technology exists so that industry can exist in an environmentally responsible way, it just requires the will to use it.
	fort st. john, Canada	2018-05-10	I am amazed that that in times wnen many fisheries have been decimated, leaving many w/o work & a source of food reduced radidically as well as a time when we Canada is trying to save our natural environment that a govt would allow a private company to emit that much effluent that would ruin the Strait waters. NORTHUMBERLAND Strait & all that it provides, is for the inalienable right of the citizens of the provinces around it; not to provide a cheaper dump for a private company to the detriment of the Strait. Very small minded. Please reconsider such an option & serve those who voted for your govt.; protect the Strait.
	Kitchener, Ontario, Canada	2018-05-10	Find a better way to deal with this !

Name	Location	Date	Comment
	Dryden, Canada	2018-05-10	We send astronauts to outer space and yet we are still dumping human waste garbage into rivers and oceans. Only clean water should enter our rivers and oceans!
	kitchener, Canada	2018-05-10	This pipeline is a ridiculous idea. Haven't we learned ANYTHING about environmental protection?
	Shelburne, Nova Scotia, Canada	2018-05-10	There will be nothing left if we keep destroying the bit of healthy environment that is left.
	Nelson, Canada	2018-05-10	Im signing because, I believe our water ways all over the planet are fundamental to human life. Our priority as we consider more expansion of human society needs to first consider if the actions taken are going to maintain the health and diversity of our waterways and the ecosystems they support. Water is the fundamental element necissary for the human body. If we continue to disregard the necessity to keep our water safe in this limited resource of earth, we will not be living in a very healthy environment 30-40-50 years down the road. We need only observe the detrimental impact we have already had on our global environment to know how bad it could get, if continue in the same light, with disregard for the very substances that sustain life. This idea should be seen as a crime, if it was implemented, a crime against humanity! Our fundamental life source is in danger and to even consider continuing to contaminate it is ludicrous!!!
	Lethbridge, Canada	2018-05-10	I am appalled that we still do this in Canada . Why are you not pre planning for the extra effluent long before you need to dispose of it. I work in research our rivers and streams are becoming very polluted naturally without mans thoughtlessness.
	Halifax, Canada	2018-05-10	I care
	Delta, Canada	2018-05-10	We need to protect wild salmon and marine ecosystems far more than we do investment and dependence on harmful fossil fuels.
	Nelson, Canada	2018-05-10	All good is wild & free!
	Elgin, Canada	2018-05-10	Help protect our fish.
	Toronto, Canada	2018-05-10	Northern Pulp must be stopped from using our ocean as a sewer. Their poisons must be prevented from entering our ecosystem.
	Summerside, Canada	2018-05-10	Perhaps in this day and age, if you can't deal with your waste in a proper manner, you shouldn't be in business...
	Sydney, Canada	2018-05-10	It’s time to stop this polluting of our environment.
	Stellarton, Canada	2018-05-10	I’m signing because it is the only right thing to do! Thanks to Matt Dort for being such an inspiring influence!
	New Glasgow, Canada	2018-05-11	Isn’t it time this stopped, rather than starting over someplace so special to so many, full of whales , tuna , and gannets feeding on Herring all of September... and rich Lobster spawning grounds!!

Name	Location	Date	Comment
	Londonderry, Canada	2018-05-11	Salmon, trout, lobster and recreation are all threatened by this NP’s pipe.#nopipe
	Midhurst, Canada	2018-05-11	Dumping 90 million litres of effluent daily into the Strait will cause harm to marine ecosystem. Find another solution!
	Vancouver, Canada	2018-05-11	Nobody should dump ANYTHING in the ocean!! Its a source of food for millons. Who in their right mind would even think of polluting the oceans??? So much for civilized.....Nature does not dump anything. There is no waste in nature. Something always cleans up and we better get on that or we will kill our environment. We are well on our way.
	Toronto, Canada	2018-05-11	Companies should not be allowed to continue to download costs onto taxpayers and the environment. They take the profit and we take the cost. How is this a fair deal for us?
	Halifax, Canada	2018-05-11	I care about the health if Canada's environment. I want it preserved for my children.
	New Glasgow, Canada	2018-05-11	This planned effluent pipe into our beautiful strait in unconscionable.
	North Myrtle Beach, South Carolina, US	2018-05-11	This ocean is a habitat for our eco system which includes us humans . We should be proud to keep our waters clean and un-polluted! Let’s do this!!!
	Vancouver, Canada	2018-05-11	Beautiful warm waters need full protection from pollution.
	Westville, Canada	2018-05-11	I think its long past time the government protected our ocean, not pander to corporations. Stop the poisoning of your citizens, and the destruction of natural habitats we depend on
	Vancouver, Canada	2018-05-11	Crude bitumen... probably not the best mineral to pipe through an environmentally sensitive area. For the life of me, I can't understand, why, governments, at every level, don't think refined stuff would be a huge improvement, and a much safer, albeit not a terrific, option. That crude filth we don't want near our shores... Get real. Remember Exxon? Sheesh! What does it take? Any disaster for BC's coastline is going to impact so many. If you want oil to come here, send it in the right form, not goop that can't be utilized until refined anyway. Wakey, wakey!
	Trenton, Canada	2018-05-11	Why risk our environment? It is insane that the government would want to allow this to happen. #NoPipe
	Knutsford, Canada	2018-05-11	You are commenting on the wrong petition Lynne Fox. This is about dumping pulpwood sludge into the Atlantic not about the oil pipeline to the Pacific. Wakey Wakey Lynne.
	Toronto, Canada	2018-05-11	I disagree with this bullshit
	Vancouver, Canada	2018-05-11	Oops! My upset - given the coverage on this pipeline it's little wonder there's a mix-up. However, my sentiment for any pipeline

Name	Location	Date	Comment
			is still the same - measures, proper structures need to be implemented. No question about it. Thanks for the point out! L
	Ottawa, Canada	2018-05-11	there is no more important cause for our future than that of our oceans - if we want a decent future for our kids we need to insure it by taking care of the planet now before it's too late - it's the only decent thing to do and it's the best inheritance we could give
	Kelowna, British Columbia, Canada	2018-05-11	How Stupid can People Be!?!?! It is High Time that Governments Do their Jobs and Deal Appropriately with All Pollutants...Wake Up People...
	Montague, Canada	2018-05-11	Save our Future!
	New Glasgow, Canada	2018-05-11	I know it is important. #NOPIPE
	River Denys, Canada	2018-05-11	Nature is more Important than a Papier mill
	Charlottetown, Prince Edward Island, Canada	2018-05-12	I am very concerned about our eco systems.
	Hammonds plains, Canada	2018-05-12	This will be an environmental disaster.
	Australia	2018-05-12	Icare about our fish
	Orillia, ON, Canada	2018-05-12	Alternative ways and means are available in this day and age of extinguishing species and climate change, surely--these companies must show the will.
	Barrie, Canada	2018-05-12	Are the people who live in these areas so stupid that they are still allowing this to happen? Why don't they stand up and demand an alternative?
	New Glasgow, Canada	2018-05-12	We are. The government is against us and multimillion dollar company is against us. Not as easy as you think.
	Burnaby, British Columbia, Canada	2018-05-13	We either close out nearly all outfishing for ever and save our people's lives, or we live very few more years and all painfully
	Ssrsfield, On., Canada	2018-05-13	Unbelievable! With today's scientific knowhow, industry is still trying to use the old «let's just dump our garbage into the sea» method of years past. Incredible! If that mill cannot find a better way of solving their waste problem, they should not be allowed to operate until they do find a clean solution to that problem.
	Attleborough, England, UK	2018-05-13	All effluent can be recycled. It just costs more. If we won't pay for an ethical product, the product must not be manufactured.
	Waterford, Canada	2018-05-13	We cannot afford any environmental disasters The priority is the planet

Name	Location	Date	Comment
N A	Pictou, NS, Canada	2018-05-13	This would be nothing short of another environmental devastation to our beautiful county. #NO PIPE
	Mississauga, Canada	2018-05-13	You must pursue other options to deal with the Pulp waste versus polluting this valuable Marine ecosystem.The Strait is a main passage for our Sea Trout and Atlantic Salmon as well as a place to feed and get energized prior to entering the rivers. However all this is at major risk with the proposed 90 million litres of effluent to be pumped into the Strait a day.
	Airdrie, Canada	2018-05-13	Seriously!! This is something that happened 100 years ago but we know better now. And let's face it, the taxpayer will pay for the clean up after the damage is done.
	North Vancouver, Canada	2018-05-13	Too much environmental damage is being done by industry in Canada.
	Cochrane, Canada	2018-05-13	Everything is being destroyed because of greed.
	Vancouver, Canada	2018-05-13	Because we have corporate shills pretending to be Minister's who represent the Citizens of Canada. With all the big icebergs drifting south, lets see if one can hit and create another oil disaster. After all they have no accountability.
	Calgary, Canada	2018-05-14	Someone has to have the will to stop this
	Nashville, Tennessee, US	2018-05-14	My mom's from Cape Breton, NS. This is too important a place, ecologically, to befoul with paper mill effluent. As someone in the printing business for the past 47 years, I understand the importance of the mill. But, the costs associated with the paper-making process should be borne by the mill and the purchasers of the paper, not the environment. The fish, and the ocean itself, should not be harmed by a shifting or disguising of real costs.
	Lincoln, Canada	2018-05-14	The government is horrible with respect to tax payers and there health and well being. They are ignorant!
	Oakville, Canada	2018-05-14	Enough is enough. We need to stop polluting the earth for the convenience of corporations.
	Washington, North Carolina, US	2018-05-14	enough destroying the inviroment ,there are other ways to get ride of there waste but will cost them a few bucks
	Kingston, Canada	2018-05-14	We can't afford to lose any more rivers!!!
	Cape Breton, Canada	2018-05-14	We need to save our rivers. no more polluting the rivers.
	Halifax, Canada	2018-05-14	Should not be
	Chilliwack, Canada	2018-05-14	this is ridiculous in todays modern world dumping raw sewage into the ocean as Victoria Vancouver Island has been doing for the 100 yrs...bullshit.
	Dieppe, Canada	2018-05-15	Enough is enough. Polluting these water must be stopped.

Name	Location	Date	Comment
	Vancouver, Canada	2018-05-15	I have personally witnessed the on going effect of the effluent , color, smell and foam along our beaches of the Northumberland Strait. In the last 10 years I have also seen its effects on Pictou Island shoreline and shellfish who’s shells are a very copper brown stain.
	Mahone Bay, Canada	2018-05-15	What kind of 'environment minister' pushes pipelines, BP offshore drilling and filth entering the Northumberland Strait? Why, it must be a yet another hypocritical Liberal 'environment' minister!
	trenton, Canada	2018-05-15	I want future generations to be able to enjoy the ocean. I for one was unable to enjoy the ocean growing up. Boat Harbour is in my back yard and the only way I can view what was once a spectacular place is by hearing stories. I want those stories to be real again for generations to come. Why ruin our beautiful home by polluting our waters?
	kingston on, Canada	2018-05-16	I care
	Summerside, Canada	2018-05-16	I care about our waterways and the Northumberland Straight
	Corner Brook, Canada	2018-05-17	Ridicules
	Westville, Canada	2018-05-17	Enough is enough, NP pollutes our air and water as well reck havic on our woodlands, talking no responsibility for their actions. Our fishing grounds must be protected.
	Port Dufferin, Nova Scotia, Canada	2018-05-17	this is wrong on so many levels ...think we had a lot of fish and marine life die and wash up on shore already . imagine if they are allowed to do this ,the devastation it will cause to marine life, eco systems and even us from eating things caught in that area contaminated by chemicals .
	Québec, Canada	2018-05-18	We must stop the planetary ecocide !
	Tatamagouche, Canada	2018-05-18	It's long past time to stop allowing a large foreign corporation pollute our environment, raze our forests, and get away with millions of dollars while harming our fisheries and tourism industries.
	Dunrobin, Canada	2018-05-18	I grew up there and shall return
	New Glasgow, Canada	2018-05-18	Keep sending your letters to the Federal and Provincial government agencies , maybe we will get a respond from a real person instead of a computer ...The Federal government should be involved in this ...there should be no way that this mill be allowed to dump their pollution into a prime fishing area like the Northumberland Strait thus affecting all three maritime provinces....
	Barneys River Station, Canada	2018-05-18	Who is allowing..?Find out who owns you, learn, understand and be conscientious about the reasons of this all and than understand the results.You live in a corporate country and you are not the

Name	Location	Date	Comment
			shareholder but their asset.Schools never tell you the truth... you must do that for yourself
	Trenton Nova Scotia, Canada	2018-05-19	I live in the Pictou Landing community and there are days the air is so toxic it is so hard to breath and I get so sick.If the wind is blowing from the east we get Boat Harbour fumes,If the wind blows from the west we get the NP fumes.Can't live this way any longer.#no pipe ever!!!
	North Vancouver, British Columbia, Canada	2018-05-19	Save the Atlantic salmon, get rid of the aquaculture fishery, and ditch the crooked politicians. See DFO Minister Leblanc's Arctic surf clam licensing to family friends and Liberal supporters. And we think the American are bad...we are becoming Americans.
	Sterling, Virginia, US	2018-05-20	I don't know whose brilliant idea it was to propose pumping 90 million litres of effluent daily, but that's insane. Trout is delicious, and before they're eaten they deserve to live healthily.
	Penticton, Canada	2018-05-22	This is disgusting and certainly not necessary in today's world. Clean up you act, and anyone else that is dumping sewage into the waterways. How do you think the Nile, Ganges, et al. became so polluted? Haven't you learned anything?
	Nanaimo, Canada	2018-05-22	Our natural habitat matters more than anything else. Keep Canada Pristine!!!
	Pitt Meadows, Canada	2018-05-22	time to clean up our planet and leave future generations with a better system than we have , no need to allow this mess
	Sturgis, Michigan, US	2018-05-22	The effects of this will be far reaching. Quality and safety of commercial fishing will affect everybody.
	Penticton, Canada	2018-05-24	Who says schools never tell you the truth? Some people just refuse to acknowledge the truth because it doesn't suit them.
	Kimberley, Canada	2018-05-24	The cost savings now will never justify the environmental impact.
	Hamilton, Canada	2018-05-25	Our enviroment has been damaged possibly beyond year. We do have to try. This is one of those steps. I like how you are going about it , saying lets look at alternates for this situation. Very commendable. We need our fish for many many many reasons. Do some research as to why but please vote. Thank you Kevin Mulholland. Hamilton Ontario Canada. L8K 1H9
	Edmonton, Canada	2018-05-25	It effects my home town pictou nova Scotia and I'm completely against what they're trying to do
	Lower Sackville, Canada	2018-05-25	Boat harbour and the stack emissions were awful since day one, but now pumping the effluent directly into the strait untreated? Shame on you, it's unacceptable.
	Montréal, Canada	2018-05-25	Having experienced that beautiful region (Melburby beach!), there is no way this idiotic project should be allowed
	Corbyville, Canada	2018-05-26	Apparently the mill ownership can be traced backed through a series of companies and at the end it appears the owner is in

Name	Location	Date	Comment
			Indonesia, so why would they care what happens to the strait. In this day of high tech engineering there has to be a better way of dealing with the waste if the parent company is forced to spend the money.
	New Glasgow, Canada	2018-05-27	We are in dire straits here! Our very health depends on clean waters to insure viable and untainted fish and other marine life. It is obscene to put big and dirty business ahead of the health and well being of the citizens who live here. They will creep away when they can no longer wrench any more out of our environment, but we will still be here, left with little to hang on to for a healthy life. It has happened before. Why let it happen again and again? Enough is enough
	New York, New York, US	2018-05-30	No pipe
	Newmarket, Canada	2018-05-30	I was raised in rural Nova Scotia and remember the prestine waters and fishing ... and that’s how it should be Our beautiful Province that is unique in its own way.... please don’t let this pipe happen
	Lords Cove, Canada	2018-05-30	Enough is enough! Our planet is in peril- it's time to start fixing it, not making it worse....
	Halifax,ns, Canada	2018-05-30	It will harm fishery, tourism , and our beautiful beaches
	Dartmouth, NS, Canada	2018-05-30	We need to be smarter about our decisions
	Kawartha Lakes, Canada	2018-05-30	I am strongly opposed to this pipe being in the Northumberland Strait.
	Halifax, Nova Scotia, Nova Scotia, Canada	2018-05-30	Our current provincial government is not acting for the environment and hence is creating an environmental deficit for our children and grand-children.
	Smiths Falls, Canada	2018-05-31	Haven't we learned anything yet about what fouling our oceans means to our species, too? Waste disposal is a cost of business that should not be foisted on the environment.
	Saugeen Shores, Ontario, Canada	2018-05-31	Is the water cleaned/filtered before flowing out into the Northumberland Strait? If not, do they fine them for polluting on such a preposterously high scale as this? Keep it clean!
	Fall River, Canada	2018-06-01	The mill is 26 past its life expectancy. No matter what anyone tells you about upgrades, people who go inside the mill are prone to relating feelings of terror about the risk of the conditions inside the mill. I have been to Boat Harbour, and I can speak to the terror of the outfall from the mill. Recent revelations about the estimated costs to clean up Boat Harbour, are grave supports for the risks the Mill's planned effluent pipe will impose on the Northumberland Strait. The illnesses, the air quality and offensive stench. The mill's impacts on our forests in the province. Enough is enough.

	Moncton, Canada	2018-06-01	No pipe in the strait
	Denver, Colorado, US	2018-06-01	Because The Northumberland Strait is more vital than pulp effluent. NS is not a paper mill trash bin. Save the Marine life. Thank you.
	Canada	2018-06-01	The water will be treated with toxins, dioxins, chlorine, pulp fibres, and fresh water. The Strait is salt water and the marine species rely on a certain degree of salinity
	Fredericton, Canada	2018-06-02	the Oceans are not our private dumping grounds.
	Toronto, Canada	2018-06-03	I want to express my deepest desire to keep the health and well-being of northern fish stocks alive and well for future generations.
	Ajax, Canada	2018-06-05	Northern pulp must treat the effluent water they produce, prior to releasing it into the Northumbrrland Strait. They must take responsibility for the garbage they create.
	Nanaimo, Canada	2018-06-08	I can't figure out how to contact the individual who started this petition, but I have information about a new technology that is far superior and cleaner than what is being proposed in the Northumberland Strait. This information was forwarded to the mill in question, but no response as of yet. If the person who started this petition would like more information about what we proposed, they can contact me at natasha.juba@hotmail.com, and I can put you in touch with the people involved in the technology. Good luck, I hope that your concerns are listened to!
	Montréal, Canada	2018-06-08	I agree with the petition...
	Toronto, Canada	2018-06-13	The salmon and trout are already facing insurmountable problems. Perhaps this is the government's plan to finish them off? So much for campaign promises.

Name	Location	Date	Comment
	Stellarton, Canada	2018-06-14	Because our oceans should not be ruined for others greed and we should be taking better care of OUR oceans and planet
	Victoria, Canada	2018-06-14	Atlantic salmon represent a resource which took thousands if not millions of years to develop. The resource is in a critical state; on life support. Any industrial project which threatens in any way shape or form the future viability of Atlantic salmon is not economically viable, period.
	Atlanta, Georgia, US	2018-06-19	We must always protect our natural resources.
	Halifax, Canada	2018-06-21	My family has lived in New Glasgow, Pictou County for generations, enjoying all the coastal beaches had to offer. I attended as a child, and worked as a young adult at Big Cove, YMCA camp, where we ran canoe trips along the shoreline of the northumberland strait, following east towards Cape Breton, or west towards the ferry to PEI. I have known personally and come to enjoy the pristine coastal waters, a boon for local tourism, and seen bountiful marine life such as seals and porpoises, schools of young fish taking refuge from the tumultous atlantic waters. I studied Biology at Dalhousie University, and have good evidence to know the harm this would cause to the local economy, and ecology. We cannot allow such reckless disregard for health and human safety, as well as our collective natural resources. Sincerely,
	Vancouver, Canada	2018-06-22	I am a property owner on Pictou Island, NS. I grew up in New Glasgow. I come back every summer. I have seen the change in the quality of the water and our shoreline on the Northumberland Strait.This needs to stop before it is completely destroyed. The short term gain for NP and its few employees is not reason enough for the long term destruction of our strait and all that that encompasses.
	Antigonish, Canada	2018-06-22	Anything worth doing ..is worth doing RIGHT!!. Do the RIGHT THING!
	Canada	2018-06-22	We will contact you
	West Vancouver, Canada	2018-06-29	This decision will require courage, compassion and integrity from Nova Scotia's political leadership. While these traits often exist in candidates for public office, they seem to erode once elected. I hope, as many have recommended, that the politicians vote to protect the marine environment and they support industries that rely on pristine coastal waters to provide employment and promote tourism.
	Micmac, Canada	2018-07-02	#waterissacred, #waterislife, #nopipe
	Conway, Massachusetts, US	2018-07-04	Dumping effluent into pristine waters is a “Third World” thing. We’re better educated than that. We know better. Do the right thing, STOP such dumping. Spend the money on up-to-date waste water cleaning and recycle it.

Name	Location	Date	Comment
	Halifax, Canada	2018-07-05	It’s an ecological disaster and the local people are strongly against it. Don’t force it on them.
	Charlottetown, Canada	2018-07-06	Maritime activities accounted for 15.2% of Nova Scotia's GDP in 2015, and between 10-25% of the GDP of the other Maritime provinces. Deliberately harming the viability of the Maritime ecosystems in this way is grossly irresponsible. This project must be stopped.(Fisheries and Oceans Canada, Maritime Sectors Gross Domestic Product Contribution to Provincial and Territorial Economies 2015, <a href="http://www.dfo-mpo.gc.ca/stats/maritime/tab/mar-tab2-eng.htm" rel="nofollow">http://www.dfo-mpo.gc.ca/stats/maritime/tab/mar-tab2-eng.htm
	Dauphin, Canada	2018-07-06	It will destroy this fragile ecosystem
	bedford, Canada	2018-07-06	The future of the Northumberland Strait is being put at risk. This greedy pulp mill could have invested in alternative soultions to clean up their operation, but instead they reap profits year after year and continue to threaten the environment, mutiple industries and the health of those living in and around the maritimes. Shame on this pulp mill and anyone who supports the idea of dumping into the water.
	trenton, Canada	2018-07-06	so many reasons
	Oakville, Canada	2018-07-06	I'm signing because the ocean is an important part of our global ecosystem, and the wastewater dumped into it would be extremely harmful.
	Montreal, Canada	2018-07-07	Our livelihood is more important than the economy
	New Liskeard, Canada	2018-07-07	WTF, only the stupid could expect to do something as potentially destructive as this. Smarten up, change your system and recycle/reuse this water.
	Oshawa, Canada	2018-07-07	Fossil fuels are NOT the way of the future. Protect what we have, politicians won’t fight for the environment-the people must.
	NANAIMO, BC, Canada	2018-07-07	It is time.
	Regina, Saskatchewan, Canada	2018-07-07	We can no longer use our oceans and our skies as dumping grounds for our garbage and waste. Everything must be net zero.
	Ann Arbor, Michigan, US	2018-07-07	Oil is out, renewable is in.
	Summerside, Canada	2018-07-08	I work in the fishing industry. As does some of my family. I don't want our lively hoods to suffer, because of a corporation in another province. I also want to continue to enjoy local sea food without worrying about what it's doing to my and my family's health.
	Richmond, Canada	2018-07-08	I can’t even believe they would even consider this🙁

	New Glasgow, Canada	2018-07-25	No pipe !!!!
	Dartmouth, Nova Scotia, Canada	2018-07-26	Just not a bright idea
	Barneys River Station, Canada	2018-07-28	Why would anyone think a petition or asking "Government" to help with created situation by big international corporations will bring remedy?Noam Chomsky stated that their own peoples are the biggest enemies of corporatized not civil authorities => Governance.Check your civil status how you being is perceived and treated as an asset/thing, CDM As long as you keep silent and don't want to understand the issue forget your fight, you are lost already be design...https://www.youtube.com/watch?v=-cT-E-zXLlI&feature=youtu.be
	Barneys River Station, Canada	2018-07-28	you should worry, the damages will be real and you be blamed on top of it.Carbon-tax is lurking, 'cause you are the problem. Most take the Tax and do not think further.., start thinking big about things you have not known.. petitions are not designed to work, petite=small
	Barneys River Station, Canada	2018-07-28	nice ideas but pls realize why a corporation exists, who developed this fiction and whyyou have to go back a few centuries--> google "Unam Sanctam" and what it realty meant, the desired outcome...still surprised?
	Barneys River Station, Canada	2018-07-28	but a corporation has, can and will, and your government being a corporation itself has applied wool over your eyes trying to keep away your waking up...just check who is issuing licences now, how "access NS" is being organized and who owns this fiction and who it can be sold to....think and ask questions
	Barneys River Station, Canada	2018-07-28	why would this Corporation be benefited with the Indemnity provision, backed up and payed by whom? btw "Government is doing things absolutely right being a Corporation itself and has to listen to its owners, no owner you are not but their asset, their thing/resource to be used up and not bestowed with rights,CDM = capitis dimintutio maxmia, learn about this to live
	Barneys River Station, Canada	2018-07-28	I know is hard to swallow but most citizen of this world have no clou why things are as the are and real problems not solvedPictou County has been plagued with this pulp mill (air, water pollution,low wood prizes, clear-cut, spraying herbicides etc), "Government" funds by the millions poured in over the last half century for no real progress, wake up and small this rotten scheme actually and as what it does to us...
	Barneys River Station, Canada	2018-07-28	good luck, if you concerned study what happened in 1974 with the Canada Bank Act and its outcome...The yet unborn of your growing kids are already loaded up.did you know about this http://www.comer.org/ ???
	Barneys River Station, Canada	2018-07-28	how? by not grasping the reality?

Name	Location	Date	Comment
	Barneys River Station, Canada	2018-07-28	correct, what do you propose?
	Barneys River Station, Canada	2018-07-28	expect more from foreign Corporation and a no civil fiction of "government"?Did school prepare you for what, who rules? think notwe all have rights but they don’t come down like dew in a hot summer nightwe don’t even have a fundamental framework for and by the peoples, what do we expect...
	Westville, Nova Scotia, Canada	2018-08-04	I’m signing because this is absolutely disgusting.
	Pictou, Canada	2018-08-14	the effluent would contain chlorines, dioxins, metals, among other toxic constituents and will contain 935kg of solid materials per day.
	Halifax, Canada	2018-08-14	As a commercial lobster fishermen in the Gulf, I know this pollution puts our entire lobster industry at risk. One contaminated lobster could sink our entire reputation and market abroad.
	st peters, Canada	2018-08-15	Because I care
	Pictou, Canada	2018-08-15	Imagine what that kind of financial boost to new small business could do for our economy! Instead of sending it over seas!
	Port Hope, Canada	2018-08-15	How can these companies live with themselves!!! The pollution in itself is horrible let alone everything being fished out!!!!!
	Truro, Canada	2018-08-17	Nova Scotia and PEI coastlines have been damaged enough over the years...let the fishing return..quit messing with the ecosystem
	Murray River PE, Canada	2018-08-17	Signing to help prevent a company that doesn't care about polluting the waters of Northumberland strait and harming incomes from fishermen, property values and tourism.
	US	2018-08-20	Enough is enough
	Indianapolis, Indiana, US	2018-08-20	Truly sickening...I am ashamed of man. "The greatness of a nation and its moral progress can be judged by the way its animals are treated."-Mahatma Ghandi "We should respect animals because it makes better human beings of us all.
	London, Canada	2018-08-28	I agree with the goal.
	Stratford, Canada	2018-08-28	We feel strongly that we must do whatever is necessary to protect the finite environment. David Ing
	Ottawa, Canada	2018-08-29	No Pipes...We're past that.
	Kensington, Canada	2018-08-29	I believe we must take better care of our planet.
	Port Moody, Canada	2018-08-29	We have to quit messing with the ecosystem!

Name	Location	Date	Comment
	St Ann, Canada	2018-08-29	I hope it's not too late !
	Wellington, Canada	2018-08-29	Because it’s time we tarted to care for this world and stop caring for our wallets
	SouthGranvile, Canada	2018-08-29	Protect our fisheries.
	Charlottetown, Canada	2018-08-29	I value our waters and marine life and beaches.
	London, England, UK	2018-08-29	Make all the culprits clean their own effluent
	Saint Catherines, Canada	2018-08-29	It is crucial that we protect our water, marine life and industry. This pollution should be criminal.
	Canada	2018-08-29	
	charlottetown, Prince Edward Island, Canada	2018-08-29	I care about my island and it's water quality! I enjoy swimming in this area, as well as thousands of others!
	Miramichi, Canada	2018-08-29	What they want to do is unacceptable.
	Montague, Canada	2018-08-29	This should not happen.
	red deer, Canada	2018-08-29	I care about the environment
	Charlottetown, Canada	2018-08-29	I'm signing because I'm neither insane nor stupid. You have to be one or the other to think this is a good idea.
	Stratford, Ontario, Canada	2018-08-29	I care a lot about the Northumberland Strait
	Crapaud, Canada	2018-08-29	I live right here....in a center of a Straight. I cannot allow this to happen....this will kill tourism and many businesses around!
	Charlottetown, Canada	2018-08-29	This is indeed a major risk to the environmental health of the Northumberland Strait.
	Canada	2018-08-30	Aquatic life and healthy waters in our region is important and deserves protection, to preserve this nature. And btw I enjoy responsible fishing.
	Stanhope, Canada	2018-08-30	In what world could this be a good idea?
	Canada	2018-08-30	I believe by standing together in unity via this petition and those like it; we can make a difference.
	Stratford, Canada	2018-08-30	No pulp in the Gulf!
	Belle River, Canada	2018-08-30	I live in Wood Islands and swim in the strait. Never let this happen to our strait and fish and beaches

Name	Location	Date	Comment
	Conquerall Bank, Canada	2018-08-31	It's important
	Port Colborne, Canada	2018-08-31	This is wrong! We're killing ourselves when we kill our planet!
	Charlottetown, Canada	2018-08-31	Our government needs to stop this and start protecting our environment.
	Miscouche, Canada	2018-08-31	I want the earth to be as healthy as possible
	Charlottetown, Canada	2018-08-31	Because it's 2018.
	Rice Point, Canada	2018-09-01	This is completely insane and stupid.
	Montague, Canada	2018-09-03	Reasons I don't want to see waste going into are waters are, is it killing sea life n beside that I swim in that water
	Trenton, Canada	2018-09-06	
	nova scotia, Canada	2018-09-23	I'm a fisherman and fishing is renewable
	Winnipeg, Canada	2018-10-02	Keep My Country (Canada) free from degradation .
	Munster, Indiana, US	2018-10-04	So many of our waters have already been ruined by mining, development, drilling, pollution, and other man-made harm.Enough is enough!Our waters are supposed to be a place of peace and quiet for us, and the fish and wildlife which live in them and/or rely on them!The animals are running out of places to live and be safe. Our fish and wildlife are under threat from so many angles. They desperately need to be protected, mainly from humans.Life is hard enough for people, let alone the animals.Can't we please offer them some much needed help?!PLEASE protect our waters for all future generations before they are permanently ruined. Some damage cannot be undone!
	Charilttrown, Canada	2018-10-09	
	Canada	2018-10-16	I am in support of saving our wildlife, fisheries and waterways. It's time that we starting being responsible for our actions and take care of what we have.
	pictou, Canada	2018-10-25	I worked there for ten years and even though the effluent in the bay of fundy is a really bad idea, you guys don't even know half off it.Good luck
	Trenton, Canada	2018-10-25	Pleas no pipe!
	London, Canada	2018-10-27	STOP THIS DISASTER NOW !!
	TERRE COTTA, Canada	2018-10-31	I have just recently reviewed the UN report on Climate Change and just tonight listened to the WWF report on declining animal /

			marine species world wide. When will the humane race wake up and realize that proposals such as this effluent dumping into the Northumberland Strait is just another piece of the puzzle aimed at the destruction and death of our planet as we know it today. One day in the not too distant future we will wake up and say "What have we done?" When you hear this , it will be too late. Prepare your children and your grand children to live on a planet the likes of which we have never seen before!
	Montague, Canada	2018-11-04	My family’s cottage is in pictou county and many of my friends livelihood depends on the strait. No pipe in the strait.
	Davis, California, US	2018-11-04	Effing environmental criminals. Put them in jail.
	Creston BC, Canada	2018-11-06	Stop it now. Show moral integrity. Make human health and Earth's protection your greatest priority.
	Sinclair's island., Canada	2018-11-08	The idea of polluting the water is insane
	Winnipeg, Canada	2018-11-14	You cannot profit over the destruction of public resources, God-given resources and not take responsibility for the damage you do, the mess you make.
	Cloverdale, NS, Nova Scotia, Canada	2018-11-20	Stop the pollution of our waters and hopefully get rid of the company period!!!!
	Surrey, Canada	2018-11-21	Close it down no delays
	Kentville, Canada	2018-11-21	The Northumberland Strait supports fishing, shellfish and lobsters.
	Stroud, UK	2018-11-21	This is ecocide. Look up Mission Life Force to become an Earth Protector!
	Hammonds Plains, Canada	2018-11-21	I’m concerned about the environmental impact, as well as the impact to Tourism in NS, PEI and NB. There are popular beach areas in the strait and I know I don’t want my kids swimming in effluent .
	Halifax, Nova Scotia, Canada	2018-12-04	Boat Harbour was approved because of lies. It has been terrible for 50 years. It must be ended as promised.
	Halifax, Canada	2018-12-05	
	Paris, France	2018-12-07	We are many people out there that are not aware and concious of these things happening and some that don't even give a damn because of their conditions and education levels, this is a wonderful way to share the and educate people so we can save our planet of this catastrophe..
	Toronto, Ontario, Canada	2018-12-11	I have swam in these waters every summer of my life. This would have devastating effects on the environment, on fisheries, tourism and the way of life for those who live in the region. I get that is scary

Name	Location	Date	Comment
			to loose an industry like pulp and paper in the province but what is scarier is loosing biodiversity.
	Pictou, Canada	2018-12-11	I'm signing because I care about the future of our fishery, our strait, and our community. #nopipe
	Canada	2018-12-11	Fuck northern pulp
	Clark's Harbour, Canada	2018-12-12	Be stupid not to sign this
	London, Canada	2018-12-12	Im connected to mother earth....
	Ottawa, Canada	2018-12-12	I believe strongly in the fact that we muct move away from Fossil Fuels.
	Canmore, Canada	2018-12-13	This just makes no sense at all.
	Cow Bay, Canada	2018-12-17	They destroyed NB's natural forest, don't want to see ours go the same way. Glyphosate (Roundup) is a dangerous poison not only us but all living things it comes in contact with. Stop it now.
	Courtenay, Canada	2019-02-02	i am very concerned about the widlife and people. i do not live there now, but i lived near there for around 3 years. linda ferns, DVM

			had too many chances to correct their wrongs and have ignored all of it !!
	Bathurst, Canada	2019-02-06	I care !
	pictou, Canada	2019-02-08	
	Eastern passage, Canada	2019-02-11	I care about our future.. our childrens future... I care about the animals. We need to think ahead. Leave the oil in the ground
	Moncton, Canada	2019-02-11	
	Hawi, Hawaii, US	2019-02-11	Protecting our water and the ecosystems within those waters should be the most important thing. We are in a climate crisis and this will only speed that up, we are on the verge of extinction as we continue to desemate this earth and all those inhabiting it.
	Harrowsmith, Canada	2019-02-12	All water sources lead in some way to the ocean, which is in need of dire help due to our society. Let's stop adding to the problem and instead start coming up with solutions! :)
	Saint John, Canada	2019-02-12	I support the cause !
	Pomaria, South Carolina, US	2019-02-13	For the families
	Truro, Canada	2019-02-13	I believe we have done enough damage. It's really time to care for our planet.
	Pigeon, Michigan, US	2019-02-13	I support this cause..
	Lucasville, Nova Scotia, Canada	2019-02-17	This is all about money and jobs. I am against destroying our waters ways for the sake of saving a factory where CEO’s are earnings millions on the backs of our environment. The pulp mill shouldn’t be there in the first place
	Mount Herbert, Canada	2019-02-17	Save the Strait from further damage, remember that PEI pesticides have already poured a tremendous amount of poison into the Strait.
	Belfast, Canada	2019-02-18	the strait is critical
	Charlottetown, Canada	2019-02-18	Water and marine life are important.
	Montague, Canada	2019-02-18	I love the waters of Northumberland Strait and this makes no sense.

change.org

Recipient: Minister Environment of Nova Scotia, Minister McKenna, Jonathan Wilkinson

Letter:

Greetings,

Minister Miller, Minister Wilkinson and Minister McKenna,

Today we have dozens of rivers that dump into the Northumberland Strait not counting tributaries. The Strait is a main passage for our a lot of marine species including Waterfowl. It is a place for them to feed, rest and live. However all this is at major risk with the proposed 90 million litres of effluent to be pumped into the Strait a day. The effluent at the outflow of the pipe is going to come out at 25c in the Winter and 37c in the summer!! (The natural water temps of the Strait reaches 15C in the summer) These temps will absolutely change the diversity and make up of this sensitive and important marine ecosystem. This will increase the overall temperatures of the Strait over time due to the high volume of effluent being pumped a day.

The Effluent is going to be fresh water. The Strait is comprised of salt water and species that require a specific level of salinity. At a rate of 70-90 Million litres a day, the salinity of the Strait will change as the waste continues to accumulate over time. This will impact Wetlands, all species that use the Strait as well as the food sources within.

The makeup of the toxic chemicals that will be part of the effluent will also pose major threat to marine life. The communications officer for Northern Pulp has said a few times that the current infrastructure of the mill cannot handle the new proposed effluent makeup because it will be to corrosive to their internal setup and that pumping it into the Strait is the most economical option for the Mill. However, there are many scientific documents that show the risk and harm that will come from this.

Furthermore, the effluent would contain chlorines, dioxins, metals, among other toxic constituents and will contain 935kg of solid materials per day. All of these can bioaccumulate, having catastrophic effects on marine life. Laboratory studies using individual chlorinated organic compounds that are commonly discharged from bleached pulp mills have demonstrated effects such as deformities, as well as embryonic and larval mortalities in fish. These chronic effects will jeopardize the future of many fish species and damage the integrity of the ecosystem. It is documented that Dioxins contaminate fish and shellfish because fish act like sponges for Dioxins,

accumulating them at 25,000-50,000 times the concentrations present in their environment. It also is reported that fish species 250 miles away from the source have been impacted.

The other obvious threat to the Strait is the colour of the water will change. The effluent due to its makeup will change the colour at the water at the outflow of the pipe which is positioned a few kms offshore and directly into the Strait. At millions of litres a day, this will impact a very large area and ultimately change the natural state of the ecosystem.

The Strait already has several large dead zones due to nutrient overloading from many sources. It cannot handle any additional pressures. Boat Harbour, once a very healthy estuary and wetlands is an official environmental disaster due to the mills current waste process. The NS Government is mandating that it be stopped by 2020 and cleaned up. However, the option Northern Pulp came up with is to dump it into the Northumberland Strait! We need Federal involvement and a full Environmental Assessment completed to ensure that the proper scientific testing is done and risks highlighted.

These are only a few points of a concern from a very long list that this pipe will cause. Our wetlands and surrounding marine habitat are not the only things at risk here. Atlantic Salmon, Trout, Herring, Gasperaux, Smelt, Eels, Whales, Atlantic dolphins, Tuna, Mackerel, Striped Bass, etc etc etc all will be impacted by high water temps, toxic chemicals, changes in salinty and water clarity.

You can help by submitting feedback on the Environmnetal process by sending your concerns to ea@novascotia.ca

Project: replacement_effluent_treatment_facility_project Comments: As a former resident of the Town of Pictou, I agree that the Mill has provided jobs over the past years. However, that is the past. My understanding is the number of actual people employed on site is around 100. The other jobs relate to the foresty industry. I think it is time to take a step back and find other markets for the wood harvests. The Mill has been polluting Boat Harbour since inception, never mind polluting the air that residents breath. The promise to close Boat Harbour MUST BE KEPT, but UNDER NO CIRCUMSTANCES should treated waste be dumped into Northumberland Strait. It would be a travesty, not just for N.S., but for PEI, NB, Magdeline Islands, etc. Name: Email: @gmail.com Addres

Project: replacement_effluent_treatment_facility_project Comments: I believe the existing science and extensive studies on effluent will show it has done little harm to the environment. A balance between the environment and good jobs has to be found we dont need another 1000 Nova Scotians heading west for work!!! Boat Harbour has drained into the Northumberland Strait for 51yrs and has not harmed the fishery. I strongly believe a modern new effluent treatment plant will be a great improvement for the area and allow the Open Septic tank of boat harbor to close even if a one year extension is required. Further to this all effluent leaving NP will now be treated preventing any future risk of a spill!!! Lets keep good jobs in our Forests industry! Thank you Name: Email: @gmail.com Address

Project: replacement_effluent_treatment_facility_project Comments: I am from a home town that lost their main industry the little now village of Canso, we died after that, if this assessment is not approved and if the plant is not given an extension even 6 months more would make a big difference, I see the future of Pictou where Canso is now essentially non existent. Keep in mind the people complaining majority are retired so they donâ?Tt have to worry about staying at home and when discussed with them their response is well the youth will have to go elsewhere to work no regard for us . We want to stay home our families want to. Northern pulp helps families multiple at Christmas I mean multiple disadvantaged families , I have yet to see a fisherman come in to pay for Christmas for a local family. Do not kid yourself they put on poor face but they are millionaires whom are self employed yet get EI in the off season . No one else self employed gets this . Itâ?Ts time people see this for what it is a company trying to right itâ?Ts wr ongs and to save a county. If it is not given the time say goodbye to multiple businesses and to the county in general. This is not just 300 jobs locally this is thousands locally approx 8000 and 12,500 across province maybe more. Project: replacement_effluent_treatment_facility_project Comments: Give northern pulp the ok to build the facility and give them the extension so they can run with out a shut down. This project is one of many of its kind we know the technology works and dumping in the strait is nothing new. We need more employers in Nova Scotia that are willing to upgrade old plants and build new ones. I think other companyâ?Ts like Pierdae energy are sitting back watching this unfold and depending the outcome may or may not make the final investment in their gas plant in goldbaro. We need to make Nova Scotia a welcoming place for businessâ?T willing to come here. Name: Email: @hotmail.com Address

Project: replacement_effluent_treatment_facility_project Comments: This project is a must to maintain good paying jobs in rural Nova Scotia. The present Boat Harbour lagoon is an effluent treatment system, it was converted to one by the province. A person would not swim in the New Glasgow or Halifax treatment systems. The treated effluent has been going to the Strait for 50 years with no effect to fisheries, in fact some fishers have seen an increase in the fisheries. Look at all the facts when your decision is made, donâ?Tt make it on emotions and fake news! Name: Email: @gmail.com Address: Municipality: Postal-Code: Phone: Privacy-Statement: agree x: 62 y: 23

Subject: Citizen Submission for Northern Pulp"s Replacement Effluent Treatment Facility Project
Date: February 20, 2019 10:36:19 AM

To: Canadian Environmental Assessment Agency (CEAA)
Re: Support for Federal Environmental Assessment of Northern Pulp's Replacement Effluent Treatment Facility Project

Dear Minister

We are submitting our comments on Northern Pulp's proposed Replacement Effluent Treatment Project.

Our comments are intended to help you decide if Northern Pulp's proposal warrants Environmental Assessment due to the possible adverse environmental effects on the region, and to determine if those effects can be mitigated, eliminated, reduced or controlled.

Addressing directly adverse effects on the environment, the damaging effects of the effluent on Boat Harbour has been very clear. The current proposal of Northern Pulp to move their dumping from that harbour to Caribou Harbour does not in any way reassure us and other citizens of Pictou area that these damaging effects will not occur again. One of the most reliable scientific studies that can be pointed to is the direct results of past actions. The results of pouring pulp effluent into Boat Harbor has tragically harmed that environment and the health and economy of the people living in that environment. The trauma of living by waters that are polluted is evident and long-standing. This evidence alone points to what would be the future of Caribou Harbour and the citizens of our local region should this proposal go ahead as planned. We are writing to be clear that we do not want a repeat of a situation that would cause obvious damage to the environment, the local economy and the people's enjoyment of that environment.

We live directly on Caribou Harbor and participate daily in the enjoyment of its clean, so far, environment, side by side with the lobster fisheries and tourism industries that are based in these waters. In our community, for instance, there is are two wharves from where fisherman operate their boats. We have first-hand relationships with them as our neighbours and as part of our local economy. We also live next to a Provincial Park, and the highly popular Pictou Lodge.

Personally, we have been living on this shore for the last 30 years. In the summer we swim in the ocean on a daily basis, and since moving to Caribou Harbour, also enjoy daily walks along the shoreline to Munroe Island. We live next to the Caribou Provincial Park, which would be negatively affected by the dumping of effluent in these waters. This park is one of the most popular in the province, and attracts people from all over the Maritimes, and the country, as well as international visitors. If you have ever visited here to see the beautiful beach and what this area offers, what I am saying would be clear to you.

Besides the local environment and economy, clearly our property values would decrease significantly if we lived on polluted water. What attracts people to live here is this beautiful, fresh, clean environment. Caribou Harbor is a sought-after area now, for these reasons. It is clear that this would change very quickly with the sheer volume of effluent being proposed to be dumped in our water, let alone its toxicity levels.

The current proposal for cleanup of the effluent to make it less toxic does not reassure us that it would be sufficient to mitigate the problems we would be experiencing in the Caribou Harbour region. To this end we request that the Minister, whose job is to protect the environment and the citizens, order an Environmental Assessment Report.

Based in a review of Northern Pulp's past actions and their detrimental effects to the environment and the people that live in the Boat Harbour environment, it seems clear and obvious that the Caribou Harbour environment and the people living here would also be directly affected if this plan went through, especially if done without the checkpoints and monitoring of an Environmental Assessment.

Should there not be an Environmental Assessment, we submit to the Minister that from our point of view we, the public, would have every right and justification for suing our government for lack of protection of the environment and the people affected.

Our hope is that our government will act responsibly and move in the direction of resolving this issue.

Thank you for reviewing our submission.

Respectfully,

From: @hotmail.com

Project: replacement_effluent_treatment_facility_project Comments: The current treatment system planned is a release system off shore not in a harbour or confided testible location and itâ?Ts designed that way to midigate/avoid the ability to scientifically verify any future effects caused by this facilities Effluent period. The NS Government will always be able to avoid dealing with harm done to the environment with this plan as will the company that owns or in future will own this facility, this is s very dangerous path. Job are very important, not just at the mill but also on he waters, this risks the Nova Scotia Brand Of sea food. The company and or our Grovernment must find a better solution for all. Project: replacement_effluent_treatment_facility_project Comments: I am in favor of approval of the Northern Pulp Pioeline project. Northern Pulp is of vital importance to economic stability not just of northern Nova Scotia, but the entire province. The new pipeline, from all that I have read will be much cleaner that the Boat Harbour outflow. It is my understanding that where the treated waste exits the pipe, there will be no discernible chemical residue beyond 100 feet of the pipe. Environmental standards are much more stringent than they were 50 years ago. I believe this system meets or surpasses current environmental standards. Therefore is should and must be approved. The naysayers do not appear to have credible evidence, scientifically based, to support their reasoning to deny the pipeline and system that NP are attempting to use. Subject: Effluent Qualities Unknown! Huge Red Flag ! Feedback opposing the Northern Pulp Waste Proposal
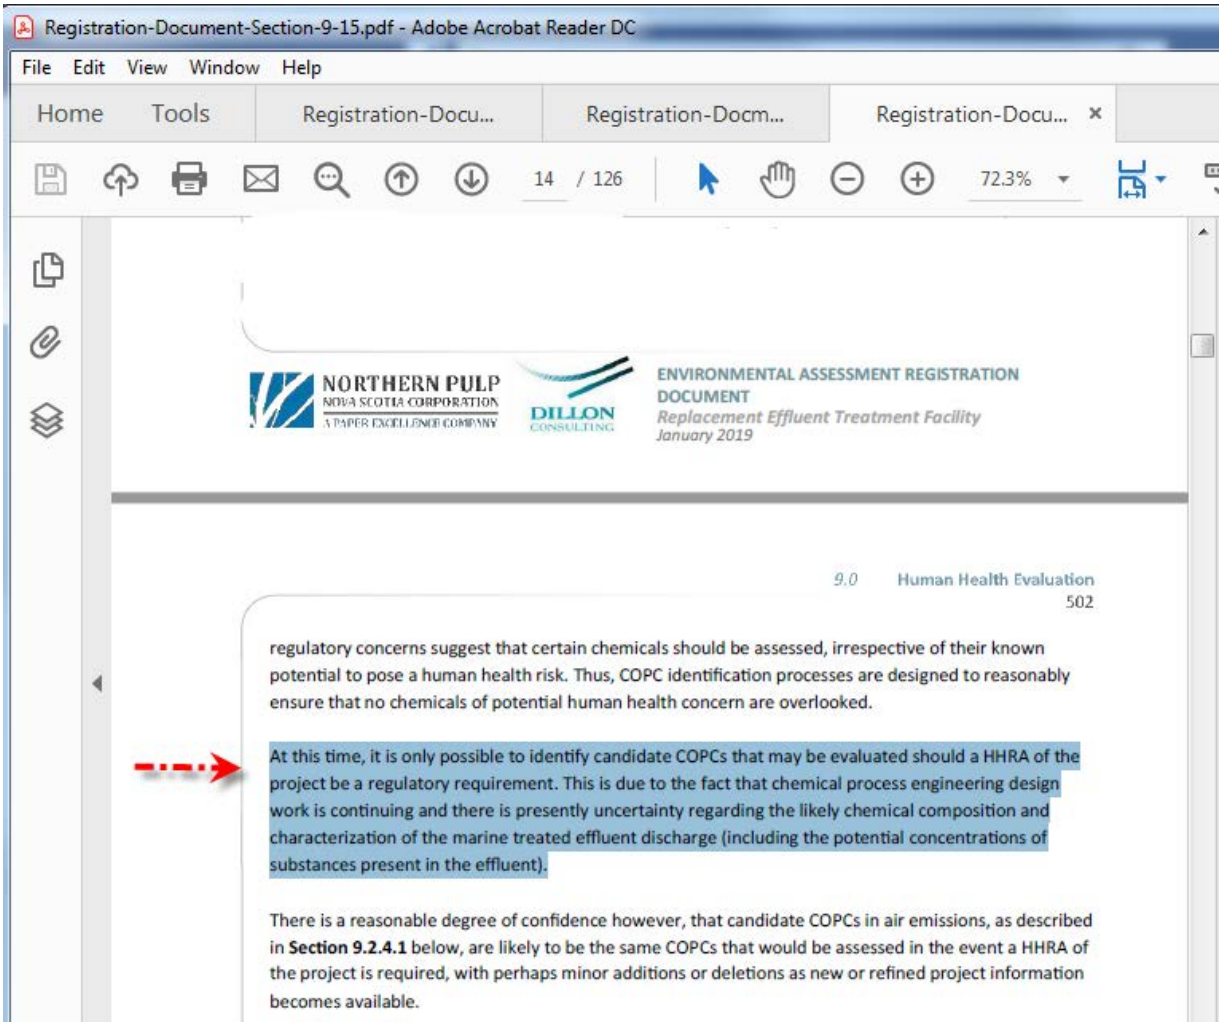
Date: February 20, 2019 10:55:03 AM
Attachments: image.png

Hello Premier McNeil and Minister Miller,

This statement within the NP EA is a huge red flag! How can anyone have trust and confidence that this effluent is safe for human health, marine species and the overall environment when the contents are still unknown and will remain unknown until its being pumped into the ocean. At that point, it is to late at 90,000,000 Litres per day!

"At this time, it is only possible to identify candidate COPCs that may be evaluated should a HHRA of the project be a regulatory requirement. This is due to the fact that chemical process engineering design work is continuing and there is presently uncertainty regarding the likely chemical composition and characterization of the marine treated effluent discharge (including the potential concentrations of substances present in the effluent)."



Sincerely,

Project: replacement_effluent_treatment_facility_project Comments: This is 2019 a environmental assessment should of been done long ago. I am tired of the smell the plant produces and we worry for our health from the effects of the mill. Fishing is a huge importance for the province. They shouldnt be even a question if they can dump the effluent in our water!!!! NO!!! The average person is bound to environment standards but people who can pay off other people can flog the system. We need the provincial and federal government to stand up and say enough is enough!! NO PIPE!! Name: Email: @hotmail.com Address:

Project: replacement_effluent_treatment_facility_project Comments: Northern Pulp should be required to treat its effluent internally with a closed-loop system, and should not be allowed to continue polluting our environment in Nova Scotia. I have serious concerns about air quality, water pollution, dioxins and furans, and their impact on surrounding communities health - not to mention the other species that call the Northumberland Strait home. Remember this is home to one of the last remaining Atlantic Salmon populations. This pulp mill has been sucking taxpayer dollars out of this province, poisoning the land and water of Indigenous communities and poisoning the air of everyone, for far too long. This new effluent treatment plan is no better than Boat Harbour, and simply shifts the burden of toxins to a different area. If the pulp mill cannot deal with its effluent internally with a closed-loop system, without foisting its pollution on the surrounding environment, it must be concluded that they are not equipped to function responsibly in our province. This effluent facility should not be approved. Name:

Subject: End of Northern Pulp not the end of the world
Date: February 20, 2019 11:48:33 AM

Closing Northern Pulp would not be the end of the world. After all, in 2012 Bowater Mersey in Liverpool and Minas Basin Pulp and Power both closed, with a total loss of 455 jobs, yet Nova Scotia didn't fold. Indeed, there was at least one positive impact resulting from those closures; they reduced the demand for coal-generated electricity and reduced Nova Scotia's GHG emissions significantly.

The closing of Northern Pulp could have several positive effects on our province. First, our emissions from coal-generated electricity would be further reduced; second, the air and water quality in the Pictou area would be greatly improved; third, the threat to our fishery would be removed; and fourth, and most importantly, the loss of jobs in Pictou could lead to the development of many more jobs elsewhere in the province.

If the province lifted the moratorium on hydraulic fracturing the harvesting of our onshore natural gas and the building of pipelines to distribute it would create hundreds of jobs. It would also allow us to cut our CO2 emissions from electricity generation in half and divert millions of dollars from South America where we purchase coal, to Cumberland and Colchester Counties where the bulk of our onshore natural gas is found. Furthermore, it would deliver millions of dollars of income to the government; income that could be used to fund improved health care, education and infrastructure. It could also be used to lower business taxes and help grow our economy for years to come.

The closure of Northern Pulp would not be the end of the world. In fact, it could be the beginning of a bright new world for Nova Scotia.

Subject: Northern pulp mill concerns
Date: February 20, 2019 12:04:14 PM

The Canadian Environmental Assessment Agency
1801 Hollis Street
Halifax, Nova Scotia B3J 3N4
Telephone: 902-426-0564
Email: ea@novascotia.ca

Dear Minister of the Environment,
I am writing to provide feedback to the Northern Pulp's 1200 page proposal to conduct a new effluent treatment facility at its Abercrombie Point location in respect to whether or not your department should recommend a federal environmental assessment.

Taken from NP proposal:
"The proposed project will consist of building a new effluent treatment facility (ETF) on NPNS property including a pipeline to transport treated effluent to Caribou Harbour. Ultimately, the effluent discharge will be into the Northumberland Strait, as has been the case since 1967 via the existing facility. The installation of a modern engineered diffuser provides an improvement in effluent dispersion. The improvement is such that as unlike the visual impact experienced today, it is anticipated that the effluent plume will not be visible when it reaches the water's surface."

This opening statement shows exactly how the rest of the document will read. NP calls it a "new effluent treatment facility" which in itself should trigger the federal assessment. NP then states that the effluent discharge will be into the Northumberland Strait as has been the case since 1967 via the existing facility. We have seen what that has done to Boat Harbour and the surrounding area so why is it o.k. to continue to pollute the Strait in an area where it will not be visible to the majority of the public. How many people other than fishers will be in boats 4 miles off the coastline? Does this make it o.k. to pump the effluent into the Strait because no one can see it happening or because it has been happening for the last 50 years as the proposal states? Just because the new diffuser will supposedly provide an improvement in effluent dispersion doesn't mean that it is better (see comments below) . What about the temperature difference of the effluent? According to NP the area affected will only be 100m from the discharge site. This is based on supposition not scientific fact and will have severe consequences to the fisheries (food over pulp please) for years to come.

Potential environmental effects are identified and predicted for both the construction and the operation and maintenance phases of the project. The residual environmental effects of each project phase are evaluated as either not significant ("NS"), significant ("S"), with the likelihood of occurrence identified in such cases, or positive ("P"). The environmental effects of accidents, malfunctions and unplanned events as well as cumulative environmental effects of the project in combination with other past, present, or reasonably foreseeable future projects or activities are also assessed.

The table that is listed on page xxiv of the proposal summarized the studies, and the effect of the project for the significance of the project related residual environmental effects of the project. I was amazed to see that all categories were predicted as NS - No Significant Residual Environmental Effects Predicted. However, in reading further into the proposal I have discovered many other areas of concern.

"Detailed design has not been completed for the construction of the marine outfall and pipeline. The preferred method for trenching the marine pipeline will likely be by side-cast excavation methods with re-use of bottom materials without bringing to surface". And comments such as "The treated effluent is anticipated to meet compliance"etc. are littered throughout the document. The whole document is written with "not been completed" or "to be determined". On numerous items the proposal states that it is not possible to know or needs more assessment due to the pipeline being defined in the fall of 2018. Again another reason for a federal assessment.

Although NP has had 5 years to adjust to the new reality that Boat Harbour was closing, they have submitted a half-baked proposal, at the 11 hour with lots of what if and projections without any scientific data to back them up. This is not the fault of the population of Nova Scotia but we will have to suffer the costs both in air and water quality for NP dragging their feet and now trying to ram their proposal through.

As one writer to the Herald stated “If one lobster from the Northumberland Strait is found to be tainted with chemicals, it will not be recorded as a Northumberland Strait lobster, but a Maritime lobster. The whole Maritime fishing industry is at stake.

The damage that NP has done to the forests of Nova Scotia should also be considered.
The Lahey report summaries that there is and has been too much clear cutting in Nova Scotia and the health of the forest ecosystems and wildlife is declining as a result. Coupled with the spraying of Glyphosate (a herbicide that remains the world's most ubiquitous weed killer that has raised concerns regarding risk of cancer to those exposed to it by 41%,) the whole project should be studied from all sides and definitely in depth. A federal proposal is required.
I understand that jobs are at stake here but there is more to consider than the economic benefit from one mill. There will always be a market for lumber and the independent foresters and the majority of Nova Scotians would like to see changes to the clear cutting that NP has been getting away with for so long. There are other industries that are affected by NP destruction of the environment notably the fisheries (1 Billion) and tourism (2.7 billion). Together these two industries outstrip the benefits of NP.

The health reasons of dumping 85,000 litres per day of a noxious mixture of dioxins, furans, metals and solids and other contaminates into a water source is inconceivable to me in this day and age of knowledge. Coupled with that, the mill wants to burn the sludge in the power boiler. This is the same boiler that has failed stack emissions tests (Northern Pulp's failed stack test happened the week of June 6 at a reading of 224, 50% over allowable levels) although I understand from NP proposal that "A frequent exceedance is defined as one that occurs more than 1% of the time".

On page 140 under section 8.1.2.2 the proposal states that there have been no exceedances of maximum allowances. This is based on their own assessment. In the proposal NP quotes a recent paper by Hoffman et al. (2017) who evaluated ambient air levels of seven volatile organic compounds (VOCs), based on ambient monitoring data reported from the National Air Pollution Surveillance Network (NAPS). There are two NAPS monitoring stations near the NPNS mill that have historically monitored for VOCs. This paper focused on ambient monitoring data for the following VOCs: chloroform; 1,3-butadiene; vinyl chloride; benzene; carbon tetrachloride; trichloroethylene; and, perchloroethylene. The paper reported that results of the conducted temporal and spatial statistical analyses indicated that 1,3-butadiene, benzene, and carbon tetrachloride air concentrations routinely exceeded EPA air toxics-associated cancer risk thresholds, and that 1,3-butadiene and perchloroethylene levels in air were significantly higher when the prevailing wind direction blew from the northeast and the NPNS mill towards the Granton NAPS site. Conversely, when prevailing winds originated from the southwest towards the mill, higher median VOC air toxics concentrations at the NAPS site, except carbon tetrachloride, were not observed. These outcomes have not been corroborated by regulatory agencies or other parties at this time. While this study was quick to attribute elevated ambient VOC concentrations to the NPNS mill based on a spatial and temporal evaluation only (i.e., a statistical evaluation of ambient data in correlation with wind direction, without further site specific investigation), it did not attempt to rule out contributions from other potential sources of VOCs in the area (e.g., transportation sources, or other industrial sources like the Michelin tire plant or the Trenton coal-fired power plant, presumably all sources of VOC emissions to some degree). So NP refuses to believe that they could be the source of air pollution but would prefer to blame it on other industries in the area.

As far as the total environment foot print, meeting current PPE regulations does not mean that harm is not happening. Regulations for pulp mills were updated in 1992 and are concerned with biochemical demand and suspended solids. As it stands now, there are no CCME guidelines established for some of the different chemicals and compounds that make up the pulp mill effluent. It is not acceptable to follow 27 year old legislation so once again, a federal assessment should be considered.

The new treatment facility is being touted as better than the old. I have several concerns and comments on this. It is my understanding that the current set up has the discharge going into the Northumberland Strait after a 12 hour

primary treatment in the settling ponds, then moves to an aeration basin where effluent is placed in contact with micro-organisms and sits there for 8 days after which the effluent is discharged into Boat Harbour lagoon (basin) where it remains for an additional 20-30 days. Further aeration, settling, cooling, volatilization and breakdown of materials take place during that time. In the proposed new Activated Sludge Treatment (AST) system on the mill site, effluent will move through a primary clarifier to an aeration basin using micro-organisms to break down pollutants, and then to a secondary clarifier. The process will take less than 24 hours. Northern Pulp states that effluent from the new system, including an added oxygen delignification system, will be similar to treated effluent leaving the present system at point C, with some (unspecified) reduction in biochemical oxygen demand (BOD.) However, the effluent being released from the proposed new system directly into the deep waters of the Strait will not benefit from the considerable reduction in BOD, Total Suspended Solids (TSS) and other contaminants including heavy metals which takes place during the 20-30 days that effluent presently remains in the Boat Harbour Basin stabilization lagoon. Northern Pulp has not provided a detailed comparison between the effluent which presently reaches the edge of the Strait and the effluent they propose to release into the fishing grounds with the new system. The present effluent outfall location at the shore edge does not disperse effluent in the Strait in the same way that the proposed new outfall site would. With the proposed new system, 70+million litres of treated effluent would be pumped directly and continuously into the prime fishing areas of the Strait every day.

Ocean environments are increasingly stressed. The Northumberland Strait Ecosystem Overview Report, prepared for DFO in 2007, documents increasing stresses on the Strait. To state that there are other industries producing stresses does not make it alright for NP to increase this toxicity and to think otherwise is just plain insanity.

In terms of toxicity, my understanding is that there is only one test required to meet federal regulations. This test measures acute toxicity -- whether 50% of rainbow trout die when exposed to effluent for 96 hours. It does not measure impacts on fish growth or reproduction or on fish habitat. No toxicity test on salt water fish is required to meet federal regulations. There are no federal regulations for a number of known harmful substances in pulp effluent, including AOX and phenols so further study is needed before this pipe is installed. We cannot wait for updated PPER legislation slated for publication in 2022.

NP lists Alternatives Considered for Final Discharge Location or Method. Discharging into Pictou Harbour is not recommended due to the lack of mixing with the Strait (as if mixing with a larger body of water is acceptable), Release into the Middle River upstream was not considered due to expectations that it will increase chlorides in the Middle River and potentially affect the maintenance of the equipment at the Middle River Pumping Station and inside the mill (but once again it is o.k. to dump on fishing grounds). The municipal stations and private facilities do not have the capabilities to handle the volume nor is a land based option available because as proposal states: Land application of wastewater effluent has not yet been approved in Nova Scotia (small wonders), Trucking or barging the sludge to a different location is not recommended. I found the barging comments interesting: A pier for barge loading would be necessary - assumed to not be at the NPNS mill location. Liquid would have to be either stored and trucked or stored and pumped to a facility to offload to an ocean going barge/tanker to be discharged outside of coastal waters in an approved area, with a large number of tankers. There would be increased industrial vessel movements in the Northumberland
Strait, potentially disrupting fisheries. Project specific permits would be required as the effluent does not fall under materials permitted to dispose of offshore. NP is concerned about the increase in traffic in the Strait but not about the effluent that will be pumped there. Why would they need project specific permits if effluent does not fall under material permitted to dispose of offshore but using a pipeline to dump the effluent is allowed?

A closed loop system is not economically viable according to Northern Pulp. NP also states: The main problems with the bleach plant effluent recovery are equipment corrosion and accumulation of chloride and non-process elements in the mill's water systems. Accumulation of chlorides and potassium are especially corrosive for the mill's boilers and often lead to scale build-up which would require the replacement of the boiler over time. However NP also argues that it would not be economically viable for NP however they are quick to boast of the annual volume of income at $535 million. If the chemicals used are too corrosive for the river and too corrosive to recycle in their own equipment, how can pumping the effluent into the Northumberland Strait be a viable solution? Surely dispersing sludge over a larger area is not the answer. And what happens if NP sticks around until the end of the lease in 2030. Who is going to clean up the mess then? Who is going to compensate the fishing and tourist industry? This are too many other stakeholders involved to let this go through without a Federal Assessment.

I haven't even commented on the state of the health industry in Nova Scotia that could use the money being spent

on NP. NP has already received $127 million dollars in tax payer's dollars over the years. We have paid for the design process of the proposed effluent process at a cost of $6 million dollars and will be expected to cover the cost of the construction, installation, labour etc. for the proposed pipe estimated at $100 million dollars. How can NP be allowed to pollute the environment as they have in the past and how can we as citizens believe anything that NP puts out in the media about how wonderful they are when history has shown otherwise? I would rather put my tax dollars towards the penalty of breaking the lease if need be.

On top of all that, I have now read that there is a conflict of interest from the minister of the environment: As Ecojustice wrote on behalf of Friends of the Northumberland Strait," the minister has a clear financial interest in making sure the environmental assessment process is over and done with as quickly as possible. Our clients also say the minister's ongoing contracts with Northern Pulp give the impression that the minister is not able to make a fair decision about whether or not to approve the project. These conflicts of interest violate the public's right to a thorough and unbiased assessment. That is why we are calling on the minister to step away from the assessment process and make way for a federal environmental assessment."

In summary, a federal assessment is required. I will accept the outcome of that but nothing less.
Sincerely,

Project: replacement_effluent_treatment_facility_project Comments: I am years old and i have breathed and tasted the stench in my mouth.I recall as a child the horrible smell

and studies prove whats causing it!! West river is

which has killed many people throughout the years. Did you know this water has not been tested for over 20 years? paid to have the water and soil tested after many fish died and were all around the coastline then DOF put signs all around the lake that reads contaminated shellfish. Last July 2018 i called Pictou several times who told me they do not do the water and soil testing i explained my concern about the dogs that died in the lakes in Halifax 2018 from bacteria in the water i simply was told by her just dont let your dogs in the water i was giving the number of DOF and r came the next day but guess what they dont test the water either the next day Pictou RCMP arrived at my door wondering why he was called?? i did not call him DOF did. After many phone calls and much frustration i was told by NS environment ..NS DOF ...and pictou municipality no one does testing nor follow ups in this water i was told. I have brought my concerns and left it with my MLA Karla MacFarlane who is looking into it since July 2018. My questions are ~ Who will be monitoring the waters surrounding this pipe? what is in the effluent and where will this pipe end? we the public deserve these answers and proper information to be detailed before ANY approval we are fighting our own government for clean air and water which in my opinion is a disgrace!! Shut that cancer polluting mill down its way past its stay here in Pictou County Name: Email: @gmail.com Address:

Project: replacement_effluent_treatment_facility_project Comments: The northern pulp mill is a vital part of the rural economy in nova scotia. Other pulp mills across canada operate within the regulations set forward buy our government. If this new system can operate safely and within the guidelines described for releasing treated effluent into a water body then i would accept a decision from the department of environment allowing the project to move forward. Project: replacement_effluent_treatment_facility_project Comments: Dear Minister, Thank you from the opportunity to comment on Northern Pulpâ?Ts environmental assessment registration document. I will preface my remarks by saying, I studied environmental assessment many years ago at Dalhousie University that I have prepared an environmental assessment registration for a project in Nova Scotia, and I am a landscape architect with a background in beaches and shoreline processes. I understand the difficult situation the Minister and the Province find themselves in with respect to closing Boat Harbour and the associated requirement for Northern Pulp to provide an acceptable alternative effluent treatment and disposal plan. I have visited Boat Harbour, and it is an environmental disaster with concentrations of chemicals in the bottom sediments. Hopefully it can be remediated successfully and the years of exposure that Pictou Landing First Nations had to endure must end. Any proposal that involves dumping millions of litres per day of a chemical process effluent into the Northumberland Strait at Caribou Harbour requires careful consideration of the potential environmental impacts at source, at the outfall and downstream . The absolute minimum requirements to assess the potential impacts are : 1] A clear understanding of the chemical composition of the effluent , 2] The design of the outlet, 3] Good baseline information on the Northumberland Strait marine environment and processes, 4] A demonstrable appreciation of the risk factors at the outlet location such as sediment migration and wave energy. 5.] Consideration of the potential impacts of extreme storm or wave events generated in part by climate change. The Registration Document for Northern Pulpâ?Ts proposed effluent treatment plan fails to provide critically important information which is essential to proper environmental assessment. It states on page 502 â?othere is presently uncertainty regarding the likely chemical composition and characterization of the marine effluent discharge â?o . It further admits in 9.2.4 that there are two sources of chemicals of potential concern that may result in potential chronic human exposure to project related chemicals. The potential impacts on the health of area residents must be known and properly evaluated before approval of this project. The document states there is no detailed design available for the main effluent outlet, and that the proposal in the Registration document was prepared without field work in the marine environment. There is no specific discussion or assessment of the potential impacts of climate change in the Registration document. The environment of the proposed effluent outfall is a dynamic, shallow, drowned shoreline with sediment movement that is subject to periodic extreme storm events as low pressure systems track into the Gulf of Saint Lawrence. The proposed effluent outfall location is in close proximity to a site of ecological significance at Monroeâ?Ts Island, an important Provincial Campground and Day Use park at Caribou , and it sits at one of the key tourism entry points to Nova Scotia. The impacts of any potential catastrophic failure of the treatment system would be amplified by this very public and ecologically sensitive location. Any mechanical system is potentially subject to failure and the impacts of such a potential failure cannot be adequately assessed without knowledge of the chemical composition and physical characterization of the effluent. The deficiencies in the document raise serious concerns with respect to its conclusions on the potential significant environmental effects on the valued ecosystem components. The conclusions indicate there will be no significant effects on all components. I submit that without knowing what the effluent contains these conclusions are scientifically impossible. I understand the economic importance of Northern Pulp to Nova Scotia and I sincerely hope that an environmentally acceptable alternative effluent treatment

strategy can be developed that does not risk destroying one of Nova Scotiaâ?Ts most valued marine environments . However, given the serious information deficiencies and uncertainties in the Registration document it cannot be accepted and the project cannot be allowed to proceed until these deficiencies are addressed . Yours truly ,

Project: replacement_effluent_treatment_facility_project Comments: As a retired engineer with northern pulp I believe there has been a tremendous amount of misinformation and hype concerning the effluent upgrade. I believe the company contracted to supply equipment and provide technical expertise for the project is a world class company experienced in many types of waste water treatment. I believe when the project is built and properly commissioned the wastewater quality will be monitored continually at the mill site before even being released to the northumberla d Straight. If the quality of effluent does not meet the specifications required for the environmental assessment then the effluent wonâ?Tt be released to the straight. I believe hype and misinformation must be take away from the review process and let the science prevail Name: Email: @gmail.com Address:

Dear Sir or Madam and Ministers:

Please be advised we represent the Harbour Authority of Caribou (hereafter the "Authority"), Pictou County, Nova Scotia. Located at the mouth of Caribou Harbour the Authority operates the busiest fishing port in Northern Nova Scotia. It is the hub of fishing activity from April to early December each fishing season. It is accessed via the106 branch of the Trans-Canada Highway and is adjacent to the Northumberland Ferries terminal. The facility managed by the Authority is the 'heart' of the commercial fishing industry in northern mainland Nova Scotia.

The Authority has retained our firm to express its grave concerns regarding Northern Pulp's proposed new treatment facility, which includes an effluent pipe to discharge an estimated minimum of 62 million liters per day, into the mouth of Caribou Harbour. The

Authority's position is that the Northern Pulp's proposal fails to adequately address and in some cases completely fails to address various environmental and navigational concerns which could cause both short and long term harm to the facilities managed by the authority as well as its patrons.

Of major concern is that Northern Pulp's associated effluent will be harmful to the receiving waters of the Northumberland Strait and its marine life habitat. Northern Pulp is considered to be among the 70% of Canadian mills whose effluent has been proven harmful to the receiving waters into which it discharges. I will outline herein several of the Authority's major concerns with Northern Pulp's current proposal.

1. Northern Pulp's current proposal (section 8.11.2.4) confirms that there has been no testing completed with respect to the water composition of Caribou Harbour. Instead Pictou Harbour was used as a proxy for Caribou Harbour with respect to water quality. There is no explanation as to why water quality data for Caribou Harbour was "unavailable". The Authority views such an assumption on water composition as entirely inadequate. There are major distinctions between the two harbours which makes such an assumption tenuous at best. Pictou Harbour has been exposed to sewage from the Town of Pictou and other municipalities for over 200 years. In addition industrial waste from a ship yard, pulp mill, power plant, tire plant and many other businesses has been discharged into Pictou Harbour for over a century. Pictou Harbour also has three major feeding tributaries and Caribou Harbour only has one much smaller tributary. Caribou Harbour's water chemistry is potentially drastically different in comparison to Pictou Harbour.

In the Authority's opinion the assumption and lack of data falls far short of federal and provincial regulatory requirements under legislation such as the Pulp and Paper Effluent Regulations (PPER), the Fisheries Act, the Disposal at Sea Regulations under the Canadian Environmental Protection Act, 1999 (CEPA), and DFO's Measures to Avoid Causing Harm to Fish and Fish Habitat (DFO 2014). The Authority submits that this lack of data and other aspects of Northern Pulp's environmental assessment indicate a 'rushed job' and which lacks substance.

2. The Northern Pulp proposal relies on a receiving water study prepared by Stantec. This study indicates that there will be minimal flow of effluent discharge into Caribou Harbour. The Authority's position is that the methodology used to make this erroneous determination is subpar and inadequate. A significant volume of water from the discharge location flows into Caribou Harbour on a rising tide. The patrons of the Authority will attest to the "allusion" of a rising tide at the proposed discharge point going mainly northwest, when this in fact, is false.

3. Section 6.5 of Northern Pulp's proposal suggests that fishermen have offered "no input to the outfall location". The Authority has been advised by its fisherman patrons that this is a false statement and that Northern Pulp's representatives were informed the entire area outlined and presented to the fishermen of Caribou Harbour, including the pipe route and outfall, is fished at one point or another throughout the year.

4. The Authority is very concerned that its patrons (both commercial and recreational) will have their navigational abilities under *Navigational Protection Act* restricted. This has simply not been addressed adequately in Northern Pulp's proposal. As previously noted herein the patrons of the Authority, in particular seventy (70) plus commercial fishermen, navigate directly across the path of the proposed pipe route in Caribou Harbour, on a daily basis, during regular fishing seasons of lobster, crab, herring and scallop seasons spanning April through November. Fishermen fishing north, northwest and west of the mouth of Caribou Harbour exit the marked channel between the third and fourth red buoys depending on destination daily – saving individual fishermen hundreds of miles of travel and reducing fuel consumption and reducing emissions. There appears to be a general lack of attention paid to these concerns. The Authority's position is that all navigation concerns must be addressed satisfactorily prior to any approval and not be left to be "figured out later".

5. The general consensus among the local fishermen and supported by the Authority is that proposed construction (highlighted on page 14, in appendix F of the proposal) will be insufficient to prevent ice damage. The Authority's experience is that a winter storm from the northeast shifts ice dramatically at mouth of Caribou Harbour. The ice piles up in the shallow water along the proposed pipe route, near the mouth of the harbour in excess of 5 meters. The silt and sand in this area is a 'moving bar' and the Authority does not believe that two (2) meters of pipe cover on this soft bottom is sufficient. A proper assessment would have to monitor the conditions of the ice over more than one winter season. As well an in-depth survey will be required as the density and hardness of the bottom varies dramatically, which will no doubt require further study to prevent pipe fatigue and stress cracking.

6. The dredging of Caribou Harbour in 2007, along the passenger ferry channel, required a Federal Assessment, as did the 2015 upgrading of PEI-New Brunswick Cable Interconnection Upgrade Project. Given that Northern Pulp proposes the dredging and installation of equipment in the same body of water the Authority's position is that this project contains all the criteria for a Federal Environmental Assessment as did the previous mentioned projects, as it pertains to section 67 of the CEAA 2012 Act. Section 67 of CEAA 2012 sets the framework for the environmental assessment of projects being carried out on federal land that are not considered designated projects and for which a full environmental impact assessment under the Regulations Designating Physical Activities is not required. As the seabed of the Northumberland Strait is federal crown land it is subject to requirements under section 67 of CEAA. Section 67 states as follows:

> .....an authority must not carry out a project on federal lands, or exercise any power or perform any duty or function conferred on it under any Act of Parliament other than this Act that could permit a project to be carried out, in whole or in part, on federal lands, unless:
> (a) The authority determines that the carrying out of the project is not likely to cause significant adverse environmental effects; or

(b) The authority determines that the carrying out of the project is likely to cause significant adverse environmental effects and the Governor in Council decides that those effects are justified in the circumstances under subsection 69(3).'

Based on the above the Authority's position is that this project is subject to review by a federal authority in order to determine whether the carrying out of the project will cause significant adverse effects on the surrounding environment, or if any potential significant adverse effects are justifiable.

The Authority requests that Northern Pulp's Effluent Treatment Project be designated a project for Federal Environmental Assessment under Section 14 of the Canadian Environmental Assessment Act (CEAA) 2012.

Please accept the Authority's legitimate concerns and address this crucial matter appropriately.

Yours truly,
MACISAAC CLARKE & DUFFY

Project: replacement_effluent_treatment_facility_project Comments: Im years old, born and raised in New Glasgow. Im a certified Power Engineer, and I have had the privilege of being employed by Northern Pulp for the last year working in my trade. Northern Pulp has given me the opportunity to work and stay living in my home town and provide me with a well paying job. They have also invested time and money in allowing me to upgrade my licence. Before getting hired I would have had to move out of province to find employment because there simply isnt many other employers willing to hire unexperienced tradesmen in our province. Many of my friends and classmates were not so lucky and had to move out of province or are still unemployed. I have studied wastewater treatment plants with my trade and I see absolute nothing wrong with the new proposed effluent treatment facility we plan to build, this is a more modern and up to date treatment facility then the current Boat Harbour plant. Northern Pulp has been working very hard to comply wi th all the environmental regulations this project requires. I believe Northern Pulp should be given the opportunity to prove that this is a viable solution. I hope to continue working at Northern Pulp for many years to come, because Pictou County needs more employers like them and not fewer. I feel the opposition to this project is based more on emotion then facts. Name:

Project: replacement_effluent_treatment_facility_project Comments: I am a resident of New Glasgow, Nova Scotia. This is a company looking to do the right thing . This is a state of the art facility that will meet and exceed any guidelines . This is a practice that is done all over the world . The effluent has been going into the Northumberland Strait for the past 50 plus years and has not harmed the fishing. The only difference is now it will be cleaner and better. The fact that this is even an issue is because of lies and fear mongering on social media . I ask you to please think of the economic disaster it would be if a facility such as this closed because of people spewing untruths. I have lived in communities that have been devistated by facilities such as this closing . Take a drive through Bathurst NB and Dalhousie NB just to name a few . It is real and it is devistating . Project: replacement_effluent_treatment_facility_project Comments: What is proposed brings current best practice technology to replace 50 year-old technology. There can be no doubt that the effluent entering the receiving water will contain fewer pollutants than it has been receiving for those past 50 years. The fishery has not been adversely impacted over these years indeed, there is anecdotal evidence that it has improved and there is no reason to believe that it will be affected with the new system. The effect on Pictou Landing First Nation is far more serious and it will be rectified when Boat Harbour is no longer receiving the effluent from the mill. For heavens sake, lets do the right thing. Approve this application for the collective good of the Province. Name: Email: @gmail.com Address:

Project: replacement_effluent_treatment_facility_project Comments: To Whom It May Concern: I am an Entrepreneur working in the Commercial Real Estate Sector and in particular, I am passionate about encouraging and working with companies from all over the World to locate and operate in Nova Scotia to the betterment of our society, economy and in the interests of jobs and technology development across our great Province that addresses challenges such as we face today. With so much having been said by so many, it is clear that all sides to this challenge have dug in or are committed to one side or the other. I find this disturbing in that from the outset, the Government of the day had signed a deal with Northern Pulp to allow their management and operation through 2030 [nobody is remembering that] and while I certainly acknowledge the negative implications thereof to the environment in terms of the evolving Boat Harbour situation, I am embarrassed as a Nova Scotian that cooler heads have not prevailed and efforts to mitigate this huge challenge with a comprehensive s olution have been reduced to name calling, anger and related non-productive actions where the focus should and needs to be on solving the problem, which NP is undertaking to do, seemingly against all odds. Why do we not get as passionate about focusing on a solution to, for and with our valued corporate operators that we encouraged and brought here to operate, create wealth, jobs, opportunities and lifestyle instead of turning on them. No Corporation can fiscally plan, act and be responsible within an environment like this where the politics are undertaking to erase the agreements originally made with these people and disregard/change those agreements, seemingly for political gain and to win over people/votes. There has never been a time in our history where we have to step up, get behind those that helped create the very communities that will be destroyed with this business of taking sides. More than anytime in our history, we need decisive leadership, cool heads and a p lan to support the Corporation we brought here and then turned on when the going got tough. Lets become the Community that fixes and supports these corporate leaders with solutions and then sell that ability and positioning around the world, as this is not an isolated case in this industrial world, but a challenge for us to embrace and fix, not be seen as the political fairweather people that back away from our own promises because we make statements at the Leadership level that the Politicians are not prepared to mitigate and protect our own people, jobs, lives, families and thats all our people, not just catering to those whom will take every opportunity to gain their own personal and selective objectives and agenda, whatever they/it may be. If we fix this and show that kind of leadership, embrace the technology, get behind it and support our Corporate Partners who helped create our Communities, we will impress the world, and become who we need to be to be a responsible an d proactive society that welcomes challenges, not shy away from them and hide, when the going gets tough, for this will tell the world we are not a responsible, professional and proactive society that are worthy of their or anyones trust to work together and back up our promises. NP did not create this dilemma, we seem to be simply saying that theyre stuck with it on their own after decades of taking their money. Shame on us!! Name: Email: @eastlink.ca Address:

Project: replacement_effluent_treatment_facility_project Comments: I fully support this project. 1. It should only be a level one assessment and not a level two- federal assessment for the simple reason, it is, as the title states, a replacement effluent treatment facility, not a new one. 2. What Northern Pulp is requesting to do, is to do what they have been doing for the 50 years, put treated effluent into Northumberland Strait. With the modern facility, and only treated effluent leaving the Northern Pulp site, it will be better than the existing site. Other mills and municipalities have been putting treated some municipalities un-treated effluent into the ocean for decades. this is no different. 3. Any wrongs that has been done in the past, in regards to the Boat Harbour facility, cannot be changed it is history. The Province, Northern Pulp and First Nations, should deal with that issue separately, in order to bring closure. 4. The negative economic ramifications of not allowing this project to proceed would be adversely felt, province wide and that includes HRM! Name: Email: @bellaliant.net Address:

Project: replacement_effluent_treatment_facility_project Comments: The Pictou County Pulp Mill has been existence for 50 years, during which time the fish stick has been thriving. The existing Boat Harbour treatment facility does a poor job of treating the waste. The new proposal is a world class treatment system which is a vast improvement of the existing scenario. From all of the technical information that I have read, this can only be a positive effect on our environment from current day. The loss of the pulp mill will be a devastating on Pictou County and Nova Scotia, with a loss of thousands of jobs. Northern Pulp is definitely demonstrating due diligence and is doing everything reasonable to make Pictou County a better place to live. We need to grant the extension and let Nova Scotia prosper! February 22, 2019

Dear Minister,

I am submitting my comments on Northern Pulp's proposed replacement effluent treatment facility project.

My name is and I have lived in the Pictou area for 35 years. I had a cottage in Caribou River for 31 years and now live in a waterfront ground level condo frighteningly close to the proposed pipeline route and effluent dumping site just off Caribou Point.

Please reject Northern Pulp's proposal. I believe a long intense scrutiny and a full environmental assessment needs to be done…no matter how long it takes. I do not believe the process has been fair. The public has not had sufficient time to read their lengthy report and Northern Pulp has not offered information sessions on this report to the public. We only have 30 days to respond and Northern Pulp had 5 years to come up with their proposal.
Northern Pulp has not identified what will be in their effluent so how can they know it will be safe? How can they realistically claim their effluent will have no environment effect 2 metres from the end of their pipe? They have not collected data from Caribou Harbour; they are using data they collected from Pictou Harbour. This is insufficient. The waters in the area have not been surveyed. The specific route of the pipeline is unknown. This project could put the Strait at risk for a long time. Harm will be caused constructing, using and decommissioning this project.

Northern Pulp does not care about our environment; they do not care about the people in Pictou County and Nova Scotia. They only alter their equipment when required by the government. All they care about is money…what they can earn and how much they can get from the government to continue polluting the air we breathe. When I open my front door to walk my dogs and the winds come from the south, it stinks. A gift from the mill to the people. Please do not let them pollute our water.

I am a graduate of three Nova Scotian Universities. I have worked as a teacher in this province and run a small business. I am not a scientist but I am an outdoor person who enjoys the ocean, beaches and woods. I have many years of experience with the environment, nature and health.

I walk the beach every day for half the year, often to the end of Munroe's Island (a bird sanctuary). I swim in the waters here from the end of June until the end of September. It is a beautiful beach and area. My neighbour, Caribou Munroe's Island Provincial Park and Campground, teems with locals and tourists, campers from near and far. I have heard a number of people claim it is the nicest campground in the province.

I believe this shore of Nova Scotia is one of our province's hidden secrets. The waters and beaches are pristine. My children grew up summering on the shore, enjoying watching hermit crabs tickle their hands and crabs scurrying sideways before digging into the sandy bottom. I want my granddaughter and all the children yet to come to enjoy these wonders.

The tides go in and the tides go out, bringing unexpected treasures. I fear Northern Pulp's garbage washing up on our shores, day after day. This will endanger our waters and make it unsafe for life in both the sea and the area.

One only has to look at the Boat Harbour mess. The First Nation's treasured water now only stinks and all sea life perished years ago after effluent was piped there.

I would like to see our government make choices for the future of our environment. This would involve not supporting a polluting industry in an outdated facility. Please make choices that support the people with a long term and sustainable future that doesn't destroy the unique gifts of this area and our health.

Your job is to protect the environment and the citizens, now and into the future. Please act responsibly. Reject Northern Pulp's proposal and ask for a full environment assessment.

Thank you for reviewing my submission.

Respectfully,

From:

Subject: Feedback on Boat Harbour
Date: February 22, 2019 12:41:41 PM

I am writing out of concern of the health consequences to Nova Scotians. The composition of the toxic effluent will contain dioxins, furans, metals, solids and other contaminates at a rate of 90,000,000 Litres *per day*. Dioxins and furans can cause very serious health issues to humans and our food sources. Shellfish absorb dioxins and furans at 25,000-50,000 times the concentration in the water.

The Northern Pulp treatment system proposal includes a plan to burn the waste sludge. The waste sludge contains toxins which would be released through the stacks of the mill's power boiler. The proposal is to "dewater the sludge prior to mixing it with bark and other wood waste for combustion in the mill's power boiler."

This is the same power boiler that is currently and repeatedly failing stack emissions tests. Problems with air quality from mill emissions have been documented for years. Lack of appropriate monitoring and enforcement already puts area residents at risk. Now, Northern Pulp is considering adding sludge containing toxins to the combustion mix, increasing health risks from NP's air emissions.

It is also important to note, the route of this effluent pipe goes through the source water supply for the town of Pictou and community of Caribou and surrounding area.

We should **no longer** be putting Nova Scotians' health and environment at risk.

Project: replacement_effluent_treatment_facility_project Comments: Nova Scotia waters support thousands of fishermen. Their products are sold worldwide. Should the effluent from the treatment facility contaminate fisherâ?Ts products the world will recognize this as contaminated fish from Nova Scotia not just from the Northumberland Strait. The resulting downgrade of our fish products will affect all Nova Scotia fish products if not all Canadian fish products and therefore the livelihood of thousands of fishers. The proposed effluent has not been fully tested. In the proposal the effluent is â?oexpectedâ? to be of a certain quality not guaranteed. Therefore should this project go ahead without further evaluation the effect on fish habitat wonâ?Tt be known until itâ?Ts too late. Northern Pulp has a record of delaying corrective measures. It was given 5 years to rectify the Boat Harbour replacement facility. Now with one year to go they want a reprive. I think a Class 2 study at the very least is what is required. The information currently available does not adequately address the fish habitat. Another area that is inadequately addressed is the potential effect on tourism in the area. That area was inadequately addressed a few years ago with the air polution from the smoke stacks at the mill. Tourism was affected for many kilometres around the mill for many years. The air treatment facility should have been addressed and fixed long before it affected the Tourist trade in the area. Now the proposed water effluent into the Northumberland Strait could affect the quality of the water at the numerous beaches in the area as well. A much more thorough study is required. Project: replacement_effluent_treatment_facility_project Comments: It is with great concern that I write this letter. The two most important points I must begin with are: my complete distrust of any information coming from Northern Pulp, as well as my uncertainty that the government of NS will do what is morally right for the people of Pictou County. I have been a resident of Pictou County for 57 years therefore I have witnessed the entire history of the mill. I reside near Pictou and have suffered medically and mentally from the daily emissions which range from whitish to black, often times being unable to leave my home due to the potency of the emissions. I also have a summer home on the Northumberland Strait. It was here that I was relieved of the horrible air quality for several months of the year. Unbelievably, my several months of reprieve are now threatened by the piping of effluent into the Strait. Even considering a Level 1 assessment for this process is beyond my comprehension. I am not a scientist or an environmentalist, I am just a citizen of this province who pays taxes and elects governments to represent the best interests of the people. Having read every newspaper article, every document published by the mill, and attended every public meeting, it glaringly obvious that this project requires a full Level 2 Federal Assessment. I recently read information published by Northern Pulp indicating that they will not know the exact potency of the effluent until the process begins. What!! The process can never begin without that information. I spoke with a NP representative at the DeCoste Centre when CBC News was there. I asked him to address this issue and his answer was, â?oWell think of it like buying a new car. Itâ?Ts always going to be better than the old one.â? Seriously, I guess he thought I was an idiot. The number of unknowns is extremely concerning. We have a thriving fishing industry in the exact location that the effluent will be dumped. Have all the questions regarding water temperature, settlement of solids, toxicity been answered? Obviously not and this is simply unacceptable. Will all the questions be answered by a provincial assessment? No! In conclusion Northern Pulp is not the first and will not be the last industry to close its doors in Pictou County. Hundreds of jobs have been lost before and government did not step in and offer these businesses a hand-out. If the only solution to this issue is the closing of the mill then so be it. The people and the environment have suffered long enough. I believe that a full federal assessment will discover that the option of pumping effluent into the Northumberland Strait is simply not feasible. It is now 2019 and I hope we have progressed far enough as a society to put an end to industries that get rich at the expense of the environment. Thank You, Name: Email: @ccrsb.ca Address:

Project: replacement_effluent_treatment_facility_project Comments: Upon reviewing the proposed Effluent treatment facility project that Northern Pulp has proposed I have come to the conclusion that I fully support this project for the sustainable future of many sectors within Nova Scotia. Being a province that already lacks diversity in the form of many industrial employers we must not chase industry out of the province. I believe that the proposal indicates that they will be prudent and exercise due diligence at all times during the construction and operation of the facility. I also believe the impact to the environment will be minimal, and if any impacts are evident then they can easily be mitigated with no long term ill effects. We must look to other effective usages of this system in other parts of Canada to see that the threat is not valid to the environment and ecosystem. I fully support this proposal. Subject: Concerns around Human Health Evaluation - Opposing the NP Waste Proposal
Date: February 22, 2019 4:36:14 PM

I am writing to express my concerns over regarding the weak Human Health Evaluation relating to the NP Waste Proposal.

1. Presently, there is no regulatory requirement to conduct a human health risk assessment (HHRA) study in association with the NPNS project. The project is currently in a Class 1 EA Process in Nova Scotia that does not specifically require the completion of a HHRA in advance of registration of an EA. Section 9-15 page 489

2. The HHE does not include quantitative exposure and risk analysis approaches at this time that would typically comprise the HHRA steps of exposure assessment, toxicity assessment and risk

characterization. The HHE is not a HHRA, though it does necessarily comprise some elements of a HHRA, as noted above. *EA. Section 9-15 page 489*

3. Tasmania Pulp mill used for comparison for the Human Health Evaluation. The Tasmania pulp mill was assumed to process mainly hardwood eucalyptus chips. There is some uncertainty regarding how the wood chips processed at the NPNS mill, which are from softwood coniferous species, would compare to eucalyptus chip processing, with respect to potential effluent chemistry differences. *EA. Section 9-15 page 492*

- Tasmania has not undergone regulatory review by Health Canada
- The Tasmania mill did not open and faced many environmental challenges in court https://en.wikipedia.org/wiki/Bell_Bay_Pulp_Mill

4. Potential Risks

- Chemicals present in treated effluent that is released to the marine receiving environment may come into contact with human receptors in marine sea water or sediments.
- Some of the chemicals present in treated effluent may accumulate within certain marine food items that are harvested by local community members.
- Air emissions of certain contaminants to the atmosphere, during construction and operation (and maintenance) of the project, may present a potential inhalation exposure pathway for human receptors in communities located within the study area.
- As the current proposed pipeline route traverses a drinking water supply area, there is a potential that accidental releases from the effluent pipeline in this area (should they occur) could potentially impact potable water supplies.
- *EA. Section 9-15 page 492*

5. Only using these contaminates for their assessment.
   - Carbon monoxide (CO).
   - Hydrogen sulphide (H2S).
   - Nitrogen dioxide (NO2).
   - Sulphur dioxide (SO2).
   - Total suspended particulate maer (TSP).
   - Fine particulate maer (PM2.5). *EA. Section 9-15 page 503*

6. Downplaying the independent air quality study perform by Hoffman et al from Dal *EA. Section 9-15 page 494*

7. Due to uncertainty regarding effluent composition and approximate concentrations of substances present in the future treated effluent (which will not be verified until the project is operational), the identified candidate COPCs in effluent are considered preliminary at this time. Refinement of the candidate COPCs would be anticipated for a potential HHRA study of the project, should one be required (wherein various screening approaches, as previously described above, would be applied to refine and reduce the candidate list of COPCs down to a more reasonable and representative set of COPCs). The same types of screening considerations apply to the potential assessment of impacted drinking water, in the event the effluent pipeline experiences accidental releases in the sections that traverse drinking water supply areas.

Candidate COPCs in future treated effluent were determined primarily on the basis of:
   - A review and synthesis of historical data and reports for areas near the NPNS project, particularly areas that are or were influenced by the NPNS mill current or historical effluent discharges.
   - The outcomes of the COPC identification processes that were applied in the Toxikos (2006) HHRA study.
   - Selected additional relevant scientific literature. *EA. Section 9-15 page 506*

8. The sludge will be used as a fuel for the NPNS power boiler. A power boiler that has a history of not working properly, and now wanting to burn unknown effluent *EA. Section 1-7 page 43-44*

9. Current NPNS Mill Effluent Chemistry being down played yet they state the end state is unknown. *EA. Section 9-15 page 515*

Sincerely,

Subject: Northern Pulp
Date: February 22, 2019 10:17:54 PM

Dear Sir or Madame:
I grew up in Pictou County and return often to see my family. I also am a Nova Scotian living along its coast line, now in Cape Breton.

I have followed the Northern Pulp debate closely and simply put, the proposed project is concerning. If hastily approved or approved under a short sighted approach or by those in a conflict of interest position, then the long term negative economic, environmental and potential health impacts will be its legacy.
This region's fisheries and tourism are key to its economic survival. A pipe with toxic effluent flowing through these same waters does not promote these industries. Further, the long term impact of millions of litres of effluent a day going into the body of water, needs to be studied and reviewed for impact on water quality, ocean biology impacts, breeding and health of the fin fish and shellfish, human health including swimming and consumption of fish. This same effluent or slight variation thereof has made boat harbour a toxic site unable to support life. Surely, the days of "it goes away" and the ocean is large enough are over in 2019.

We need to be able to trust our government will act in our best interest - on all fronts. This is not a partisan matter. This project is a one time shot, a legacy decision, that may determine the very future of our fisheries, tourism, enjoyment of the waterways, health and our First Nations ability to fulfill their treaty rights.

The time required to do a proper federal or proper assessment cannot be grounds for dismissing or opposing this assessment. We deserve to be protected and have proper due diligence completed. After all, once the pipe is in, the ability to monitor and track its effluent standards becomes difficult. The public lacks confidence those standards will be followed, given the company's public track record of environmental violations to date. We do not have the luxury of a simplistic or short sighted review, as too much is on the line and reversing the pipe impact or even mitigating it may be impossible or take generations. An extensive review and study is required.

Further, on its face Nova Scotia appears to be in a conflict of interest position; as such, a independent authority such as the federal government is an appropriate to step to remove any real or perceived conflict and to ensure due diligence and objectivity.

Regards,

Subject: Northern Pulp's replacement ETF
Date: February 22, 2019 11:37:08 PM

Dear Premier McNeil, Minister Miller and CEAA,

I am writing in relation to Northern Pulp's Replacement Effluent Treatment Facility project.

My name is and I live in Pictou County and have been following this issue very closely for a few years now. I would like to identify some uniquenesses about Northern Pulp, some differences between the current and proposed ETF along with some other concerns that I feel should be taken into consideration by you.

A 2010 AMEC study presented to the Province of NS identified that Northern Pulp were in the 100th percentile when compared to other similar bleached kraft pulp mills in the country for: average flow rate (water usage), COD levels and colour of effluent. And since this study was completed Northern Pulp has not reduced their water usage, still use chlorine dioxide for bleaching and have made no known upgrades that would have improved effluent quality. Bleached kraft mills by nature are the worst polluters out of all the different types of pulp mills in the world. The production yield of a bleached kraft mill is approximately 50% meaning that half of the tree gets used for production and the other half ends up being released into the waste stream. TMP mills like Port Hawkesbury Pulp & Paper have a production yield closer to 95% so 95% of the tree gets used and 5% ends up in the waste stream. Plus bleached kraft pulping requires the use of chemicals to break down the lignin in the wood to make pulp and the use of chlorine dioxide to bleach with versus TMP mills that use thermal mechanical energy to make pulp and peroxide to whiten the product. So by nature, bleached kraft pulp mills are the worst polluters out of all the different pulping processes and Northern Pulp is in the 100 percentile in Canada for water usage, COD levels and colour of effluent. They are the worst of the worst in Canada.

According to the KSH Engineering's projections the new EFT system would be better than Northern Pulp's current system, approximately 20-60% better depending on which variable you view. However, the receiving water now for the treated effluent is the Boat Harbour Basin and not the Northumberland Strait. After leaving the Boat Harbour Treatment Facility - at point C, the treated effluent is then released into the Boat Harbour Basin where it is retained for approximately 20-30 additional days. Point C is the federally regulated point. The new ETF would release the treated effluent directly into the Northumberland Strait without the added bonus of the 20-30 day retention time for additional cooling, dilution and settling in the large Boat Harbour Basin. The elimination of the Boat Harbour Basin is a huge factor because EEM data shows that the Basin has a large effect on effluent quality that is currently reaching the saltwater.

The receiving water for the treated effluent is at point C where it is released into the Boat Harbour Basin. Point D is where it leaves the Boat Harbour Basin at the opposite end and meets the saltwater at the shoreline of Pictou Landing. EEM data from 2014 showed a significant improvement in effluent quality between points C and D proving that the Boat Harbour Basin does have a positive affect on effluent quality. It shows an improvement in TSS of 77.6% to 80.8% during the months of October, November and December between points C and D. And during that same period it showed that BOD levels were improved between 74.1%

and 77.4% between points C and D. Strangely it showed that these numbers were worse at point D during the month of August. One industry professional that we spoke with speculated that there was either a problem with how the data was collected that month or that summertime pollen and dust could have settled on the surface of the Boat Harbour Basin contributing to the results measured. But regardless it is very clear that the elimination of the Basin would have a substantial and negative impact on the effluent quality reaching the Strait. Based on this data there is enough information to conclude that the new ETF would be worse than the old facility because of the elimination of the Boat Harbour Basin. So Northern Pulp is proposing a newer system but a worse location for the receiving water. The elimination of the Boat Harbour Basin would result in more of the toxins reaching the Northumberland Strait.

Many third party consultants have completed studies and documents for Northern Pulp and the Province of NS including: R.V. Anderson, CBCL, Neil McCubbin, Stantec, AMEC plus an internal audit conducted by their parent company. There are known problems internally at Northern Pulp which are causing air emissions problems (i.e. the High Level Roof Vent that is identified in NPulp's current Industrial Approval). Are other Canadian mills allowed to vent unfiltered pollution through high level roof vents? We are unaware of any other Canadian mills allowed this same privilege which is essential a way around the regulations for Northern Pulp given that that stack is not regulated. Northern Pulp's proposed ETF shows that much of the waste sludge would be burned in the power boiler. This is of great concern because the power boiler has no precipitator and there have been several reports about non-functioning scrubbers. And there is no hourly or daily monitoring of the stacks at Northern Pulp, only quarterly self-reported results conducted by Stantec who are hired by Northern Pulp.

Black liquor spills, sometimes referred to as process disturbances or process upsets have been documented by third party consultants as well. These events often result in raw untreated effluent being released from the mill. These statements come from a Neil McCubbin memo to Northern Pulp dated April 6th 2015. "A few other kraft mills operate with annual average COD discharges of 15 kg/ton, demonstrating this level is attainable, but not without considerable effort. I consider that oxygen delignification, improved brown stock washing and screen-room closure, and substantially upgraded spill recovery systems for black liquor would be required to attain such a COD discharge level in the NPNS mill." The report also states, "The data in the AMEC report indicates that the sources of colour discharge are roughly one third each for brown stock washer losses, bleach plant and spills. The sources of COD are probably distributed similarly, except the condensates and causticising department will contribute some COD. These latter two sources will contribute virtually nothing to the COD of the treated effluent since the substances in them are very efficiently oxidized in any kind of biological treatment system." "COD from the bleach plant can be cut by about 40% by installing an oxygen delignification stage. This would leave the so called “spills”, which consist of accidental losses, leaks, draining equipment for maintenance, operator errors, etc. Consideration of the variations in daily COD discharges suggests to me that there is room for fairly inexpensive and substantial improvement in this area. However, it must be recognized that while spills can be reduced, one can no more eliminate spills completely than one can eliminate traffic accidents." The Neil McCubbin memo also states, "Replacing the ASB with an AST system would reduce COD discharges somewhat, probably by roughly 20%. However, the cost would be significant.”

Take away points from above paragraph;
1. There are three main sources of COD, divided evenly at NPNS; brown stock washer loses, bleach plant and spills.

2. An oxygen delignification system would only improve the COD level from the bleach plant by 40%. So that's 1/3 of 40% which equals 13.333%. At best an oxygen delignification would only reduce COD levels at NP by 13.3333 %
3. Northern Pulp would need substantial upgrades to obtain a COD discharge level that matches the level of other bleached kraft pulp mills.
4. The new AST system would likely only reduce COD levels by 20% compared to their current ASB system.

Again, it has been identified that Northern Pulp uses more water per ton of production than any other pulp mill in Canada. The Province of NS is aware of this issue and NSE has listed water use reduction requirements in Northern Pulp's current Industrial Approval. In an email obtained through freedom of information the manager of Northern Pulp informed NSE in November 2017 that they will not be able to reduce their water usage moving forward with the newly proposed ETF even though this was a requirement within the current Industrial Approval.

A study conducted by R.V. Anderson Associates studied Middle River where Northern Pulp draws its water from. "The sustainable water withdrawal rate for the Granton water intake was determined to be 1.10 m3/s (95,040 m3/day)". "The Middle River watershed has a drainage area of 239 km2 at the water intake location in Granton." In an email to Nova Scotia Environment from Northern Pulp dated November 3, 2017 it states, "NPNS will achieve the maximum daily water consumption rate of 92,310 m3/day by the end of the current IA". And it goes on to say "a future 2020 annual water withdrawal limit of 70,000 m3/day is now not realistic or achievable." So Northern Pulp is using almost all of the water that is sustainable in a watershed area of 239 km2 and despite the requirements to reduce water usage to 70,000 m3/day by 2020 they are telling Nova Scotia Environment that they will reach 92,310 m3/day by the end of the current Industrial Approval.

In the EA on page 33, Northern Pulp / via Stantec (who were hired by Northern Pulp) are being very critical of the "Pilot study investigating ambient air toxics emissions near a Canadian kraft pulp and paper facility in Pictou County Nova Scotia" but they are leaving out important details from the rest of the study. According to the data collected the prevailing wind direction more often blows toward the Town of Pictou than it does toward Granton where the monitor was placed to collect the data for this study. The study concluded that "the mill is a likely contributor to increased concentrations" and "in addition, there are clear seasonal variations of meteorological conditions and VOC concentrations. Southwest prevailing winds blowing towards Pictou dominate during summer months, when people spend more time outdoors, and consequently are exposed to higher concentrations". Northern Pulp is trying to claim that it's really not clear that they are the source of the high VOC levels found present in the air. Yet this is a scientific, peer-reviewed study and the fact that the authors suggested that Northern Pulp is the likely source could also be taken that NP is indeed the source if the rest of the study is considered in its entirety. Given that the cancer risk thresholds were exceeded and that the scientists recommended that more monitors be located in areas of higher population, wouldn't we be better served by listening to the science instead of Northern Pulp / Stantec? With all the talk about "listening to the science" why does Northern Pulp put such an effort into trying to discredit the science. Science that isn't approved by Northern Pulp and their hired consultants does not make it non-science.

So there are air emissions problems, black liquor spills at Northern Pulp and more water per ton of production being used at Northern Pulp when compared to other Canadian bleached

kraft mills. The mill is in need of significant updates internally before a treatment system dumping into the Northumberland Strait can be considered.

This is a very complex issue and one that many including myself have been studying for years. I could send in a hundred pages of comments but I chose just a few things knowing others are covering some of the other important points. Looking back I believe that we started our group with naive intentions. We were hopeful that the mill would clean up its act and that the government would more strongly enforce existing regulations and perhaps tighten up some of the weaker ones that we have in Nova Scotia when compared to the other provinces with regards to pulp and paper effluent and air emissions. My brother and a group of us have made a real effort to become informed and stick to facts. We have been very fortunate that the issue has attracted the attention and support of many local business people, doctors, scientists, lawyers and other concerned citizens along with three pulp and paper experts, including two engineers, a wastewater treatment expert and former employees of Northern Pulp along with third party consultant firms. One of our mill professionals has worked all over the world at many different mills including some zero effluent mills. I'm just a folk-singer but thanks to all of the support from many industry professionals I have become very informed about this issue and at this point it's safe to say that I know more about pulp mills than folk music.

During one government meeting it was said to us that "your group is spreading misinformation and being far too emotional and there are crazy things being posted on your Facebook Group". We were quick to respond that “our group” isn't all of the 5000 plus members on a Facebook Group. The people who've joined the Facebook Group are every kind of person with every kind of opinion on both sides, from mild to extreme. In fact, many of the members include forestry workers and mill workers too. It is social-media and you should think of it as a giant town-hall discussion and not "a group". So to put it bluntly, it's not "our group" - but they are your constituents.

I'll conclude with a list of points in no particular order although the last one has been the fuel for me throughout my involvement with this issue:
1. Northern Pulp’s known and identified internal problems create a unique situation and building a new ETF would not cure the internal problems at the mill.
2. There is an active fishing industry in the Northumberland Strait that needs to be protected.
3. Many of the air pollution issues have not been fixed at the mill despite requests by the community and NSE for Northern Pulp to move forward.
4. Northern Pulp uses more water per ton of production than any other mill in the country and draws upwards of 92 million litres per day from a river that drains an area of 239 square kms and has a sustained recovery rate of only 95 million litres per day. So Northern Pulp is using almost all of the water available within a 239 square km watershed area.
5. The elimination of the Boat Harbour Basin and the change in location for the receiving water means that more pollutants would reach the Northumberland Strait than compared to the current system.
6. I believe there would be a protest of 'never before seen in NS' proportion to stop a Boat Harbour extension and a pipe from going into the Northumberland Strait. And this would not be about a community whining that it didn't "get its way". This has been a 50 year plus battle for a lot of people.
7. Many first nations people and non-natives have had this pollution dumped on them for over 50 years. But our entire, and one and only Mi'kmaq community have been victims of environmental racism from the beginning and throughout the entire history of this mill. It must be stopped and they must be protected and respected in a real and meaningful way moving

forward. Moving the pollution from their backyard to their front yard and putting their fishing fleet at risk would not be the way to do this.

A sincere thank you for the opportunity to be engaged with this very important issue. I do not envy the position you're in but I do know that enough information is available to back your decision should you not approve this project.

Attachments: Northern Pulp.docx

Hello,
I am pleased to have the opportunity to submit my input in support of a federal environmental assessment, and for a proposal of an in-mill, closed loop solution.
Sincerely,

MSc MD
FRCPC(Int Med) FRCPC(Rad Onc) rtd

To: Our provincial government

Re: Northern Pulp Replacement Effluent Treatment Facility Project

Change is difficult. But this is exactly what both the Ivany Report (2014) and the Independent Review (Lahey, 2018) challenge us to do within the forestry industry in Nova Scotia. Both emphasize the importance of biodiversity and the health of our forests. I am convinced that now, urgently, the forest industry in Nova Scotia must adopt practices to become eco-friendly and sustainable. Never has this been better illustrated than in the Northern Pulp (NP) proposal to run a 15.5 km pipeline for effluent in support of its current activities.

Forestry practices that currently feed Northern Pulp are heavily reliant on clear cutting, and are decimating Acadian woodland biodiversity with monoculture replanting of short turnaround species. It has severely polluted Boat Harbour and environs, and there has been at least one significant effluent pipeline leak on land (47 million litres, June 9, 2014). A few kilometres of pipeline were incompetently maintained and monitored, yet now a line is proposed that traverses the Pictou Harbour Causeway, the Pictou town roundabout, the TransCanada Highway for several kilometres, and enters the harbour at the Ferry Terminal – a proud, major point of entry from PEI, and also of the Pictou Island Ferry.

In the Executive Summary of The Northern Pulp Replacement Effluent Treatment Project report, Table E1.1.1, Northern Pulp anticipates NO SIGNIFICANT (NS) impact on each and every environmental and socio-economic metric, through every phase of the project, including accidents. This must be considered ludicrous conjecture.

One example from the plan, the construction of a 4 km trench, 9 m wide and 3 m deep, would most certainly result in a SIGNIFICANT impact on the ocean floor. Construction activities and resulting sediment would have significant negative effects within Caribou Harbour and beyond. Then the introduction of 60-90 million liters of treated effluent <u>each day</u> would certainly have an effect on marine habitat, lobster larvae, lobster and herring.

The Northumberland Strait waters source our “world famous” Nova Scotia lobster fisheries. Our north shore fishing community will be providing more educated, experienced input. But, in fact, the lobster fisheries of 3 maritime provinces share risk here. It is not reassuring to read the note in the NP report that “unlike the visual impact experienced today, it is *anticipated* (italics added) that the effluent plume will not be visible when it reaches the water’s surface” (Executive Summary). It is not the visual impact of the effluent which is the largest risk to the long term sustainability of the fishery. Further, there must be some doubt about whether a short term exposure test can predict the long term impact on this important fishery.

Nova Scotia boasts of its Northumberland Shore with the “warmest waters north of the Carolinas”. The site of effluent discharge would be into these waters and within sight of four islands, all of which are permanently or seasonally inhabited – Caribou Island, Caribou and Munroe Island Provincial Park, Pictou Island, and Prince Edward Island. Not only the commercial use, but the recreational use of effluent waters and the potential socio-economic impact on local residents and businesses gives pause.

In Section 2.1.1.1, pg 8 of the report, Northern Pulp notes that they have achieved 80-99% reduction within the mill of “mill-wide particulate emissions, odorous emissions, and boiler particulate emissions”, yet in spite of this, the residents of and visitors to Pictou (and within many kilometres of the town) still note skin, respiratory and sensory symptoms.

The Canadian Environmental Law Association (website) defines the precautionary principle in environmental decision-making to “denote a duty to prevent harm, when it is possible to do so, even when all the evidence is not in”; that is, even in the setting of simply, uncertainty, decisions should favour health and sustainability of the environment. Thus, the NP effluent pipeline project must be refused: this is especially so, since there exists an alternative in-mill, closed-loop effluent treatment option.

I believe that Pictou County can survive, and indeed thrive after a decision to deny the proposed effluent treatment plan, and could withstand a temporary (downtime for the conversion to closed-loop system) or even permanent closure of the mill.

Michelin, Pictou County plant, recently announced that they are to make 200 part-time jobs permanent and will hire 150 more (Chronicle Herald, October 23, 2018). People will be more likely to come and to stay - currently we have instances of folks leaving Pictou because of the blight of the mill on the landscape and on the senses. Visitor numbers to Pictou will be improved and local businesses will be able to reinvigorate. I also believe that the hardworking, innovative woodlot owners would also thrive when relieved of current constraints.

Certainly, a Federal Environmental Assessment of the proposed effluent plan is required, but not only the water testing, but also of the potential impact of a leak along the full length of the proposed 15.5 km pipeline.

Again, the larger issue to be addressed is how to better sustain the forestry industry in this province, to launch eco-friendly practices, with minimized impact on the environment, other industries (fishery, tourism and small businesses), and importantly, on the health and wellbeing of the residents of Nova Scotia.

With this effluent treatment pipeline proposal, Northern Pulp, a foreign-owned entity, has pitted the forestry industry against the regional fishery, local businesses and residents. In 2014, following the Ivany Report, a group in to continue the positive discussions and devised a vision for Pictou County: “In 2020, Pictou County will be healthy, united, thriving and bold.”

I support the Nova Scotia Government in upholding the January 31, 2020 date for closure of the Boat Harbour site, and encourage the immediate prioritization of working with the forestry industry to adopt sustainable practices with respect for environmental values and the health of Nova Scotians. Effluent into the Northumberland Strait via the proposed pipeline should not be part of that practice.

Now is the time for strong Government action, and for change.

Project: - Choose - Comments: My name is
I live in Caribou River approximately 20 minutes from the Town of Pictou. Our home overlooks the Northumberland Strait. We moved here from Halifax 15 years ago after falling in love with the area while coming here to visit friends who live on Caribou Island. We fell in love with the Town of Pictou, with the pristine, clear and warm waters of the Northumberland Strait and the people who live in Pictou County. From our home we can watch the lobster fishers, the herring fishers, the ferry to PEI and in late February we watch the seals giving birth to their pups and listen to their converstions with one another on the ice. In the summer we enjoy the many beaches found around Pictou County. When we moved here 15 years ago, the Town of Pictou was a bustling small Town with lovely shops on the main street. Over the years we have watched this change dramatically. Not being a business owner, I am sure that it was not good for business when there were days, with the wind in the wrong direction, that one could hardly breath when one got out of their vehicle due to the stench and â?ofogâ? of the discharge from Northern Pulp. It doesnâ?Tt take a scientific mind to figure out that tourists will not want to stay in a place where you can hardly breath. Northern Pulp was asked to fix this problem time and time again to no avail. Yes, they say they have improved the air quality in leaps and bounds, however I invite you to come to Pictou when the wind is blowing in on the Town. There is no difference. Then, of course, there is Boat Harbour. This environmental disaster has gone on for far too long. The people of Pictou Landing First Nations should not have to suffer with this any longer. And it is not just the First Nations people. There were many people who had cottages in Boat Harbour where they once swam, fished and enjoyed nature. Unfortunately, those cottages are no more as is the nature that surrounded them. Enough is enough. Now, Northern Pulp wants to pollute the waters of the Northumberland Strait. Northern Pulp does not have a very good track record as far as trust and being a â?ogood corporate neighbourâ? goes. They cannot guarantee that there will be no adverse affect to this pipe going into the Strait. Waters that are so clear that on a calm day it is like swimming in the Carribean are in danger as is the marine life that lives there. The waters of the Northumberland Strait are, as they say, â?othe warmest waters north of the Carolinasâ? . Now Northern Pulp wants to pump more warm fresh water into the Strait which will raise temperatures unnaturally. I have been swimming at Chance Harbour once which is not to far from Boat Harbour. The water is orange. I could not believe it. Why would tourists come here to swim in orange water. They say they are doing all they can to meet the Provincial and Federal Regulations. They said the same about the air quality. I am in no way a scientific person, however, I am a person very concerned about the environment and what we are doing to it. I know what I see and smell. I realize that this issue is very contentious here in Pictou County and has driven a wedge between a lot of people. I also donâ?Tt believe that Northern Pulp should be allowed to hold people hostage - â?oNo Pipe. No Millâ? . No one wants to see people loose their jobs in either sector. We just want Northern Pulp to do the right thing as the people of Pictou County have been asking them to do for the last 50 years. On behalf of myself, and my husband, I implore you not to allow Northern Pulp to put this pipe into the Northumberland Strait. Make them do what is right for all people of Pictou County. Thank you for taking the time to read this letter.

Project: replacement_effluent_treatment_facility_project Comments: The Pictou pulp mill has been both an important environmental problem considering the destruction of Boat Harbour and a major economic problem considering the enormous amount of public money that has been diverted into keeping the mill going for years and it is time that this stop. An environment assessment by either the provincial or federal authorities is not reassuring because the types of tests involved would only detect severe short-term affects of the effluent e.g. the number of fish which would die in 24 h. What about the effects of long term low levels of pollution? There is also the problem of the devastation that the mill is doing to forests in Nova Scotia. The Lehey report clearly indicates there is need for a revision of forestry practices, and in particular less clear cutting. In addition, conserving our forests, and allowing abused forests to recover, is extremely import at this point in time, as expanding living forests is the best way for Nova Scotia to contribute to reducing climate change by providing increased canopy covered lands to sequester of CO2. Certainly extending the use of Boat Harbour would be further insult to the indigenous peoples that have been so strongly affected by the mill. The environmental racism has gone on far too long. This is a very appropriate time to reconsider forestry practices and to reorganize the forestry industry. We need better practices, such as selection cutting where the canopy is retained, and focus on high end uses of harvested wood. Biomass burning, such as done at the Pictou mill is a particulat concern as it is a polluting as burning coal not to mention the removal of trees that could absorb CO2. The government needs to take on a leadership role there, rather than letting it all drag on. Name: Email: Address:

Project: replacement_effluent_treatment_facility_project Comments: I am writing with regards to the plan for the bleached kraft pulp mill in Pictou County, Nova Scotia to pump many 60-90 millions of litres of effluent into the Northumberland Strait on a daily basis. I have read the Replacement Effluent Treatment Facility Project Description and Appendices in their entirety and I have grave concerns. The issue I have chosen to address in this letter is that of toxic chemicals being released into the Northumberland Strait. Using the numbers presented in the Project Proposal and Appendices, I calculate a total of approximately half a tonne of Adsorbable Organic Halides AOX per day will be released into the Strait. Appendix E3 1 reports that the maximum AOX in the effluent is 7.8mg/L. If we are conservative and assume only 60 million litres of effluent are discharged per day this would equate to 468 kg of AOX per day into the Northumberland Strait. Below I outline why I recommend the proposal be rejected. Appendix I1-B, panel 9 2 roughly outlines the effluent composition and percentage removal of chlorinated compounds by the treatment facility. I use the word â?oroughlyâ? because the categories listed are very general organics, metals, chlorinated organics, etc and do not contain the actual chemical composition of each category. The mill has stated they cannot predict the chemical composition of the effluent because it is â?odetermined by the make-up of the wood being processed on any given day.â? 3 Paid advertisements by the mill emphasize the effluent will be treated, however, the new facility is expected to remove only 45-65 of the chlorinated compounds. Many of the chlorinated and non-chlorinated organic compounds produced during the pulp bleaching process are toxic and are not readily degraded. For example, the highly toxic polychlorinated dioxins and furans are reported below the detection threshold stated by the laboratory performing the tests, and it has been deemed no longer necessary to test for them. It should be noted that â?onot detectedâ? does not mean the substance is not present. They are known to be generated during the pulping process. Furthermore, many of these compounds bio-accumulate in fatty tissue, which means they are not cleared by an organism, but continue to accumulate and, as a result, the concentration is increased higher up the food chain. Given that the proposed treatment facility only removes about half of the organic chemicals that will be released into the Northumberland Strait, we need further investigation into the long-term health effects. It is important to note not all of the chemicals present in the effluent are tested or the chemical components of the effluent are fully understood. The following statement is from the Canadian Environmental Protection Act 4: â?oAlthough approximately 250 individual compounds have been characterized in bleachery effluents, they have been estimated to represent only 10 to 40 of the total low molecular weight materials present.â? I am not confident that we truly know the effect of the chemical mixture on biological systems. Some may argue the toxins are within the allowable limit or there are no established limits. Stantec consultants in Appendix E3 5 state â?oThere are no CCME or provincial guidelines for AOX for marine or freshwater environments.â? In Appendix I1-B, panel 23 2, the AOX is predicted to be below the World Bank Group Guidelines 6 within 2 metres of the diffuser. These guidelines should not be used to justify acceptable limits of AOX as the concentrations listed in the guidelines vary based on the technology used for pulp and paper. For example the limit of AOX for bleached kraft pulp mill is 0.25kg/ADt while the limit for sulfite pulp and paper is 0.005 kg/ADt 6. This implies the limits are not set based on the effect they have on health or environment, but rather on the concentrations produced by the methodology employed in the paper industry. If the concern were truly about AOX exposure, the limits of allowable amounts would be the same for all

processes. Based on this information I conclude it is not an acceptable set of guidelines to be used for establishing concentration limits of AOX in the effluent. The experiments used to determine the effect of stress toxins, temperature, salinity, pH, turbidity, etc. on an organism have come a long way since the early 1990â?Ts therefore an LC50 experiment should no longer be considered sufficient. Sub lethal exposure may still affect the physiology and gene expression of the fish and/or shellfish and this is something we need to understand. We know many of the halogenated organic compounds affect the reproductive and immune systems, and can lead to developmental disorders or cause cancer. In addition, gene expression experiments help gain a better understanding of the exposure effects on protein and enzyme production which gives us an idea of how the effluent will influence the function of biological processes. I request gene expression profiling experiments be performed on fish and shellfish that are exposed to the effluent at concentrations consistent with what will exit at the diffuser final effluent â?" NOT once it is diluted and compared to the same species that has not been exposed. In Appendix H, it is stated â?oTo address the concern, NPNS will commission toxicity testing to determine both potential acute and sublethal effects on immature stages of lobster and herring. Standardized toxicity testing protocols are not available for lobster and herring however, custom tests have been developed that can be completed using larval lobster and herring embryos. The tests will include Stage I-IV larval lobster and include a live-dead acute assessment of the various stages, as well as the assessment of sublethal effects on moulting time and growth. Herring tests on embryos would be similar in that they would assess acute toxicity to eggs, as well as the growth post-hatch for a number of days.â? These tests are not sufficient to assess long-term effects of toxic effluent exposure and do not examine multiple biological processes. Below is an excerpt from the Canadian Environmental Protection Act 4 â?oSome chlorinated organic compounds can be biologically degraded or transformed and transformation may lead to more persistent and bio accumulative compounds. Chloroveratroles, for example, transformation products of chloroguaiacols which are unique to bleached pulp mill effluents, are capable of accumulating in fish up to 25 000 times the concentration in water. Some other chlorinated organic compounds detected in biological tissues downstream of bleached pulp mills reflect repeated or long-term exposure rather than high bio accumulative potentials.â? And â?oLaboratory studies using individual chlorinated organic compounds that are commonly discharged from bleached pulp mills have demonstrated such chronic effects as deformities, and embryo and larval mortalities in fish. These chronic effects include significant irreversible factors which jeopardize the continuance of the species and the integrity of the ecosystem.â? My confidence in the proposal is further undermined by the following disclaimer from KSH consultants in Appendix C regarding the â?oPreliminary Engineering for Effluent Treatment Plant Replacementâ? â?oThis report and any or all associated estimates included herein are indicative only and should not be viewed as definitive. KSH does not guarantee the accuracy of such estimates and shall bear no responsibility for any reliance on such estimates by the authorized recipient. KSH is making no representation or warranty as to the contents of this report, including, without limitation, with regards to capacity, quality, production or any other eventual project outcome, and KSH hereby disclaims all warranties whatsoever, including, without limitation, any warranty of merchantability, quality, suitability, performance or fitness for a particular or intended purpose. Any representations and warranties provided by KSH to the recipient in connection with the proposed project shall be limited only to those set forth in a definitive agreement to be entered into between the parties.â? This statement implies we cannot take the numbers seriously and they are not to be held accountable if any of the assumptions are incorrect. Over the past year and a half I have seen the county divided. It is divided because the currency for the discussion is â?ojobsâ? . Politically, I understand why. However, I think it is incredibly short sighted on our part. We need to understand what the volume and composition of waste

will do to the local ecosystem and what will be the long reaching effects. Half a tonne of toxic AOX chemicals along with the rest of the substances in the effluent every day into the Northumberland Strait is unconscionable. I have added an appendix to this letter that contains several other points that came to mind while reading through the literature for the proposal. Please consider these points as well. Thank you for taking the time to read this letter and please consider that we could potentially be destroying the sensitive aquatic ecosystem of the Northumberland Strait and rendering it uninviting for aquatic species and human recreation if the current proposal is granted. We could also be poisoning and/or killing the fish and thereby poisoning ourselves. I beg you to ensure the proper and current experiments are performed before pulp effluent is pumped into the strait. It is my opinion that the limits of allowable toxins and effects of said toxins are not well established. Please copy me on the environmental assessment report once your office has made their decision. Sincerely, Retired scientist BSc, MSc, PhD organic chemistry, concerned citizen and resident of Pictou County. 1. Appendix of additional questions/concerns: A. It will affect more than fish. See Appendix N in the Project proposal for rare, threatened or endangered flora and fauna. There are many listed within less than 5 km from the project site. B. Effluent composition is different if the mill is undergoing maintenance. Have levels of contaminants been taken into account during this scenario? I have not read anything regarding that in the proposal. C. One of the risks identified by the mill is that plastic from the MBBR moving bed biofilm reactor could end up in the receiving water. How is this addressed? D. Power outage caused Harmac mill in BC to pump untreated effluent into the ocean. 7 What would prevent that from happening here? E. If we assume the regulations are acceptable for environmental health, the allowable concentration or pH, salinity, temperature, etc. limit does not mean 2 metres, or 8 metres, or 100 metres from the diffuser. Allowable concentration means the effluent should be at or below the legislated concentration prior to exit from the diffuser. Dilution into the receiving water should not be used for justification. Project: replacement_effluent_treatment_facility_project Comments: Piping the effluent from Northern Pulp into the strait is no solution at all. The plant claims that its crucial to Pictou County because it provides jobs, but it would ruin the livelihoods of all those fishers who take their catches from the strait. The pulp plant has been polluting our waters far too long. Perhaps if it closed down, it would make the area more attractive for enterprises that would bring new, more sustainable, less toxic industries to the area. Name: Email: @gmail.com Address:

Project: replacement_effluent_treatment_facility_project Comments: I have worked both part-time and full-time in forestry and arboriculture for 10 years and continue to stay aware of the issues affecting the industry and its subsequent impact on the ecology of our province. It is very clear that this proposal requires an assessment from the Canadian Environmental Assessment Agency. This is due to the fact that the province of Nova Scotia has financial stake in this project moving forward with its contribution towards the investigation of potential proposals for the effluent pipe. The current assessment, with its 30 day window for the submission of pubic comment, is not an adequate period of time for the public to fully read and understand Northern Pulps 1700 page submission. Furthermore, Section 34 of the Environment Act states: a the location of the proposed undertaking and the nature and sensitivity of the surrounding area b the size, scope and complexity of the proposed undertaking c concerns expressed by the public and aboriginal people about the adverse effects or the environmental effects of the proposed undertaking d steps taken by the proponent to address environmental concerns expressed by the public and aboriginal people da whether environmental baseline information submitted under subclause 91Abx for the undertaking is sufficient for predicting adverse effects or environmental effects related to the undertaking e potential and known adverse effects or environmental effects of the proposed undertaking, including identifying any effects on species at risk, species of conservation concern and their habitats f project schedules where applicable g planned or existing land use in the area of the undertaking h other undertakings in the area ha whether compliance with licences, certificates, permits, approvals or other documents of authorization required by law will mitigate the environmental effects i such other information as the Minister may require. I do not believe that the 30 day period allotted for the current assessment is adequate to fully consider all of these issues. Thank you. Name: Email: @gmail.com Address:

Project: replacement_effluent_treatment_facility_project Comments: I am a Child and Adolescent Psychiatrist in Nova Scotia, and live a drive from Pictou Landing First Nations and Boat Harbour. My Sub-Specialty training included studying and treating the effects of environmental toxins on the developing brain. There are many toxins which affect the brain, However I will focus on Methyl Mercury and Particulate MatterPM 2.5. My concerns are the unaccountable loss of several tons of mercury in the 1970â?Ts near PLFN. The peak was 5 tons of mercury in 1975 Canada Press 1977. This would be an estimated loss of 10-15 tons over a 10 year period Montreal Gazette archives. In my opinion, we are testing fate with this amount of Methyl Mercury in the ground. JIF Consulting has found 3 areas of mercury in the groundwater surrounding Pictou Landing. Methyl Mercury bio-accumulates in seafood. Humans who consume seafood with Methyl Mercury can develop Minamata disease. This is a devastating disease which first was encountered in Minamata Bay in Japan where humans developed this disorder after consumption of toxic seafood. There is no treatment for this disease. Pregnant mothers transfer this Methyl Mercury to the placenta to the developing fetus causing severe brain damage. In Canada, we have had Minamata disease diagnosed in Ontario, Grassy Narrows and White Dog First Nations communities. This developed after Dryden Pulp and Paper spilled 10 tons of mercury into their river. Pumping toxic effluent directly into the Northumberland Strait is not an acceptable alternative for all the above reasons. The effluent will not be toxin free no matter how treated and will bio-accumulate in bi-valves mussels, scallops, oysters and lobsters. Seafood will be contaminated. The archaic expression dilution is the solution to pollution is no longer acceptable. Humans are at risk! We have the most pristine cold waters and export seafood to a dollar value of 2.0 Billion Dollars in 2017. Infrastructure at Halifax Stanfield Airport has begun to increase with holding areas for lobster and 3-5 air cargo shipments to China per week, as well as to Seoul, Korea. Why would we want to put this at risk? With regards to air pollution, Northern Pulp emits 63 of all the PM2.5 in NS of all businessâ?Ts combined. WHO in 2013 declared PM2.5 carcinogenic to Humans . Once in the air it can stay in the air days to weeks and travel hundredâ?Ts to thousandâ?Ts of miles. The new precipitator installed on the recovery boiler addressâ?Ts the odour but not the PM2.5. The main boiler has no precipitator. We are concerned about our local lumber industry and how they would be forced to adapt if the Mill ceases to operate. The lumber Industry will change in the upcoming year when the new laws will be enacted regarding sustainable forestry practices. It will be a reshaping of the Lumber and Forestry Industry and they will need direction and support from the community and the Federal Government. It is never Wealth over Health, Itâ?Ts always Health over Wealth. This information has been exposed over and over again. 50 years of environmental racism is shameful and it is time to resolve this issue. Honour the Boat Harbour act. We need a Federal Assessment, not just a Provincial assessment. No more extensions. Peopleâ?Ts Health and High Quality standards of environmental protection should be our goal. We have to live with Industry. We donâ?Tt have to live with Industry that pollutes. Respectfully Submitted,

Subject: Concerns around 4 Tonne of TSS PER DAY - Opposing the NP Waste Proposal
Date: February 25, 2019 8:44:26 AM

CEAA, NS EA

On pg 84 of the EA, the projected Total Suspended Solids is 48mg/L. If 85 Million Litres of Effluent is processed per day, that equates to around 4 Tonnes of TSS per day into the Strait. Even if that meets the 25 year old PPER, it still poses a major risk to the marine species in that area.

The EA states that with the proposed AST facility, that TSS will be higher than the old waste process. This us unacceptable.

Sincerely,

Table 5.6-1: Anticipated Daily Maximum Effluent Water Quality (reprinted from Stantec 2018, Table 3.2)

Parameter	Unit	Value
Adsorbable Organic Halides (AOX)	mg/L	7.8
Total Nitrogen (TN)	mg/L	6.0
Total Phosphorus (TP)	mg/L	1.5
Colour	TCU	750
Chemical Oxygen Demand (COD)	mg/L	725
Biochemical Oxygen Demand (BOD_5)	mg/L	48
Total Suspended Solids (TSS)	mg/L	48
Dissolved Oxygen (DO)	mg/L	>1.5
pH	-	7.0 to 8.5
Temperature	°C	25 (winter) 37 (summer)
Total Dissolved Solids (TDS) or Salinity	g/L	4

At 85,000,000 L = 4 Tonnes of Solids PER DAY

Subject: Support of Approval Permit
Date: February 25, 2019 9:13:54 AM

Good Morning

I am writing a letter in support of an approval permit for a Class 1 Environmental Assessment for the replacement system for Boat Harbour submitted by Northern Pulp on January 31,2019. I believe the company has put many long hours into this assessment and has done a thorough job making sure all environmental standards have been met. I know that the Boat Harbour setup was not the way to go but back in 1967 environmental standards were not in place like they are today and technology in these areas has changed substantially in the last 50 years. The new owner of Northern Pulp has already done work to this mill over the years he has had ownership to reduce his environmental footprint with technologies such as the new precipitator which has reduced the emissions going into the atmosphere and is now willing to put the money into the new effluent treatment facility. This new facility will treat the effluent on site before ever leaving the mill eliminating the risk of another effluent leak from ever happening again.Northern Pulp has found the best existing technology today for Bleach Kraft Pulp Mills . The owner has also proposed an O2 delignification after the treatment plant is built which will reduce chemical usage along with water consumption reducing the amount of effluent. I believe that the Remediation of Boat Harbour has to happen for not just the First Nations people of Pictou Landing but for all the residence of Pictou Landing but I feel that the government has not given Northern Pulp enough time to complete the entire process for this to happen. At the beginning when the Premier gave the deadline of January 31, 2020 there were only 7 studies to apply for an EA but ended up being a total of 28. These studies take time and some of them can only be done in certain seasons. It has come out recently that the company that is to be in charge of the Remediation of Boat Harbour will not be able to start work on the expected date due to delays. I would like to ask you how it is fair that this company that had the same amount of time to get their ducks in a row is entitled to an extension but Northern Pulp who has taken on all these extra studies that kept coming up throughout this process is not entitled to an extension? Any project whether it be a new school, hospital or effluent treatment facility all have delays that are out of their control. Northern Pulp has had many obstacles whether it be the weather, having to find an alternate route for the pipeline right up to the blocking of their survey boat which I'm sure you have most likely seen on the news. I feel that it is only fair that you give the same exception to Northern Pulp as you are to the company in charge of the Remediation.
I have lived in Pictou County for my entire life (30 years) and feel that the closure of the pulp mill would be detrimental to the county and also the entire province. Throughout my life I have seen the impact that it has had on this county when places like Maritime Steel and Trenton Works had closed and the economy was in a better place than it is today.
I believe all the industries involved fisheries, forestries and the pulp mill can coexist. I believe that the EA brought forth by Northern Pulp will pass all environmental standards and that this County and Province will continue to prosper.

Respectfully

Sent from my iPhone

Subject: northern pulp proposal for environmental assessment
Date: February 25, 2019 10:38:08 AM

I have read and noted the Registration Document dated Jan. 31, 2019 and to the attention of Ms. Helen Yeh, Environmental Assessment Officer. What follows are my comments on same and my views on the proposal to pump large volumes of pulp effluent into the Strait of Northumberland.

At pages 8 and 9 of this submission is found the following statement: "For its entire fifty year history the BHETF has discharged into the Northumberland Strait at the outlet of the Boat Harbour Estuary." My comments on this seeming justification for continuing a process rife with environmental negative consequences- Yes this is true, and what have been the impacts of that? 1. pollution of Pictou Harbour (see study of cancer development in mussels in cages at strategic locations in the said Harbour and in the areas immediate to the Harbour's mouth.) Second, this outfall is a black pitchy mess that has caused the closure of one of Nova Scotia's most popular beaches (Lighthouse Beach); it has also resulted in the closing of the swimming area for the Girl Guides Camp (MacLellan's Girl Guide Camp- east of the Boat Harbour outfall; those children have been bussed to Melmerby Beach just to be able to have their swim lessons). Lobster traps that had been set in the area of the outfall and to the east of the outfall have had to be moved as the bottom does not allow a habitat for the lobster to thrive in. The effects on A'se'k (the other room) or Boat Harbour are abundantly clear!

Next: Here is a glaring and serious flaw in Northern Pulp's submission; it cannot be minimized and must not be ignored. At Section 2.3, page 11 is this statement: "Due to the EA Registration submission timing, the study period did not facilitate full biological field assessments for the current proposed transmission pipeline corridor." And "Field studies for the marine environment have been hampered by both seasonal constraints... and by physical opposition and obstruction..."

To proceed with any project given this admission by the proponent is totally unacceptable and amounts to a rolling of the dice that cannot be endorsed at any level of meaningful analysis and assessment. For a company to submit this as part of its plan is simply an admission that it has not done its work robustly! Here is the quote from this EA submission that shows how slack and lacking in thoroughness this proposal is. "The existing environmental conditions and associated potential environmental effects of the project therefore have been defined based on EXISTING AVAILABLE INFORMATION {non-specified} and OTHER DESKTOP SOURCES." Are they kidding? They did some Google searches and that is robust, competent, scientific analysis and assessment? No, it is blatantly insufficient, and presumptuous in the extreme. The proponent has chosen to put money into advertisements and sponsored media content. It should have started in 2015 when the Boat Harbour Act became the law of the land and done its due diligence. For Northern Pulp to state that it feels that their superficial analysis is justified given what it frames as a "... practice (that) is consistent with federal and other provincial EA processes..." is ludicrous and irresponsible, especially given the magnitude and likely negative impacts to the fishery and to tourism that account for several billion dollars of economic activity every year. These interests have been consulted and their opposition to this pipe in the Strait is uniform and persistent. In a nutshell, the tourists operators and the fishermen will never support this proposal. As to the feelings of those who cottage and camp along the Strait, there feelings have been made clear in their attendance in very large numbers at numerous public awareness sessions. The provincial government has heard these voices and the Boat Harbour Act has addressed some of the concerns. The views of the ordinary citizens have been documented and a survey of these letters to the editor will show where the majority

of people come down on the proposal to pipe pulp effluent to Caribou Harbour and dispose of it there or anywhere in the Strait. Hopefully the Government of Nova Scotia has seen fit to assess this citizen commentary; it is relevant.

With regard to the fishery particularly, there are several points that need to be made. There is ample evidence to support the concern that there will be bioaccumulation of deleterious, toxic substances that will impact the development of lobster larvae and will also cause the lobster to move to more hospitable environments in which to feed and reproduce. Pulp effluent in the Fisheries Act and other documentation is clearly identified as "toxic". Further, Northern Pulp has never identified the constituents that are in this effluent; the company has refused to do so. How can any government department, be it federal or provincial, sanction any such effluent if the constituent elements and each of their concentrations is not clearly established? In terms of known toxic and even lethal substances, it is clear that dioxins and furans are in the liquid effluent in Boat Harbour. It is clear, and has been most recently established with a published study by six Dalhousie scientists, that there are at least three known carcinogens that leave the stacks at Northern Pulp. They are in the form of 1,3 butadiene, carbon tetra chloride and benzene. That study also stated that these three elements exceed the Environemtal Protection Agency standards for safe emission levels. The aforesaid study also indicated the inadequacy of monitoring of such emissions. In other words, it stated that the monitoring stations are improperly sited and there are too few of them. As of this writing, it is believed that the monitoring station in the Town of Pictou (the only one in the Town, is inactive). How can this be allowed to persist?

As to the siting of the marine outfall to allegedly "minimize potential impact to marine water quality...". How can this claim be made when the constituent elements of the effluent and the concentrations of each have not been established? A study done in the early 1990's, with the lead author being S,. A. Jones, indicated that the release of effluent stays in the water column that it is released in for many kilometres and is found in "measurable amounts" even at a distance of thirty-six kilometres. How then can the proposal from Northern Pulp claim, without any significant modelling, that ambient conditions will return to the norm within a few metres of the outfall? This claim arrived at through inadequate modelling does not jive with the study just referenced. The NP submission also states that it feels that a pipe in theStrait will be a visual improvement to the existing obvious visual effects of today. It should be remembered that it was advocates for the pulp mill who in 1965 were telling residents and First Nations that there would be nothing but clear water coming out of Boat Harbour. In the literature put out at the November, 2017 meeting sponsored by Northern Pulp at the Wellness Centre in Pictou County at pages two and three it showed several beakers with the one to the far right showing a clear beaker of what looks like water. Once again, this is what Northern Pulp is saying the effluent will look like when it exits the pipe. I found this tactic to be reminiscent of what was displayed to the public in the mid 1960's. And, of course, the illustration then was dishonest and lacked genuineness.

This submission by Northern Pulp also states that there will be a surfacing of the effluent. I am sure that the boaters and swimmers in PEI, Pictou Island, in Brule and Tatamagouche will be pleased to hear that there will be effluent on the surface of the waters of the Northumberland Strait. Even more significant than the surface visual effects will be what happens to the marine biota and flora. This proposal does nothing to convince me that any best practices have been followed in the sense of solid scientific research, modelling and assessment to ascertain the likely impacts on these. It is what cannot be seen from the surface and what will bioaccumulate that will be most devastating to marine species. When so many livelihoods in

sustainable industries could be so affected, why should such a gamble as the one being offered in this proposal be entertained? The federal government needs to intervene here and make its own determination as to the "significance of environmental effects of the project." The federal government also must assess whether or not the Department of Environment in Nova Scotia has duly consulted with First Nations people in the Maritime Provinces ,as to this proposal!

Dillon Consulting in this submission to the Nova Scotia Department of Environment suggests that First Nations have been one of the groups offering "valuable input and raised important questions", yet it is very clear that this input has not at all been reflected in the submission Dillon has made on behalf of the proponent. First Nations may have been asked for input, but they have not been MEANINGFULLY CONSULTED. There is a huge difference, and it is one that has implications for the involvement of the Federal Government of Canada.It must be noted that the relationship that has developed between Pictou Landing First Nation and Northern Pulp has not been harmonious in any sense.

The proposal to run a pipe along the roadside, within a right of way is fraught with numerous problems. Also, the pipe itself will be an ugly presentation for all to view- even those who disembark from the ferry in Caribou. Tourists avoid the area now by driving quickly through Pictou County to other more pristine destinations. This has been clearly articulated by numerous people in the tourist and retail sectors. The owner-operators of Pictou Lodge have been making this abundantly clear for many years.

The Municipality of Pictou County has voted to support a firm closure date for Boat Harbour. It also has to give due consideration as to whether it will permit the passage of this effluent pipe over Municipal lands and watersheds. This is also the case , and more particularly so, for the Town of Pictou which depends to a significant extent on well-water supplies that this proposed pipe will pass over.

There are so many problems with running the pipe withing the right of way of the highway that it would be exhaustive to mention them all, but here are three concerns: 1. The proposal states that "The pipe may also be installed withing a paved portion of highway 106 to avoid existing infrastructure or environmentally sensitive features." So, tractor trailers, buses, cars,motorcycles will be travelling alongside a pipe carrying effluent and the barriers between them will be a guardrail. Really!
2. It is proposed that a "boring method" will be used to send the pipe around the current and recently redesigned rotary in Pictou. Again, really? In an area that is just beginning to give the Town of Pictou some promising retail development? 3. As far as decommissioning of this pipe , the plan, if it can be called such, is to leave everything in the ground or under the water and to merely cap it off after it has been cleared of the effluent in it. Hey, no problems here, just let mother nature and the future taxpayers deal with it.

The legislature of Nova Scotia has passed a law that will be followed, as being law abiding is in the best interests of all of us. To suggest that we should break the law to convenience any party is not tenable.Therefore the Boat Harbour Act must be followed to the letter. Lastly, the company Northern Pulp/ Paper Excellence opted to take a stance on how to "negotiate" with all interested and concerned parties with respect to a new effluent treatment proposal. It now proposes to hold effluent at Abercrombie Point for no more than two days before it transports it into the Strait. This is not an improvement over the existing treatment. The proponent has not done diligent work with respect to appropriate modelling nor proper and complete assessment of the potential harmful effects of this proposal if it were to be implemented. It

used numerous excuses as to why such thoroughness was not possible. It did not point to its own hesitation to get at this from the time that the Boat Harbour Act was passed. That is on the company. The company chose brinkmanship as a negotiating ploy. Brinkmanship is not part of a negotiating process that is used until late stages when one party or another opts for desperate moves. This was not a good faith approach by the proponent, and it has led to the divisions of not just the local communities, but to communities more distant. The strategy has also had the effect of strongly uniting previously loosely - connected elements; for that we should be thankful since being united in a cause can help to level the playing field. That, in my view, is what has happened in this matter. The leanings of the majority is found in the proclamations and meetings and press relaeses offered by the various, but now united, entities which include but are not limited to the following: Pictou Landing First Nations and the other First Nations communities in the Maritimes; Friends of the Northumberland Strait; Clean the Mill; the Fishermen's associations from across the Maritimes; the government of Prince Edward Island; concerned citizens.

There is a determination among all of these elements to advocate for the workers at the mill in Abercrombie and to advocate for the independent contractors who provide the mill with product should a closure of the mill occur. It is this determination to advocate and secure best results possible for these workers and contractors that is on the record. It is also this commitment that may be the force to re- fuse relationships that have soured because of the effects of the proposal to handle pulp waste in the manner that this proposal advocates.

Attachments: My letter to the Environment Minister.docx

Good Morning
I am including my letter to the Environment Minister on my interest in the Northern Pulp issue and the assessment that is taking place on this subject at this time.
King Regards,

Re: Request for Designation for CEAA Federal Assessment - Northern Pulp Effluent Treatment Facility

I am writing this letter in regards to Northern Pulp's Replacement Effluent Treatment Facility Project.

My name is and I have been a resident of , Nova Scotia for the past 37 years. I have also worked at the same Company for 35 years (Sobeys Inc). Previous to that I grew up in , Pictou County, Nova Scotia which is on the Sunrise Trail and not far from the coast. In the summer months we spend our time at our cottage in Caribou Island. We enjoy swimming and walking the beautiful shoreline collecting drift wood and beach glass. It is a beautiful spot rich in mussels, quahogs, clams and razor fish with beautiful clear waters. When these shellfish are in season we will go down and walk the beach to get a few for an enjoyable summertime treat.

At the Ferry Wharf in Caribou, Pictou not far from our cottage it is a busy time in the spring, summer and fall months. Fishermen are getting their traps/gear and boats ready to go fishing for the season. The fishing industry is an anchor industry for Nova Scotia and several rural communities have survived for years and many times have thrived in the past and will continue in the future. It is also the same spot where the Northumberland Ferry docks to pick up and drop of Tourists from Nova Scotia to Prince Edward Island daily. It is a place of clean water, clean air and bountiful fish.

My father was a fisherman for some years, he fished Lobster, Scallops and Herring and this livelihood is what supported our family. I now have two brothers that also fish for a living and have been doing so for years. It is in their blood and it is now what supports their family. I have cousins who also fish out of this area every year. And also had uncles who have since past but this was their source of income for which made families succeed and stay in Pictou County.

If this pipe goes into the Strait and pumps effluent into the water, it does not just affect the Northumberland Strait this is part of the Gulf of St. Lawrence, this is a shared body of water for our three Provinces and the rest of Canada. Wastewater temperature also affects receiving waters. When discharged in large quantities, it can raise the temperature anywhere from 28 degrees Celsius in the winter to 38 degrees in the summer which means no marine life will survive. In the Northumberland Strait waters marine life spawns, nurses and migrates here, how is that possible if they are exposed to chemicals and heat? We are talking about wastes from an industry and turn it into a form of effluent waste and then pump into pipes underground into the Strait. There are just too many variables, as it might not be recycled properly, or treated properly and unnoticed leaks can happen, it will have detrimental impact on the environment through air, water and soil pollution.

In this letter there are three things that I would like to address that are just some of the concerns that I have with this assessment:

Example #1: "In paragraph 9.2.4 at page 501, NP states as noted previously, the project has two main sources of emissions/discharges. These sources may result in potential chronic human exposure to project-associated chemicals:
"Chemicals present in treated effluent and in air emissions may pose a potential human health risk if there is significant exposure to the project-associated chemicals.

They are stating that it is a potential Human Health Risk. I am extremely concerned about the health of people living close to Northern Pulp. For decades air emissions from the mill have been a problem affecting resident's health and the main issue has been the cancer numbers in Pictou County and now they want to pump it into our water.
Pulp and Paper mills pollute our water, air and soil. There are about 500 Kraft mills, and many thousands of other types of pulp and paper mills, in the world. Primary concerns include the use of chlorine-based bleaches and resultant toxic emissions to air, water, and soil

Below is an article from the Globe in Mail in 2013 and then was once again updated in 2018. This article is stating the cancer rates in Pictou County back in 2013 with the effluent pumped to Boart Harbour. How high will those numbers go if the pipe goes into the water and effluent is released?
According to Statistics Canada, the Pictou area has the seventh highest rate of cancer per 100,000 residents of the country's 106 health regions. The area around Saint John, N.B., which also has a pulp mill, is the only region with a sizable population that has higher cancer rates than Pictou. *(Andreatta. David (2013) "In Nova Scotia town, residents fight local mill's pollution" Globe and Mail, 13 September).*

Example #2: "In paragraph 10.2.1 at page 521, NP states as noted below

During operation of the ETF, there is potential for release of chemicals used in the treatment process as well. Such a spill may contaminate soils and Groundwater and, through runoff, contaminate watercourses. Contaminants may adversely affect fish. And fish habitat and waterfowl. Groundwater contamination may adversely affect nearby water Supplies!

My concern with this section is the unsafe effect that can happen to the water supply, fish and marine life and human safety if there is an accidental release of dangerous material. We are talking lives and the rich eco-system that is being put at stake all for this company and their wealth, Northern Pulp had a recent leak in October 2018 although the Company did not think it was a huge deal because to them it was just a small one. It does not matter the size of the leak, it is the fact that it went unnoticed by the Company as it was reported by a couple out walking. There was another one at this plant 5 years ago. *(CBC News (2014) "*Northern Pulp mill shut down due to effluent leak" CBC, 10 June). Then in 2008, the underwater pipe broke and caused a lengthy shutdown of the mill. The Provincial taxpayers either loaned or gave the $15 million to make sure this would not happen again and then for it to happen so soon again is a huge concern. . I question the NP inspections and how many leaks are happening that the community is not aware off? And if a pipe is underground it will never be noticed!

Example #3: *"In paragraph 9.2.4 at page 501, NP states a*s noted below

As noted previously, the project has two main sources of emissions/discharges. These sources may result in potential chronic human exposure to project-associated chemicals: Chemicals present in treated effluent and in air emissions may pose a potential human health.
There are three major exposure routes through which chemicals present in environmental media can enter the body: Inhalation, ingestion and dermal (skin) absorption. This can happen from ingestion of soils, dusts, drinking water and garden produce, local country food items (e.g., fish, shellfish and hunting)

My concern with this paragraph is that any chemical flushed through a pipe to discharge 70-90 million litres of effluent from a bleached Kraft mill is unacceptable for this day and age. Mill waste water continues to wreak havoc on surrounding ecosystems. Common sense can tell someone if chemicals are flushed into a water area then the first to digest the chemicals are zooplankton, plankton and krill which are the main food source for larger marine life. Then the lobster, herring, crab and tuna will ingest these contaminates and then eventually humans eat the pullulated food supply. The fish get contaminated and so do the people who eat it, which can cause exorbitant health problems in the future for humans. So basically we should not eat the food in the ground or fish the marine life and be watchful of our drinking as there is a potential for human exposure. So how do we live what is left?

Based on the Northern Pulp's Treatment Project and the information that I provided, I feel that the marine life in the waters of the Northumberland Strait will cease to exist if this pipe goes through. As it is there is a deteriorating habitat for lobsters in the waters now and we need to get better control and come up with better data to sustain the management of our fishery resources. When this toxic waste harms one organism, it can end up destroying an entire food chain of aquatic life. Improperly disposed chemicals pollute marine life and kills sea mammals, corals and fish. And any organism that digests affected marine life can have adverse effects. Over 1 million seabirds and sea mammals are killed by pollution every year. People who live in places with high levels of air pollutants have a 20% higher risk of death from lung cancer. This pipe is not a project that we want passed! Fish and seafood are among Canada's largest exports of food products. Lobster, Atlantic salmon, snow crab and shrimp remains Canada's top species exported in terms of value, with over $2 billion worth in 2016. Aquaculture is the fastest growing food production activity in the world and a growing sector in Canada. Approximately 72,000 Canadians make their living from fishing and fishing related activities.

Overall I feel that we need more information before the Minister can make her decision. We need an in-depth investigation. After reading this assessment there is so much evidence to show the likelihood that it will cause adverse effects on the fishery and marine life. And it will cause effects on Humans by air and water pollution. I feel that the Minister needs to reject this proposal. We need to have a Federal Environmental Assessment completed on this treatment facility. This project is undergoing a shorter, 50-day provincial Class 1 assessment, which is unacceptable. It is outrageous that you can get a Federal assessment to do the cleanup at Boart Harbour when the damage is done after 50+ years. But you cannot get a Federal assessment when Northern Pulp wants to go and cause more of a threat to our environment. The government's past handling of effluent from this mill has resulted in one of the most contaminated sites in Canada, Boat Harbour. I want to see a strong, science based review of this project which will protect the present and future health of our Strait and the economy which depends on healthy waters.

My question to you Minister… Remember it only took one diseased steer to basically cripple the beef industry in Canada for 5 years. If this goes through there will be no fishery, can Canada live without that?

Thank for taking the time to read this.

Kind regards

Subject: Northern Pulp Effluent Pipe
Date: February 25, 2019 11:06:42 PM

To Whom it may Concern,

I am writing on behalf of my family. My husband is a fisherman and we have 2 children. We all love to go fishing, go to the beach, go camping, go swimming, have fun & live life.

The idea of putting a pipe into the Northumberland Strait may jeopardize all of the above things that we as a family love to do.

It's just not all about the fishing industry but about tourism and everyday life that this will affect.

I'm sure when they opened the mill and proposed all there information that they did not for see Boat Harbour turning out the way it is or at least I hope they didn't!! You have to have answers you can not speculate that it is highly unlikely to harm the fisheries. If you can't say it won't then you shouldn't do it. There is too much at risk. I know there are people at the mill, the forestry industry, etc but there are also lots of people on the other side, if the pipe goes in and it ends up like Boat Harbour. Then what? We have residents, we have tourists, we have fishers and we have fish, that what, don't count?

If there is a minimal percentage that it could 25, 50, 100 years down the road, turn into a hazardous site like Boat Harbour then it's NO GOOD. We need guarantee there is going to be no affect!

I have family, relatives, friends & strangers close and afar, that deserve & NEED answers. So please do the proper Federal Assessment and get answers.

Some intresting points from section 9.2.4
"Chemicals present in treated effluent and in air emissions may pose a potential human health risk if there is significant exposure to the project-associated chemicals. As such, many of the chemicals present in treated effluent and in air emissions are considered to be candidate COPCs at this time."
"At this time, it is only possible to identify candidate COPCs that may be evaluated should a HHRA of the project be a regulatory requirement. This is due to the fact that chemical process engineering design work is continuing and there is presently uncertainty regarding the likely chemical composition and characterization of the marine treated effluent discharge (including the potential concentrations of substances present in the effluent). "

There's a lot more vague information in his proposal, this is just one part of the proposal that doesn't give me a 100% guarantee the quality of life I want for my children! It doesn't give me a 100% guarantee that the pipe will not affect my families livelihood!

Project: replacement_effluent_treatment_facility_project Comments: This is a very comprehensive document and I think the project should go ahead as soon as possible. This company has put a lot of effort and expense into preparing this project and have been cut short of time by McNeils Boat Harbour Act. The mill will be put under a great deal of stress if a shut-down of more that 10 days occurs. A lot of damage will occur in that period of time and the mill may not recover. Please pass this accessment and allow the mill and all of the spin-off business to continue operations. I would not be against the continued use of Boat Harbour to facilitate this project to its completion. Sincerly, Name: Email: @hotmail.ca Address:

Re: Northern Pulp Nova Scotia Effluent Treatment Project Proposal

Submitted by:

Dear Sir or Madam,

I respectfully submit the following comments on the Northern Pulp proposal for the replacement effluent treatment project (NP Proposal), as registered at your office on February 7, 2019. The proposal document is too voluminous to possibly comment on all of the sections that could be included here. Therefore, I have selected several issues that I feel I am able to reasonably comprehend and make valid comments on.

I hold a Bachelor of Science from Mount St. Vincent University, and a Master of Public Health from the University of Massachusetts, Amherst. In my academic work at both the undergraduate and graduate levels, I have had to read many research papers in various disciplines in order to fulfill coursework, including writing my own graduate thesis. Understanding the underlying challenges of collecting and analyzing data using statistical methodology, and the importance of appropriately communicating conclusions of studies has informed my comments below.

My responses to the NP Proposal document include the following issues:

- Lack of scientific and statistical basis for many conclusions
- Use of ecological models without validation via observed data
- Lack of current and accurate baseline data
- Vague descriptions of the final effluent composition and impacts of solids content of effluent
- Omission of thermal pollution and global warming issues from effluent
- Irrelevance of Section 9 regarding human health impacts

The first general comment that I wish to make about the NP Proposal is its lack of what is commonly referred to as '**scientific method**'. There is a burden of work that must be completed in scientific endeavor. The best description that I could readily find on the internet (my underscores):

1. Make an observation or observations.
2. Ask questions about the observations and gather information.
3. Form a hypothesis — a tentative description of what's been observed, and make predictions based on that hypothesis.
4. Test the hypothesis and predictions in an experiment that can be reproduced.
5. Analyze the data and draw conclusions; accept or reject the hypothesis or modify the hypothesis if necessary.
6. Reproduce the experiment until there are no discrepancies between observations and theory. "Replication of methods and results is my favorite step in the scientific method," Moshe Pritsker, a former post-doctoral researcher at Harvard Medical School and CEO of JoVE, told Live Science. "The reproducibility of published

experiments is the foundation of science. No reproducibility – no science."

https://www.livescience.com/20896-science-scientific-method.html

In the instant NP Proposal, data is derived from models created and operated in controlled environments. In the natural world, the number of variables that affect the validity of the data are either too numerous to list, or are simply unknown. Statistical confidence intervals of conclusions in this proposal are not stated, nor are any statistical analyses mentioned (See #5 above). All scientific and technical data must withstand statistical scrutiny. This is meant to address the probability that the data is replicable and applicable in the natural environment or larger population.

There is no mention in the NP Proposal of how the models utilized by Stantec were validated, yet numerous assumptions/conclusions regarding the performance parameters of the proposed project are presented. Studies have been published about the validity of utilizing **models in ecological studies**:

> "Because there are no generally agreed validation criteria for ecological models, the best that can be done at present is for the modeller to state explicitly what the validation criteria are and leave it to the user to judge if the criteria are adequate. The most common criteria at present are the "see how well the simulated data matches the observed data"…
> Rykiel, E.J., Jr. "Testing ecological models: the meaning of validation." *Ecological Modelling* 90 (1996) 229-244.

Validation criteria are not mentioned in the NP Proposal, based on my own reading. Stantec has included simulated data on many effluent and pipe parameters. However, observed data is not included. For instance, with respect to the receiving environment – the baseline (current) water quality data is *assumed* to be the same at the outfall location as a previously considered location. This is articulated in the following disclaimer found in Appendix E - Receiving Water Study p. 16:

> "No historical water quality data are available for Northumberland Strait around the CH-B location. Data from neighboring Pictou Road (Stantec 2017) located about 6 km southeast were used."

Two year old data from a location "about" 6 km southeast was utilized, and characterized as "...expected to be worse than off Caribou Point at CH-B..." **This is a significant flaw in the validity of conclusions about the risks inherent in this project. Scientific conclusions cannot be drawn from the modelling data, only hypotheses.**

This deficiency should be considered pursuant to Section 12 (da) of the Environmental Assessment Regulations.

Section 5.6.1 Replacement Effluent ETF Effluent Discharge

The NP Proposal provides projected *estimated* composition of effluent leaving the diffusers at Table 5.5-1. It is then purported that this effluent "...will meet ambient water quality (current background) at the edge of a standard mixing zone." This critical section of the proposal is lacking in detail and does not explain where the extraordinary volume of effluent matter that will be continually exiting the diffusers will go. A fundamental scientific law states:

> "**The law of conservation of matter** or principle of matter conservation states that the mass of an object or collection of objects never changes over time, no matter how the constituent parts rearrange themselves. The mass can neither be created nor destroyed."

https://www.nuclear-power.net/laws-of-conservation/law-ofconservation-of-matter/

There is one variation in the law of conservation of matter, which is the production of energy in radioactive materials. The basic law of conservation of mass/matter is well known and applies in the fields of chemistry, physics, fluid dynamics etc.

The NP Proposal does not adequately address where the effluent mass being delivered at the diffusers will end up once it enters the Northumberland Strait. Every molecule of effluent will remain in the strait/ocean waters unless vaporized into the atmosphere.

Table 5.6-1 Anticipated Daily Maximum Effluent Water Quality (Reprinted from Stantec 2018, Table 3.2)

1. The **total suspended solids** in the effluent are *estimated* to be 48 mg/L. Using the conservative approach, the mill will be sending 85,000,000 Liters of effluent to the Northumberland Strait every day. This is the equivalent of 4,080 kg/day, or 1,489,200 kg/year of "suspended solids" being dumped into the strait. It is further noted that these suspended solids will be comprised of an unknown proportion of floc – biological organic solids, including microbes. Whether floc, sediment, chemical or any other substance, this is an enormous volume of organic and inorganic solid mass entering the Northumberland Strait.

If the solids become diluted within an arbitrary "mixing zone", then the massive amount of solid organic and inorganic material will simply be present in a more dilute concentration.

Given that each year there will be 1,489,200 kg of suspended solids released, the consequences should be addressed by the proponent. This is a serious deficiency in the proposal.

This deficiency should be considered pursuant to Sections 12 (c), (d) and (e) of the Environmental Assessment Regulations.

2. The temperature of the effluent leaving the diffusers is *estimated* to be 25º C in the winter and 37º C in the summer. At Appendix E - Table 3.1 Background Water Quality (from Stantec 2017) at the location "about 6 km southeast", the average winter temperature is denoted as 0º C and average summer temperature as 17.6º C. Thus, the average **effluent to ambient temperature differences would be 25º C in the winter and 19.4º C in the summer.**

Thermal pollution is perhaps the most concerning aspect of this proposed project, in its **deleterious effects on organisms** and contribution to **global warming**. A short primer on thermal pollution:

- Cold water contains more oxygen than hot water so increases in temperature also decrease the oxygen-carrying capacity of water. In addition, raising the water temperature increases the decomposition rate of organic matter in water, which also depletes dissolved oxygen. These decreases in the oxygen content of the water occur at the same time that the metabolic rates of the aquatic organisms, which are dependent on a sufficient oxygen supply, are rising because of the increasing temperature.

- Ocean invertebrates, fish and marine reptiles are obligate poikilotherms - their body temperatures depend entirely on the surrounding water. Each species is adapted to a single range of temperatures and many pass through several different life stages, each with an individual range of tolerance. The ocean's vast populations of microbes, fungi and sea plants also rely on narrow temperature ranges for optimal growth.

- Thermal pollution often temporarily increases aquatic plant populations. Other life forms, including microbes and animals, move into these regions to exploit the higher oxygen levels, but when photosynthesis stops at night or upon the death of plants, dissolved oxygen levels plummet, leading to massive animal die-offs. Excess heat can also cause unnaturally large microbial blooms, which kill animals by depleting local oxygen or producing toxins.

- Unnatural warmth and cold can also delay and redirect migration, influence when and whether breeding occurs, and decrease survival of young in marine mammal, reptile and bird populations. Heat pollution that leads to an overabundance of organisms in a region can draw in excessive numbers of creatures that feed on them, while depletion of prey populations by heat stress forces their predators to encroach on regions outside their normal range. Both situations lead to unnatural competition between and within species.

- A sudden thermal shock can result in mass killings of fish, insects, plants or amphibians. Hotter water may prove favorable for some species while it could be lethal for other species. Small water temperature increases the level of activity while higher temperature decreases the level of activity. Many aquatic species are sensitive to small temperature changes such as one degree Celsius that can cause significant changes in organism metabolism and other adverse cellular biology effects.

  https://www.slideshare.net/meghamajoe/effect-of-thermal-pollution-on-marine-life

This aspect of the proposal should be considered pursuant to Sections 12 (c), (d) and (e) of the Environmental Assessment Regulations.

It is unclear whether this EA will consider the effluent contribution to **global warming**. The gradual warming of the receiving waters within and beyond the arbitrary "mixing zone" from hot/warm effluent is not discussed in the NP Proposal. There is a document on the Nova Scotia Environment website at the Environmental Assessment pages titled: "Guide to considering climate change in environmental assessments in Nova Scotia". According to this document, Global Warming considerations in the EA include:

"Operational processes and activities can include the project's energy sources and operational boundaries (Guide to Considering Climate Change in Project Development in Nova Scotia Section 2.2, Steps 1−A and 2−A);
• Anticipated emissions can include information on the processes contributing to GHGs (Section 2.2, Steps 1−A,2−B) and estimated GHG emissions (Section 2.2, Step 2−C);
• General layout and size can describe the loss of carbon sinks through extent of forest removal (Section 2.2, Step 1−B); and
• The project's location or setting can be used in relation to a project's climate change vulnerability."

https://novascotia.ca/nse/ea/docs/EA.Climate.Change.Guide.pdf

Table 2-1 Criteria for Assessing Significance of Impacts from Project Activities

Operational processes and boundaries include the piping of hot effluent into the marine environment. Thermal pollution and its contribution to global warming are not discussed in the NP Proposal. The contribution to global warming should NOT be glossed over in this assessment. The 1967 mill should not be pushed forward into our collective future without considering the timely and relevant issue of global warming vis-a-vis the thermal pollution that will result from the proposed project. **Thermal pollution from the effluent will cause a significant adverse residual environmental effect in its contribution to global warming.**

Section 8.1.3.1. Potential Environmental Effects

The following paragraph in its entirety is vague and without any scientific basis. This paragraph should be rewritten to provide clear and detailed information about potential harm from the emissions after the project:

> "Without mitigation, the project *could* interact with the atmospheric environment in the following ways...emissions from the combustion of such sludge in the power boiler during operation and maintenance *could* disperse from mill stacks to off-site receptors." (Registration Document at page 142)

The use of "estimates" of current emissions at Table 8.1-5 is inadequate. The use of "estimates" at Table 8.1-6 is therefore, also unacceptable. Note that the "estimated" values are then utilized as baseline in the modeling noted at page 146: "Ground-level concentrations (GLC's) of air contaminants were predicted for two modeling scenarios...".

The models utilize baseline "estimates" to inform the conclusions seen in **Table 8.1-7 Summary of residual environmental effects related to the atmospheric environment VEC** (page 147). Ultimately, the findings under Significance of Residual Effect are all deemed "not significant". The conclusions based upon estimates are not valid or scientific. The conclusions are based on conjecture.

Breathtaking in their brevity, and vague, sweeping conclusions, Sections 8.1.3.1 through 8.1.4 should be rewritten to include a scientific basis. The conclusions are based on hypothetical outcomes derived from models. There is simply no rigorous scientific study noted in the proposal to support the assumptions in Sections 8.1.3.1 – 8.1.4.

This deficiency should be considered pursuant to Sections 12 (c), (d) and (e) of the Environmental Assessment Regulations.

Section 9 Human Health Evaluation

As a public health professional, it is impossible to understand why a project of this magnitude and nature would not require a human health risk assessment (HHRA) in an EA.

Anecdotally, there have been long suffering health effects in the population in geographic proximity to the Abercrombie pulp mill. The mill emissions are copious and unpredictable as they flow in response to wind velocity and direction. The waters of Boat Harbour are toxic and therefore, the effluent leaving Boat Harbour and going into the Northumberland Strait cannot be innocuous to marine or human life.

Morbidity and mortality can be measured and analyzed in a healthcare system such as Nova Scotia's. Reportable disease is recorded and some data is published. However, rates of disease such as cancer in Nova Scotia are published at "zone level", which makes it impossible to discern an elevation of disease rates in small geographical locales, or clusters.

https://www.cdc.gov/mmwr/preview/mmwrhtml/rr6208a1.htm

My public health practice has been outside of Nova Scotia and so I cannot speak to the reason why the province has failed to study disease rates in Pictou County. I find it unusual that over the long history of the mill's presence, this has not been undertaken. This work is the domain of epidemiologists who utilize data (such as from the Nova Scotia Cancer Registry) and determine if disease rates appear to be elevated and, whether high rates of disease might be associated with the mill emissions and effluent. To the best of my knowledge, this has never been undertaken.

In the absence of epidemiological studies, it is not possible to dismiss the effects of the mill on human health. Nor is it possible to confirm the effects without delving into epidemiological studies. Unfortunately, this EA is currently proceeding without requirement to review the project's potential future effects on human health. This follows the paucity of attention to health effects from mill emissions and effluent over the last 51 years. This is an unjust burden upon the people of Pictou County. In any case, the information in Section 9 has no application in this EA in the absence of any historical epidemiological data. Any future epidemiological study would obviously take many months or years.

If human health were deemed relevant to this undertaking, the matter should be considered pursuant to The Environment Act, Section 34 (1) (b).

Project: replacement_effluent_treatment_facility_project Comments: I do not approve of pumping treated effluent into the Northumberland Strait. no proof that the effluent will not be harmful to the surrounding waters especially with the temperature it is being quoted at. A lot of items with should or should not as per their model. The first proposal shows what little forethought was given to the proposed route as charts were readily available with depths and shipwrecks clearly marked. Furthermore the presumption they could cross the town of Pictous watershed without requesting approvals shows how entitled they think they are The amount of monies spent on the first and subsequent plans have been mainly funded by the provincial government and with the time spent could have been used to find a real plan and a solution. This company has continually been above the emission levels with no regards for the people in the surrounding area. Name: Email: @hotmail.com Address:

Project: replacement_effluent_treatment_facility_project Comments: Northern Pulp effluent treatment facility as proposed February 2019. Volume of waste water effluent 82,500 cubic meters/day is 57,300 litres per minute, system maximum. 70,000 cubic meters/day is 48,600 litres per minute, the rate which is most commonly created during the normal operations which the plant manager reported to me in conversation. Please note: the volume of one cubic meter is 1000 Litres The Northern Pulp proposed average daily waste water is projected to be 62,000 cubic meters per day of effluent, which is a rate of 43,056 litres per minute and is also 717 Litres per second. The volume of liquid waste from the the Northern Pulp Mill is extremely high. The upper maximum waste effluent suggested by Northern Pulp Nova Scotia is a volume of 82,500 cubic meters of effluent, this is 954.8 Litres per second to enter the environment. The current effluent temperature from Mill production to the Boat Harbour Effluent Treatment Facility is at 40- 42 degrees Celsius. There is no known heat loss for the current pipeline although it is likely more than a kilometre in length. However, the flow rate and the polyethylene piping may prevent heat loss while the Mill is in steady state operations/production. A 1,000,000 L one million litre storage tank may have the capacity to store Northern Pulp liquid waste effluent for 17.4 minutes /- 1 minute when production generates 57,300 L/minute effluent per day. At 40,000 L/minute of NP liquid waste effluent, fills a 1,000,000 L storage tank within 25 minutes /- 1minute, assuming it was empty at before hand. An 11.4 km pipeline which is 36 inches inside diameter will contain 7,479 cubic meters of waste effluent, or approximately 7.5 million litres of effluent should a catasrophic pipe failure occur. This environmental risk is significant, given the communities have no experience with large effluent pipeline failure. The 7.5 million litres of effluent does not include headwater effluents that would continue to be pumped or gravity fed from the mill should the transmission pipeline fail. The proposed 12 million litre clarifiers have a maximum four hour capacity to treat the effluent. The current Boat Harbour Effluent System has approximately seven to ten days by comparison. The open clarifiers will pose a very significant occupational health risk to Northern Pulp Mill workers/employees. The daily exposure limit to hydrogen sulphide H2S is less than 1 part per million ppm. The three clarifiers will off-gas hydrogen sulphide from 5 to 50 ppm depending upon winds. Hydrogen sulphide toxicity is not well addressed given labour regulations. This one gas can be potentially deadly as 100 ppm H2S with be fatal within 30 seconds to adult humans. Clarifiers The primary stage clarifier may remove 2.3 grams of suspended solids per litre of waste water with an on-going rate of only 0.3 grams per litre clarification as stated. Turbulent flows by the 700 to 950 Litres/second inbound waste waters into the clarifiers will negatively impact settling, raking or screening actions of the on-going success in the clarifier systems. Clarifiers work best with a calm steady state fluid, where there is little turbulence and there are days for solids to fall from mechanical suspensions or have time to settle gradually due to differences in specific gravity. Little discussion is made of wood fibres and the inorganic composition of the effluent water waters. The process chemicals in a Kraft pulp digestion process are mainly and potentially all water soluble. Settling in the clarifier is difficult, to say the least. The waste wood fibres lost in the waste waters will float due to their specific gravity. The first stage clarifier does not describe any wood fibre retention or extraction, nor the capture of water soluble chemicals. The proposed clarifier is designed to capture only dense total solids which may or may not settle out in the very turbulent clarifier environment. Waste matter from the clarifiers will be diverted to a sludge tank and ultimately to the Power Boiler para 5.2.2.8. The

text as presented is misleading. It suggests: Pressed sludge/solids containing water will be combusted in the power boiler to produce heat. The text should state any water component of the waste sludge is totally released to the atmosphere along with the soluble contaminants. While the power boiler, produces stream and electricity, any moisture in the combustion chamber can only exit via the chimney and into the atmosphere of Pictou County. Should this same moisture contain soluble sulphites, sulphides and related process chemicals, these will all be made airborne by the combustion process. Please also note: The combustion/power boiler is the least equipped for pollution abatement. Marine Pollution at Caribou Harbour The Caribou Harbour opening suggested for the effluent diffuser is adjacent to Northumberland Ferry vessel route. This means the visitors to Nova Scotia or leaving the Province via the ferry service will be subjected to high concentrations of sulfur dioxide gases and related sulfur oxides arising from the effluent diffuser. The effluent water exiting the proposed diffuser apparatus with be toxic to marine life. With respect to ferry users, the effluent is fresh water, hot and very gasified. This will result in the effluent rising to the surface of the Northumberland Strait water immediately. The notion that these waters will mix uniformly by natural blending is misleading. The differences in temperature and specific gravity will cause the effluent to create a continuous rift pattern which will prevent wishful mixing/blending as suggested by Northern Pulp. The analogy is higher industrial chimneys from factories were thought to better diffuse airborne pollution. Scientists and engineers now know this does not occur in fact. The proposed position of the effluent diffuser is immediately upstream of the Caribou Provincial Park, the Pictou Lodge and across the harbour from the Pictou Landing First Nations lands. As the Northumberland Strait tides fall twice daily the Northern Pulp effluent will be mixing and flowing toward these locations. The smell of oxides of sulphur, sulphur dioxide, hydrogen sulphide and related kraft pulp wastes will greatly impact breaches, the nasty odour of the sulphur complexes will cause undue respiratory stress for humans and other mammals on, in or adjacent to the Northumberland Strait. Marine Habitat 717-949 litres of Northern Pulpâ?Ts liquid effluent will enter the Northumberland Strait per second. The Biological Oxygen Demand BOD, the pH and maybe physical attributes, will have been pretested by routine daily compliance measures. The BOD usually laboratory test requires at least an hour of lab time to perform the testing. Stopping production because of a failure of BOD testing will not happen due to the safely to the workers and the plant processes this plant must slowly be shut down which would fail the three hour available for the decision. Compliance issues will be next to impossible to evaluate as the waste water will be entering a saltwater environment, well below the surface waters. 717-949 litres of very hot water per second will be entering the Northumberland Strait. The huge temperature variation compared with receiving waters by some 25 to 35 degrees Celsius will be lethal to marine life. Northern Pulp Management suggest they expect this lethal impact to be spread over an area of 100 meters/any direction from each diffuser. However tidal action, thermal rifts and the specific gravity differences will cause the warmer waste waters to rise immediately, having a larger impact on fish and marine mammals. The inorganic waste chemicals from the NP Millâ?Ts operations, will impact benthic shellfish life. The nasty odours and the chemical/physical pollution will negatively impact tourism, recreational land use and the fisheries. Little work has been done to accurately quantify waste metals from the Millâ?Ts current operation. The quantities of iron, nickel, chromium, molybdenum and other ingredients within stainless steel and chromium plated steel roller surfaces have left an impact in Boat Harbour. Having sampled the embankment soils and having had a third party test laboratory analyze the soil samples, there was a noticeable trend within Boat Harbour. Inorganic heavy metals have occurred and entered into Boat Harbour since the Mill was built in 1967. These metal contaminants are likely from eroded stainless steel, worn pipes, worn roller surfaces, etc.. that 50 years of operations has lead to chronic heavy metal waste/pollution. Should Northern Pulp

and this kraft pulp process operate for another 25 years or more, the inorganic metals pollution needs to be addressed as part of current evaluation. The lead, tin, antimony, cadmium from bushing/metal bearings, chromium from hard electroplated chro mium rollers, chromium/nickel/iron/molybdenum from stainless steel piping, cadmium plated bolts and fasteners, all these metal suffer daily erosion, corrosion and cavitation which will impact the Northumberland Strait lobster fishery. The oxides of sulfur, the changes in salinity, water temperature, turbidity will impact fish habitat and the migration of fish stocks within the Strait. Northern Pulpâ?Ts Environmental History Paper Excellence and Northern Pulp Nova Scotia operated the kraft pulp mill without an electrostatic preceptor for more than a year without reporting its failure to the community or its regulator. Northern Pulpâ?Ts Power Boiler has failed emissions testing. The Northern Pulpâ?Ts Recovery Boiler failed emissions testing. Regardless of failed airborne pollution testing, the Mill operations continued until appropriate shutdowns could be scheduled well after directions/Ministerâ?Ts Orders were given to the Mill management. The proposed size of the first and second stage clarifiers and the â?oBAS technology may appear interesting to the environmental assessment decision makers. However, there is only a four hour residency of waste waters to remain in holding tank system. However with waste waters of 700 - 950 litres per second entering each of the first and second stage clarifiers, this flow rate will cause extreme turbulence. The magnitude of the waste water flow rate limits the capacity of the clarifiers. Furthermore the off-gasing of hydrogen sulphide from the clarifiers will create a process that is difficult to understand and control as well as potentially deadly to workers exposed to the open clarifiers. Sedimentation as described by the proposal within the clarifier system will not meet current standards. The recent Mill Management, while perhaps willing to invest in operator training, most likely will under resource this waste treatment system, as previously demonstrated. The waste treatment proposal only addresses the BOD/COD, pH attributes of the waste waters. The off-gasing from sulphites/sulphides/oxides of sulphur, wear metals, inorganic chemical iron, nickel, chromium, cadmium, sodium sulphide, sodium sulphates pollution, and the huge thermal pollution issues are not addressed by the proposed plan of action. The high density polyethylene or polypropylene piping system to transport the waste water effluent to the final marine site will effectively insulate the waste waters and prevent heat loss. The daily loss of 62,000,000 to 82,500,000 litres of hot water 35 to 40 degree Celsius into the environment is â?ocriminal. Conclusions: 1. The proposed effluent treatment system is under sized for the clarifiers and the current daily water volumes. 2. Once effluents have passed the clarifier system, there is little opportunity for subsequent remediation should BOD testing indicate an issue. BOD testing, requiring an hour to complete, provides only three hours to stop production of the mill. 3. Waste effluent at 35 degrees or more will enter the Northumberland Strait killing marine life. The projected waste path does not accurately address the thermal toxicity to marine life, the foul smelling oxides of sulphur by-products, chronic heavy metal contamination by the effluents. 4. The waste waters are out of visual sight of the Mill, its response teams and could have days of non-compliant waste disposal before regulatory processes would require immediate shutdown of the proposed waste treatment system. This would be at the expense of fishermen, marine life and a valuable coastal zone area for tourists, residents and endangered marine mammals. Lastly 5. An Industrial Approval should not be considered but the Province of Nova Scotia for the continuing operations of Northern Pulp Nova Scotia Limited the Mill until the Mill replaces the existing kraft caustic digestion technology and implements a closed loop water pulping process such that there is little or no waste management issue, no need to dump waste process chemicals and spent waters into the marine environment of Pictou County, the Pictou Landing First Nations or the Strait of Northumberland. Subject:	Proposed Project Comments
Date:	February 27, 2019 11:20:39 AM

Project: replacement_effluent_treatment_facility_project Comments: As residents of Pictou County wed like to address the serious issue affecting the local area and the broader province of NS in regards to the proposed Effluent Treatment Facility project put forth by Northern Pulp We feel confident that NP has carefully prepared, planned, studied in depth material for the proposal and the tests that theyâ?Tve been undergoing the past five years to meet environmental regulations, requirements, and scrutiny set forth by the province of NS to move forward with construction. Today we all are concerned about the various effects on our environment and have become skeptical of false truths passed on throughout the years that has made us very guarded. We strongly believe with all the studies, tests, preparations that this company has done, and millions of dollars spent since purchasing the mill that their seriousness, commitment to the project, and willingness to continually improve on this mill since becoming owners shows their dedicatio n in making the future of this mill and its effluent outfall one of present dayâ?Ts highest in technology. A five year deadline was set forth by government for the closure of Boat Hbr and timeline for NP to complete everything necessary to pass an environmental assessment, in essence this may have seemed ample time to achieve all crossed Tâ?Ts and dotted Iâ?Ts but with all considered the company was met with challenges from government with continued added criteria and challenges of interference when trying to fulfil the necessary studies to gather that information. There are many who are not in favour of an extension to Boat Hbr, and we all agree that a clean-up is necessary, effluent has been treated this way for fifty years and facts tell us that some of the best catches for fishers over the years have not been affected, an extension may be necessary for NP to complete scientific crucial detail for the effluent project they propose for continued operation of NP, and I hop e government, local groups, and community give consideration into a short term extension if needed. Very concerning is the fact that there are individuals and groups locally non-local on a crusade to shut down NP permanently regardless of the outcome of scientific tests results. Itâ?Ts ironic to hear comments coming from the government of PEI regarding our effluent when facts tell us that over 90 of nitrates in our strait comes from that province and as well the outfall from other industry waste water from towns travel through our rivers including Pictouâ?Ts to the Northumberland Strait. Our communities, neighbours, families, etc. have become divided in conflict due to lack of leadership within our boundaries of Pic.Co. N.S., political parties blaming each other, or anyone, when it was they all political parties who voted for a deadline, instead of the blame game they should be coming together for viable solutions resolution. There is a real concern for the many jobs in PC, rural NS, the entire province, and the more than 500 retirees of the pulp mill whose benefits and pensions may be impacted and disheartening to think about the many young families presently employed by NP and forestry who would undoubtedly have to leave our county and province in search of employment elsewhere to support their families and further jeopardize an already declining population and decreasing property value of land and homes in our county as well as the negative effect on business locally and provincially. Respectfully sincerely,

Subject: Northern Pulp"s EA of New ETF and Pipe
Date: February 27, 2019 12:30:44 PM
Attachments: "s letter.docx

24 Feb 19

Dear Environment Minister Margaret Miller,

I am writing to you about Northern Pulp's pipe that they want to build. I am nine years old from Central Caribou, NS. Please do not dismiss my letter because of my age. I have grown up on the beaches of Caribou and my cottage on Pictou Island. I have fished lobster with my grandfather and father every spring since I was four. My Great-grandfather, grandfather and father have all fished the same Pictou Island grounds that I would like to fish someday. Kids like Greta Thunberg are making grownups take climate change serious, if she can do that maybe I can do the same with this pipe idea, because it is serious, seriously bad.

I am asking you to not allow Northern Pulp to put their pipe in our ocean. It will make all the marine life swim away. People around the world are making changes and working to stop pollution, why would we allow this to happen to our beautiful beaches, to the animals and fish that live in the Northumberland Strait. We need to think forward not backwards.

In 4H I am doing a project on Sustainable Fishing Practices in Nova Scotia. While doing my project I have found lots of examples of fishermen, scientists and First Nations working together and coming up with ideas so there are still fish in the ocean in the future. Destroying their marine habitat with brown, hot, smelly water is not sustainable.

When I was at marine biology camp we did an experiment with oil on a feather and used Dawn soap to try and get it off like in the commercials. It was hard to get any of the oil off and in the end we weren't able to get it all. We were learning about a spill, an accident, this pipe will be pumping an unimaginable amount of pollution on purpose everyday into the ocean. This experiment also made me think about the Dawn commercial, using hurt ducks to sell their soap and it made me mad. I have to listen to Northern Pulp commercials everyday telling me how great they are, but just because it is in a commercial does not make it true.

In school we talk about not littering, reduce, reuse and recycle. We learn about pollution and what we can do to help the Earth, but we are not allowed to talk about Northern Pulp even though some days when the wind is blowing the smog toward our school we have to play inside because the air hurts to breathe and it smells worse than dog farts. If you allow them to build their new system it will be burning sludge on top of what they burn now, it will be worse.

If you have ever played on a beach, ate seafood, enjoyed your day on a boat I want you to think about that when you make your decision, think about that and think about a nine year old in Caribou NS staring out at a new Boat Harbour.

Thank you for reading my letter,

Central Caribou NS

Project: replacement_effluent_treatment_facility_project Comments: I was born in Pictou and left in 1994, but still visit several times every year. I have spent many summers growing up on our Northumberland Strait beaches and lots of time onboard a fishing boat hauling in our lucrative lobster, scallop and herring catches as well as snow crab and tuna further down the shores. It is bad enough with the air pollution this pulp mill emits, with its faulty and outdated equipment, but now they want to continue to pollute our waters, so my focus will be on this aspect. There is a certain beauty out on the open water of our Northumberland Strait, which cannot be underestimated as to how long that could quickly disappear with such a waste proposal put forth by Northern Pulp. I am well informed on Northern Pulp and its predecessorsâ?T operations at Abercrombie Point, but more importantly Boat Harbor. The deceit which has taken place for over 50 years by our own government and the many pulp mill owners including NP, needs to come to a halt in January 2020. The Pictou and surrounding communities, especially Pictou Landing First Nation, need time to heal and recover from this worst case of environmental racism in Canadian history. To even consider putting a fresh water toxic effluent pipe from an outdated, broken down pulp mill, at the mouth of Caribou Harbor, which would run over water-sheds for drinking water to get there, and then into salt-water fishing / spawning grounds makes no sense at all in this day and age. I will not forget to mention this area is adjacent to Caribou - Munroeâ?Ts Island Provincial Beach Park, which locals and tourists visit on a regular basis, our very own historic Pictou Lodge and Waterside Beach. Also add our beautiful Pictou waterfront in the mix, and I just do not see any logic with wanting to jeopardize parts of Canadaâ?Ts Ocean Playground in favor of a foreign entity who has no real interest in long-term investment for our Province. If they did, there would have been other options available over the years to either change their pulp process or close the effluent loop, which we all know they can! It will be costly, but is there really a price on peopleâ?Ts health a nd lives with the way this pulp mill is running now?? To not do it, or provide a more environmentally friendly option, shows their level of commitment because from my understanding the only reason seems to be the almighty dollar! And that is their profit loss! Who needs bleached toilet paper and kleenex tissues nowadays when we know what is coming from this type of pulp-mill effluent process and into our air / waters? The further concerns I have are that Northern Pulp cannot even say what this discharge of so-called treated effluent will contain. What is the chemical composition and how much solids go with this daily discharge?? How can they not be 100 certain on this now but expect us to approve of their weak proposal to discharge it?? Are we seriously thinking pumping up to 60-90 million liters of heated fresh water into a salt-water environment will not do irreparable harm to our fisheries and aquatic lifestyle?? Where is the 1 ton of expected solids going to go, let alone the plume of effluent in our waterway? Dilution is simply not the solution to pollution nowadays. It is a known fact already that our oceans and waters are warming up at an alarming rate, and it is affecting marine life, so why does our Province want to contribute to what will be an ongoing daily activity?? Also, this is not new state of the art technology, regardless of what Northern Pulp wants to say. How this proposal went for Federal reviews already, but not this time around, further baffles me. What has changed from the last time this proposal was rejected due to suspected harm to our very important fishing industry, as well the environmental damage to our waters and coastline we have already witnessed and need to clean up now at the taxpayers expense? Furthermore, and it also came from your own dept, and regardless of what NP says again, this toxic effluent has NOT been pumped into the

Northumberland Strait for over 50 years! It is not heated fresh water, with solids going directly into OUR Strait. It has time to settle and cool in the Boat Harbour lagoons, before being released into the Strait. There is a dead zone around this discharge pipe as well, where the receiving waters look like Root Beer. So maybe we want to visit Boat Harbor once more in order to see what our tourists travelling on the Northumberland Ferries just might end up seeing. Surely they will want to get right off the ferry and go down and buy some lobsters off our local fishing boats, which I have seen so many do, and then continue their journey to Caribou Beach or Pictou Lodge and jump in the waterâ?¦â?¦Sorry for the sarcasm but it is a very realistic possibility our Strait will look like Boat Harbor and I would hate to see the outcome once it does . In closing, Boat Harbor needs to shut down in January 2020, and if still required this effluent proposal should go to go to a Federal Assessment, where our own Fisheries Dept. and scientists etc. can assess it instead of NPâ?Ts paid scientists. Thanks for your time in this very important matter to our communities, but more importantly our environment and the future of our children / grandchildren. Name: Email: @hotmail.com Address:

Subject: Response comments to Northern Pulp EA Registration document
Date: February 28, 2019 1:11:31 PM
Attachments: Northern Pulp response comments.pdf

Hello,

Attached please find my letter containing thoughts and comments to this recent application for assessment approval by Northern Pulp Nova Scotia Corporation.
I believe in the interest of saving and conserving on paper product use, e-mailing the document would be a preferred method of communication.

Thank you very much for your favourable consideration in this regard,

February 28, 2019

Dear esteemed protectors of Nova Scotia,

This Northern Pulp Nova Scotia (NPNS) Environmental Assessment Registration Document totals 1698 pages, including those in the 14 Appendices. The public has a minimal 30 day window of opportunity to read, research and respond to this overwhelmingly-lengthy report. To recognize that the provincial taxes I trustingly pay are used to grant Northern Pulp funds, from the sweat of my labour, to use and abuse in this manner, is extremely disheartening. **Please invest my money in providing exemplary health care services for all Nova Scotia residents instead.**

NPNS's prepared EA report is guilty of using repetitive jargon as a red herring to cover up hypocrisy throughout. That is interpreted to be an intentionally intimidating waste of time - mine and yours! Pertinent information stated well the first time would be adequately convincing. What is not being said, deceitfully hidden within this vast maze of hedged wording, is factually the most relevant and potentially frightening.

When that many words are deemed necessary to describe a project, common sense would dictate it is nothing more than an elaborate fast talking scheme to sell an idea they also know is terrible. If this project had actual feasibility and merit, these words would not have to work so hard to sell it.

What experience credentials does this company actually have for a project construction of this magnitude? This mill's parent company usually takes over existing mills already in operation do they not? What they are proposing will waste a colossal amount of money if attempts fail. It will take at least 3 to 4 years, if not 5 or 6 years (given their procrastination tendencies) to complete during the weather-dependant working months offered by our Maritime climate.

Have they addressed the risk for project interference with the Bell Aliant fibre optic telecommunications submarine cable running from Caribou to Wood Islands, PEI? Telecommunications is a lucrative industry for Nova Scotia.

Northumberland Strait waters are relatively shallow depths. Is there adequate volume to use this disposal at sea method? Disposal at sea is prohibited without a permit issued by the Environment and Climate Change Canada (ECCC) Disposal at Sea Program under the Canadian Environmental Protection Act, 1999 (CEPA). Pulp and paper effluent wastewater is not listed in the applicable substances list on Schedule 5 of CEPA for eligible consideration.Without appropriate depth, would effluent waste debris of significant proportions continually rise to the water surface, washing inland with each rising tide and winter ice?

- Nova Scotia, Canada's Ocean Playground, is surrounded by more than 7,500 kms of ocean coastline. Anywhere in the province you are never more than 56 kms or an hour's drive from ocean access.

- Promoting environmental protection from pollution for these coastal water resources is crucial as sea levels steadily rise each year.

- Compromising the vulnerable integrity of Northumberland Strait waters and coastline with pulp and paper mill effluent wastewater containing unspecified chemicals of potential concern (COPCs) would prove to be fateful.

I've selected a couple of section details to comment on. I hope these will serve to convey my grave concerns about this entire matter. Also included is an article researched from the Pulp and Paper Canada Newsletter website:

Table 1.1-1: List of PIDs Involved in the Proposed Project

- Federal agency approval will be necessary for use of the four outlined properties belonging to Her Majesty the Queen (Canada).

- Risk of jeopardizing an entire marine environment in the Northumberland Strait will warrant conscientious federal consideration under the CEPA.

- Basin Head on the eastern end of PEI is a federal Marine Protected Area (MPA). It is highly plausible to expect large volumes of industrial contaminants, with COPC characteristics, released daily from adjacent NS shorelines will affect the unique ecosystem of that MPA.

Section 9.0 Human Health Evaluation

Preface

[paragraph 2]...Health Canada clearly communicated their position that a human health risk assessment (HHRA) of the project would need to be considered

NPNS states an HHRA is not needed unless specified as a condition once approval has been signed. Statistics are quoted from an HHRA prepared for a pulp mill proposal located in Tasmania on the other side of the equator? It bears noting, that mill never received approval to operate due to environmental concerns. There are bound to be significant differences between health challenges faced in that Eastern Hemisphere country than we experience here in the Northern Hemisphere. For instance, Tasmania claims to have the cleanest air in the world. Not exactly something Pictou and surrounding counties can boast with ongoing problematic putrid emissions from this aged pulp mill.

I believe NPNS shows serious contempt for all public health and well-being, not only of local, provincial or even federal consumers but that of every international seafood consumer as well. Potential for industrial activities to also impact global health warrants mandatory federal health agency involvement. Popular Nova Scotia seafood is a multi-billion dollar commercial export industry. But do you recall how one mad cow incident in Western Canada shut down all international borders for Canadian beef exports? One contaminated lobster from Nova Scotia could very well cause an international crash for all Nova Scotia provincial seafood markets - not just those located in Pictou County.

9.1 Introduction and Background

[paragraph 3] *At this time, effluent chemistry characteristics (including the specific substances present in treated effluent and their anticipated concentrations) will not be known with certainty* ***until the project is operational****.*

9.1.1 Canada Health Consultation

[paragraph 1; bullet ix] *Including a reasonably well defined characterization of likely effluent chemistry that represents a conservative prediction of the chemicals that may be present in effluent discharge.*

[paragraph 3] *With respect to item ix above, there remains uncertainty at this time regarding the specific chemical parameters that will be present in the project's treated effluent (and their concentrations).*

9.2.4.2 Identification of Candidate COPCs in Treated Mill Effluent

[paragraph 3] *Due to uncertainty regarding effluent composition and approximate concentrations of substances present in the future treated effluent (which will not be verified* ***until the project is operational****)*

Evident throughout this entire document, the repetitive phrase, **"*until the project is operational*"** reads similar to a blackmail extortion attempt.....NPNS is essentially saying, "sign over approval for us to operate before we will release the identity of the chemicals that will be present." They are literally holding human health hostage!

It is disappointing not to see compiled data of accurate chemical identification from Northern Pulp scientists and chemists that presumably would be employed on site and responsible for daily monitoring of this effluent treatment system. Working with toxic substances used in this pulping process, they should be able to knowledgeably provide the characteristics for these COPCs. Why outsource that necessary information from other mills and outside agencies? How can they claim uncertainty about something they've certainly been creating and using for years?

Section 14.0 Assessment Summary and Conclusion

[paragraph 2] *The continued operation of the NPNS mill is essential to meet global market demands.....*

A quick Google search of pulp and paper mills, just in Canada alone, indicates a total of at least 30 mills. Social sourcing for renewable sustainable products is trending for conscientious consumers concerned about the devastating environmental impacts these mills create. There will be better, more earth-friendly products sourced, produced and manufactured in the very near future. A smart investor would be encouraged to give serious consideration to those long-range plans rather than continuing to provide huge financial crutches for this aged mill to keep limping along on.

If the global market has the high demand they claim, why is NP not able to generate enough revenue to support their own projects? Perhaps there is already too much competition within this sector of the business market?

https://www.pulpandpapercanada.com/news/feds-provide-update-on-forthcoming-pulp-and-paper-effluent-regulations-1100001557 **{*Pulp and Paper Canada, February 4, 2019*}** The federal government has delivered an update on the new pollution regulations it is developing for pulp and paper mills.

The new regulations would set more stringent standards on the level of contaminants allowed in pulp mill wastewater. The effluent makeup has changed with the introduction of new technologies, officials say.

The Northern Pulp mill would be subject to these new regulations if it is to meet the Nova Scotia government's January 2020 deadline to move its effluent drainage pipeline off the Pictou Landing First Nations reserve.

The second round of consultations for the new pulp and paper mill regulations will not occur until early 2020. ***{by PPC staff}***

Questions arising from the afore-mentioned EA sections and the Pulp and Paper Canada article:

- Does NPNS have ulterior motive for attempting to fast track this project in advance of new Canadian pollution regulations coming into effect?
- Is it possible NPNS will qualify to claim exemption from these new regulations if the construction process receives conditional approval and begins prior to these regulations coming into effect?
- Is your Department confident any effluent treatment system financially invested in now will have the capabilities to handle these future stringent federal standards?
- Or will N.S. taxpayer funds be drained yet again for costly future upgrades to technology installed now that does not meet those revised standards?
- Do these new technologies referred to actually require more caustic chemical compounds which affect the effluent makeup?
- In this EA, consultants frequently weave the phrase "uncertainty regarding effluent chemistry characteristics" throughout the daunting web of word entanglements. Would that expressed lack of conclusive information by a company who has been in this industry for so long be cause for questionable concern within your department?
- Is it deemed professionally acceptable in the pulp and paper industry to withhold revealing accurate effluent chemistry characteristics to environment government officials? Would that be deemed acceptable practice by N.S. environmental laws and regulations?
- Is it conceivable that NPNS is deliberately stalling or withholding facts on correctly identifying these effluent chemical characteristics in order to be able to claim compliance - only after they know what the new acceptable Canadian standards are going to be? Deemed a highly suspicious and contentious practice.
- Would common sense and logic dictate that astute financial investors, like the Nova Scotia government, adopt a practical approach of first determining what the pollution limitation guidelines are going to be before sinking further taxpayer monies into an environmentally sensitive project of this magnitude?

- How long must we, the taxpayers, be expected to keep throwing good money after bad into this aged pulp and paper mill that long ago ceased to be an environmentally-conscious asset by Canadian federal standards? **Again, I ask that my taxes be used to provide exemplary health care services for all Nova Scotia residents instead**. The pulp and paper industry is a highly competitive market - human health care should not be!
- How many mill jobs will actually be phased out and eliminated after being replaced by upgraded modern technology?

At the expense of many, I believe, NPNS is seeking permission to wash away any and all industrial waste woes to sea solely for their own corporate economic convenience and advancement.

I fear this metaphorical Pandora's Box pipeline carrying effluent wastewater will unleash residual effects into the Northumberland Strait that can never be reined back in. Irreparable and irreversible damage will wreak havoc in Canadian waters. Hope was the only remaining symbolism left in Pandora's box before it closed. Thus, it is my fervent hope lessons learned from using Boat Harbour for effluent treatment and the subsequent catastrophic effects will not be in vain when that facility is shut down on January 31, 2020.

In closing, I offer this trademark quote printed in each issue of SALTSCAPES magazine:
"Some would make us just names on a list. But we are people in a place - and resist."

Respectfully submitted,

Subject: Proposed Project Comments
Date: February 28, 2019 9:34:38 PM

Project: replacement_effluent_treatment_facility_project Comments: We as residents of Pictou County, living in New Glasgow and owning property along the Northumberland Strait, have the following concerns re the proposed Northern Pulp waste solution for its effluent that currently goes into Boat Harbour. Pumping the effluent into the Northumberland Strait is an environmental time bomb with no possible method of containment or cleanup. We need to have buy in from N,S. , PEI, N.B. and Quebec, as the waters of the Northumberland Strait and the Gulf of Saint Lawrence affect us all. The fishermen of all of these provinces will be affected if there is a consumer backlash against fish being marketed from polluted waters. This industry is worth millions of dollars and is a federal responsibility. The fact that our Native nations are affected, as well as the fisheries and many provinces, should make the case that this situation calls for a full federal government environmental assessment. Tourism will be further affected as we already have seen the impact on the town of Pictou with the existing smell from the Northern Pulp plant with the impact of the discharge location near the Caribou Ferry Terminal connecting us with Prince Edward Island. This terminal is a major tourism entry point into our county of Pictou. Who will be excited to go into the waters to swim, kayak,etc around this area when they know that possibly there could be pollution from a pulp mill in the water? This proposal will affect tourism. The visibility of such a pipe along the Pictou causeway or anywhere along the Trans Canada Highway connector to the Caribou Ferry Terminal will be a clear negative to our tourism image. Our tourism industry is worth millions of dollars. There is no guarantee that a waste pipe going alongside the Pictou Causeway will not be punctured at some point due to a car or transport truck leaving the road. If punctured, Pictou Harbour will be affected and there is no containment possibility. Other points that are of concern to us from the Northern Pulp proposal are as follows: The waste proposal poses major risk to harming marine life , marine habitat, species at risk/endangered/threatened that include migratory and marine birds, fish, vegetation, reptiles etc. The proposal goes through the Pictou town and Caribou water supply. A provincial park and a nature preserve are within the effluent pipe footprint Meeting Pulp and Paper Effluent Regulations PPER doesnâ?Tt prevent harm to marine life or marine habitat per Environment Canada. The chemical characteristics of the proposed effluent is â?ounknownâ? to Northern Pulp. The proposal shows the plan to burn the toxic sludge in the power boiler. Air emissions are an issue today and health issues are already known to be above provincial averages today in Pictou County. The proposed spill basin on the plant site is planned to only hold 35 million litres of untreated effluent which is only 10-12 hrs of plant operation before it goes into the downstream system. If a malfunction happens where does the excess go? The proposal also lists temporary and permanent closures for fishermen around the outflow area and to create a no anchor zone. The proposed O2 delignification system is not laid out regarding how or when it will be constructed or maintained. It is listed in the appendix of the proposal as a â?ofuture upgradeâ? . This should have to be defined now and not in the future. The Waste proposal will be pumping effluent into the ocean after only processing it for 8 hours as opposed to the current waste system that takes about 30 days to process and reach the Strait. The Nova Scotia provincial government has many conflicts of interest going back decades between itself and the mill and should not be involved in the environmental assessment and the approval/rejection of a Boat Harbour Effluent Treatment Replacement Solution. We would like all of these points to be considered and strongly suggest that a Federal Environmental Assessment is necessary. Name: Email: @hotmail.com Address:

Dear Minister of Environment

I am writing this letter concerning the Northern Pulp Environmental Assessment on replacing the effluent pipe . My name is , I'm a fourth generation commercial fishermen and have owned my own fishing enterprise since 10 years .I strongly object to this project , the release of up to 90 million liters of effluent into any body of water is un-acceptable! The chemicals and the freshwater being released into salt water will cause adverse effects on the marine environment an on all fish stocks in the area that can Not be mitigated

In closing I urge you to REJECT this project !!!

Dear Sirs;

Re: **Northern Pulp Replacement Effluent Treatment Facility Project**

I have read through the project documents and have the following concerns:

In section 8 I have concerns about floatation of the underwater pipe if the slope is not uniform. I do raise serious concerns about how to detect leakage on the underwater portion of the pipe. Once the pipe is in service, nothing short of plugging the diffusers would allow any testing for leaks from the underwater based part. There is also no real ability to sample at the diffusers to get a real effluent test. Sampling in the Northumberland Strait would leave all kinds of room for argument about the effluent albeit from the plant. One item on the land based part of the pipe that really disturbs me is air release valves on the high points. These would be likely something like 4 inch openings and such valves do stick open occasionally. When that happens, then the drain point often goes unnoticed in a ditch or field for some time. If such a drain happens to be in the Pictou Water Supply area, then the situation could be serious.

In section 10.0 there is a statement that HDPE is not susceptible to thermal expansion like steel pipe. THAT IS FALSE. For example, on a 10 degree Fahrenheit temperature change, the 4.1 km section underwater would change 11 feet in length. The seasonal seawater change is more than that. Therefore, expansion does need attention. Repairing a leak in a 3 foot diameter pipe on land is a significant exercise. Repairing a leak underwater, after a difficult job of finding the leak, is even more significant.

Section 12.3.9.3 says that the plume from the diffuser will reach the surface but will not be visible. That statement is questionable.

Appendix J1 Part 2 on testing for urchins in Boat Harbour makes me wonder. Boat Harbour is presently fresh water or effluent but not salt water. How can it be salt water at this time?

The documents seem to tell me that the intention is to keep the Mill operating as a bleached kraft pulp mill. This is my greatest concern. The appetite for wood has resulted in the depletion of

supply within a 200 km radius. The process itself requires about 2 cords of wood to make a ton of pulp. Having been around when the Scott mill was built and seen the forests of the day, I am appalled with what has grown since the first clear cuts were made for supply. Too much fir has come back and it is now reaching the end of its life cycle without becoming really useful because it has never been thinned to allow it to grow. Dead fir does not make good pulp. Maybe right now with the dollar at a 25% premium for sales trucking long distances makes sense but if the dollar is par, things will be different even with lumber that is cut in trying to get chips from the slabs. Maybe if the pulp were made into paper on site, then the added value would justify the new treatment but the present system is doubtful.

Before Northern Pulp or the people of Nova Scotia spend as much or more on a treatment plant as Northern paid for the mill in the first place, we should all consider whether or not to continue or to abandon. Just the power required for treatment, whether in Boat Harbour or in the new treatment system would pay the wages of quite a number of people. Considering the fact that we have to pay for the Boat Harbour cleanup anyway and considering that we share in expenses and not profits from the mill, it is time to cut our losses. Too many vibrant communities have been ruined already. I will name Parrsboro, Advocate, Mooseland, and White Rock just to name a few.

Further to this, the reports submitted do not include a good cost accounting of the operation. Too much of the input is for transportation of raw material and a lot is for transportation of the finished material. Not enough is spent on restoration of the lands, company owned, crown land and private land that have been harvested. There are too many costs unknown to us all, kept secret by both company and government. On that basis alone, it is good time to quit. Give our young people a clear slate to figure out. And hopefully one where they can share the profits.

I would strongly recommend that the mill itself cease to operate, at least as a kraft mill.

Thank you

Honorable Margaret Miller

Re: Replacement Effluent Treatment Facility Project-Northern Pulp, NS Corp.

Madam,

We are writing as present Pictou residents and former home owners in the Carbou Island area of Nova Scotia, very near the site of Northern Pulp's proposed discharge of its effluent material. We are active residents who enjoy fully the environmental life of this part of Northern Nova Scotia from the recreational persuits of walking, biking, swimming, sailing and kayaking on and around Pictou Harbour and the Caribou Harbour areas, to the pride we have in the area as a viable environment in which we can continue to thrive and in which other generations will buy and build homes, settle and raise children and continue to enjoy the wonderful and close communiity that has been built here over the years. We feel strongly as members of this great county that the proposal put forward by Northern Pulp is flawed in a number of ways and should not be considered as a way forward for this mill. This pipe proposal should be denied as it has the potential to "...damage or change the environment in a manner that negatively affects aspects of human (and marine) health".

We have long lived with the air pollution caused by the mill over that past 50 plus years and felt this was a very high cost for the economic life of the community, as said air quality has been thought by some studies to cause many of the lung, heart and other health issues of those in this county. In recent years we have looked with horror at the conditions at Boat Harbour, its affect on wildlife and on the indigenous peoples of Pictou Landing First Nation. We have been very gratified to learn that there will be restoration there for the land and waterways with the clean-up porposed to begin next January. The air pollution continues....

In the Executive Summary of the proposal, Northern Pulp suggests that there will be "no significant" affects of the effluent from the pipe on Fish, Fish Habitat, Flora, Sediment Quality or on the Social and Economic Environment in and around Caribou Harbour and

the Northumberland Strait. It is hard to beleive that they could proport this without any understanding of how much of the solids, how much silt, what smell, what measure of 'plume' or what temperature of water will be issued from the end of the pipe on any given day and what effects each will have. Water temperature and effluent will affect the fish/lobster/oyster/ life of the immediate water area and the fishing industry as a whole, including licences for shell fish just off shore. The changes in water color, and the sight and smell of waste will affect land and property values, even passenger service on the Norhtumberland Ferry during the summer months has the potential to be affected. The water pollution affecting fish and wildlife habitat, especially migrating birds such as heron and small shore birds and the seal population living close to Caribou Island and Pictou Island a good deal of the year is vast. The human recreational and tourism costs of loss of swimming, boating and recreation in the area including many parks and public beaches could reach millions of dollars of revenue to the community just by the fact that tourists would know that the effluent is being relased into the area. With solid and or silt effluent the very currents may be changed by this accumulating effluent on the Harbour bottom.

Tens of thousands of litres of effluent will be flushed into Caribou Harbour and the Northumberland Strait daily without an affective monitoring system applicable to either land or water useage. This company has yet to develop any monitoring system that speaks to long term assessment and when Northern Pulp says that it will have a sytem in place to "adapt long term to changing conditions" we are skeptical, as we have seen what the mill has done over the years in Boat Harbour. We are concerned as well about the life of the pipe itself overland or in some places a few feet underground as it follows the #106 to the sea and how this may affect our land masses, transportation and most importantly our Pictou Watershed.

The proposal of a "new" program on the mill site for dealing with solids does not sit well with us as we wonder how they will be handled in the short and long term. Will burning some of the remaining solids add to the air pollution we are now exposed to daily? Will they end up in the effluent as sludge and further pollute the waterways in Caribou Harbour? Will they be buried and how will that affect the health of indiviuals who live in the area and work on site? The trust is thin on this issue as you can imagine.

Therefore, for these reasons we oppose the Pipline Proposal and suggest a more extensive study to ameliorate the concerns we and many others in the area have about this proposal. We beleive strongly that a Full Environmental Assessment is necessary for the continued health and safety of the environment in Pictou County.

We thank you for your time and attention to our concerns as citizens of Nova Scotia.

We would appreciate an acknowlegement of this letter,

Most sincerelv.

Pictou, Nova Scotia

Project: replacement_effluent_treatment_facility_project Comments: As a resident of Pictou County, a woodlot owner, a professional engineer, and a person familiar with the technology behind the proposed treatment facility, I would really hope that reason and sound scientific analysis prevails over emotion. The proposed facility is not a threat to the environment or to the fishery. It is time for local politicians and residents to stand together and do the right thing. Baseless emotional arguments unchallenged have the potential to devastate the Pictou County economy. Name: Email: @gmail.com Address:

Project: replacement_effluent_treatment_facility_project Comments: I feel the project should go forward if the science says there will be no adverse effects of the discharge line. There should be an extension given for the use of Boat Harbour. The way I look at it is why shut the forestry sector down when the present owners of Northern Pulp are committed to the project. If the effluent line cannot go where the assessment wants it to go there should be an extension granted until a discharge place is found. It would be foolish to shut down the forestry sector. This project is a massive undertaking and if the government was doing it, it would take way more than 5 years to complete. Actually Northern Pulp and the government took the first year plus just to hammer out the industrial approval that Northern Pulp could operate under. Has there been any effects elsewhere where discharge lines enter waterways. Will all Federal and Provincial Regulations be met. Why am I so concerned:1 I have and still am working in the forest industry for 30 years:2 My brother has and still is working in the forest industry for 35 years:3 My father worked and actually still does part time for 40 years:4 Many friends and other relatives work in both the forestry and fishing sectors:5 We raised and are raising our families here and dont want to leave:6 We work full time and pay taxes to support the social system. This must be based on science not Fear mongering and Here say and Northern Pulp must be given the chance to proceed with this project without any interference of any partiesfishermen Blockading this just puts projects behind. My final note is that if Northern Pulp closes the Nova Scotia economy with be devastated. Many people will move away. This isnt just the workers in the sector. This means families as well. I just hope everyone will work together for the better of Nova Scotia. Thank You. Name: Email: Address:

Project: replacement_effluent_treatment_facility_project Comments: This treatment facility is the same as the most modern facility used at many mills in both Canada and the USA. Diffusing the treatment wastewater this is more correct then affluent as once chemicals are removed there are only the mineral residues from wood which occur naturally left into the massive water body of the Northumland Strait and the current flow there will disperse the wastewater and dilute it and make the effect marginalized almost immediately. This is a good system and proven treatment facility and pipeline method that should be approved by Department of Environment. Class 1 EA is appropriate as this is a replacement of an existing system in an existing facility. Name: Email: @ns.sympatico.ca Address:

Project: replacement_effluent_treatment_facility_project Comments: This project must be approved. This needs to happen for the sustainment of rural life in Nova Scotia. The NIMBY effect in NS is decimating rural life and eliminating resource jobs that provide quality pay and a good standard of living. The products that you use everyday are either farmed or come from the ground. Why do Canadians feel that we are so privileged that we donâ?Tt require the resource industries that supply us with everyday items? That just leads to a shift in resource extraction to poorer countries with less than adequate environmental and safety standards that are truly putting people at risk. Canada has some of the highest environmental standards in the world. We should be proud of our resource industries, not trying to end it. Name:

Project: replacement_effluent_treatment_facility_project Comments: I am a first year student at Dalhousie University. I have lived in Pictou, Nova Scotia my entire life. I am writing to explain why there should be an expansion for the effluent treatment plan for Northern Pulp. My dad is a dedicated employee at Northern Pulp and he has worked there for the past ten years. His job at Northern Pulp was and still is our primary income within our household. A large amount of funding for my university program and living has come from my fathers income. My first year of university costed our family over . It scares me to hear that Northern Pulp could possibly be shutting down in the following year as it would leave me without funding. I know that I am not the only student going through this possibly devastating news because there are many students within the county that are experiencing the same issue. Not only does my father work at Northern Pulp, but my uncle has worked in the forestry industry for 35 years. My grandfather has also worked in the forestry industry but for over 45 years. As a student who was planning to graduate and move back home to work, I am extremely scared of what is going to become of Nova Scotia, especially Pictou County. It is from my understanding that if Northern Pulp closes in the upcoming year, it will cause a domino effect in all other forestry jobs within Nova Scotia. Northern Pulp closing means that there will be no jobs for not only mill workers, but also little to no jobs for the truck drivers transporting wood/chips and workers initially cutting the wood in saw mills. If this large group of people is no longer having this primary income to spend, then there will be less money to spend on local businesses. I know for a fact that Northern Pulp employees spend a great chunk of their paycheck on goods in local businesses. It is very possible that some of these local businesses would close as well as a result of Northern Pulp closing. Since there are very little good paying jobs in Pictou County, this will force people to m ove elsewhere to find work. From what I have heard, Northern Pulp employees would like to move out west to find a good enough pay job if Northern Pulp closes. I am one of twelve students in my first year of at Dalhousie University. It is a demanding program, but I honestly love who I am becoming. It is from my understanding that are in high demand right now as there is a greater population that is aging as I write this. As I sit in the classroom, I start to wonder what my hometown will be like when I graduate. If my community becomes a ghost town, will I want to come home to work? And if I do want to come home to work, will there still be a job for me here? If people and their families are moving away to find work, that means there will be a smaller population of people for me as a health care professional to treat. Therefore, less will be hired to work. I strongly believe that the project should go forward if the science reveals that there will be no adverse effects due to the discharge line. If the effluent line cannot go where the assessment wants it to go, there should be an extension granted until a discharge place is found. The present owners of Northern Pulp are committed to the project. I just wish that everyone could work together and find a solution that is best for everyone. At this point in time, the best way for everyone to work together would be extending the deadline. In conclusion, Northern Pulp closing its doors would truly be devastating for everyone in Nova Scotia, including myself. So many families will be forced to move elsewhere in the country to find a good source of income. I honestly donâ?Tt know how I will be paying my way through university next year if dad loses his job. This cares me every time I think about it. Some people may say â?oOh but you did/will receive scholarships to pay your way throughâ? . The scholarships that I received at my high school graduation did not even pay for half of my cost to go to school this

year. Thank you for reading. Name: Email: @dal.ca Address:

Subject: Northern Pulp Effluent Treatment Proposal
Date: March 3, 2019 5:58:58 PM

Dear Honorable Minister,
I am writing to support the request from fishermen's organizations from Nova Scotia, New Brunswick, Prince Edward Island and Pictou Landing First Nations to have Northern Pulp's Effluent Treatment Project designated a project for a Federal Environmental Assessment under Section 14 of the Canadian Environment Assessment Act (CEAA) 2012.
I have been a life long resident of Pictou County and have lived in the town of Pictou for the past 40 years. I taught school for many years and raised a family in the town of Pictou. I have been following closely the media coverage of the Northern Pulp situation.
I fully support the fishermen of Nova Scotia, New Brunswick, Prince Edward Island, and the Pictou Landing First Nations residents. I am concerned about the impact the proposed effluent pipe will have on fish and fish habitats in the Northumberland Strait. I feel a full Environmental Class 2 Assessment is needed to fully address the concerns of the fishermen, the Pictou Landing First Nations residents and the citizens of Pictou County.
My family has had close ties to the Northumberland Strait spending our summers enjoying the warm waters and beautiful beaches. What will happen if this proposed pipe ruins the waters and in doing so ruins our very lucrative fisheries and tourism industries that rely on the Northumberland Strait?
As a resident of Pictou I am concerned about the proposed pipe extending through our watershed area. I have the following questions:
What will happen when this pipe leaks?
What contingency plan will be put in place for the eventuality of a leak?
What effect will a leak have on our health?
What monitoring system will be put into place to detect a leak? Past effluent leaks from the Northern Pulp Mill to Boat Harbour have been detected by local residents. That is unacceptable.
My lives within a kilometre of this proposed pipe and she uses a well. How will her water supply be effected when there is a leak?
I ask that you recommend a Federal Environmental Class 2 Assessment be completed regarding this proposed effluent pipe plan.
Thank you for your time and consideration of this issue.
Yours truly,

Subject: Northern Pulp Effluent pipe
Date: March 3, 2019 8:37:04 PM

I am writing to support the request from fishermen's organizations from NS, NB, PEI, and Pictou landing First Nations to have Northern Pulp effluent treatment project designated a project for federal environmental assessment under section 14 of the Canadian environmental assessment act. (CEAA) 2012.
I am a lifelong resident of the town of Pictou. A great deal of my summer days as a kid were spent enjoying the waters and beaches of the Northumberland Strait and as an adult I spent many summers sailing those beautiful waters. I've eaten clams, oysters, smelts, mackerel, and lobsters from the Northumberland strait. Now all that and much more is threatened with the proposed effluent pipe from Northern Pulp. I would like to know:
1) What chemicals are in the effluent?
2) What affect will these chemicals have both in the long and short term on the fish stocks in the strait?
3) Pictou's domestic water is supplied by numerous deep wells through which the proposed effluent pipe will pass. What steps are being proposed to protect this water supply?
4) What affect will mill effluent in the strait have on tourism?
5) Who is going to monitor the affects of a pipe and how will it be monitored?
6) With so much at stake and with so much distrust created over the years with this mill, it should be apparent that nothing less than a federal assessment is needed. Why is it not being recommended?
It is for questions like those I have asked above that I feel a class 2 federal environmental assessment.

Thank you for your time.

Project: replacement_effluent_treatment_facility_project Comments: Comments to Northern Pulpâ?Ts Environmental Assessment for the Replacement Effluent Treatment Facility Project My name is and I am the current owner of property in Chance Harbour held in our family for over a century. The property borders the Northumberland Strait a few east of MacKenzie Head and approximately meters from the mouth of Boat Harbour as the crow flies. I am years old and I am quite familiar with the impact Boat Harbour has on our shore line prior to and after the effluent treatment facility EFT was installed. I also see the results of improvements made to the EFT over the past 50 years. Even though the aesthetics of the shoreline in front of my property may improve, there are more important environmental issues at stake. I welcome the closure of Boat Harbour as an ETF however, I have concerns about the rush to approve and implement a new ETF. The environmental assessment EA should not be concerned with the deadline of the Boat Harbour Act, but a thorough review of the data and a reasonable time line for testing should be done. N o, I am not agreeing to, nor supporting an extension to the closure of the Boat Harbour EFT. The impact to the mill of a premature closure should be dealt with separately. First, come up with a best case replacement EFT. EA Class I Inadequate There is far too much data to review and too much incomplete information to pass the EA in a 30 day period. Monitoring: The EA does not detail the monitoring of the new system. A detail of inspections by people and electronic devices should be provided. Will monitoring be continuous 24/7, or longer periods of time? How will the portion of pipe imbedded in the Strait be monitored? Based on the last two pipe breaks, the current methods of detecting and preventative maintenance are inadequate. Current air monitoring is minimal and that tells me Northern Pulp will continue minimal reporting. Total Suspended Solids TSS: During an open house hosted by Northern Pulp, Hugh MacDougal, NP Engineer, explained to me and my wife the new activated sludge treatment AST process. Part of the process that jumped out was TSS emptying into the strait would increase. an environmental lawyer, found evidence of increased TSS in an e-mail from a NP technical manager to Dillon Consulting. received the e-mail through an FOI request. Testing: There are several areas in the EA where the writer states further study is recommended. For the sake of brevity, I will mention one. The conclusion in Appendix R, A Summary of Scientific Literature Related to the Effects of BKME on American Lobster recommends further study. The conclusion is on page 51 of Appendix R. When asked about the chemical composition of the effluent at discharge point, no information was available. Ice scouring was briefly discussed in the report, but there was no mention of mock diffusers being installed. I would think a test over several winters would be required to see the diffusers avoid being damaged by ice scouring. Conclusion: The Province should hand over the EA to federal government to do the review. The Province, as a lender and lease holder of wood lands, is too close to NP creating an apparent conflict of interest. Concerned Citizen New Glasgow, NS Name: Email: @bellaliant.net Address

Project: replacement_effluent_treatment_facility_project Comments: I absolutely support the replacement effluent treatment facility project proposed by Northern Pulp. Given the amount of time they had, they have done really well in researching and planning for his project. They have put a lot of effort in gathering scientific evidence that there will be little to no negative impact in the Northumberland Strait. They have, in my opinion, jumped through more hoops and than other industries in Nova Scotia to educate the public. The proposed system is not bran new technology. It has been used by other mills around the world and in Canada and has proven to be great. My kids and I swim in the Northumberland Strait, we live in Abercrombie so I take the environmental concerns very seriously and I confidently support and believe in Northern Pulps effluent treatment facility project and absolutely think the project should be approved asap. Project: replacement_effluent_treatment_facility_project Comments: Since the 1970s, Environment Canada has established Pulp and Paper Mill Effluent RegulationsPPER that would surely be applied to the proposed Northern Pulp pipeline installation. However, the local impact of effluent discharges on seafloor communities has probably not been addressed as yet, or has the regional dispersal pattern tidal of effluent discharges in relation to toxic effects on a range of planktonic and benthic marine species? I would presume that these issues would be addressed in a federal environmental impact statement EIS? Name: , Email: @gmail.com Address:

Project: replacement_effluent_treatment_facility_project Comments: Am I bias? I try not to be. I work at the mill and I feel like my livelihood will be jeopardized if Northern Pulp closes. I have always tried to look at each side of the story when it comes to environmental issues. As we know it. The Maritimes have made their wealth off industryâ?¦. And it seems each time when industry leaves the public and government think that tourism will boom but I have yet to see that happen in places that are ghost towns now. I feel we need to look at the overall problem. The public has seen what has happened to the mill in the past and they bring those past experiences with them and they arenâ?Tt positive. In order to move forward we need to put the past behind us and live for the future. What future is here in Nova Scotia? Nova Scotia has an abundance of renewable resources. Tress being one of them. We have a seedling department in Debert that we have seasonal workers plant trees in the summer. I know it does take time for the trees to get to be at the state that we harvest them â?" but itâ?Ts not like we donâ?Tt think about replanting. I know if the Mill closes I will more than likely venture out west to find better work. That includes my partner as well. Everything will be affect in my life. If the industry isnâ?Tt here it will just go elsewhere and it will be a loss to the Maritimes. Keep people working in the Maritimes! Name: Email: @hotmail.com Address:

Project: replacement_effluent_treatment_facility_project Comments: Good morning I have been a commercial fisherman in Northumberland Strait since 1981 when I first bought my fishing gear.the proposed pipe from Northern pulp is of great concern to me as the discharge Will be located and a very good lobster fishing area and Right Beside one of the last large Herring Spawning grounds in the area. Northern as stated that theyâ?Tre Discharge will be in the Deepwater but a couple hundred feet on either side you will be into 25 feet or less this is a very small channel it runs Past Caribou harbour at the Norwest end of this channel the affluent will discharge in to the main lobster fishing area in the rising tide and then fall back over the area where about 25 of the boats out of Caribou Harbour Fish . And then just east of the pipes discharge is a Large scallop bed this I believe will have a Drastic effect on our fishery. In the area of the discharge and a larger area as Water between the discharge and Pictou Island has an average dep th of 30 feet and not a big tide to carry stuff away Name: Email: @gmail.com Address:

Subject: response to Northern Pump dumping effluent into the Northumberland Strait
Date: March 4, 2019 11:53:44 AM

My purpose for writing to you is over my concern for the place I still consider home – New Glasgow.

I am writing in relation to Norther Pulp's Replacement Effluent Treatment Facility Project. I am for a full blown national external environmental assessment that will not be a conflict of interest.

I am very informed about the mill...have read everything I think there is to read and spend the first hour of every day reading the websites on it. I am very sad to see the issue of a pipe tear the community of Pictou County apart.

I am very sensitive to the arguments on both sides.

- Hundred (into the thousands) of people making their living in the forestry, trucking, etc.
- The cost of healthcare due to high cancer rates in Pictou county, the billion dollar cost to tax payers to clean up the chemical mess at boat harbour, the affect on tourism and the fishing industry, the cost of all the donations the government gives to the mill to keep those 250 jobs (and spin offs), the fresh water cost, the clear cutting, the chemical spraying, the corruptness, deception and lies from all governments.

I am strongly against Northern Pulp, putting a pipe into the strait and continually not meeting industry environmental standards and regulations.

I believe this foreign company can afford to meet industry standards but enjoys getting away with abusing the citizens and government because they can... fear and threats have worked well for them for years. I am not against the mill but am against the abuse the native Canadians, the environment and citizens of Pictou County. I don't think the owners of Northern pulp care about the environment or the health of Pictou County residents. Yet they are making the profits that they could invest in these things.

I grew up a cottage on the Northumberland strait cottage and watched the water continually grow browner and smellier each year. We can't continue to accept the assault on the environment at any cost. I understand jobs are important!! But if a study were conducted and the cost of the donated land, water, causeway, health costs, clean up, loans, donations made compared to the cost of jobs.... I wonder which would come out on top... minus the assault on the water, forest, air and water pollution. It is very complex.

More people would invest and start businesses, more doctors, retired people, professionals, artists and trades people would come, stay longer or move back, and Tourism and property sales and prices would increase, if people were not afraid to breathe, eat the fish, and swim in Pictou County.

I still live in Pictou county 2 months a year - but I pay property taxes and expenses (12 months a year), insurance, hydro, boat storage, and grass cutting/snow plowing, twelve months a year. I have purchase property, hired an architect, contractor, plumbers, electricians, bought boats, cars, a, put on a new roof

month, replaced a deck, heating system, bought gym memberships, paid boat mechanics and boat storage, groceries, gas, have an account at home depot.

The vision for the future has be in line with a knowledge based economy. The economy in Pictou County appears pretty bleak. The front street of Pictou and New Glasgow, the malls, and restaurants appear empty, houses are for sale everywhere, the population is not growing, - it doesn't seem like the mill is saving the community. The status quo has not and is not working. The citizens of Pictou County deserve better. Nothing is worth breathing chemicals, swimming in brown water and gooey foam when the breeze is onshore, water with mercury and other chemical and eating fish from this water. I want to raise awareness and be part of the solution to bring the place I still call 'home' back to life.

I recently wrote a letter to the environment minister voicing concerns over the rush to get the assessment conducted on NP proposal to pour the effluent directly into the strait. It took his office more than 30 days to send me a form letter, which didn't even answer my questions. If they can't answer emails in 30 days how can we expect them to do an environment review in 30 day!

My question is, why the rush? It appears biased. If we all want the best for our town lets take our time and do the right thing long term. I know this can't be easy. But please do not cave to NP threats. Their concern is profits for their foreign company not the health and welfare of New Glasgow citizens or the environment in Pictou county. What is the worst thing that could happen if they take an additional 30-60 days to access the proposal? The facts will emerge and the plant could close? Perhaps then NP would invest in their company and finally meet industry expectations. Do we not have the vision and foresight to deal with this scenario? I can think of several alternatives as I am certain you can too.

Please recommend an extended review so decision are based on knowledge and not emotion. Take the time required for such a serious decision. Develop mechanisms to keep the young people in New Glasgow, strategies to grow the population (which hasn't grown since NP arrived), and stop New Glasgow from receiving consistent negative press as one of the worst Canadian communities to live. Please make a decision based on information and facts and to keep more people from leaving and more of us coming back.

I look forward to seeing you soon in New Glasgow.

Project: replacement_effluent_treatment_facility_project Comments: Feel that Northern Pulp should be granted an extension on Boat Harbour in order to have their effluent line installed. The loss of jobs this mill provides directly and indirectly would certainly be felt across a good part of the province. Pictou Co.can not afford to lose the large financial contribution the mill puts in to the local economy. However it is important that the pipe is installed meeting or exceeding the environmental standards that are imposed on them. I believe there is a solution that everyone can benefit from if done correctly. Name: Email: @ns.sympatico.ca Address

Subject: Northern Pulp EA Response Letter
Date: March 4, 2019 12:16:00 PM

Department of Environment,

I am writing in regards to Northern Pulp's new effluent treatment facility and 15.5 km pipe proposed to discharge up to 85 million litres of treated effluent and four tonnes of suspended solids every day into the Northumberland Strait. I would like to address losing the Marine Stewardship Council (MSC) blue seal, the fact that the quality of the treated effluent will actually be worse and Appendix R Bleached Kraft Mill Effluent (BKME) effects on lobster.

I am a third generation fishermen, my grandfather and father both fished the Northumberland Strait. Fishing has changed a lot since my grandfather started, we regulate the size of our lobsters, put in escapes, use dissolving string, reduced the amount of traps we fish just to name a few of the sustainable fishing practices we use. Lobster from the Bay of Fundy, Scotian Shelf and Southern Gulf of St. Lawrence have the prestigious Marine Stewardship Council blue seal since May 2015. This is an international stamp of environmental sustainability. It opens up international markets that require third party certification. This is hard to achieve and easily lost. MSC are watching this Northern Pulp proposal very closely to see the outcome. If that certification is lost it will greatly affect the sale of lobsters from all three provinces which ship to the US, Europe and Asia. More than 3000 people make a living on the Northumberland Strait, 18,000 people are working in the fishing industry in Nova Scotia. Seafood exports is a $2 billion industry for Nova Scotia, if the blue seal of MSC is lost that number will go down significantly, this is a serious threat to the Canadian fishing industry(Dept Fisheries, Gov't of NS, NS Exports).

The Nova Scotia provincial government and Northern Pulp have both been spreading the misinformation that their treated effluent has been going out into the Strait for 50 years therefore there is nothing to worry about. This is not true, I have witnessed it firsthand. My first year rock crab fishing I put my crab cones along the mouth of Pictou Harbour. As I fished up from Lighthouse Beach the smell became unbearable and the cone came up filled with black silt and no crab, I moved the cone away from the area and found out that was close to the Boat Harbour outfall. What I have come to learn in the past year is the way Boat Harbour treatment facility works is the treatment is completed at point C, but just because this is the end of the Boat Harbour Effluent Treatment Facility (BHETF) does not mean that is has finished treatment. It there releases into the lagoon where the water sits for 20-30 days, cooling and settling solids, then through a dam as the water levels get high and with the tide release into the Strait at Point D (Boat Harbour Map attached). It then flows back and forth within a box tide along the shore between MacKenzie Point and the end of Lighthouse Beach (Tidal Flushing of Pictou Harbour and Pictou Road, Fisheries Research Board of Canada Technical report no. 146, 1969). This is much different from the new proposed system where it will be treated for hours instead of 20-30 days, the temperature will be 25oC in the winter and 37oC in the summer (NP proposal Table 5.2-1) and relentlessly pumping out onto fishing grounds. The treated effluent quality at point C is the same quality it will be when pumped into the Strait. Both meet regulations, these regulations are not stringent enough to prevent harm, the mill is meeting regulations but their Environmental Effects Monitoring (EEM) shows Northern Pulp is doing harm to fish habitat and the only thing being done about it is every three years Environment Canada gives them recommendations (PEI Legislative Assembly Feb 1st 2019). Through a FOIPOP it was found that Northern Pulp's technical manager agrees that the effluent will actually be worse coming out of the new pipe that what is coming out of Boat Harbour now. (Email dated Nov 2017 Technical Manager Northern

Pulp, FOIPOP) What is in the treated effluent that will be pumped onto our fishing grounds? It is not in the environmental assessment which states that the chemistry characteristics will not be known until the project is operational. This is a huge gap in the proposal, we do know that it contains dioxins, furans and heavy metals. Shellfish, such as scallops which I also commercially fish, absorb dioxin and furans at 25,000–50,000 times the concentration in the water. Cumulative effects would cause deformities, and embryo larval mortalities in fish, chronic effects include significant irreversible factors which jeopardize the continuance of the species and the integrity of the ecosystem (Environment Canada, 1991). Further to accumulative effects on marine life the FOIPOP done by had a letter from the Dept of Environment stating that Northern Pulp should have a study on accumulative effects of BKME on marine life, this was not completed, another gap in the EA.

After reading Appendix R of the EA I fail to see how this can even be called a study, if Stantec can run the study saying everything will meet background by 2 to 5 meters and Stantec is also in charge of running the lobster study which says because it meets background by 5 meters lobsters will not be affected. There needs to be independent third party studies done on both the plume and the effect on lobsters. Harvesters have history with Stantec (Confederation Bridge) and they have a history of not agreeing with their reports. The receiving water study is just a prediction, it is not factual therefore the results of Appendix R are not fact they are just a prediction based on a prediction, not very comforting to a $2 billion a year industry.

The devastating effect this could have on the commercial fishing industry cannot be overstated. The construction alone of the pipe has the potential to greatly harm the fishing industry, the frequency of daily pumping 85 million litres of hot treated effluent and four tonnes of suspended solids would cause uninhabitable conditions for marine life. As for reversibility, we need to look no further than Boat Harbour Remediation Project. This will take millions of taxpayer dollars and years to restore and that is a contained area. There will not be a remediation project large enough for the Strait, it will never recover if this proposal is approved. Therefore I ask that you reject this proposal, if you can not reject I ask that an Environment Assessment Report be completed, there is too much at risk.

Thank you Minister,

Project: replacement_effluent_treatment_facility_project Comments: This project can not go ahead, the proposed pipe line will destroy our strait. Itâ?Ts not a job vs job situation, itâ?Ts abojt the environment. Even if it was about jobs, there would be far more jobs lost in the fishing and tourism industry. This affects 3 provinces and all 3 depend on clean water to fish and attract tourists. Nova Scotia is Canadaâ?Ts ocean playground, this pipe will ruin everything Nova Scotia is known for. People already avoid swimming in Pictou and Lyons brook because the mill has contaminated those waters even will the smaller amount of effluent going in. Northern pulp constantly says the effluent is treated but will not disclose what is actually in it. The millions of litres of effluent will be too warm for any salt water marine species to survive, marine life is very sensitive to change and this would be a sudden change. It will be a larger version of boat Harbour. If the mill wants to continue, I believe, along with many others, that we shou ld switch to hemp products. Itâ?Ts more environmentally friendly, grows faster and produces more products. Weâ?Tve got to start thinking about the environment more and less about money, with time money will come but the environment is already on the verge of being destroyed. Project: replacement_effluent_treatment_facility_project Comments: I write today on behalf of ForestNS in support of the Northern Pulp ETF replacement project. This project is vital to the continued operations of Northern Pulp and therefore the future of a tightly integrated forest industry here in Nova Scotia. From landowners to harvesting and trucking contractors, sawmillers to the thousands of Nova Scotians that work in and with our sector every day - this project is very important. Having reviewed the EA submission within my laymans capabilities on such an in-depth submission, I have every confidence in the expertise at Northern Pulp and the engineers, consultants and experts they have worked with to develop this project, along with the regulatory and oversight expertise of ENS to ensure the operation and compliance of a new ETF. It is my belief that this project should proceed as early as possible to ensure Northern Pulps future in a strong forest sector in our province. Name: Email: @forestns.ca Address:

Subject: Northern Pulp"s Proposed Effluent Pipe into Caribou Harbour
Date: March 4, 2019 1:08:41 PM
Attachments: Submission to Northern Pulp Environmental Assessement re Rock Crab.pdf

March 4, 2019

Re: Northern Pulp Replacement Effluent Treatment Facility Environmental Assessment

My name is . I have been a fisherman for years. I fish in and around the area of Caribou Harbour and have great concern over the possibility of an effluent pipe in this area.

Caribou Harbour is one of the largest rock crab nurseries in the Eastern Gulf. It contains millions of female and juvenile crab. I have fished rock crab for several years. I fish Hillsborough, PEI and from Wallace Harbour to Caribou Harbour in Nova Scotia. Female crab can be found in all the bays and inlets, but for some reason Caribou Harbour holds a far greater number of female and juvenile crab than all the other areas.

The survival of the lobster industry in this end of the Strait depends on the health of this rock crab nursery. Crab is the main food supply for lobster.

I am concerned about the potential impact of a pipe carrying and **continuously discharging up to 3 million litres an hour** of effluent through three diffusers, and the potential that this will produce noise and/or vibration that would disturb marine life.

I would like to draw the Minister's attention to the potential impact of noise and/or vibration from the diffusers on the marine species in Caribou Harbour and surrounding area. This issue has not been addressed in Northern Pulp's submission. I believe this issue must be fully addressed before any approval is given. Noise and vibration can carry long distances under water and change conditions which make a habitat favourable for many species.

I also believe that Northern Pulp's plan to excavate a trench through the centre of this very special eco-system may disrupt the fishery in this area.

The DFO description of Scallop Buffer Zone 21, 22 and 24, which runs 1 nautical mile from the nearest point of land and includes the entire proposed pipeline and outfall, states that the ecological components of interest protected by the buffer zone are" juvenile American lobster and habitat that is important to biodiversity" and states "specifically American lobster nursery habitat is important for the life-cycle of the species."

The description also states, "No other human activities that take place in this area are incompatible with the conservation of the ecological components of interest" and that "These closures offer protection to other important species and habitats in the southern Gulf of St. Lawrence." As an example, DFO refers to SFA 22 containing "rock crab (an important pr ey for several species and a commercial species." http://www.dfo-mpo.gc.ca/oceans/oeabcm-amcepz/refuges/sfa-zpp-eng.html

Caribou Harbour is home to the largest commercial fishing fleet in the Northumberland Strait. The strong lobster catches in this area are the result of the continuous food supply from the rock crab nursery. The potential destruction of this crab habitat will have devastating consequences on the lobster industry in this area. No studies have been done on the possible effect noise and/or vibration from this effluent pipe could have on local marine life. When foreign material is dumped into the environment, it will have an effect. Sometimes it takes years to realize how big that effect will be and then it is too late to fix it. Northern Pulp needs do something environmentally friendly, not something that is economically beneficial to themselves.

Sincerely,

hotmail.com

Subject: Proposed Project Comments
Date: March 4, 2019 1:25:06 PM

Project: replacement_effluent_treatment_facility_project Comments: Dear Sir or Madam and Ministers: Please be advised we represent the Harbour Authority of Caribou hereafter the â?oAuthorityâ?, Pictou County, Nova Scotia. Located at the mouth of Caribou Harbour the Authority operates the busiest fishing port in Northern Nova Scotia. It is the hub of fishing activity from April to early December each fishing season. It is accessed via the106 branch of the Trans-Canada Highway and is adjacent to the Northumberland Ferries terminal. The facility managed by the Authority is the â?~heartâ?T of the commercial fishing industry in northern mainland Nova Scotia. The Authority has retained our firm to express its grave concerns regarding Northern Pulpâ?Ts proposed new treatment facility, which includes an effluent pipe to discharge an estimated minimum of 62 million liters per day, into the mouth of Caribou Harbour. The Authorityâ?Ts position is that the Northern Pulpâ?Ts proposal fails to adequately address and in some cases completely fails to address various environmental and navigational concerns which could cause both short and long term harm to the facilities managed by the authority as well as its patrons. Of major concern is that Northern Pulpâ?Ts associated effluent will be harmful to the receiving waters of the Northumberland Strait and its marine life habitat. Northern Pulp is considered to be among the 70 of Canadian mills whose effluent has been proven harmful to the receiving waters into which it discharges. I will outline herein several of the Authorityâ?Ts major concerns with Northern Pulpâ?Ts current proposal. 1. Northern Pulpâ?Ts current proposal section 8.11.2.4 confirms that there has been no testing completed with respect to the water composition of Caribou Harbour. Instead Pictou Harbour was used as a proxy for Caribou Harbour with respect to water quality. There is no explanation as to why water quality data for Caribou Harbour was â?ounavailableâ?. The Authority views such an assumption on water composition as entirely inadequate. There are major distinctions between the two harbours which makes such an assumption tenuous at best. Pictou Harbour has been exposed to sewage from the Town of Pictou and other municipalities for over 200 years. In addition industrial waste from a ship yard, pulp mill, power plant, tire plant and many other businesses has been discharged into Pictou Harbour for over a century. Pictou Harbour also has three major feeding tributaries and Caribou Harbour only has one much smaller tributary. Caribou Harbourâ?Ts water chemistry is potentially drastica lly different in comparison to Pictou Harbour. In the Authorityâ?Ts opinion the assumption and lack of data falls far short of federal and provincial regulatory requirements under legislation such as the Pulp and Paper Effluent Regulations PPER, the Fisheries Act, the Disposal at Sea Regulations under the Canadian Environmental Protection Act, 1999 CEPA, and DFOâ?Ts Measures to Avoid Causing Harm to Fish and Fish Habitat DFO 2014. The Authority submits that this lack of data and other aspects of Northern Pulpâ?Ts environmental assessment indicate a â?~rushed jobâ?T and which lacks substance. 2. The Northern Pulp proposal relies on a receiving water study prepared by Stantec. This study indicates that there will be minimal flow of effluent discharge into Caribou Harbour. The Authorityâ?Ts position is that the methodology used to make this erroneous determination is subpar and inadequate. A significant volume of water from the discharge location flows into Caribou Harbour on a rising tide. The patrons of the Authority will attest to the â?oallusionâ? of a rising tide at the proposed discharge point going mainly northwest, when this in fact, is false. 3. Section 6.5 of Northern Pulpâ?Ts proposal suggests that fishermen have offered â?ono input to the outfall locationâ?. The Authority has been advised by its fisherman patrons that this is a false statement and that Northern Pulpâ?Ts representatives were informed the entire area outlined

and presented to the fishermen of Caribou Harbour, including the pipe route and outfall, is fished at one point or another throughout the year. 4. The Authority is very concerned that its patrons both commercial and recreational will have their navigational abilities under Navigational Protection Act restricted. This has simply not been addressed adequately in Northern Pulpâ?Ts proposal. As previously noted herein the patrons of the Authority, in particular seventy 70 plus commercial fishermen, navigate directly across the path of the proposed pipe route in Caribou Harbour, on a daily basis, during regular fishing seasons of lobster, crab, herring and scallop seasons spanning April through November. Fishermen fishing north, northwest and west of the mouth of Caribou Harbour exit the marked channel between the third and fourth red buoys depending on destination daily â?" saving individual fishermen hundreds of miles of travel and reducing fuel consumption and reducing emissions. There appears to be a general lack of attention paid to these concerns. The Authorityâ?Ts position is that all navigation concerns must be a ddressed satisfactorily prior to any approval and not be left to be â?ofigured out laterâ?. 5. The general consensus among the local fishermen and supported by the Authority is that proposed construction highlighted on page 14, in appendix F of the proposal will be insufficient to prevent ice damage. The Authorityâ?Ts experience is that a winter storm from the northeast shifts ice dramatically at mouth of Caribou Harbour. The ice piles up in the shallow water along the proposed pipe route, near the mouth of the harbour in excess of 5 meters. The silt and sand in this area is a â?~moving barâ?T and the Authority does not believe that two 2 meters of pipe cover on this soft bottom is sufficient. A proper assessment would have to monitor the conditions of the ice over more than one winter season. As well an in-depth survey will be required as the density and hardness of the bottom varies dramatically, which will no doubt require further study to prevent pipe fatigue and stress cracking. 6. The dredging of Caribou Harbour in 2007, along the passenger ferry channel, required a Federal Assessment, as did the 2015 upgrading of PEI-New Brunswick Cable Interconnection Upgrade Project. Given that Northern Pulp proposes the dredging and installation of equipment in the same body of water the Authorityâ?Ts position is that this project contains all the criteria for a Federal Environmental Assessment as did the previous mentioned projects, as it pertains to section 67 of the CEAA 2012 Act. Section 67 of CEAA 2012 sets the framework for the environmental assessment of projects being carried out on federal land that are not considered designated projects and for which a full environmental impact assessment under the Regulations Designating Physical Activities is not required. As the seabed of the Northumberland Strait is federal crown land it is subject to requirements under section 67 of CEAA. Section 67 states as follows: â?¦..an authority must not carry out a project on federal lands, or exercise any power or perform any duty or function conferred on it under any Act of Parliament other than this Act that could permit a project to be carried out, in whole or in part, on federal lands, unless: a The authority determines that the carrying out of the project is not likely to cause significant adverse environmental effects or b The authority determines that the carrying out of the project is likely to cause significant adverse environmental effects and the Governor in Council decides that those effects are justified in the circumstances under subsection 693.â?T Based on the above the Authorityâ?Ts position is that this project is subject to review by a federal authority in order to determine whether the carrying out of the project will cause significant adverse effects on the surrounding environment, or if any potential significant adverse effects are justifiable. The Authority requests that Northern Pulpâ?Ts Effluent Treatment Project be designated a project for Federal Environmental Assessment under Section 14 of the Canadian Environmental Assessment Act CEAA 2012. Please accept the Authorityâ?Ts legitimate concerns and address this crucial matter appropriately. Yours truly,

Project: replacement_effluent_treatment_facility_project Comments: I strongly recommend that the replacement effluent treatment facility project be approved by the Nova Scotia Department of Environment.In the Executive Summary there is no significant residual environmental effect predicted. The summary states that under worse case conditions water Quality at the end of the mixing zone for the three port diffuser will reach ambient conditions within less than two meters from the diffuser in terms of total nitrogen,total phosphorous,total suspended solids,dissolved oxygen,ph and salinity.Colour will return to baseline conditions within five meters of the diffuser.Temperature will be within 0.1 degrees Celsius of background at the end of the 100 meter mixing zone The summary states the wastewater treatment facility projects the effect on the environment during all phases is rated as not significant. I strongly recommend that your decision will be to approve this project.I believe your decision should be based on the science presented in this environmental assessment registration document.It should not be based on the unsubstantiated arguments of fear. Subject: Northern Pulp's Replacement Effluent Treatment Facility Project
Date: March 4, 2019 2:02:38 PM

Dear Honourable Margaret Miller,

I am writing in relation to Northern Pulp's Replacement Effluent Treatment Facility Project.

I recently completed my Ph.D. in Clinical Psychology and am currently practicing as a Resident in Psychology in New Brunswick, with plans to return to Nova Scotia. I grew up just outside of Pictou in the community of Braeshore, where I spent summer months exploring the surrounding beaches and swimming in the Northumberland Strait. The Effluent Treatment Facility Project is of great personal significance because my husband and I recently purchased waterfront property in Braeshore.

The allocated one-month time period is insufficient for me to comprehensively read and critically analyze the 600+ page document prepared by Dillon Consulting for Northern Pulp. However, in my review thus far, one summary section of the report caught my attention. In Appendix E3 the conclusions section states the following:

"Among the four potential outfall locations discussed in this study for the discharge of the effluent, the Alt-D outfall location provides the smallest potential long-term cumulative effects on the fishery and socio-economic environments, and therefore is considered the better outfall location for the discharge of the treated wastewater from the mill."

This statement indicates that there is potential for long-term, negative effects of the proposed outfall location. I would suggest that it is not acceptable to select this option simply because it provides the "smallest" risk of four options presented by Northern Pulp. Are we limited to these options? I would like to see more comprehensive information regarding the feasibility of a treatment facility that is contained on site and has no discharge pipe into the Northumberland Strait.

Sincerely,

Dr. Everett Chalmers Hospital

Project: replacement_effluent_treatment_facility_project Comments: Dear Minister of Environment I have a trucking business that employs 40 employees and depend on Northern Pulp to keep every one receiving a pay cheque so they can buy grocerys and make house payments, car payments and all the other expenditures that go with every day living. I ask that you ignore all the fake news that is going around and make your assessment on Science and the fact that the effluent has gone into the Strait for the last 52 years and there has not been a fish kill in its history. We know that there are fish living in Boat Harbour now so with the new Wastewater Treatment Facility and where it is proposed to go will ensure a very acceptable Environment. Name: Email

Subject: Northern Pulp"s new ETF
Date: March 4, 2019 3:44:09 PM

Minister Margaret Miller
Dept of Environment

I am writing today in regard to Northern Pulp's replacement Effluent Treatment Facility.

As a wife and mother, i have grave concerns regarding their plan to place a pipe into the Northumberland Strait.

1. Air Pollution:

In 2003, my husband and I built a new home in Three Brooks, maybe 8 km from the Town of Pictou and 5 km from the Caribou Ferry Terminal where this proposed pipe will enter the Strait.
Shortly after moving into our new home in 2003, our son He had zero issues prior to the move.

"In 2012, Northern Pulp reported to NPRI the release of 1,011 tonnes of fine particulate matter into the atmosphere. Remember, this is the deadliest kind of particulate, the kind that can get lodged in your lungs forever. One industry insider noted it was like having 37 Irving mills worth of fine particulates. In fact, NPRI data shows that in 2012 Northern Pulp was the highest emitter in Canada of seven substances, including Total Reduced Sulphur (TRS), Total Particulate Matter, PM10 and PM2.5. [1]
Stack tests from November 2013 showed the mill was producing emissions 78 per cent above what was allowed. " (https://www.halifaxexaminer.ca/province-house/dirty-dealing-3/#Living%20Downwind%20Dangerous)

Now, under their new effluent treatment facility, their plan is to burn the activated sludge in their power boiler . I fear this will only increase their emissions and based on their past history, i have zero faith they will keep it within regulatory limits.
After reviewing their new Environmental Assessment submitted to the Province of NS, it appears they won't even have an air monitoring station in the Town of Pictou which is directly across the water from the mill. This is unacceptable !

Why doesn't Northern Pulp have to have "Continuous Emissions Monitoring" CEM on all of their stacks like other mills in Canada are required to do with live streaming to a website for everyone to see exactly what chemical compounds are being released and whether or not they are surpassing the risk thresholds?

2) Water Pollution / Economic Impact

My husband is a self employed commercial fisherman in the Northumberland Strait. His fishing grounds are in the immediate area of where the outfall of this pipe will be located.
We are hearing there will be a 'no fish zone' of 3 square km around the outfall of the pipe.
So, essentially, my husband and his gear will be displaced as a result. So, is he supposed to move to another location on top of other fishers?
As a family we have invested hundreds of thousands of dollars into this business. If a pipe is permitted to dump millions of litres of effluent per day into the Northumberland Strait, fisherman in all 3 Provinces will suffer financial impact.
As soon as the effluent starts pumping in, I suspect they will lose certification as Atlantic Canadian lobster is certified to be coming from clean, pollution free waters. The loss of this certification will impact markets globally and the prices will no doubt drop. Considering Seafood is one of our biggest exports in the Province of NS, worth over a billion dollars, is it worth the risk? Will there be a compensation package to all fishermen in the Strait ?

In the Environmental Assessment document from Northern Pulp, Table E. 1. 1-1 shows the Summary of the Significance of Project Related Residual Environmental Effects relating to fish and fish habitat.
In every possible category, Northern Pulp shows "NS" which means " No Significant Residual Environmental Effect". WOW ! What are the chances of that ?

In every single category they predict "No Significant Residual Effect" ;
how convenient ! Dumping up to 70 million litres of effluent into the ocean, 24 hours per day, 7 days per week, 365 days per year….. Non stop. Common sense would tell you that HAS to have some residual impact ! To my knowledge, Northern Pulp have NOT studied what the effects effluent will have on Lobster Larvae or Herring eggs or Juvenile Rock Crab; let alone Tuna, Porpoises, or Whales.
In fact, they state in the Environmental Assessment document that they don't know for sure what composition the effluent will be. They "anticipate" it will meet federal guidelines.
And if it doesn't ? Does the Strait become the next Boat Harbour ? How do you clean up an ocean where its not contained ?

All the regulations put in place in the past year to try to save the North Atlantic Right Whales in the Gulf of St. Lawrence, yet allowing Northern Pulp's plan will mean they will swim through toxic waste water flushed into the Strait. What long term effects will this have on them? Will it kill the majority of plankton they eat? Will it impact their already low reproduction rates ?
The World is watching after so many of these whales died in US and Canadian waters in the past few years. Will the World approve of Canadian authorities allowing them to be poisoned?

Northern Pulp have stated they are confident they can meet the federal pulp and paper regulations. Supposedly all they have to do is pass the acute lethality test where they put effluent into a bucket with some trout. If more than half survive after so many hours , it passes.
It concerns me that our federal regulations have not been updated in over 20 years.
As well, Northern Pulp's plan is not to dump into a fresh-water River , they are wanting to dump into an ocean; so why wouldn't the test be in relation to species in the ocean like lobster larvae , herring eggs, plankton, etc.

Minister Miller, I urge you to reject this proposal Or at the very least send it for a Federal assessmen
Recently it was announced that Boat Harbour Remediation will require a federal assessment. This company helped pollute Boat Harbour . So, in turn, it should require a federal assessment to dump that toxic waste into the Strait.

- Impact on 3 Provinces
- Financial impacts on 1000's of independent business owners
- Impact on Species at Risk in the Strait
- Impact to First Nations who fish there as well
- Same plan was denied by the Feds twice before
- Proponent has completed NO science of the impacts to fish and fish habitat
- did NOT hold any public information sessions after they changed their planned route from Pictou Harbour to Caribou Harbour
- Province of NS cannot conduct this Environmental Assessment without bias as they are also financing the project and have an enormous conflict of interest considering the Indemnity Agreement signed with this company

Subject: Replacement Effluent Treatment Facility - EA
Date: March 4, 2019 3:56:29 PM

Dear Minister,

Please accept this communication in response to Northern Pulp's Environmental Assessment for the Replacement Effluent Treatment Facility Project. My name is . I am the General Manager of the Pictou Lodge Beach Resort, President of Destination Eastern and Northumberland Shores, Board of Directors Tourism Industry of Nova Scotia, and Chair of the Nova Scotia Tourism Human Resource Council.

I have many concerns about Northern Pulp's Environmental Assessment, but will focus my communication on the following points:

1 - Effect on Tourism and the socio-economic impact.
2 - Issues in Engagement

1 - The socio-economic impact and the effect on tourism

As per the Nova Scotia Environment Act, Purpose of Act, section A:

The purpose of this Act is to support and promote the protection, enhancement and prudent use of the environment while recognizing the following goals: (a) maintaining environmental protection as essential to the integrity of ecosystems, human health and the socio-economic well-being of society;

In the EA submission section 8.14.4.2 it is stated:

The daily operation and regular maintenance of the project is not anticipated to impact the socio economic environment.
AND
No impact to community use of recreational areas is anticipated from the operation of the outfall. Additionally, odour prevention was a basic design criteria used in the development of each stage of the ETF process. Through employing a process that has, for example, continuous sludge removal, subsurface air injectors, and indirect effluent cooling, odour is controlled during the treatment process. No impact to community is anticipated from odour during the operation of the ETF.

My concerns here are two fold:

1 - Risk of impact to waters

I am concerned with the lack of studies around the economic impact this project could have on the tourism industry. Tourism produced 2.8 billion dollars in revenues in Nova Scotia in 2018. Northumberland Shore area typically makes up 8% of this total. The Pictou Lodge Beach Resort (built in 1924) is located about 5km down the strait from the proposed outfall area. The resort has been built to a 2.8 million dollar business that employs 70 people. According to the 2017 NS Tourism Visitor Exit Survey, the top reasons pleasure tourists visit Nova Scotia are “Coastal Sightseeing - 47%” and “Visit a Beach - 49%”. Lobster remains an important part of the visitors experience as well. 45% of pleasure visitors to the province in 2017 ate lobster while here.

From a destination marketing perspective, the Northumberland Shore has always lead with the beaches in our area. Northumberland Strait’s unique selling point is that our beach waters are swimmable reaching as high as 25 degrees Celsius.

The impact of dumping millions of litres of effluent into the Strait will be harmful to our branding efforts and will have a negative impact on tourism businesses in the area. We are a destination that primarily sells warm swimmable waters and fresh local seafood. Nova Scotia is traditionally known as Canada’s Ocean Playground. The impact of this pollution could affect Nova Scotia’s tourism brand as a whole. It could also have negative impacts on the lobster brand for Northumberland Strait and Nova Scotia in general.

The lack of a study around economic impact and tourism impact for the Northumberland Shore and Nova Scotia is a major concern. This is cause enough for the Minister of Environment to order an environmental assessment report for the new treatment plant and subsequent effluent outfall. This report needs to include a socio-economic impact study on the tourism industry.

2 - Air quality issues.

In section 8.1.2.2 the EA claims that odours are impossible to address as the new odour coming from new treatment plant will not be known until such time as the plant starts to operate. Until the new chemicals and compounds are combined. It also states that this issue is subjective and will quite possibly not be worse than current.
It also states that “Because the perception of odour and its effects are subjective and relative to an individual’s perceptions, limits, and tolerances, it is more frequently treated as a nuisance issue”.

The current state of air quality and odours produced from the plant have had a negative

socio-economic impact on the community. In my tourism operation we have lost long term guests who had to leave because of poor air quality. We have lost potential group bookings and weddings because of the air quality on the day of planning visits and tours. The local town has lost residents and potential investors because of the air quality. There is no current study on what the economic impact the poor air quality and odour produced by mill has had on tourism industry and economic development in the community over the last 50 years. This is of concern to me.

I would argue it is more than a “nuisance issue” when air quality and odours are recorded and publicly displayed on trip planning sites such as TripAdvisor. This has a real impact on potential travel and booking decisions. For example:

Lovely spot - except for the smell
Review of **Pictou Lodge Beachfront Resort**

Reviewed October 12, 2015

We only stated for a brief overnight visit and didn't get to fully appreciate this resort. Desk staff very pleasant and helpful, supper in the pub area delicious with the server going out of her way to make us comfortable. Room clean with usual facilities you would expect. However, there is a continuous smell in the air which at first we thought was sewage, but were told it is the emissions of the local pulp mill. This is disappointing as the location and facilities at this resort are lovely and it is very convenient for catching the ferry to Prince Edward Island (10 mins to the terminal). My mother and I were very relieved that we did not have to stay for longer and if we had booked for longer would have probably checked out and found someone else. I am sorry for the poor review as the problems are largely outside the control of the owners, but hope this will help their cause in trying to get the Mill to clean up its act.
Date of stay: October 2015

In addition to the current air issues, the new treatment plant will include the combustion of sludge generated in the replacement ETF for energy recovery. Emissions from the combustion of sludge in the power boiler during operation and maintenance is to be dispersed from mill stacks. A socio-economic study into what the impact of the poor air quality will have on local businesses and residents needs to be done before construction of the new treatment plant begins. As a local business operator and resident I insist the Minister of Environment order a environmental assessment report.

2 - Lack of Public Consultation

Under the section 6.0 Public Engagement I take issue with the following points:

6.2.5 - Engagement with Government.

At no time was the Provincial Department of Business, Tourism Nova Scotia, or the Minister of the Department mentioned here. The potential impact on the tourism industry is the same as the forestry and fisheries industries. On several occasions I had written to the Minister with my concerns on the impact of tourism. An environmental assessment report needs to be done with the inclusion of the Department of Business and Tourism Nova Scotia.

6.3.2 - Engagement Sessions

The public consultations that I attended did not have any information in regards to an outfall in the Caribou wharf region. All discussions and diagrams we were presented had the outfall in the Pictou harbour region.
The Caribou wharf area is the 3rd highest entry point for Nova Scotia. It is an entry point for 475,000+ visitors to Nova Scotia annually on the ferry service between Caribou / Wood Island. I would have presented a much different scenarios of questions to the public sessions if this location would have been identified. Although it is the same approximate distance from our public beach, the potential impact on tourism to Nova Scotia would be 10 fold if there were discoloration, odour, or any other visible issues at this new outfall point. What is perceived as a nuisance could have real socio-economic impact. An environmental assessment report and new public consultations need to happen before construction can begin on the new treatment plant.

6.4.1 - Engagement Activities

There were no invitations sent to any tourism representatives during this session. Tourism operators were never identified as stakeholders in this EA process. An industry that produces revenues of 2.8 billion dollars provincially and 224 million locally was not seen as a “stakeholder”. This complete absence of an industry that would be affected by the new project who were not properly engaged in the EA process is reason enough for the Minister to order an environmental assessment report.

In conclusion, the hefty treatment replacement facility project document submitted by Northern Pulp did not address a key part of Nova Scotia’s Environmental Act, “the socio-economic well-being of society”. It did not address a key stakeholder in the process. I would ask the Minister to order an environmental assessment report for these reasons.

Subject: Northern Pulp"s new ETF
Date: March 4, 2019 4:02:20 PM

Minister of Environment
Province of NS

March 4/19

I am writing you about Northern Pulp in Abercrombie , NS and their plans to put a pipe in the Northumberland Strait.

My dad is a fisherman out of Caribou Harbour. He fishes lobster, rock crab, herring and scallops. I go fishing with him sometimes and look forward to doing that when I am older.

Someday I might want to do that for a living .

Boat Harbour is one of Nova Scotia's worst environmental sites. Now, Northern Pulp wants to pump that waste into the Strait via Caribou Harbour; right where my Dad fishes.

I am scared this will kill all the fish. What will he do then?

Also, I heard on the radio today that what will come out of this new pipe into the Strait will actually be worse than what currently flows out of Boat Harbour into the Strait.

Here is the link to the CBC radio show :

https://www.cbc.ca/listen/shows/information-morning-ns/segment/15672343?fbclid=IwAR0jKWPZfrIYOx1s-N8pQsddtWS6jY8FdaE13dS5oZqwHocqdg9GPkhYClg

I am worried this will poison the fish and lobster and crab. Will everyone still be able to eat it?

On pg 84 of the EA, the projected Total Suspended Solids is 48mg/L. If 85 Million Litres of Effluent is processed per day, that equates to around 4 Tonnes of TSS per day into the Strait!

The EA states that with the proposed AST facility, that TSS will be higher than the old waste process.

How can 4 tonnes of Total Suspended Solids NOT harm the Northumberland Strait every day

.

I hope you reject this environmental assessment application and do what is right for the Province o f NS

thank you

Subject: Proposed Project Comments
Date: March 4, 2019 4:06:44 PM

Project: replacement_effluent_treatment_facility_project Comments: Lets Do The Math: Everyone wants better health care, better access to mental heath care, all 100 series highways twinned as well an overall better maintained road system, a better education system, help for the homeless, an end to poverty, and the list goes on and on. So how do we fix these problems? Well it comes down to government expenditures doesnt it? We are a poor province and are in debt up to our ears, so the province cannot afford to do any better than they are doing now. Without sustainable economic growth and a growing taxpayer base, how can we expect the government to address these issues adequately? So the solution is simple, Nova Scotia needs more taxpayers. We have heard for decades that â?obusiness is the backbone of a good economyâ? . Well this is where the rubber meets the road. The citizens and government must support new industries and foster the growth of present industries. This is not rocket science. The world views Nova Scotia as a non-business friendly province, especially in the resources industries. I started my own business from scratch almost forty years ago in the forestry industry. It is a small business, but we employ between 15 and 18 full time, seasonal employees, some of whom have been with us for over thirty years. For most, we are their only source of employment. I can say without hesitation that Paper Excellence, the owner of Northern Pulp, is unquestionably the best company we have done work for in all of those years. They far exceed the amount of money they are required, by legislation, to put back into privately owned woodlots on an annual basis. Their budget for follow up treatments, such as planting and thinning, are consistent and reliable every year. This allows a small business such as mine to retain an experienced labour force. They are a globally known company, particularly for being efficiently run and environmentally friendly. Northern Pulp leaving our province would have two monumental negative effects: 1 the forest industry would be near collapse-- this far exceeds the immediate 300 jobs related to the mill itself. Its closure will result in thousands of lost jobs as there are numerous companies who rely up them for a significant portion of their revenue. To think that their is a plan B that will overcome this lose is simply absurd 2With our already tarnished image around the world as being anti-industry, and wilfully booting out such a globally well regarded company as Paper Excellence, this will serve as just another nail in the coffin for our province. If weâ?Tre willing to sacrifice a company which is vehemently working to re-establish its image and develop a forward-thinking environmental plan, what possible expectations can we have for future industries to consider our province as â?~open to businessâ?T? To quote General Colin Powell, former U.S. Secretary of State Great leaders are almost always great simplifiers, who can cut through argument, debate and doubt to offer a solution everybody can understand. Come on government and opposition, where is the leadership? Name: Email: @eastlink.ca Address:

Subject: Proposed Project Comments
Date: March 4, 2019 4:33:07 PM

Project: replacement_effluent_treatment_facility_project Comments: 4 Mar 2019 Nova Scotia Department of Environment, I am writing in regards to Northern Pulpâ?Ts new effluent treatment facility and 15.5 km pipe proposed to discharge up to 85 million litres of treated effluent and four tonnes of suspended solids daily into the Northumberland Strait. I am a resident of Central Caribou, where this pipe is proposed to run through, I have walked the coast of Caribou Harbour almost daily with my children for 12 years. I have several concerns about effluent and suspended solids where my children, dog and I swim. What will happen to the clam and oyster beds that live in the mud of Caribou Harbour, Northern Pulpâ?Ts open house information is not matching what is in the EA, the treated effluent leaving the aeration basins of Boat Harbour is meeting Pulp and Paper Effluent Regulations and causing harm but nothing can be done to remediate this other than some recommendations. Caribou Harbour is not a large body of water, the tide will bring effluent and suspended solids into the harbour. The EA and receiving water study state that the effluent will not come into Caribou Harbour, I fail to see how this is possible as the end of the pipe is right outside the mouth. Figure 8.12-1 page 363 of the EA is a still photo of the bottom of Caribou Harbour and states that it is devoid of microflora and microfauna. I can tell you that it is most certainly not void of life perhaps, because one still shot of a sand bar cannot show the huge oyster and clam beds present in Caribou Harbour, we have to wear swim shoes in the water there are so many you cannot walk without them. Oysters and clams are filter feeders and will be the first affected by this pipe. The mitigation measures for socio-economic issues is to take our concerns to the NSE Dept in Granton and Northern Pulp Community Liaison Committee will continue to facilitate two-way communication and advise to Northern Pulp. It is well known that the Community Liaison Committee meets in secret and the membership is hidden from the public. It also states that a communications and compensation plan will be available for the commercial fishermen, this is the first mention that there will be any effect of the effluent 2-5 meters past the outfall. If there needs to be a compensation package due to regular operation of the ETF how can the significance of the residual effects be: not significant or averse as stated in Table 8.14-2 pages 444-445. I attended all of Northern Pulps open houses, these were held for the Pictou Harbour outfall, they did not have any information sessions on the Caribou outfall. The information I received stated that there would be one tonne of suspended solids being pumped out daily, after reading the EA and calculating 48 mg/L by 85 million litres that would mean there are 4 tonnes of suspended solids daily going through the pipe. The ferry channel already needs to be dredged due to sand build up in the channel, how often would it need to be dredged if four tonnes of solids would be pumped into it daily, also I have not seen anywhere in the EA how routine dredging would affect the pipe. At the information open houses they had pictures of treated effluent from 1970, 1990, 2017 and finally a predicted photo of 2020. The last picture showed that the effluent was clear and this is how it would look in the new system History Effluent Quality picture Open House Panel 14, link below. This is not h ow it will look coming out of the pipe. There are pictures and video of what the effluent looks like leaving Boat Harbour now it is dark brown, however that is better than what it will look like coming out of the pipe because the new system does not replace the Boat Harbour Lagoon. It is only replacing the settling basins and aeration basins, what the water will look like leaving the pipe is what the water looks like now leaving the aeration basins. This is meeting regulations, and will continue to meet regulations in the new system. That does not mean it will not cause harm to fish, shellfish, marine plants, marine animals, birds as

well as their habitat. When Environment and Climate Change Canada Pulp and Paper Effluent Regulations PPER came to meet with the PEI Legislative assembly Feb 1st, 2019 see link below for transcripts they stated that Northern Pulp is one of the 70 of pulp mills that are causing harm even though they are meeting regulations. The Environmental Effects Monitoring EEM shows they are harming fish habitat while meeting regulations. The only corrective action taken after harmful effects are found by the effluent is Pulp and Paper regulators make recommendations for them to implement for the next three years, whether or not these changes are made or work isnâ?Tt checked until the next three year period of the EEM, and if they are still harming fish habitat there would just be more recommendations to them. So just like when Pictou Landing First Nation told Environment Canada that the mill was killing all the fish 50 years ago, there is still nothing living in Boat Harbour and the mill is meeting regulations. Would the same not happen to the Northumberland Strait? Everyone could complain that there is nothing living around Caribou but the mill is meeting regulations so the only thing that can be done is recommend changes every three years. The Strait is a unique ecosystem that must be protected. We are known for our swimmable beautiful beaches, our pristine waters that produce a sustainable seafood industry renowned around the world. If this is approved there will be no turning back, the Pulp and Paper regulations do not protect us or the Strait, if this decision is based on whether or not the EA can pass PPER then the Strait will become the next Boat Harbour, because it is the same regulations that they are passing now. Northern Pulp has made no effort to meet with the communities of Pictou and Central Caribou before and after the pipe location changed and the information that was provided by the meetings in New Glasgow are not even close to the information that is now in the EA. For these reasons I ask you Minister to reject this proposal. Thank you Central Caribou, Nova Scotia http://www.assembly.pe.ca/sittings/2018fall/transcripts/17_2019-01-02-transcript.pdf http://www.paperexcellence.com/copy-of-faq click on tab for project launch open house materials if link below does not work https://drive.google.com/file/d/14OWv3oA8C1E1ys4hxFCBCq4IcRkpkJq5/view Name: Email: @mail.com Address:

Subject: Response to Northern Pulp pipeline proposal
Date: March 4, 2019 5:49:58 PM

Dear Margaret Miller , NS Environment Minister,

I am writing to express two concerns I have with regard to Northern Pulp's Replacement Effluent Treatment Facility Project.
I am a retired teacher, father of two, and have been a resident of Braeshore, Pictou County for 39 years. I have lived in a shorefront home for the past 14 years and water related activities are a very important part of my life.

My first concern relates to the yellow signs that appeared all along our shore a number of years ago warning us not to eat the shellfish.

When these signs went up it made me worry about the quality of our water. Why can't we safely consume shellfish?

I learned that according to Fisheries and Oceans Canada, Pictou Harbour is in a prohibited area because of contamination from waste from the following:

- failing residential wastewater systems
- municipal wastewater treatment system
- runoff from land, like in the case of agricultural activities
- industrial facilities discharging into the environment

Some steps have been taken to help this situation. The town of Pictou has installed a sewage treatment facility. County residents have their own septic systems that must meet strict guidelines relating to proximity to water. I doubt that agricultural run off is now not as significant as there are now many more homes and cottages along the shore than there are farms.

That leaves Northern Pulp. Its new pipe will dump 60 to 90 million litres of effluent per day into Caribou Harbour, which also is in a prohibited shellfish area. It seems that while municipalities and property owners are working to improve water quality, Northern Pulp is only making our water worse. Will we ever have a time in the future when the yellow signs won't be needed?

My second concern relates to recreational sea bass fishing. This is an activity I enjoy very much from my shoreline and I fear that with continued effluent entering our water that this activity may go the way of shellfish harvesting.

I suggest that more research needs to be done to ensure the safety of ours waters.

Sincerely,

To: Hon. Margaret Miller, Minister of Environment for Nova Scotia

Thankyou for the opportunity to provide comment regarding the EA presented by Northern Pulp with respect to the Northern Pulp Wastewater Treatment Project. Can you please see the enclosed letter dated March 04,2019 reference to Northern Pulp Wastewater Treatment Project from myself and register it with the EA documents as public comment.

With Appreciation.....

To: Honorable Margaret Miller, Minister of Environment for Nova Scotia

Date: March 04, 2019

From:

RE: Comments to Environmental Assessment "Northern Pulp Wastewater Treatment Project"

I have read large portions of the "Northern Pulp Wastewater Treatment Project EA and would appreciate your consideration of four points which I have identified. I live in the small community of Toney River and although retired now, worked with Michelin Tires Canada for most of my working career. I had worked with Scott Maritimes Paper and am also a woodlot owner.

1. I live in an area which is a strong fishing community. We continually hear local concerns regarding this project and comments are most often presented with no facts. Example…."the effluent will be poison to everything", "in today's world, we do not need to put effluent in the ocean water", etc. It is essential that The Ministry deal clearly with facts and science. The EA has presented extensive facts and it is correct and good to question for detail and understanding. There should be questions and a need for further description however always with a focus on the facts. Our efforts to achieve environmental improvements must be based on clear true facts of science and history.
2. The EA has proposed detailed design and construction of an effluent treatment system described as Moving Bed Biofilm Reactor (MBBR) BAS and has identified comparison Kraft mills in Germany and Sweden where the technology is used….section 4.2.1. To provide factual performance results of this technology, data collection from these mills should be provided identifying effluent volumes, chemical quality, color and temperature. Note section 5.2.2.9 which describes the anticipated effluent quality of the NP project. The results of technical "best practices" should be well identified in order to provide confidence in the engineered project.
3. I have not been able to identify clearly in the EA, a multiyear past history of the effluent quality from the Boat harbor facility to the Northumberland Straight with respect to quantity, chemical qualities, color and temperature. Note again section 5.2.2.9 the anticipated effluent quality for the new NP project. I would suggest that we should be making a clear comparison between the "before" and the "after" for this project with respect to each of the effluent parameters. This study of the past effluent entry to the Straight should also be compared with the health and catch rate of lobsters in an area of several kilometers from the Boat Harbour outfall. Twenty to thirty years of data regarding this would be benefit in understanding our current situation and

predictability of the future. Lobsters should be somewhat representative of the ocean health as they are bottom feeders of other ocean life and not plant life. As the resource is so important, extensive data should be available.

4. One area of this development is the installation of 4.1 KM of buried undersea piping and diffuser assembly. Section 8.12.3.3 of the EA deals with construction of this piping and the disturbances with a resulting influence on sea life. Can I suggest that a comparison could be made to the Confederation Bridge project from New Brunswick to PEI. Although the NP project is much smaller and in a more confined water area, historic information of physical changes and lobster catch rates in areas around the Confederation Bridge could improve the understanding of any negative consequences from this part of the NP project. I would suggest that the effluent pipeline route option Section 4.2.4….to the Pictou Landing / Boat Harbour area and underwater a distance into the Northumberland Straight should have had greater consideration and priority. The Caribou Harbour area is a very busy location with the largest fishing boat concentration on the Northumberland Straight, the PEI to Nova Scotia ferry location and a very busy tourist accommodation area.
5. Closing……

   I would ask you to consider my noted points and call for some further study and documentation to best clarify the construction, results and influences of the project. This can lead to better managing any potential risks of the Northern Pulp Wastewater Treatment Project. Our Province has a very high rural population and that follows to be a region where reliance on natural resources is very high and important. The forest industry and Northern Pulp are very important to the economy of the entire Province, and every effort must be made to safeguard this contribution to the economy. A detailed understanding of all the science and facts associated with this project is of upmost importance to well inform the public and ensure that wise decisions are made.

   Changes in our Provincial forest policy as regards to the use of low grade wood fiber deserve long term planning and must not be any part of this project consideration.

   Can I please suggest that further information to the EA be developed per the above items 1,2,3, and 4
   Thanking you……

Subject: Proposed Project Comments
Date: March 4, 2019 9:46:02 PM

Project: replacement_effluent_treatment_facility_project Comments: I am writing to express my concerns around the proposed Effluent Treatment Facility that Northern Pulp is planning and the placing of out flow pipes into the Northumberland Strait. Having had cottages on the Strait for most of my life and frequenting the local beaches with my children and grandchildren, I am greatly concerned with the damage the treated effluent will cause to the waters we swim in , beaches we play on and fish we consume. I believe that a Federal Assessment would be more stringent and have little doubt the results would show a truer picture of any risk to our environment. I only want to ensure that the ecosystems in the Northumberland Strait and those that live by it and work on it are protected. We do not need to rush into a situation that could ruin the fragile ecosystem that borders on three provinces, itâ? Ts breeding grounds and the local fishing and tourism industries. Northern Pulp will be dumping approximately 85 million litres of effluent da ily and they have noted on Page 2 of their EA that the contents of the effluent will not be known until the system is operational so they have not released the chemical make up in their EA. As a citizen of the affected area, I request the Provincial Government do their due diligence, ensuring we know exactly what is going to be pumped into our waters and the effects it will cause on the ecosystem. The Mill has been poisoning our air and water for the last 50 years, we must be sure this is not the case in the future, therefore we need a Federal Assessment to ensure our environment and our children will no longer be negatively affected by the mill. Thank you for your time. Sincerely,

Resident of Pictou, NS Name: Email: @gmail.com Address:

Subject: Northern Pulp Replacement Effluent Treatment Facility Project
Date: March 4, 2019 11:45:06 PM

Dear Minister of the Environment for NS, Margaret Miller,

I am writing to request that an Environmental-Assessment Report be undertaken with regard to the above-named project.

I have lived my entire life, with the exception of my time at Dalhousie University in Halifax, along the shores of the Northumberland Strait in Pictou County. I can look out across the Strait and see the shores of Prince Edward Island and I am very aware that it is not only the people of Nova Scotia who will be affected by this project.

I have attempted to read through the voluminous quantity of documents presented by Northern Pulp to your department, and I find that a number of things concern me

1. In Table E.1.1-1, Summary of the Significance of Project-Related Residual Environmental Effects, page xxxiv, it is **predicted** that the project, during all phases, will have no significant effect on any component of the environment. However, no where is it stated exactly what will be the composition of this effluent that they propose to continually pump into the Strait, day in and day out .... until something goes terribly wrong. And that may not take long, given that there has been no study done to determine the potential impact of this effluent of unknown composition on lobster larvae. This deluge of materials and chemicals **cannot and will not** simply "disappear" with no adverse effects. Indeed, it is entirely possible, perhaps even probable, that this action will cause significant adverse effects to environmental health, to human health and to the economic health specifically of the fishing and tourism industries, and also to other individuals and businesses whose livelihoods depend on the well-being of these major industries.
2. There has been **no public consultation** on the proposed route of their 15.5 km pipeline along Highway 106, entering the marine environment near the Ferry Terminal at Caribou and proceeding out into Caribou Harbour where the effluent (of unknown composition) will be discharged into the **prime fishing grounds** of the Northumberland Strait. This is madness! It would truly be reckless to take such a risk adjacent to any fishing harbour, let alone the largest fishing harbour on the Nova Scotia side of the Strait, without consultation and further study.
3. The concluding paragraph of Section 14, page 588 states "Overall, based on the results of this EA Registration, it is concluded that, with planned mitigation and the implementation of best practices to avoid or minimize adverse environmental effects, the residual environmental effects of the project, including the effects of accidents, malfunctions and unplanned events as well as cumulative environmental effects, during all phases are rated not significant." Is this a logical conclusion considering that it is stated no field work was conducted with regards to Harbour Physical Environment, Water Quality and Sediment Quality (Section 8.11) nor with regards to Marine Fish and Fish Habitat (Section 8.12)? My second question is: Not significant to whom? Perhaps not to the owners of Northern Pulp. They don't need to care about the

marine environment in Atlantic Canada. They don't need to care about the well-being of those who live along the Northumberland Strait. They don't need to care about the livelihoods of those who work in the fisheries or in tourism. They don't even need to care about the forestry workers in this area. They can simply continue to live their lives far from here, no matter what happens with their predictions and assumptions.

For these reasons, I believe it is important that this project be the subject of the more in-depth analysis and investigation of an Environmental-Assessment Report.
May God give you wisdom in this matter.
Sincerely,

Project: replacement_effluent_treatment_facility_project Comments: Having no regard for our environment, and never have, NP has proposed a replacement Pipe plan to release untreated effluent directly into the Strait. This is a terrible plan. How is it okay to dump it anywhere for that matter? Who, in their right mind, could possibly think otherwise? The continued damage our Nova Scotian Government permits to happen to our environment in the name of jobs is outrageous! My mind is boggled at the sheer stupidity of it all. Putting Our Oceans Habitat, its ecosystems, at risk is putting Humanity at risk, in my view, and a crime. Of course were not the only polluter in Canada, or the world, but doing something because everyone else does it doesnt make it right or solve the problem Our World faces. Lets be better than that Nova Scotia. Name: Email: gmail.com Address:

Subject: NP and the environment
Date: March 5, 2019 10:18:33 AM

I spent my summers on the pristine Northumberland Strait. My grandfather had built our cottage in 1929. My mother grew up there. I and my five siblings grew up there, as did my children and my 10 nieces and nephews.
I was seven when “the smell of money” would blow over and ruin our days. Our water turned brown and reeked. Dead fish would turn up on the beach. President of Scott Paper, was our neighbour at Chance Harbour and he would occasionally take samples of the water and have it tested: nope! That’s not Scott !
Well now we know it was. Jobs were too important at the time. And indeed at least for the terrible insidious poison they were shipping our way at least they employed about a thousand locals. You kind of felt like at least Scott cared a bit about us and our environment...
NP doesn’t care.
NP employs a couple of hundred (I know there is spin off in he woodlands and Halifax but that is not enough to justify poisoning the locals of Pictou County, our air and water, our fisheries and tourism).
NP sends all there profits to Indonesia.
NP is not willing to invest in Pictou County and when they finally have to invest - they will choose to close and leave NS and its taxpayers with a huge cleanup bill.
.
Save our fisheries.
Save our water.
Save our air.
Save our people.
Save ourselves some pain and insist now on a proper EA

Subject: Northern Pulp E.A
Date: March 5, 2019 10:39:21 AM

Why should Northern Pulp be allowed to send their effluent treated or not treated directly into the Northumberland Strait?

1. Pipeing effluent into a most lucrative fishing grounds on the North Shore of Nova Scotia, too much risk.
2. Proposed pipe outlet being in marine navigation waters, jurisdiction Federal Government.
3. Climate change and pollution. We cannot afford anymore risk. Improve risk assessment Government Red Tape is required when Canadians health and wellbeing are at risk. Improve risk-based compliance.
4. The government needs to strengthen regulations to ensure transparency, predictability and accountability.
5. This decision is not about jobs vs. jobs it's about industry vs. an entire eco system. Too much risk.
6. We cannot afford to be making future investments in an industry that is decimating our forests. Too much risk.

Project: replacement_effluent_treatment_facility_project Comments: Dear Ms. Miller, I have worked at Northern Pulp for six years as of yesterday. This month also marks my 25th year in the Pulp Paper industry. I understand very well the importance of this industry to our provincial economy. In my six years at Northern Pulp, I have seen many positive changes in terms of emissions and our environmental footprint. The Mills owners have spent large amounts of money to improve the operation and a reduction in emissions is clearly evident. Northern Pulp has treated me well the past six years. I get to work relatively close to home and I get to work in a professional environment with other well educated individuals. Northern Pulp has allowed me to continuously improve myself through training opportunities. This allows me to improve and maintain the professional designation that I hold. The other Pulp Paper mill that I worked at constructed a new effluent treatment center in the mid-1990s. That was seen as an expansion to the mill and an improvement for all concerned. It amazes me daily that the ETC proposed for Northern Pulp isnt seen the same way. There is no reason why the forest and fishing industries cant co-exist. They have in this community for over 50 years. Now with 2019 technology for effluent treatment, it will be better than ever. People should listen to the science and not the uninformed opinions of a few. The science will prove that this is a worthwhile project for not only today but also in the future. I look forward to the remediation of Boat Harbour. Hopefully decisions made in 2019 are far better thought out compared to decisions made in the late-1960s. I also look forward to continuing my career at Northern Pulp. I look forward to providing my daughter with a good standard of living and opportunities for her today and in her future. I hope to do this in a province that respects the environment and values industry in a variety of forms. Im confident that all can co-exist. Respectfully yours, Name:

Subject: Northern Pulp Proposal Environmental Impact
Date: March 5, 2019 10:50:13 AM

Re: Northern Pulp Proposal,

Dear Sir/Madam,

We live directly across the Strait in Little Sands, PEI from where the proposed pipe is planned and view the smoke stacks of Northern Pulp. We already have them polluting our air and now the want to further pollute the ocean waters.

The health impacts experienced from those living across from Northern Pulp are most concerning. People of all ages are experiencing rates of cancers and disease that appear to be far higher than averages. Why? The only source of known pollution in this area is Northern Pulp. Pollutants from the stacks are put high into the air and come down in areas miles from the pollution source. Now there is a plan to direct waste discharge 4k into the Strait towards PEI.

We are calling for a full health impact study to be performed to find out why so many cancers and diseases are being experienced by people living in our area.

This plant has a documented history of polluting which brought about the questionable plan to dump their waste into the Strait. Should we trust them or their studies? Using the threat of closing and job loses to in order to justify their actions which are having such a profound negative impact upon so many people. Surely there exists a better way.

If the effluent does not contain pollutants or carcinogens then:

Why are is it not being discharged at the shore by Pictou?

Why is it being piped 4 Km from shore?

This strait is not isolated and will cause environmental damage far beyond our region as it connects to the oceans of the world.

Please have the vision to see the serious consequences of allowing this to go forward and do the right thing by rejecting their application.

Sincerely,

,

Little Sands, PEI

Project: replacement_effluent_treatment_facility_project Comments: I would like to see a more thorough investigation of the environmental impact of this project than what the NS government currently plans to do. Northern Pulp has a history of erratic adherence to regulations and regulation guidelines and delay in notification of the public of problems. Equipment can fail, pipelines can break. What happens if equipment failure results in contaminated effluent - who is monitoring, how long will it take to find out there is a problem, and will the consequence be immediate shutdown of the mill until there is a remedy? What is the cumulative effect of long-term deposit of heated effluent into the Strait? I also commend the Premier of this province for holding firm on no extension. If this issue was truly a threat to their business, I believe that Northern Pulp would have made it a priority and funded the necessary resources to get a plan together within the legislated time frame. That they havent and are asking for an extension suggests to me that they thought they could use the politics of job loss to get an extension. I also believe that they do get an extension, they will be back in a years time with other excuses for why they need an additional extension. Name:

Under no circumstances can I agree to an extension of the use of the Boat Harbour facility or a pipe directed into the Northumberland Strait. Polluters need to be responsible for the damage they cause not the tax payers.
Let’s get this right in 2020. Enough harm has already been done.

Project: replacement_effluent_treatment_facility_project Comments: To: Minister of the Environment, I will firstly start with an article, below, from the Chronicle Herald which summarizes nicely my feelings on this whole affair. I do believe that the time for the Mill to close has come, I have lived in Pictou County all my life and enough is enough. This Mill in its many forms has been subsidized too much for over 50 years and the pollution, to the water and the air, has caused far too much damage to even estimate to human health, recreation on the waterbrown sludge for years stretching for many miles down the shore, to tourism in general and, in particular, to the town of Pictou, the constant foul smell in the air, damage to the Fisheries, etc. Cut our mill lossesChronicle Herald, Voice of the People, Feb.23, 2019 Thank you to Jim Vibert for his Feb. 20 column on Plan B for the Northern Pulp mill. I really think itâ?Ts time to return Pictou to a pristine tourist destination, and allow the fishers to keep earning a living without more problems threatening their fishing grounds. This is also our food supply. Certainly, if the mill is to remain open, an in-depth and unbiased assessment of the effluent is essential, and promises to the Pictou Landing First Nations community must be honoured. A solution is for the mill workers to be compensated with three yearsâ?T salary or expected wages, and be provided with career counselling. The foresters should be provided with an appropriate lump sum to help them return to responsible forestry management and environmental considerations. This would be a mere drop in the bucket compared to what the province has spent on the mill so far, and what itâ?Ts likely to cost us in the future.

Antigonish I am of the learned opinion that a Class 1 does not cut it, the Registration Document for this is certainly lenghty but it is insufficient to learn the truth and prove once and for all that the Mill will not cause further environmental problems. Your job is to protect the whole environment and a Class 2 assessment needs to be done period!! Please keep the politics out of your decision and do your job, not what is best for politics. Name:

Response to Northern Pulp's Application for an Environmental Assessment

March 5, 2019

To: Minister of the Environment,

I will firstly start with an article, below, from the Chronicle Herald which summarizes nicely my feelings on this whole affair. I do believe that the time for the Mill to close has come, I have lived in Pictou County all my life and enough is enough. This Mill in its many forms has been subsidized too much for over 50 years and the pollution, to the water and the air, has caused far too much damage to even estimate to human health, recreation on the water (brown sludge for years stretching for many miles down the shore), to tourism in general and, in particular, to the town of Pictou, the constant foul smell in the air, damage to the Fisheries, etc.

"**Cut our mill losses** (Chronicle Herald, Voice of the People, Feb.23, 2019)

Thank you to Jim Vibert for his Feb. 20 column on Plan B for the Northern Pulp mill. I really think it's time to return Pictou to a pristine tourist destination, and allow the fishers to keep earning a living without more problems threatening their fishing grounds. This is also our food supply.

Certainly, if the mill is to remain open, an in-depth and unbiased assessment of the effluent is essential, and promises to the Pictou Landing First Nations community must be honored. A solution is for the mill workers to be compensated with three years' salary or expected wages, and be provided with career counseling. The foresters should be provided with an appropriate lump sum to help them return to responsible forestry management and environmental considerations.

This would be a mere drop in the bucket compared to what the province has spent on the mill so far, and what it's likely to cost us in the future.

Jean Harrison, Antigonish"

I am of the learned opinion that a Class 1 does not cut it, the Registration Document for this is certainly lengthy but it is insufficient to learn the truth and prove once and for all that the Mill will not cause further environmental problems. Your job is to protect the whole environment and a Class 2 assessment needs to be done period!! Please keep the politics out of your decision and do your job, not what is best for politics.

Project: replacement_effluent_treatment_facility_project Comments: EA Submission2nd March 4,2019 Additional Info from Stantec Chart 5.6-1 and more observations. Page 8

Further to my comments submitted by email on February 13, 2019, solids dispersed into Northumberland Strait were described as minimum 1000 Kg on page 4, last paragraph. Actual maximum values of 4 Tonnes of Solids per day have been calculated based on Stantecâ?Ts Table 5.6-1 regarding discharged solids. TSS of 48 mg/liter equates to a probable maximum of 4 Tonnes. This large amount of solid material was never put into the ocean by the old Boat Harbour System indicating the new AST will be much worse for the environment. This amount is absolutely unacceptable, yet the antiquated Canada PPER regulation for TSS is 11,500 kilograms/dayfact supplied by Bruce Chapman of NP. This TSS Regulation MUST be updated and can never be one size fits all. It must be tailored to the receiving water to permit any safety to our marine life. The Northumberland Strait is described unscientifically, yet accurately by PEI MLA Colin La Vie as being like an old washing machine sloshing that highly tainted fresh water effluent back and forth with the tides, over the Lobster and Herring Beds and not sufficiently flowing out to ocean. A more scientific approach is this warning: Hypoxic or anoxic conditions can develop when oxygen is consumed by decomposing organic matter. If currents are weak and the organic matter is not being flushed from the area, these conditions may generate potentially toxic reduced compounds such as methane, ammonia and hydrogen sulphide Pearson and Rosenberg, 1978 Human Health Evaluation: There is none in a Class One Assessment. The Minister could order one but this would prolong the timing of the process which NS Environment does not appear to want. County residents have long decried the lack of health monitoring yet statistics seem to bear out there are increased serious health issues occurring. I can only hope that enough public comments on Health might be generated in this Environmental Assessment Forum to allow for the possibility of including human health considerations. My final comment is on the most disappointing action not taken by Northern Pulp. A Lobster Study! To gather info to understand and help protect the Lobster Fishery from that effluent, which will carry an enormous organic load. A Lobster Study was promised to be undertaken. PEI Legislature Committee 16 Feb 2018. Their testimony revealed Lobster Studies were on their immediate radar and would be carried out. NPâ?Ts agent, Dillon was looking after securing Scientists for expert advice. Those studies were never carried out or perhaps no experts could be secured who felt there was no danger? Trust broken! Again, Thank You. Name: Email: @hotmail.com Address:

Subject: Proposed Project Comments
Date: March 5, 2019 8:07:05 PM

Project: replacement_effluent_treatment_facility_project Comments: I want to start this comment by stating that I wish to remain anonymous and my views do not represent that of my employers. My relation to this project is I am a homeowner that will be within the 500m distance from the pipeline and I am a professional engineer who works in the water and wastewater industry. I have had concerns since the initial consultation that is referenced within this report section 6.4.1. At this time, the consultants did not conduct themselves appropriately nor did they do their appropriate homework. Statements from their public sessions can be paraphrased as Pictou still dumps their sewage into the harbour and the treated effluent of a municipal wastewater plant is similar to that of industrial plants. The first statement was/is untrue and the second statement has several implications to me. Municipal wastewater is treating organic waste in some rare instances more than this. Industrial wastewater contains several other elements including inorganics such as heavy metals. If the belief that industrial wastewater is the same as municipal, why not set the limits the same. Those can be found in the Atlantic Canada Wastewater Guidelines Manual and are almost half 25 mg/L of the 48 mg/L BOD and TSS requirements listed in section 5.2.2.9. I will give the consultant credit however. They did mention the Caribou watershed and the Source Water Protection Plan, but they did not seem to engage stakeholders the way they should have. Nova Scotia Environment is part of the Source Water Protection Committed and helped develop several key components to the communication plan with the help of Hydrogeologist consultation. If the consultant truly wanted to gain full public input, reviewing the Source Water Protection Plan would have guided them to first talk to the Committee. This would have helped them identify additional water sources that are being currently developed northern section of the watershed, and it would have helped guide who to contact. Additionally, the Watershed identified within the report is actually considered Zone 2 of a three-zone watershed area that was defined by a hydrogeologist. Zone 3, not shown in the report, is a much large area that shows surface water zones that impact the watershed. This is r elevant for both private and municipal water sources as groundwater sources that are impacted by surface water, typically defined as GUDI, can be impacted by activities in surface water. The idea is, if the surface water becomes contaminated, there is risk for nearby GUDI sources to become tainted as well. Furthermore, the delineation of 500 meters used in the consultant report is the minimum value that is recommended in the Source Water Protection Plan. The recommended distance is 650 meters. Finally, as both a private well/land owner and someone who works in the water/wastewater industry, I have concern with how quickly the consultants dismiss risks as non-significant or NS. If there is a chance that the pipeline could break and devastate water sources and the environment, thereby creating a non-reversible condition, with only partial promise that the effluent will not harm the environment it is not ANTICIPATED that the effluent plume will not be visible when it reaches the water surface, this is more than non-significant for those who could be impacted. The report states that effluent will meet PPER requirements, but this does not give me confidence when I drink water based on the Guidelines for Canadian Drinking Water Quality GCDWQ. I would like to conclude with, I do not fully agree that EAA 2012 should not apply as section 41a states to protect components of the environment... from significant adverse environmental effect caused by design project. Several significant adverse environmental effects have been observed in the past. Therefore, hedging risk management on operational inspection and maintenance does not instill confidence in me that things will be different this time. If this means the mill has to close, I would prefer to have a

short-term partially depressed economy than a permanent loss of water, environmental damage and property that has zero value. Name: anonymous Email: @gmail.com Address:

Subject: Northern Pulp Class I Environmental Assessment - Replacement Effluent Treatment Facility Project
Date: March 5, 2019 8:37:53 PM

To Whom It May Concern,

I am writing this message to try and convene to you my concern regarding the proposed replacement effluent treatment plan Northern Pulp has presented. The mill has tainted the Northumberland Strait and Nova Scotia forests for over 50 years. The conversion of forest to disease and fire prone mono cultures (so called fiber farms) has been hard enough to swallow. Trees are resilient however and given enough time tend to reclaim the ground and return to a forest. The Strait and it's rivers, beaches, estuaries, etc. may not be able to recover as well if at all. Why risk so much for an industry that has hardly been a champion of the environment? They seem uninterested in exploring any other option than their pipe.

I don't want to see the end of the forestry industry. Surely there are other options for the province's woodlands than just pulp wood. The closure of a pulp and paper mill is nothing new. What have other areas that lost mills done with their trees? I can't imagine they were left to die in the woods. Wouldn't the government of Nova Scotia serve it's voters by encouraging a change in that industry through education, grants, etc?

The Northumberland Strait is a beautiful and important part of three provinces. The culture and economy of the land that it touches depends on it being healthy. Demand the federal government update the pulp and paper industry standards. Demand a federal environmental assessment. Demand Northern Pulp find an alternative solution.

Please stand up for the Strait, all it's provinces and the people that enjoy it.

Sincerely,

From: @yahoo.ca

Subject: Proposed Project Comments
Date: March 5, 2019 9:46:54 PM

Project: replacement_effluent_treatment_facility_project Comments: Dillon Consulting on behalf of Northern Pulp has stated that there is â?oNo Significant Residual Environmental Effect Predicted.â? That proclamation is dishonest in more ways than one. There is no way to predict leaks, spills, equipment failure, malfunctions, or other accidents, natural or man-made. The waste proposal poses major risk to harming marine life , marine habitat, species at risk/endangered/threatened that include migratory and marine birds, fish, vegetation, reptiles etc. The proposal goes through the Pictou town and Caribou water supply. Two provincial parks and two nature preserves are within the effluent pipe footprint. If they are contaminated, then what was the point of preservation??? This cannot be allowed to happen. Meeting PPER doesnâ?Tt prevent harm to marine life or marine habitat per Environment Canada. The characteristics of the proposed effluent is â?ounknownâ? to Northern Pulp. This is unacceptable. We want clean air and water and healthier forests. We want to protect our marine life. We want our children and grandchildren to be safe from this environmental time-bomb. We want our communities to thrive without having to worry about how lethal the effluent might be. Name: Email: @yahoo.ca Address:

Please find attached by response to Northern Pulp's Replacement Effluent Treatment Facility Project.
I would appreciate an email indicating you have received my comments.
thank you.

March 6, 2019

Dear Margaret Miller, Minister of Environment,

I am writing in relation to Northern Pulp's Replacement Effluent Treatment Facility Project.

I have been a long time resident of Braeshore and taught high school biology in the town of Pictou for 32 years. I feel strongly that we need to protect our environment and be very cautious about any human activities that may threaten it.

I would like to comment on two concerns I have with the proposed effluent treatment project. My first concern is for marine mammals and turtles and secondly I would like to see results from studies on the effect of the effluent on lobsters included in the report.

Marine Mammals and Turtles

On page 398 of the report, Table 8.13-1 lists marine mammal species known to occur in the Northumberland Strait. I have personally seen a Fin Whale and Harbour Porpoises and see that they are listed in the table under the category of special concern. Later in the report on page 570, section 12.3.9.1 it states *"it is anticipated that potential residual environmental effects of the project on marine mammals, sea turtles and marine birds may occur during the construction and installation of the pipeline, and during pipeline operation and maintenance activities."* This is very concerning. I
Also, I have sighted what I am fairly certain was a **Kemp's Ridley sea turtle** on the beach near our house. Unfortunately, I do not have a photograph of the turtle but I did report it to the Canadian Sea Turtle Network in 2015. A few months after my sighting another Kemp's Ridley was found in Hall's Harbour Nova Scotia and reported on CBC News · Posted: Nov 11, 2015. After seeing news images of the turtle I am more confident in my identification of the type. According to the Nature Conservancy of Canada the Kemp's Ridley is categorized as critically endangered and is considered the most endangered species of sea turtle in the world.
We must do everything possible to protect these vulnerable species.

Lobster Research

A second concern I have about the report is that I do not see any data on the possible damaging effects that the effluent might have on lobsters.
A personal experience I have with lobster research relates to a project done by one of my Advanced Biology 12 students. She was using Stage 4 lobster larvae in her project and unfortunately most of the larvae died when the temperature in the tank inadvertently increased over one weekend.
A quick literature search shows that there have been a number of research studies relating to various stages of lobster development and the factors affecting them.

The following is from the study titled Declining fecundity and factors affecting embryo quality in the American lobster (Homarus americanus) from the Bay of Fundy
Canadian Journal of Fisheries and Aquatic Sciences 72(3):1-12 · October 2014

"By far the largest change we observed across years was the steady and significant decline in fecundity, with an 8%–10% decline from year to year and an overall decrease of 31% from 2008 to 2013 (Fig. 3). Fecundity is influenced by multiple factors (see above) but ***temperature is likely one of the most important.*** *Laboratory experiments have shown that female lobsters require periods of low temperature (<5–8 °C) for ovarian development; if it is warmer, females will begin to transfer energy to molting and reduce spawning effort "*

Citation N. Koopman, Heather & J. Westgate, Andrew & Siders, Zachary. (2014). Declining fecundity and factors affecting embryo quality in the American lobster (Homarus americanus) from the Bay of Fundy. Canadian Journal of Fisheries and Aquatic Sciences. 72. 1-12. 10.1139/cjfas-2014-0277.

The effluent discharged into the proposed outfall area will range between 25 and 35 degrees Celsius. The study above indicates that climate change is already threatening the fertility of lobster, therefore, it does not seem advisable to release in excess of sixty million litres of warm liquid per day into a lobster breeding area.

This report, prepared by Dillon Consulting, indicates in appendix E3, section 3.3.2.10 that *"at 100 m the effluent plume temperature is* ***0.2 °C*** *above background" but later in the report on page 563 the statement is "Water temperature is anticipated to meet compliance for applicable federal water quality guidelines within approximately 2 m of the diffuser and be within* ***0.1 °C*** *of background at the end of the 100-m mixing zone."*

This inconsistency seems to indicate that they are not really sure what the thermal effect will be. I would like to err on the side of caution and have the thermal effect on lobsters more carefully considered.

In conclusion, I feel that the Northern Pulp's Replacement Effluent Treatment Facility Project, as presented, poses too many risks to species that inhabit our waters and should be rejected.

Sincerely,

From: @xplornet.com

This place is a disaster. The information being given out is not the same as what is discussed in house.

Factors are missing in large proportions. There is NO WAY this effluent should be set free in Northumberland Strait. NS has a large business in seafood export, much larger than NP's and much more sustainable too, providing it is NOT damaged by chemicals being allowed to flow into the Strait.

This Pipe is NOT the answer to this problem and should NOT be allowed.

Project: replacement_effluent_treatment_facility_project Comments: Its mind blowing to believe that in 2019 this type of pollution should be allowed to continue. I am sorry for the forestry workers that would be effected, but Northern Pulp has been a disaster for this province and I hope the Premier stand firm with his 1 year deadline. Northern Pulp is also responsible for massive deforestation across Nova Scotia, which makes the forestry industry unsustainable for the long term. Now along with putting our old growth forests at risk, they want to target our fishery in the Northumberland Straight. It is time for Northern Pulp to shut down. I believe the job losses of 12,000 are overstated and I have also heard rumors that there are other pulp companies in waiting to take over the mill if Northern Pulp should leave. Northern Pulp has no respect for Nova Scotia or the people that live in this province. Its time for Northern Pulp to shut down and go away! Name: Email: @eastlink.ca Address:

Subject: Northern Pulp Pipe concerns
Date: March 6, 2019 9:36:54 AM

I am sending along my objection to Northern Pulp's pipe proposal. I understand they submitted a class 1 EA. A project of this size and footprint on the environment, health of our ecosystems and people needs a more rigorous review. A Class II assessment is needed to ensure the effluent will not have long lasting effects to fisheries, marine life, environment and health of people. It is very alarming that Northern Pulp did not release the contents of the effluent to the public. The fact that documents obtained from freedom of information act suggest the content be disclosed but they choose to omit it from the submitted EA is very concerning. Why are they hiding it? Boat Harbour is a dead zone! It qualified for a Class II EA. How is this pipe proposal any different and less hazardous? The content going from the pipe into the projected landing zone of the Atlantic Ocean will be as bad or worse then what is being dumped today. This was confirmed by NP Technical Manager in his CBC interview. It is asinine to think that this pulp waste is acceptable to be dumped in the pristine Atlantic Ocean. Current standards for pulp and paper are out dated. Northern Pulp suggested they are meeting those standards. Are 25 year old standards acceptable when there is so much risk involved? Absolutely not! Tests done on fresh water Rainbow trout do not reflect the standards needed to PROVE this effluent is safe. Many of the marine life species that exist in this ocean today are salt water species that have reproduction life cycles around controlled consistent water temperature. Dumping this effluent into the breeding grounds of these species is a disaster waiting to happen. Mercury!! that NP did not include in their EA is present in effluent. Not only will it impact the marine life it will impact and cause harm to those who consume it.. Humans, other fish species, mammals, etc. I also am concerned with the pipe breaking. The unknown chemicals in the effluent now can reach town water supplies adding further risk to public health. The make up of the effluent leaching into the ocean today can already be realized on our shore lines. Look at PLFN and Sinclair beach.. a dark brown foam makes up the shore line. How can we let our children go near the water, swim, and enjoy the coast line if we now have Northern Pulp dumping this toxic pulp waste in the ocean. Everything about this toxic Pipe proposal is concerning. At a very minimum a Class II EA assessment is needed. This is 2019. Polluting our waterways and jeopardizing peoples health is now taken serious and can no longer happen.

thank vou.

Subject: Proposed Project Comments
Date: March 6, 2019 11:08:16 AM

Project: replacement_effluent_treatment_facility_project Comments: There are so many reasons *not* to approve Northern Pulps planned Replacement Effluent Treatment Facility. Let me list them in point form: ** There is absolutely no guarantee that this system will actually remove all of the toxins. Even one of NPs own engineers says as much Chronicle Herald, Feb. 28: In an email between Northern Pulpâ?Ts technical manager and Dillon Consulting, a Toronto-based consulting firm, written on Nov. 29, 2017 the technical manager said in reference to the effluent coming from the proposed Northumberland Strait pipeline, â?osome say effluent quality will be worse than today because of all the polishing that is happening across the Boat Harbor basinâ?"and they are correct to some extent. ** Contaminated sludge from the effluent treatment system will be burned in the boiler facility -- thus spreading more pollutants into the air -- regardless of scrubbers, there will be some percentage of release. ** Piping the warm, dilute effluent out into the Northumberland Strait is creating an unacceptable and irresponsible risk to humans and to the lobster and other shellfish industry. As commented upon by Dr. John Krawczyk, MD, Kings Head, NS, Nova Scotia Advocate, March 6, 2019. Pumping toxic effluent directly into the Northumberland Strait is not an acceptable alternative for all the above reasons. The effluent will not be toxin free no matter how it is treated and will bio-accumulate in bi-valves mussels, scallops, oysters and lobsters. Seafood will be contaminated. The archaic expression dilution is the solution to pollution is no longer acceptable. Humans are at risk! I would add to this that, not only will we be risking the industry, but also the entire ecology of the surrounding Northumberland Strait. All shellfish are extremely sensitive to toxins -- and also to temperature and to acidity in water as their shells are formed of calcium. I have thus far seen no proof that there wont be damage to the shellfish and other aquatic flora and fauna of the Strait. In fact, I have read the opinions of several marine biologists that such effluent could be extremely harmful to shellfish. And I quote from a study on just such effluent: Untreated pulp and paper mill effluents are very toxic to most aquatic life. Concentrations as low as two percent can be acutely toxic to fish. Sufficient treatment can render the effluent essentially nontoxic much of the time however, treatment processes used by most mills reduce toxicity but do not eliminate it. Even effluents receiving good treatment may exhibit sporadic and dynamic increases in toxicity due in part to spills or dumping of spent pulping chemicals. Sublethal exposures to aquatic organisms to pulp effluent may affect a number of their physiological and behavioral functions. Toxicity of Pulp and Paper Mill Effluent: A Review of Literature:, Floyd E. Hutchins, Western Fish Toxicology Station, Corvallis, Or. ** There are now serious questions being asked about missing mercury at that site, and the building a new facility on mercury contaminated soils see Northern Pulps Environmental Documents: Missing Mercury, etc.. by Joan Baxter, Halifax Examiner, March 5, 2019 ** Perhaps the greatest and most damning reason of all is that, for 50 years, this mill has subjected the people of Pictou to terrible pollution, egregious health hazards, and obnoxious odours. Regardless of what improvements have been made, it has been more of the same old, same old. How much more should they, ESPECIALLY the people of Pictou Landing First Nations, be expected to endure? That this terrible environmental racism has been allowed to persist to this day is reprehensible. This latest plan to now pipe effluent into the Strait is just more of the same. Enough is enough. Subject: Proposed Project Comments
Date: March 6, 2019 12:03:40 PM

Project: replacement_effluent_treatment_facility_project Comments: By Page number: xxxv â?" â?oIn addition, NPNS has had a Toxicity Prevention and Remediation Plan in place for many years which provides a structured approach for addressing treated effluent toxicity problems, should they occur.â? -this seems to conflict with the above table, in that â?~Accidents, Malfunctions, and Unplanned Eventsâ?T are all deemed to have non-significant environmental effects. If the effects of any unplanned events are non-significant, why would a remediation plan ever be needed? 8 â?" â?oReduced greenhouse gas emissions by replacing fossil fuels with natural gasâ? -this is great, but â?~naturalâ?T gas is, in fact, a fossil fuel, and one that also needs to be reduced considerably in the next decade and beyond Stocker et al. 2018. Are there plans to convert to even lower-carbon power-sources or offset additional CO2 emissions? 25 and 115 â?oâ?¦chloride ion is naturally present in salt water, in the form of sodium chloride. The presence of chloride in the ocean does not represent a concern for the environment.â? -while this may be true in the general sense, it is a logical leap and could be perceived as misdirection. Itâ?Ts like saying that Aluminum tailings are not of concern because it is a naturally-occurring element in reality, Aluminum is one of the most widely occurring natural metals, but when soils are acidic it can become toxic to plants because it preferentially binds to sites normally occupied by base cations at neutral pHs. In other words, the environmental context, and concentrations, are what cause the problems for many naturally-occurring ions, including most salts. Presumably, marine-life in the proposed area is adjusted to â?~naturalâ?T chloride concentrations of water in the Northumberland Strait. If increases of Cl- concentrations are expected to be within the tolerances of marine life, and within the range of historic variability for a particular diffusion area, the proponents should say that instead of simply regarding the ion as unimportant. 29 â?oâ?¦not a current technologyâ? - please define â?ocurrent technologyâ? 86 section 5.6.4 and 417 section 8.12.3.1 â?" -these sections may have relevance for North Atlantic Right Whales not mentioned directly in the report, because they are not normally known from the Northumberland Strait waters and other marine mammals because the marine component of the pipeline involves underwater noise and traffic. While the sound levels may not be sufficient to cause acute hearing damage, similar construction projects have shown clear impacts on the behaviour of marine mammals in other jurisdictions Culloch et al. 2016. Some additional monitoring and modification of construction schedules may be necessary to avoid 1 increasing stress to these animals and 2 displacing them from feeding grounds. DFO should be consulted for more specific recommendations. 121 â?othe findings of this study cannot be considered conclusive or causal in any way.â? -this choice of language is overly defensive and only serves to cast doubt on the proponents. The cited study was not perfect, but the lead author DID write â?oIn the field, Mytilus caged near untreated municipal wastewater and bleached kraft pulpmill effluents have a significantly greater chance of developing haemocytic leukemia than do mussels exposed to reference sites.â? -Consequently, saying that it canâ?Tt be conclusive or causal â?oin any wayâ? is neither accurate nor honest. Moreover, taking the old-fashioned industry-to-public communication approach, wherein an appropriate question based on peer-reviewed research is responded to using the triumvirate of conflate lots of things cause this, deny we donâ?Tt know what causes this, and attack the study was flawed! is clearly not objective, and I think the proponents can do better. I recommend an â?oacknowledge, critique, and explainâ? approach instead. E.g., â?oYes, the cited study drew this conclusion, and it is concerning. No, the study was not perfect in its attributions of cause and effect, so we

followed-up with the lead author should provide a more detailed account of this discussion for accuracy. In the end, we believe the NEW facility will be better / worse pick one.â? It might also be a good idea to commit to a follow-up biomonitoring study once the harbour has been reclaimed. 332-333 â?oMitigationâ? and â?oConstruction Phaseâ? -it would be a good idea to do some quick nest surveys for those barn swallows, as their nests might be in existing structures near the ETF footprint. If that is the case, the construction phase should avoid conducting work during the nesting season, to avoid displacing the birds or interrupting their foraging patterns through excess noise and emissions. I am writing this email in regard to the Northen Pulp effluent disposal proposal. Pleas know as a young professional that moved back to Nova Scotia from Alberta I am strongly opposed to the proposal and can not possibly believe that anyone would even consider this as a viable option. Furthermore my husbands occupation will be directly impacted if the plant is to close and he could very well loose his job however still we do not support this as the risks associated with the plan impact our community and family far more than those associated with with a job loss. We need to think of the long term heath of our environment and community; we are resilient we will flourish if the mill closes. Please do not focus on the fear of a few in this monumental decision. My family swims fishes and uses our straight .....think of the fisheries the tourism the health that can be negatively impacted unless you can guarantee 100% that this will not be the case . This proposal can not be passed it can not move forward too much is at risk . You have put the environment and people at risk for too long. Do what is right to what is best for the greater good . Do not think of your job loss do not let fear of job loss outweigh the unknown of our environment.

Respectfully submitted

Subject: Call for the rejection the Northern Pulp Effluent Treatment Project
Date: March 6, 2019 1:06:21 PM
Attachments: Northern Pulps rejection request.docx

March 2 2019

Northern Pulps proposal to pump effluent into the Northumberland Strait must be rejected because of the significant adverse effect that it will have on the Strait.

I was born and raised in Pictou county. I have fished the waters of the Northumberland Strait for 30 years. There was a time when we did not think much about the effects our actions had on the ocean. We see now firsthand how fragile the ocean is. We now work with DFO to preserve an ecosystem, an industry and a way of life. We have reduced our lobster trap numbers from 300 to 280, stopped fishing single trap trawls and are increasing the carps size. We have also increase the web size of our herring nets to allow the small fish to go free. In recent years we have seen the Northumberland Ferries Limited and the town of Pictou implement sewage systems, so that they no longer dump their sewage into the ocean . Land owners along the Strait have built sea walls to stop erosion and the accompanying sediment. And these changes are working. The last several years have seen an increase in lobster catches in our area. Sustained scallop seasons.

Proving that our oceans and fishery are sustainable is very important to the world. Dumping industrial waste into the ocean does not constitute Sustainability. This is a step backwards for Nova Scotia ...for Canada.

"Our Oceans, Our Future
As Canada's Minister of Fisheries and Oceans, it gives me great pleasure to present Canada's Oceans Strategy. This far-reaching policy framework will make Canada's vision for modern oceans management a reality.

As a country bordered by three oceans, Canada is truly an oceans nation. Today we see an ever increasing number of demands on oceans and their resources. While traditional fishing and marine transportation continue to be of prime importance, they are now joined by other uses, such as aquaculture development, oil and gas exploration and development, recreational and commercial fishing, and eco-tourism. Canada's oceans also support important features of Canada's social and cultural identity. Managing these demands is critical to the protection of the marine environment and the long-term sustainability of Canada's oceans and their resources.

On January 31, 1997, the Government of Canada brought the Oceans Act into force, making Canada the first country in the world to have comprehensive oceans management legislation. The Act authorizes the Minister of Fisheries and Oceans Canada to lead the development of a national oceans management strategy, guided by the principles of sustainable development, the precautionary approach and integrated management."

source: Robert G. Thibault
Fisheries and Oceans Canada, Oceans Directorate, *Canada's Oceans Strategy,* 2002, Cat. No. Fs23-116/2002E, Ottawa - Ontario: Fisheries and Oceans Canada 2002, iii

,

My fishing grounds are the waters along Caribou Island. It is an extremely fragile area. It is extremely sensitive to water temperature changes. If we get a Nor-Eastern the water becomes brown with sediment. It takes several days for the sediment to clear and fish to return. Northern Pulp proposes to dump 90 million litres of effluent per day on this area. Northern Pulp estimates that the propose pipe will dump 48mg of Suspended Solids per litre into the Strait. **For a grand total of 4.32 tonnes of Suspended Solids per day.** This is daily. That is 1,576 tonne per year. The area will never have a break / never be given a chance for it to recover*. The long term effects of this have to be studied.*

"*(5.6.1* Replacement ETF Effluent Discharge

Adsorbable Organic Halides (AOX) mg/L 7.8
Total Nitrogen (TN) mg/L 6.0
Total Phosphorus (TP) mg/L 1.5
Colour TCU 750
Chemical Oxygen Demand (COD) mg/L 725
Biochemical Oxygen Demand (BOD5) mg/L 48
Total Suspended Solids (TSS) mg/L 48
Dissolved Oxygen (DO) mg/L >1.5
pH - 7.0 to 8.5
Temperature oC
25 (winter)
37 (summer)
Total Dissolved Solids (TDS) or Salinity g/L 4
Addi□onally, the project is designed with key established water quality guidelines and/or will meet ambient water quality (current background) at the edge of a standard mixing zone (CCME 2009 - Canada-wide Strategy for the Management of Municipal Wastewater Effluent)."
source:(NP EP Proposal)

The sediment from the construction of the pipe alone will be catastrophic. We have witness firsthand the significant adverse effect that the construction of the Confederation Bridge, in 1993,had on the fishery. It has taken about twenty three years for lobster stocks to return up to 90km away. This was a finite project, with a recovery time. The proposed NP is a constant 4.32 tonnes per day! Every day.

I've always had a since of pride about living in Nova Scotia, Canada. I've felt that we were moving forward towards a greener country. Northern Pulps proposal to dump effluent into the Northumberland Strait is a step backwards. **I am asking you to Reject the proposal on the grounds that the significant adverse effects cannot be mitigated.**

Project: replacement_effluent_treatment_facility_project Comments: This is great news. I believe this is the right time for Northern Pulp to grow and prove to the community they are here for the long term. With the new upgraded system you will not see any untreated effluent leave the mill which is a significant improvement and they are just going to keep improving. We all want to see boat harbour cleaned up which we will. Northumberland Straight will have the best treated waste and it will keep improving over the years like it has in the past. If this mill has to close you will see the population drop tremendously and it will not only effect the mill workers but also lots of indirect jobs. It has been co existent for more than 50 years so there is no reason why all of a sudden now it is an issue when the mill wants to improve their system. Hopefully one day everyone can see eye to eye and this will all be put behind. Northern Pulp is a huge asset to Pictou County. Name: Email: @hotmail.com Address:

Dear Minister,

I am writing to disclose my concerns with Northern Pulps new treatment facility. First off, I would like to describe my frustration with this environment assessment in the sense that I do not find it fair to read through 1700 pages and only have 30 days to respond to you in regards to the many topics I find appalling.

The many issues I have with this proposal are numerous. I would like to describe the sections I find troubling which must be considered by yourself in formulating the decision under subsection 34(1) of the Environment Assessment Regulations.

a) The location of the proposed undertaking and the nature and sensitivity of the surrounding area: Having grown up in Pictou and New Glasgow, I have worked on the water and lived in this surrounding land area. I am unsure how a pipe would be able to bypass a colony of protected birds which are found near the Pictou Causeway, Munro's Island, Caribou Provincial Park, and Water Side Provincial Park. This area is known to be a habitat for species at risk, and I would like to be informed with how this pipe would not alter life of various marine and land species. These migratory and salt water habitat birds that are on the specicies at risk, listed as threatened, endangered within the footprint of the pipe proposal.

b) The size, scope and complexity of the proposed undertaking: Again, I am unsure how the Boat Harbor cleanup process would be suitable for a federal assessment and undertaking yet a project of such huge cost and nature would only require a 50 day provincial assessment. Viewing reports through the FOIPOP request show that Dillion consultants raised the issue of heavy metals, such as metals and mercury and of Dixons and furans in the effluent. In January 2018, Dillion sent a list of questions to Northern Pulp, KSH consulting and TIR, saying it needed information on the "percentage of dioxins and furans in the final effluent going into the strait daily". In February 2018, Dillion again wrote to Northern Pulp reminding the technical manager of the need to acknowledge these substances, noting that questions have arisen regarding the content of metals in the discharge. So far, Northern Pulp cannot address in their proposal, the chemical characteristics or concentration of known

chemicals in their effluent. I would like to understand in common language, how this would be acceptable in 2019. For an area where I live and breathe in, I am extremely frustrated that this level of arrogance to human health is allowed to be documented and presented in a formal means of proposal from a company.

c) My concerns expressed should be seriously noted. I will refuse to live in this area or province if you shall allow a pipe of poison and sludge system of this nature to be granted. I will not allow myself or my family to suffer to this level of criminal environmental behavior. I have attended various committees and understand the EcoJustice may be following this case to the Supreme Court level. At this time, this level of jurisdiction has granted Pictou Landing First Nations to be considered and consulted by this company for any future construction. I would hope you would be on the right side of history in regard to this serious case of environmental racism this group has already endured for the last 53 years. I stand firm in support, as do many of my friends and family with the closure of Boat Harbour and will not support an extension of any sort for Northern Pulp to continue using Boat Harbour for a treatment facility of their poisonous waste.

d) Whether environmental baseline information has been submitted for the undertaking is sufficient for predicting adverse effects: As we know now, Northern Pulp did not create any base line date to understand any negative impacts to marine life or lobster larvae. They consulted a marine biologist who stated there was once a study done in 1960 and did not hold any true value to the nature of this current Northern Pulp wish to create a pipeline through the Northumberland Strait. Most pulp mills put in oxygen delignification systems back in the 1980s or 1990s but not Northern Pulp. They have never paid for themselves to reduce chemical use and goes on without the use of this system. We know as well, they have not added this system to their proposal. I would like to understand why this is, as they promote the system to the public and state it will be added. Tax payers should not be on the hook for this system. It is very clear that the elimination of boat harbor basin would have substantial and negative impact on the effluent quality reaching the Northumberland Strait. Based on data thereis enough information to conclude that the new ETF would be worse than the old system because of the elimiiation of the basin. This elimination would create more toxins reaching the Northumberland Strait. The effluent treatment system consists of construcutred sedimentation basins followed by aeration in natural basin with baffle curtains directing flow. A large, natural final polishing follows prior to release to the Northumberland Strait. Point C of the current effluent treatment system also benefits from the settling effect of Boat Harbour prior to Point D, so the impact on marine

environment is even less profound.

e) Potential and known adverse effects including identifying species at risk and concern for their habitat: There are known species at risk at the locals of this pipe proposal. The piping plover and wood turtle are known species in the area of the Caribou provincial park, only kilometers away from the proposed pipe location. The Nova Scotia Endangered Species Act (NS ESA) was proclaimed in 1999. This act protects species in NS that have been assessed and determined to be at risk of extinction. The Act applies to all species at risk on private and provincial public (crown) land in NS. The Act prohibits: killing or disturbing species, destroying or disturbing its residence (i.e. habitat), destroying or disturbing core habitat, Prior to development, construction, or alteration of the land; species at risk must be considered. The Federal Species At Risk Act also applies to all migratory bird species at risk and all marine species at risk, on all land in Canada. The Act prohibits: killing or disturbing species destroying or disturbing its dwelling place (i.e. habitat) destroying or disturbing critical habitat. Prior to development, construction, or alteration of the land; species at risk must be considered. Shellfish and marine ecosystems would also be negatively impacted through the construction of a pipe and dumping of 90 million litres of unknown effluent into the Northumberland Strait, which would occur daily.
Bleach Chlorine Mills and the Impacts on Marine Life: The molecular chlorine or chlorine-containing compounds currently used as bleaching agents by the pulp and paper sector react with materials released from wood during the pulping process, resulting in the formation of chlorinated organic compounds which are in part discharged into the aquatic environment via effluents. Canadian mills are estimated to use over 610 000 tonnes of chlorine annually to produce over 10 million tonnes of bleached pulp and to release over a million tonnes of chlorinated organic compounds to the aquatic environment. The dioxins and furans are part of the bleaching process and are considered “toxic" under Sections 11(a) and 11(c) of the Canadian Environmental Protection Act and the Federal Government . TSS and BOD are regulated under Sections 34 and 36 of the Fisheries Act which is a Federal act thus requiring Federal involvement. The chemical composition of bleached pulp mill effluents is variable and not well characterized. Approximately 250 compounds have been identified in bleachery effluents but many more remain unidentified. Thus, substantial quantities of chlorinated organic compounds, both of known and of unknown composition, enter the Canadian aquatic environment from bleached pulp mill discharges. Many of these chlorinated organic compounds are persistent and have been detected in water, sediments and biota up to 1400 km from bleached pulp mills outfalls. Compounds with low chlorine substitution

degrade within hours to days, whereas highly chlorinated organic compounds may persist from days to weeks or longer. Persistence may be longer in winter, especially under ice. Some chlorinated organic compounds can be biologically degraded or transformed and transformation may lead to more persistent and bioaccumulative compounds. Chloroveratroles, for example, transformation products of chloroguaiacols which are unique to bleached pulp mill effluents, are capable of accumulating in fish up to 25 000 times the concentration in water. Seventy-five percent of Canadian bleached pulp mills discharge effluents that are acutely lethal to fish, sometimes at concentrations as low as 3.2% effluent. A few individual chlorinated organic compounds in these effluents approach or surpass concentrations that cause mortalities in aquatic organisms ranging from algae to fish.
Seventy percent of Canadian freshwater bleached pulp mills discharge whole effluent that, even upon dilution by the receiving waters, are at levels which cause chronic effects. Chronic effects, such as reproductive anomalies, biochemical changes, and behavioural alterations in aquatic organisms, have been observed in Canadian field studies at 0.5 to 5 % whole effluent. Laboratory studies using individual chlorinated organic compounds that are commonly discharged from bleached pulp mills have demonstrated such chronic effects as deformities, and embryo and larval mortalities in fish. These chronic effects include significant irreversible factors which jeopardize the continuance of the species and the integrity of the ecosystem. Thus, the levels of whole effluents discharged from Canadian bleached pulp mills to the aquatic environment and the resulting acute and chronic effects observed both in the field and in the laboratory combine to represent a significant risk to the aquatic ecosystem.

f) Project schedules where applicable: I am unsure how this pipe line would be able to fit into nearly a few feet of water, where known sandbars are found within the channel of where this pipe would be settling at. Known ice scours are also another factor, and I am unsure how a plastic pipe would be monitored or saved from major ice which is published by studies in the Northumberland Strait for holding true power to destroying large equipment in recent history.

g) I am wondering for planned land use: The town of Pictou (mayor) has publically stated they will not allow a pipe through their water shed. I am unsure how this plan can continue without the support of a town to allow a construction phase of this nature to occur when the mayor is standing firm and stating “NO” to this pipe proposal.

h) Other undertakings for this proposal: Why is it that Northern Pulp has listed 6 diffusers in their diagram but registered the plan with only 3

diffusers to discharge the effluent? Why is that Northern Pulp was allowed to release a proposal without holding ANY new public information sessions for the public in regards to this new location?

These are only a few of my recent concerns. I would like to address the PM2.5 levels as well, seeing as how we do not have equipment that is properly monitoring or giving a cut off to these levels and how this is allowed to continue to be poisoning the surrounding area with known dangerous chemicals. Why is it that Northern Pulp quoted many of their statements to a pulp mill that never was up and running in Tasmania? Again, how is this allowed to be presented to your level when this knowledge is false and not fairly represented for data collection?

Many Nova Scotians (and beyond) will not allow a pipe to be put forth regardless of your conflict of interests decision. This assuming you will forgo with this project due to being told to do so. It is well known and document the level of shameful conflict our past government has had with this mill. The people will no longer support a known danger to the community any longer if you shall state this plan may continue. Please be morally and ethically correct when addressing this plan. There is not enough data to conclude this will not be harmful to our area. I have worked for the department of fisheries, located in Pictou, Nova Scotia and have been told this matter will fall into federal grounds due to the outfall being in federal waters. Regardless of who owns the case, I would hope you would realize the impacts would be so dangerously outrageous and carry a price tag this province would not be able to fix when it comes to ruining the Northumberland Strait and continuing to poison the area for a foreign company

Thank you for reading my letter of distress.

A very concerned local resident of Pictou County-

To whom it may concern
Am very concerned about the proposed plan to dump effluent into caribou harbour,I fish lobsters in Wallace west of pictou,yano I think it's a joke in 2019 we are talking about having a industrial plant dispose there waste into any body of water let alone a free flowing ocean

My concern is the impact on my fishing industry,how do we truly no that the effluent coming out of the proposed pipe won't kill all the fish and further more who with be crazy enough to purchase the seafood if they actually do survive because everyone nation and world wide would know that those lobsters crab herring etc swim in mill run off

I thank you for your time really hope to see environmental racism come to a hault or someone people will be on the hook for large amounts of money..we say no pipe!!

Project: replacement_effluent_treatment_facility_project Comments: This new Effluent Treatment Facility is state of the art and a leap in science with the latest technologies. I fully 100 approve it. It would be total and absolute financial insanity for the Province of Nova Scotia to shut down the pulp mill when it is proven beyond the shadow of a doubt that both Industry Forestry fishing can co-exist together as they already do in other Provinces in Canada. Furthermore Northern Pulp MUST be given an EXTENSION past the January 2020 deadline,for the proper installation of the pipe and construction of the new treatment facility. I have lived in the town of Pictou for over 50 years. Back then (pre-mill), it was a vibrant town with all the amenities. It is a town steeped in history. I will forego all of what was to offer and go straight to the point. As a young boy I remember when the pulp mill opened. I vaguely remember the foul smell and the reported flakes of a substance that was landing on peoples' cars.

52 years on into the future. I now own that house in which I lived as a young boy – *a circa 200 year old* house that sits prominently on the Pictou Harbour waterfront, with Northern Pulp in the background.

I know the pulp mill well. I grew up with it. I even worked there for a couple months in the early 80s in the spring after my 1st year and 2nd year of university – I worked in the woodlands division when it was Scott Paper. Nevertheless, we now are 35 years beyond that time and I have since witnessed a decaying plant and the simultaneous decline of a community, in part due to the effects of this putrid and rancid smell that often is emitted from those stacks. Today, all of the windows in my house that face south (toward the mill) remain closed permanently. I dare not open in case that waft of sickening air permeates into my living space. Further, I am a runner. I run daily. As soon as I awaken, I must look out the window toward the mill. The wind direction dictates the direction in which I run. Unfortunately on some days, when the wind is from the due south, there is no escaping the foul smell. What am I breathing? Does anyone seriously believe that these odours are harmless? Is this Soviet Union or East Germany of the 1960s?

Pictou's air quality is not of its own doing. This mill is not even in our civic community. It is located across a body of water in the rural municipality of Pictou – a political unit unto its own. People of the town have borne the brunt of this bad air simply due to geography and meteorology. That is, the prevailing winds – primarily blowing from the south and southwest – directly in the path toward our little community.

I have listened and read intently to all of the discussions about the mill. My conclusion is that the behaviour of this pulp mill and its current state is beyond resolve. Its egregious violations, its displays of greed, its lies and half-truths, its ignorance, its poor stewardship of the land, and its disrespect of the lives of citizenry deem this mill to be not worthy of supporting.

Mercury, sludge, toxic, chemical effluent, stench, contamination, cover-up --- these are but a few of the words that go hand-in-hand with this company. There are many other words I am sure. To those Who say it is "the smell of money", I say it is the smell of illness, of cancer, and of death. To the supporters of the mill – the saw mill operators and truck drivers, please come

live in the town of Pictou. Bring your families. Enjoy the stench. Real estate is cheap – house prices have been stagnant for 30 years.

Tell me – which community would accept a pipe carrying toxic chemicals to pass through their watershed? Citizens of Halifax – would you accept this? Citizens of anywhere in Canada – would you accept this?
Of course not. Further, the gall of Northern Pulp to propose that the pipeline be diverted toward the very town which bears the brunt of its toxic shit, then crossing its water source, then proceeding into the Northumberland Strait – right below the waters of the very fishermen who are actively opposing your ill-thought solution. Unbelievable!

I have focused primarily on my own perspective in this letter – from a resident of the town of Pictou. It goes without saying that the good people of Pictou Landing and the Boat Harbour situation is deplorable. I applaud chief Paul for her stance. I also applaud the efforts of the fishermen in protecting their industry.
"No to the effluent plan". Instead of a 21st century solution to a problem, Northern Pulp has offered a very poor 19th century solution. It is clear that the pulp mill is well past its *best-before* date.

I am not naïve to know that there would be economic consequences to whichever decisions are made. I understand what the mill was, but that is now history. Our world has changed. Yes, I understand the jobs discussion. After a mill closure I am confident that a new equilibrium will emerge. We cannot be afraid of change. I want to be on the side of right. In 100 years will the narrative be about propping up a pulp mill that pollutes, that pillages our forests, destroys the environment, and destroys communities, or do I want to be part of a narrative that takes back our pristine province. We are on the cusp of being a "1 million inhabitants" province. Time to shed the old ways and embrace our new strengths.

NO PIPE OVER LAND NOR IN STRAIT

From:

Subject: Letter concerning Northern Pulp
Date: March 6, 2019 2:34:30 PM

Dear Minister,

I am writing to disclose my concerns with Northern Pulps new treatment facility. First off, I would like to describe my frustration with this environment assessment in the sense that I do not find it fair to read through 1700 pages and only have 30 days to respond to you in regards to the many topics I find appalling.

The many issues I have with this proposal are numerous. I would like to describe the sections I find troubling which must be considered by yourself in formulating the decision under subsection 34(1) of the Environment Assessment Regulations.

a) The location of the proposed undertaking and the nature and sensitivity of the surrounding area: Having grown up in Pictou and New Glasgow, I have worked on the water and lived in this surrounding land area. I am unsure how a pipe would be able to bypass a colony of protected birds which are found near the Pictou Causeway, Munro's Island, Caribou Provincial Park, and Water Side Provincial Park. This area is known to be a habitat for species at risk, and I would like to be informed with how this pipe would not alter life of various marine and land species. These migratory and salt water habitat birds that are on the specicies at risk, listed as threatened, endangered within the footprint of the pipe proposal.

b) The size, scope and complexity of the proposed

undertaking: Again, I am unsure how the Boat Harbor cleanup process would be suitable for a federal assessment and undertaking yet a project of such huge cost and nature would only require a 50 day provincial assessment. Viewing reports through the FOIPOP request show that Dillion consultants raised the issue of heavy metals, such as metals and mercury and of Dixons and furans in the effluent. In January 2018, Dillion sent a list of questions to Northern Pulp, KSH consulting and TIR, saying it needed information on the "percentage of dioxins and furans in the final effluent going into the strait daily". In February 2018, Dillion again wrote to Northern Pulp reminding the technical manager of the need to acknowledge these substances, noting that questions have arisen regarding the content of metals in the discharge. So far, Northern Pulp cannot address in their proposal, the chemical characteristics or concentration of known chemicals in their effluent. I would like to understand in common language, how this would be acceptable in 2019. For an area where I live and breathe in, I am extremely frustrated that this level of arrogance to human health is allowed to be documented and presented in a formal means of proposal from a company.

c) My concerns expressed should be seriously noted. I will refuse to live in this area or province if you shall allow a pipe of poison and sludge system of this nature to be granted. I will not allow myself or my family to suffer to this level of criminal environmental behavior. I have attended various committees and understand the

EcoJustice may be following this case to the Supreme Court level. At this time, this level of jurisdiction has granted Pictou Landing First Nations to be considered and consulted by this company for any future construction. I would hope you would be on the right side of history in regard to this serious case of environmental racism this group has already endured for the last 53 years. I stand firm in support, as do many of my friends and family with the closure of Boat Harbour and will not support an extension of any sort for Northern Pulp to continue using Boat Harbour for a treatment facility of their poisonous waste.

d) Whether environmental baseline information has been submitted for the undertaking is sufficient for predicting adverse effects: As we know now, Northern Pulp did not create any base line date to understand any negative impacts to marine life or lobster larvae. They consulted a marine biologist who stated there was once a study done in 1960 and did not hold any true value to the nature of this current Northern Pulp wish to create a pipeline through the Northumberland Strait. Most pulp mills put in oxygen delignification systems back in the 1980s or 1990s but not Northern Pulp. They have never paid for themselves to reduce chemical use and goes on without the use of this system. We know as well, they have not added this system to their proposal. I would like to understand why this is, as they promote the system to the public and state it will be added. Tax payers should not be on the hook for this system. It is very clear that the elimination of boat harbor basin

would have substantial and negative impact on the effluent quality reaching the Northumberland Strait. Based on data thereis enough information to conclude that the new ETF would be worse than the old system because of the elimiiation of the basin. This elimination would create more toxins reaching the Northumberland Strait. The effluent treatment system consists of construcutred sedimentation basins followed by aeration in natural basin with baffle curtains directing flow. A large, natural final polishing follows prior to release to the Northumberland Strait. Point C of the current effluent treatment system also benefits from the settling effect of Boat Harbour prior to Point D, so the impact on marine environment is even less profound.

e) Potential and known adverse effects including identifying species at risk and concern for their habitat: There are known species at risk at the locals of this pipe proposal. The piping plover and wood turtle are known species in the area of the Caribou provincial park, only kilometers away from the proposed pipe location. The Nova Scotia Endangered Species Act (NS ESA) was proclaimed in 1999. This act protects species in NS that have been assessed and determined to be at risk of extinction. The Act applies to all species at risk on private and provincial public (crown) land in NS. The Act prohibits: killing or disturbing species, destroying or disturbing its residence (i.e. habitat), destroying or disturbing core habitat, Prior to development, construction, or alteration of the land; species at risk must be considered. The Federal Species

At Risk Act also applies to all migratory bird species at risk and all marine species at risk, on all land in Canada. The Act prohibits: killing or disturbing species destroying or disturbing its dwelling place (i.e. habitat) destroying or disturbing critical habitat. Prior to development, construction, or alteration of the land; species at risk must be considered. Shellfish and marine ecosystems would also be negatively impacted through the construction of a pipe and dumping of 90 million litres of unknown effluent into the Northumberland Strait, which would occur daily.

Bleach Chlorine Mills and the Impacts on Marine Life:

The molecular chlorine or chlorine-containing compounds currently used as bleaching agents by the pulp and paper sector react with materials released from wood during the pulping process, resulting in the formation of chlorinated organic compounds which are in part discharged into the aquatic environment via effluents. Canadian mills are estimated to use over 610 000 tonnes of chlorine annually to produce over 10 million tonnes of bleached pulp and to release over a million tonnes of chlorinated organic compounds to the aquatic environment. The dioxins and furans are part of the bleaching process and are considered “toxic" under Sections 11(a) and 11(c) of the Canadian Environmental Protection Act and the Federal Government . TSS and BOD are regulated under Sections 34 and 36 of the Fisheries Act which is a Federal act thus requiring Federal involvement. The chemical composition of bleached pulp mill effluents is variable and not well characterized. Approximately 250

compounds have been identified in bleachery effluents but many more remain unidentified. Thus, substantial quantities of chlorinated organic compounds, both of known and of unknown composition, enter the Canadian aquatic environment from bleached pulp mill discharges. Many of these chlorinated organic compounds are persistent and have been detected in water, sediments and biota up to 1400 km from bleached pulp mills outfalls. Compounds with low chlorine substitution degrade within hours to days, whereas highly chlorinated organic compounds may persist from days to weeks or longer. Persistence may be longer in winter, especially under ice. Some chlorinated organic compounds can be biologically degraded or transformed and transformation may lead to more persistent and bioaccumulative compounds. Chloroveratroles, for example, transformation products of chloroguaiacols which are unique to bleached pulp mill effluents, are capable of accumulating in fish up to 25 000 times the concentration in water. Seventy-five percent of Canadian bleached pulp mills discharge effluents that are acutely lethal to fish, sometimes at concentrations as low as 3.2% effluent. A few individual chlorinated organic compounds in these effluents approach or surpass concentrations that cause mortalities in aquatic organisms ranging from algae to fish.

Seventy percent of Canadian freshwater bleached pulp mills discharge whole effluent that, even upon dilution by the receiving waters, are at levels which cause chronic effects. Chronic effects, such as reproductive

anomalies, biochemical changes, and behavioural alterations in aquatic organisms, have been observed in Canadian field studies at 0.5 to 5 % whole effluent. Laboratory studies using individual chlorinated organic compounds that are commonly discharged from bleached pulp mills have demonstrated such chronic effects as deformities, and embryo and larval mortalities in fish. These chronic effects include significant irreversible factors which jeopardize the continuance of the species and the integrity of the ecosystem. Thus, the levels of whole effluents discharged from Canadian bleached pulp mills to the aquatic environment and the resulting acute and chronic effects observed both in the field and in the laboratory combine to represent a significant risk to the aquatic ecosystem.

f) Project schedules where applicable: I am unsure how this pipe line would be able to fit into nearly a few feet of water, where known sandbars are found within the channel of where this pipe would be settling at. Known ice scours are also another factor, and I am unsure how a plastic pipe would be monitored or saved from major ice which is published by studies in the Northumberland Strait for holding true power to destroying large equipment in recent history.

g) I am wondering for planned land use: The town of Pictou (mayor) has publically stated they will not allow a pipe through their water shed. I am unsure how this plan can continue without the support of a town to allow a construction phase of this nature to occur when

the mayor is standing firm and stating “NO” to this pipe proposal.

h) Other undertakings for this proposal: Why is it that Northern Pulp has listed 6 diffusers in their diagram but registered the plan with only 3 diffusers to discharge the effluent? Why is that Northern Pulp was allowed to release a proposal without holding ANY new public information sessions for the public in regards to this new location?

These are only a few of my recent concerns. I would like to address the PM2.5 levels as well, seeing as how we do not have equipment that is properly monitoring or giving a cut off to these levels and how this is allowed to continue to be poisoning the surrounding area with known dangerous chemicals. Why is it that Northern Pulp quoted many of their statements to a pulp mill that never was up and running in Tasmania? Again, how is this allowed to be presented to your level when this knowledge is false and not fairly represented for data collection?
Many Nova Scotians (and beyond) will not allow a pipe to be put forth regardless of your conflict of interests decision. This assuming you will forgo with this project due to being told to do so. It is well known and document the level of shameful conflict our past government has had with this mill. The people will no longer support a known danger to the community any longer if you shall state this plan may continue. Please be morally and ethically correct when addressing this plan. There is not enough data to conclude this will not be harmful to our area. I have worked for the department of fisheries, located in Pictou, Nova Scotia and

have been told this matter will fall into federal grounds due to the outfall being in federal waters. Regardless of who owns the case, I would hope you would realize the impacts would be so dangerously outrageous and carry a price tag this province would not be able to fix when it comes to ruining the Northumberland Strait and continuing to poison the area for a foreign company

Secretary/Secrétaire

UNIFOR

63 Otter Lake Court, Halifax, NS, B3S 1M1

March 6, 2019

Environmental Assessment Branch
Nova Scotia Government, Environment Department
Halifax, NS

Re: Northern Pulp Replacement Effluent Treatment Facility Project

Greetings,

Unifor proudly represents 240 workers at Northern Pulp, 12,000 workers in Nova Scotia, and 23,000 forestry workers across Canada. We are Canada's largest union in the private sector with 315,000 members in every sector of the economy, and regularly advocate for good jobs, sustainable development, and progressive change for a better future.

Northern Pulp has proposed a world-class multi-million dollar investment to fully meet new, more stringent, environmental standards. Nova Scotia, along with the rest of Canada, has among the highest global standards for environmental stewardship in the forestry sector. With this proposed investment, Northern Pulp will be on the leading edge of environmental responsibility and stewardship in the industry. We are writing today to encourage a rapid conditional environmental assessment approval for this project.

Northern Pulp's proposed new effluent treatment facility incorporates the AnoxKaldnes BAS biological treatment process purchased from Veolia Water Technologies, one of the world's leading firms in this field. With more than €2billion in annual revenue and 130 business units around the world, Veolia Water Technologies operates with over 9,000 employees; more than 60% of whom are researchers, engineers and project managers. Moreover, the Water Technologies division is part of the much larger France-based Veolia Group, with €25 billion in annual revenue and 169,000 employees around the world.

We are confident that with appropriate government oversight, a partnership between two global industry leaders, Paper Excellence (Northern Pulp's parent company), and Veolia, is fully capable of rigorously implementing proven technology that will meet all required environmental standards for this project. These two successful global leaders in their fields rely on fully addressing their environmental responsibilities.

Beyond the essential matter of this project meeting the technical requirements for effluent treatment, we would also like to draw your attention to the broader implications of this decision-making process. The Nova Scotia *Environment Act* is recognized as an essential piece of legislation designed to protect our shared environment, and guide our economic development. The *Act* rightly spells out its purpose through a set of principles for sustainable development that should guide its application, including:

> *The linkage between economic and environmental issues, recognizing that long-term economic prosperity depends upon sound environmental management and that effective environmental protection depends on a strong economy.*

It is on this principle that we would like to bring forward a fuller understanding of the vital economic role played by Northern Pulp in the community, and the wider Nova Scotia economy.

A failure to provide approval for this project puts at serious risk the very future of the mill, with far-reaching implications for the entire inter-connected Nova Scotia forestry sector. Beyond the direct operations of the mill, the wider economic impact of Northern Pulp is best understood through the role it plays in sustaining the province's 93 sawmills (responsible for 2,000 direct jobs), and the broader woodland operations held by the more than 30,000 forest landowners (responsible for a further 1,300 direct jobs).

Simply put, each element of Nova Scotia's forestry sector relies on the others. The province's woodland operations supply logs to sawmills for processing into lumber and other wood products, with the leftover woodchips then sent to Northern Pulp as raw material. The top eleven sawmills in Nova Scotia, which account for 96% of the lumber produced here, all have ties to Northern Pulp – more than 90% of sawmill woodchips in the province end up there.

Beyond providing logs to the sawmills, the province's woodland operations also rely on Northern Pulp as a result of their use of selective

harvesting. This best-practice approach involves selectively removing smaller trees to allow others to grow, creating a healthier forest and minimizing the overall environmental impact. These pruned trees are sent to Northern Pulp, which takes 35%-40% of the pulpwood from the provincial market.

Without Northern Pulp as the end market for sawmills and woodland operations, the entire inter-connected forestry sector is at risk. Like many businesses, sawmill and woodland margins are slim, and the removal of a key source of revenue can easily push the operation over the tipping point, resulting in a failure of the whole business. Given the geography of the industry, it is simply uneconomic to transport these unprocessed heavy commodities long distances to pulp mills in other provinces, or the United States.

It is no surprise that an independent economic assessment of Northern Pulp conducted in 2015 found far-reaching impacts. The key findings of that study showed the operations responsible for:

- 339 direct jobs
- 5 spin-off jobs for each direct job
- 2,043 combined direct and spin-off jobs
- Over $100 million in labour income
- $315 million in annual spending and investment
- 1,300 companies in the supply chain affected
- 1 in 12 jobs in Pictou County

It is essential to keep in mind that these are good-paying jobs at risk, the kind of jobs which remain scarce in many rural and smaller communities. A recent analysis by the Forest Products Association of Canada highlighted the vulnerable nature of many forest-dependent communities, finding more than 600 communities across Canada, including several in Nova Scotia, where more than half of all household income comes from forestry jobs. The loss of good jobs in these dependent communities is even more devastating than in larger communities with more diverse local economies.

Nova Scotia’s forestry sector is an essential ingredient in our economy, delivering a $2.1 billion annual economic impact, 11,500 direct and indirect jobs, is the second-largest source of employment among good-producing sectors, and the province’s third-largest goods exporter. Around the world, forestry is increasingly recognized as a renewable green industry with the potential for a strong future as part of a sustainable economy.

The *Environment Act* clearly articulates the link between sustainable development and long-term economic prosperity. We believe that it is not only possible to make decisions that deliver both strong environmental standards, and good jobs, but that it is our responsibility.

Sincerely,

Atlantic Director, Unifor

Re: Northern Pulp Replacement Effluent Treatment Facility Project

Greetings,

Unifor proudly represents 240 workers at Northern Pulp, 12,000 workers in Nova Scotia, and 23,000 forestry workers across Canada. We are Canada's largest union in the private sector with 315,000 members in every sector of the economy, and regularly advocate for good jobs, sustainable development, and progressive change for a better future.

Northern Pulp has proposed a world-class multi-million dollar investment to fully meet new, more stringent, environmental standards. Nova Scotia, along with the rest of Canada, has among the highest global standards for environmental stewardship in the forestry sector. With this proposed investment, Northern Pulp will be on the leading edge of environmental responsibility and stewardship in the industry. We are writing today to encourage a rapid conditional environmental assessment approval for this project.

Northern Pulp's proposed new effluent treatment facility incorporates the AnoxKaldnes BAS biological treatment process purchased from Veolia Water Technologies, one of the world's leading firms in this field. With more than €2billion in annual revenue and 130 business units around the world, Veolia Water Technologies operates with over 9,000 employees; more than 60% of whom are researchers, engineers and project managers. Moreover, the Water Technologies division is part of the much larger France-based Veolia Group, with €25 billion in annual revenue and 169,000 employees around the world.

We are confident that with appropriate government oversight, a partnership between two global industry leaders, Paper Excellence (Northern Pulp's parent company), and Veolia, is fully capable of rigorously implementing proven technology that will meet all required

environmental standards for this project. These two successful global leaders in their fields rely on fully addressing their environmental responsibilities.

Beyond the essential matter of this project meeting the technical requirements for effluent treatment, we would also like to draw your attention to the broader implications of this decision-making process. The Nova Scotia *Environment Act* is recognized as an essential piece of legislation designed to protect our shared environment, and guide our economic development. The *Act* rightly spells out its purpose through a set of principles for sustainable development that should guide its application, including:

> *The linkage between economic and environmental issues, recognizing that long-term economic prosperity depends upon sound environmental management and that effective environmental protection depends on a strong economy.*

It is on this principle that we would like to bring forward a fuller understanding of the vital economic role played by Northern Pulp in the community, and the wider Nova Scotia economy.

A failure to provide approval for this project puts at serious risk the very future of the mill, with far-reaching implications for the entire inter-connected Nova Scotia forestry sector. Beyond the direct operations of the mill, the wider economic impact of Northern Pulp is best understood through the role it plays in sustaining the province's 93 sawmills (responsible for 2,000 direct jobs), and the broader woodland operations held by the more than 30,000 forest landowners (responsible for a further 1,300 direct jobs).

Simply put, each element of Nova Scotia's forestry sector relies on the others. The province's woodland operations supply logs to sawmills for processing into lumber and other wood products, with the leftover woodchips then sent to Northern Pulp as raw material. The top eleven sawmills in Nova Scotia, which account for 96% of the lumber produced here, all have ties to Northern Pulp – more than 90% of sawmill woodchips in the province end up there.

Beyond providing logs to the sawmills, the province's woodland operations also rely on Northern Pulp as a result of their use of selective harvesting. This best-practice approach involves selectively removing smaller trees to allow others to grow, creating a healthier forest and minimizing the overall environmental impact. These pruned trees are sent to Northern Pulp, which takes 35%-40% of the pulpwood from the provincial market.

Without Northern Pulp as the end market for sawmills and woodland operations, the entire inter-connected forestry sector is at risk. Like many businesses, sawmill and woodland margins are slim, and the removal of a key source of revenue can easily push the operation over the tipping point, resulting in a failure of the whole business. Given the geography of the industry, it is simply uneconomic to transport these unprocessed heavy commodities long distances to pulp mills in other provinces, or the United States.

It is no surprise that an independent economic assessment of Northern Pulp conducted in 2015 found far-reaching impacts. The key findings of that study showed the operations responsible for:

- 339 direct jobs
- 5 spin-off jobs for each direct job
- 2,043 combined direct and spin-off jobs
- Over $100 million in labour income
- $315 million in annual spending and investment
- 1,300 companies in the supply chain affected
- 1 in 12 jobs in Pictou County

It is essential to keep in mind that these are good-paying jobs at risk, the kind of jobs which remain scarce in many rural and smaller communities. A recent analysis by the Forest Products Association of Canada highlighted the vulnerable nature of many forest-dependent communities, finding more than 600 communities across Canada, including several in Nova Scotia, where more than half of all household income comes from forestry jobs. The loss of good jobs in these dependent communities is even more devastating than in larger communities with more diverse local economies.

Nova Scotia's forestry sector is an essential ingredient in our economy, delivering a $2.1 billion annual economic impact, 11,500 direct and indirect jobs, is the second-largest source of employment among good-producing sectors, and the province's third-largest goods exporter. Around the world, forestry is increasingly recognized as a renewable green industry with the potential for a strong future as part of a sustainable economy.

The *Environment Act* clearly articulates the link between sustainable development and long-term economic prosperity. We believe that it is not only possible to make decisions that deliver both strong environmental standards, and good jobs, but that it is our responsibility.

Sincerely,

Atlantic Director, Unifor

Project: replacement_effluent_treatment_facility_project Comments: Please dont approve Northern Pulps proposed effluent pipe into the Northumberland Straight because: - This is 2019 not 1967. Ive had enough of the lies and broken promises by the pulp mill and government over the years, and destruction of our environment by this big corporation. - The proposed line goes through the Town of Pictous watershed and, given the mills past history, a leak is inevitable. - To put this untreated effluent into the Northumberland Straight and take the chance of damaging the ecosystem and losing the fishing industry would be devastating and more costly to the economy than closing the mill. I dont want to see another toxic mess in the Straight, like the one in Boat Harbour, that we can never clean up. My vote is for closing the mill today!!! Thank-you. Sincerely, Name: Email: Address:

Please see below our joint comments on the ***Environmental Assessment for a Replacement Effluent Treatment Facility Project by Northern Pulp Nova Scotia Corporation***.

We are an environmental engineer and a biologist from Pictou, NS, so this project is of significant importance for us both personally and professionally. We frequently visit the Northumberland Straight area of Pictou with our families for recreation and also have many friends and family who live in Pictou; so being assured that the new effluent treatment plan by Northern Pulp will not jeopardize the environmental conditions of the area is extremely important for us.

After reviewing the environmental assessment (EA) submitted by Northern Pulp Nova Scotia Corporation it is our mutual opinion that much of the supporting information submitted as part of this Class I EA is incomplete. This is presumably due to the project timeline and that significant components of the proposed project required a redesign which only commenced in late 2018. The redesign of the effluent discharge system was required in order to avoid ice scour in the originally proposed Pictou Road effluent discharge area. The project team should be commended for making this change to avoid potential environmental impacts resulting from damage to the proposed effluent diffusers, however, **the scope of the environmental assessment should not be reduced (or finalized after EA approval) given the need for a project redesign**.

In many cases field work that was completed for the original design was used for the redesigned project. There is a significant difference between the original project scope and the redesigned project as presented in the EA; namely the introduction of a 15.5km pipeline and an entirely new location for discharging the treated effluent into the marine environment. Critical information is missing from the submitted EA including any biological assessments along the routing of the on land pipeline (which passes through the watershed for the Town of Pictou's municipal groundwater supply) and no marine habitat surveys were completed in the area now proposed for treated effluent discharge.

Additional, the EA relies heavily on the 1992 Pulp and Paper Effluent Regulations (PPER) which are part of the Fisheries Act. The report states that *"The effluent is anticipated to meet compliance with federal PPER."* It should be noted that the EA provides no evidence to support this statement. No calculations of maximum total suspended solids (TSS) or biochemical oxygen demand (BOD) (which is how the PPER regulates effluent) are provided.

A status report on the PPER was published by Environment & Climate Change Canada (ECCC) in 2012 (http://publications.gc.ca/site/eng/420919/publication.html) which found that a review of environmental effects monitoring (EEM) data from active pulp mills indicates that *"…some effluents appear to continue to cause effects on fish and/or fish habitat."* Further, a consultation document on the proposed modernization of the PPER prepared by ECCC in 2017 (https://www.nben.ca/en/marine-fisheries-aquaculture?download=5045:proposed-modernization-of-the-pulp-and-paper-effluent-regulations-consultation-document-environment-and-climate-change-canada-september-2017) noted that *"effluents from 70% of pulp and paper mills are impacting fish and/or fish habitat and the impacts at 55% of these mills are indicative of a higher risk to the environment."* This is despite the fact that

"Effluent samples from these mills were compliant with BOD and SS limits 99.9 percent of the time, and were non-acutely lethal to fish 97.6% of the time." As indicated in the consolation document ECCC are currently working to modernize the PPER and are aiming to publish proposed amendments to the PPER for comment in 2019. Clearly Northern Pulp Nova Scotia Corporation are only required to adhere to current regulations, however, the work being conducted by ECCC should be considered when assessing the potential for cumulative environmental effects of the proposed project. ECCC's findings indicate that compliance with the 1992 PPER itself does not guarantee that there will be no adverse effects to the marine environment. NSE should exercise a precautionary approach when determining the potential for adverse environmental impacts of the proposed project.

Lastly, we are concerned that a Class 1 EA was deemed appropriate for this project. On NSE's website it is noted that *"Class 2 undertakings are typically larger in scale and are considered to have the potential to cause significant environmental impacts and concern to the public. These types of developments include, but are not limited to, solid waste incinerators, petrochemical facilities and pulp plants"* From existing mill operations the proposed project involves an entirely new effluent treatment system, a new process to burn waste sludge (from the new effluent treatment plant) in the mill's power boiler, a new 11.4 km on land pipeline, a new 4.1 km marine pipeline (involving marine trenching and possible construction of a small jetty for installation) and an entirely new marine discharge location. Given this **it is our opinion that a Class II EA should be required**. While initially it was agreed that a Class I EA was sufficient by NSE, the scope of the proposed project has changed significantly (as noted above) since that time.

Based on the comments above and below, in particular the lack of land based and marine biological assessments and indications from ECCC that active pulp mills complying with the federal PPER are actually impacting fish and/or fish habitat **we would implore NSE to not approve this project at this time**.

Please see the table below with more specific comments.

Respectfully,

Section	Comment
2.3 para. 7, 8	The report indicates that *"…it was not possible to conduct field work in the new pipeline corridor or marine environment in order to inform this EA Registration"* The rationale for not completing these biological assessments is that an alternative pipeline route and discharge location was identified in fall 2018 due to the presence of ice scour found in the originally proposed treated effluent discharge location. Presumably the timing of this discovery would have not allowed for biological field investigations in 2018. The report indicates that *"Follow up field work as appropriate for the work proposed will be completed in parallel to the EA Registration review…"*. The full extent of biological impacts cannot be assessed without proper field work first being undertaken. The scope of the assessment should not be lessened due to construction time constraints and design delays based on site conditions As per the proposed project schedule, the project will not be completed prior to legislated closing of the BHETF anyways. NSE should require full biological assessments, which could be conducted in spring / summer 2019, prior to approval.
5.2.2.9 Table 5.2-1	Table 5.2-1 (also presented in Table 5.6-1) provides information on the anticipated daily maximum treated effluent water quality as reprinted from the Receiving Waters Study (Appendix E). The Receiving Waters Study indicates that this data was provided by KSH (the design consultant for the effluent treatment system). No supporting documentation was provided from KSH as part of the EA submission. How was the treated effluent water quality data presented in Table 5.2-1 and Table 5.6-1 calculated? What level of accuracy is the data?
5.3.2.5	Given the majority of the pipeline will be buried under 1m of fill or asphalt how will inspection of pipeline condition be conducted? The report indicates visual inspections be conducted.
5.4	The proposed project schedule indicates that the new effluent treatment facility would not be completed prior to the legislative closure of boat harbor effluent treatment facility (BHEFT) as per the Boat Harbor Act. The NS provincial government has stated publically that an extension will not be provided for the BHEFT. Is the proposed project even viable?
5.4 Table 5.4-1	The report indicates that the assessments listed below are not yet completed: • Avian / turtle follow-up field studies, • MEKS field surveys, • Vegetation, wetland and watercourse follow-up field studies, • Marine seismic, geotechnical and habitat surveys The potential environmental impacts of the proposed project cannot be fully assessed with this work not yet completed, in particular the marine habitat surveys. NSE should require these assessments be completed prior to granting approval.
5.7.2.7, 7th bullet	The report indicates that *"Scheduling of project activities will be coordinated through consultation with local fish harvesters, Northumberland Ferries and other stakeholders and best-efforts will be made to schedule activities to minimize interference" A*s per table 4.5.1 the proposed schedule for the construction of the marine pipeline is April / May 2020 – Oct. 2020 which entirely

	overlaps with lobster fishing season as well as the Northumberland Ferries operational season. The proposed project would likely be very disruptive to Lobster fishing as well as to Northumberland Ferries.
8.7.2.5	The report indicates that no field assessments for wetlands in the pipeline footprint area were completed due to the pipeline redesign required in fall 2018. Functional assessment information is only provided for WL-1 and WL-2 within the effluent treatment facility (ETF) footprint. Some of the wetlands in the pipeline footprint area would likely be considered wetlands of special significance by NSE given their location within a source water protection area or their type being salt marsh. The assessment of potential impact to wetlands cannot be determined without proper field assessment and functional assessment work being completed. This work should be completed prior to NSE making a decision on the proposed project.
8.12.2.3, para. 5	To describe benthic invertebrate habitat the report references a marine habitat survey completed by AMEC in 2015 for a different project. Does the AMEC habitat assessment cover the full extent of the marine project footprint area for the proposed project? It appears that no marine habitat survey was completed specifically for the proposed project. A new marine habitat survey should be completed prior to NSE making a decision on the proposed project.
8.12.3.3 para. 10	The report states that *"Effluent quality will necessarily comply with all federal and provincial permit conditions and regulatory requirements such as PPER."* Has a calculation been completed to confirm effluent will comply with the PPER? The PPER sets maximum daily and monthly limits on BOD and TSS based on the mill's reference production rate. What is the reference production rate for the mill? This information along with the concentrations of BOD and TSS in the treated effluent and flow rates (both provided in the EA report) could be used to calculate compliance with the PPER. This information does not appear to be provided.
8.12.3.3 para. 10	The report states that *"It was determined in the receiving water study (Stantec 2018; Appendix E) that water quality at the end of the mixing zone for the three-port diffuser will reach ambient conditions within less than 2 m from the diffuser in terms of total nitrogen, total phosphorous, TSS, DO, pH, and salinity. Colour will return to baseline conditions within 5 m of the diffuser. Temperature will be within 0.1 °C of background at the end of the 100-m mixing zone."* It is noted that given the project redesign initiated in fall 2018 no background water samples were collected from Caribou Harbour, therefore, background water quality data from the previous discharge location at Pictou Road (6km from the current proposed discharge site) was used. How can it be concluded that water quality will return to ambient conditions within 100m of the diffuser when no background water quality samples were collected in this area? Also no background information was collected for AOX, COD, or BOD. NSE should require the collection of background water samples from the proposed effluent discharge location before approving this project.
9.2.4.2 Para. 3	The report indicates that "*Due to uncertainty regarding effluent composition and approximate concentrations of substances present in the future treated effluent (which will not be verified until the project is operational), the identified candidate COPCs in effluent are considered preliminary at this time)."* How can cumulative human health and environmental effects be determined to be non-significant given that the chemical composition of the treated effluent is not fully known?

10.4.3.1	The mitigation measures provided for an accidental release of treated effluent from the pipeline or the effluent treatment facility are construction specifications and a proposed maintenance and inspection program. If a leak is encountered the mill should be required to stop operations (cease effluent flow). Further, what is the risk to groundwater if a leak occurs in the land-based pipeline? This is not discussed in the report and is of particular concern given that the pipeline crosses through the watershed for the Town of Pictou's municipal well water supply.
10.4.4.1	As a mitigation measure for potential damage to the treated effluent diffuser the report states that *"Given the strong currents of the Caribou Channel at the outfall location significant diffusion is still likely to take place without the diffuser nozzle(s) in place;"* While the Receiving Waters Study (Appendix E) indicates that effluent would predominantly be transported with offshore current there are several scenarios where far-field modeling results indicate effluent intrusion into Caribou Harbour. Given the proposed treated effluent discharge area is known to have ice present what is the likelihood of diffuser damage and what are the cumulative effects of treated effluent intrusion into Caribou Harbor? The report indicates that *"Upon detection of any marine outfall pipe damage or diffuser fouling, repairs would be promptly performed;"* the mill should be required to stop operations (cease effluent flow) in this scenario.
12.2 Groundwater VEC	The report indicates that interactions between the project and groundwater are not anticipated. The rationale for not including groundwater as a valued ecosystem component (VEC) is that *"…it is unlikely that groundwater from the PFA* (project footprint area) *would affect residential water supplies."* Is groundwater for municipal use considered in this section? It appears only private residential wells were considered. The potential for impacts on the town of Pictou's municipal well water should be considered.
12.3.8.1, para. 7	The report states that *"…any potential environmental effects on water quality during the operation and maintenance phase will be highly localized."* and *"that water quality at the end of the mixing zone for the three-port diffuser will reach ambient conditions within less than 2 m from the diffuser in terms of total nitrogen, total phosphorous, DO, pH, temperature, and salinity. Colour will return to baseline conditions within 5 m of the diffuser."* What is the cumulative effect of absorbable organic halides (AOX) which include Dioxins? As per the Receiving Water Study background concentrations of AOX is n/a (assumed to be negligible). The treated effluent contains a concentration of 7.8 mg/L of AOX with a concentration of 0.05 mg/L at the end of the mixing zone 100m from the diffuser. Given the high volume of treated effluent discharge at 62,000,000 L / day and the 50 year projected lifespan of the project what are the long term impacts of AOX presence above existing conditions? This is of particular importance given that AOX are known to be persistent and accumulate in the environment. Subject: Proposed Project Comments
Date: March 6, 2019 3:38:49 PM

Project: replacement_effluent_treatment_facility_project Comments: Hello, Firstly, Id like to say that it is ludicrous to even consider a proposal for a pipeline carrying partly treated pulp mill effluent through the Town of Pictous watershed on its way to an important fishing area. Already the presence of the toxins from the effluent in Boat Harbour, and the leaks that have happened mean that people in Pictou Landing First Nation and in the Pictou Landing area in general have good reason to distrust the safety of the aquifer. Why take this same risk for the Town of Pictou? Please prioritize the health of the forests, all the life in the Northumberland Straight and the safety of the air we breath, when making your decision. If any of these deteriorate more than they already have, human communities in the area will suffer. This mill has a terrible colonial history from the very beginning, when the Nova Scotia Water Authority gained permission from Pictou Landing First Nation to use Boat Harbour for the mills effluent by pretending that a not yet in use sewage lagoon near Saint John was a treatment facility for the nearby pulp mills waste water. This continued with a series of broken promises by Nova Scotia governments to close the Treatment Facility. Now that it is finally slated to close, Chief Andrea Paul has made it very clear that Pictou Landing First Nation does not agree with the mills proposal for a new waste treatment process that would mean the discharge of partly treated effluent into the Northumberland Straight. Please break from the colonial way of doing things and respect the people of Pictou Landings right to free, prior, informed consent about developments affecting them, according to the United Nations Declaration on the Rights of Indigenous Peoples. Canada has ratified this dec laration, so we should abide by it. The answer should be no! Please dont approve this pipe because if it cannot go ahead the mill might close and that would be a very good thing because it would give the environment a chance to recover. This includes the air, the waters of Boat Harbour and the Northumberland Straight, and the forests which have endured years of clear-cutting, whole tree harvesting and spraying. Besides the ecological benefits of the closure of the mill, other kinds of economic activities that are hampered by the pollution from the mill could flourish if it were to close. There is a climate emergency on earth caused by human activity. We need to do our part to curb greenhouse gas emissions and preserve the ability of ecosystems like forests to absorb carbon dioxide. The closure of the mill would be an opportunity to change forestry practices in the province that could lead to an end to clear-cutting. This would be a step in the right direction for the climate and for the sake of the forests themselves as living entities. Successive federal and provincial governments have pandered to the will of the various owners of the pulp mill at Abercrombie Point since its construction was first proposed. Your government has shown you can stand up to the mill owners by not extending the deadline for the closure of the Boat Harbour Treatment Facility. Please stand up to them now and refuse to approve this preposterous proposal. Thank-you, Name: Email: @gmail.com Address:

Subject: Pulp Mill
Date: March 6, 2019 4:26:26 PM

I am against giving the pulp mill any right whatsoever to pump any pollutants into the water surrounding Nova Scotia. I am against the pulp mill in every way. I do not want them to have the right to harvest our crown land, and think we should have a small sustainable forestry plan for the province. I do not believe a foreign owned company should have rights to our land. Letting them pump pollutants into our water is unacceptable.

Thank You,

Teacher, HRCE

Subject: In support of Northern Pulp"s EA application
Date: March 6, 2019 4:40:58 PM

I am writing in support of the Environmental Assessment application submitted by Northern Pulp for its new treatment facility.

A lot has been said about Northern Pulp and its impact on the local community. I stand in agreement with many, including Unifor, that Boat Harbour must close and be cleaned up to respect Pictou Landing First Nations people and their land. I also know there are many positives about having 300 good-paying jobs in Pictou, supporting thousands more across Nova Scotia, particularly in rural communities.

The Nova Scotia Environment Act is an essential piece of legislation designed to protect our shared environment and guide our economic development. The Act rightly spells out its purpose through a set of principles for sustainable development that should guide its application, including:

------> The linkage between economic and environmental issues, recognizing that long-term economic prosperity depends upon sound environmental management and that effective environmental protection depends on a strong economy.

In this situation, science should determine the best path forward. Nova Scotia, along with the rest of Canada, has among the highest global standards for environmental stewardship in the forestry sector.

The job of government and every person we elect to represent us in government is to find the best way forward when there are many competing and sometimes opposing interests. Communities across Canada manage to find a fair balance where good mill jobs coexist with a prosperous fishing industry and thriving communities.

We can and must find this balance for Pictou. There is a lot at stake: jobs, the environment, and respect for First Nations. We can and must find a solution that supports all three.

Thank you.

The Nova Scotia Environment Act is an essential piece of legislation designed to protect our shared environment and guide our economic development. The Act rightly spells out its purpose through a set of principles for sustainable development that should guide its application, including:

------> The linkage between economic and environmental issues, recognizing that long-term economic prosperity depends upon sound environmental management and that effective environmental protection depends on a strong economy.

In this situation, science should determine the best path forward. Nova Scotia, along with the rest of Canada, has among the highest global standards for environmental stewardship in the forestry sector.

The job of government and every person we elect to represent us in government is to find the best way forward when there are many competing and sometimes opposing interests. Communities across Canada manage to find a fair balance where good mill jobs coexist with a prosperous fishing industry and thriving communities.

We can and must find this balance for Pictou. There is a lot at stake: jobs, the environment, and respect for First Nations. We can and must find a solution that supports all three.

Thank you.

I am writing in support of the Environmental Assessment application submitted by Northern Pulp for its new treatment facility.

A lot has been said about Northern Pulp and its impact on the local community. I stand in agreement with many, including Unifor, that Boat Harbour must close and be cleaned up to respect Pictou Landing First Nations people and their land. I also know there are many positives about having 300 good-paying jobs in Pictou, supporting thousands more across Nova Scotia, particularly in rural communities.

Subject: Soutien à l"évaluation environmentale de Northern Pulp
Date: March 6, 2019 4:53:39 PM

Je vous écris pour appuyer la demande d'évaluation environnementale présentée par Northern Pulp pour sa nouvelle installation de traitement.

On a beaucoup parlé de Northern Pulp et de ses répercussions sur la collectivité locale. Je suis d'accord avec beaucoup de gens, y compris Unifor, pour dire que Boat Harbour doit être fermé et nettoyé pour respecter les Premières Nations de Pictou Landing et leurs terres. Je sais aussi qu'il y a beaucoup d'avantages à avoir 300 emplois bien rémunérés à Pictou et à soutenir des milliers d'autres en Nouvelle-Écosse, particulièrement dans les collectivités rurales.

La Loi sur l'environnement de la Nouvelle-Écosse est reconnue comme une loi essentielle conçue pour protéger notre environnement commun et guider notre développement économique. La Loi énonce à juste titre son objet au moyen d'un ensemble de principes de développement durable qui devraient guider son application, notamment :

------> Le lien entre les questions économiques et environnementales, en reconnaissant que la prospérité économique à long terme dépend d'une saine gestion environnementale et qu'une protection efficace de l'environnement dépend d'une économie forte.

Dans cette situation, la science devrait déterminer la meilleure voie à suivre. La Nouvelle-Écosse, tout comme le reste du Canada, possède l'une des normes mondiales les plus élevées en matière de gérance environnementale dans le secteur forestier.

Le travail du gouvernement et de chaque personne que nous élisons pour nous représenter au gouvernement consiste à trouver la meilleure voie à suivre lorsqu'il y a de nombreux intérêts concurrents et parfois opposés. Les collectivités d'un bout à l'autre du Canada parviennent à trouver un juste équilibre où de bons emplois dans les usines coexistent avec une industrie de la pêche et des collectivités prospères.

Nous pouvons et nous devons trouver cet équilibre pour Pictou. Il y a beaucoup en jeu. Des emplois. L’environnement et le respect des Premières Nations. Nous pouvons et nous devons trouver une solution qui soutient les trois.

Merci.

Our whole household income relies on Northern Pulp, mine as a direct employee and my husband as well who works as a harvester operator for one of Northern Pulps forestry contractors! This whole process has been so stressful and has caused us to not make any unnecessary purchases due to all this uncertainty!

Date: March 6, 2019 5:15:03 PM

I am writing in support of the Environmental Assessment application submitted by Northern Pulp for its new treatment facility.

A lot has been said about Northern Pulp and its impact on the local community. I stand in agreement with many, including Unifor, that Boat Harbour must close and be cleaned up to respect Pictou Landing First Nations people and their land. I also know there are many positives about having 300 good-paying jobs in Pictou, supporting thousands more across Nova Scotia, particularly in rural communities.

The Nova Scotia Environment Act is an essential piece of legislation designed to protect our shared environment and guide our economic development. The Act rightly spells out its purpose through a set of principles for sustainable development that should guide its application, including:

------> The linkage between economic and environmental issues, recognizing that long-term economic prosperity depends upon sound environmental management and that effective environmental protection depends on a strong economy.

In this situation, science should determine the best path forward. Nova Scotia, along with the rest of Canada, has among the highest global standards for environmental stewardship in the forestry sector.

The job of government and every person we elect to represent us in government is to find the best way forward when there are many competing and sometimes opposing interests. Communities across Canada manage to find a fair balance where good mill jobs coexist with a prosperous fishing industry and thriving communities.

We can and must find this balance for Pictou. There is a lot at stake: jobs, the environment, and respect for First Nations. We can and must find a solution that supports all three.

Thank you.

Subject: Re: Northern Pulp Replacement Effluent Treatment Facility Project
Date: March 6, 2019 5:31:15 PM

March 6th, 2019

To whom it may concern

I am writing you to voice my *strong opposition of Northern Pulp's proposed on-site activated sludge treatment system*, which will pump millions of litres of hot toxic pulp daily through 11.4km of pipe across sensitive watersheds, directly out of Caribou Harbour, one of Nova Scotia's key tourism entry points and into the Northumberland Strait, one of Nova Scotia's most important lobster and fishing/breeding grounds.

As a cottage owner in Pictou County for over 20 years I am being asked to trust that the research has been exhaustive and thorough and that I have nothing to worry about based on a company with a dismal track record and an environmental assessment report that reports there will be no residual effect on the environment...whatsoever, in any scenario!

Let me start by saying that I find it unfathomable that Dillon Consultings' 'executive summary' of the Environmental Assessment report developed on behalf of Northern Pulp, indicates that not one single item within the submission would have any significant 'Residual Environmental Effect Predicted'. Not one out of 18 areas affected (including marine habitat, ground water, wildlife, plant life...etc) will have any residual effect; including no effect during construction, no effect during ongoing operation, no effect during ongoing maintenance, no effect during accidents, no affect during malfunctions, no affect during unplanned events! How can this even be possible?

Not to mention the amount of fresh water and forests consumed daily to feed the mills ongoing operations, or the air pollution that we have all been living with which becomes literally unbearable depending on which way the wind blows and whether the mill is in its '130% operational efficiency' mode!

Here is an additional part that causes me significant concern. What exactly will be coming out of the pipe and dumping into the Northumberland Strait? How can we possibly know, when they don't even know. The Dillon EA report referred to above has the following statement:

'At this time, effluent chemistry characteristics including the specific substances present in the treated effluent and their anticipated concentrations will not be known with certainty until the project is operational'

Clearly additional information is required before any decisions can be made on Northern Pulp's proposal. Why are we not insisting that this should either be a closed loop system or nothing at all. Give Pictou County a chance to thrive with clean air and clean water.

The County and all of its residents deserve that much!

Yours respectively,

Cottage Owner,

I also know there are many positives about having 300 good-paying jobs in Pictou, supporting thousands more across Nova Scotia, particularly in rural communities.

The Nova Scotia Environment Act is an essential piece of legislation designed to protect our shared environment and guide our economic development. The Act rightly spells out its purpose through a set of principles for sustainable development that should guide its application, including:

------> The linkage between economic and environmental issues, recognizing that long-term economic prosperity depends upon sound environmental management and that effective environmental protection depends on a strong economy.

In this situation, science should determine the best path forward. Nova Scotia, along with the rest of Canada, has among the highest global standards for environmental stewardship in the forestry sector.

The job of government and every person we elect to represent us in government is to find the best way forward when there are many competing and sometimes opposing interests. Communities across Canada manage to find a fair balance where good mill jobs coexist with a prosperous fishing industry and thriving communities.

We can and must find this balance for Pictou. There is a lot at stake: jobs, the environment, and respect for First Nations. We can and must find a solution that supports all three.

Thank you.

I am writing in support of the Environmental Assessment application submitted by Northern Pulp for its new treatment facility.

A lot has been said about Northern Pulp and its impact on the local community. I stand in agreement with many, including Unifor, that Boat Harbour must close and be cleaned up to respect Pictou Landing First Nations people and their land. I also know there are many positives about having 300 good-paying jobs in Pictou, supporting thousands more across Nova Scotia, particularly in rural communities.

Subject: Proposed Project Comments
Date: March 6, 2019 8:17:22 PM

Project: replacement_effluent_treatment_facility_project Comments: We are writing to express our opposition to Northern Pulpâ?Ts Proposed Replacement Effluent Treatment Facility Project as we feel it will result in significant adverse effects to the environment. Although we oppose the continued environmental pollution the mill has caused to the air, land and water as well as the on-going degradation of our forests within the province, for the purpose of this letter we will concentrate primarily on the effluent discharge into the Northumberland Strait in relation to the proposed Effluent Treatment Facility ETF. Our family have been property owners on Caribou Island for over 40 years, close in proximity to where the proposed effluent discharge outlet will be located. We have the utmost concern as to how this proposal will not only affect the environment, but the fishery, tourism, recreation and the general health and well-being of residents in Pictou county and beyond. Perhaps the biggest objection to the argument the Northern Pulp Nova Scotia NPNS proposal makes for the acceptance of the ETF and the discharge of effluent into the Northumberland Strait, is the lack of an objective, transparent, and unbiased opinion. This is no more evident than the fact that NSPC is the client of Stantec who has prepared the study. This as well as the limitations put upon the consultant are brought to light in the Sign-off Sheet of Appendix E1 which states: â?oThis document entitled Addendum Receiving Water Study for Northern Pulp Effluent Treatment Facility Replacement Project â?" Additional Outfall Location CH-B, Caribou Point, Nova Scotia was prepared by Stantec Consulting Ltd. â?oStantecâ? for the account of Northern Pulp Nova Scotia Corporation the â?oClientâ?â?¦â?The material in it reflects Stantecâ?Ts professional judgement in light of the scope, schedule and other limitations stated in the document and in the contract between Stantec and Clientâ?¦â? As we have no real knowledge â?oof the scope, schedule and other limitationsâ? in the contract between Stantec and NPNS, we cannot know if this assessment is truly unbiased, and given the terms as stated above, could not be perceived as being independent. Likewise, the â?oscheduleâ? as stated in the above, in itself questions if there was appropriate time to conduct a thorough enough research and analysis. We feel that much of the analysis is based on assumptions and models that we would not truly know if correct until this proposal was implemented, and at that point it would be too late should it be discovered that any of the key assumptions donâ?Tt hold true. Therefore, we feel that much of key information as written in Northern Pulpâ?Ts proposal is potentially flawed and requires further examination and scientific assessment by an independent third party. Table E.1.1-1: Summary of the Significance of Project-Related Residual Environmental Effects found in the Executive Summary, Pg. xxxiv, of The Northern Pulp Nova Scotia Effluent Treatment Facility Environmental Assessment Registration Document states within all of the Valued Environmental Component Vac categories that there was â?oNo Significant Residual Environmental Effect Predicted NSâ?. This includes such wide ranging environmental categories as Wetlands, Marine Mammals, Sea Turtles, and Marine Birds, Marine Fish and Fish Habitat, Harbour Physical Environment, Water Quality and Sediment Quality, to name only a few. However throughout the submission it is stated that the outcomes are predicted, so it is clear that results are best guesses and far from certainties. We do not feel that this assessment can be a true reflection of the potential damage to each of the VACâ?Ts based on the assumptions. It has been proven time and again that when it relates to the environment, assumptions are often misplaced. Examples of such assumptions can be found within the footnotes of the above noted table: â?oWater quality has been assessed through modelling of the treated effluent discharge. Through the analysis it has been

determined that under â?~worse caseâ?T conditions water quality at the end of the mixing zone for the three-port diffuser will reach ambient conditions within less than 2 m from the diffuser in terms of total nitrogen, total phosphorous, TSS, DO, pH, and salinity. Colour will return to baseline conditions within 5 m of the diffuser. Temperature will be within 0.1 Â°C of background at the end of the 100-m mixing zone.â? The key term to consider in the above statements is â?oWater quality has been assessed through modelling of the treated effluent discharge.â? It is not a certainty that results in actual conditions which are harsh and unpredictable will be the same as modelling that has taken place. Due to the importance of this, it again illustrates that modelling, testing and data needs to be completed by an independent, third party source. Likewise, in our eyes, it defies logic that: â?owater quality at the end of the mixing zone for the three-port diffuser will reach ambient conditions within less than 2 m from the diffuser in terms of total nitrogen, total phosphorous, TSS, DO, pH, and salinity. Colour will return to baseline conditions within 5 m of the diffuser. Temperature will be within 0.1 Â°C of background at the end of the 100-m mixing zone.â? With effluent discharge at a rate of 62,000 to 85,000 litres per day, the mere volume of effluent flowing through the end of diffusers would result in the effluent being pushed out with such force that reaching ambient conditions a mere 2 m of the discharge point is questionable. The consecutive statement that â?ocolour will return to baseline conditions within 5 m of the diffuserâ? appears to discredit the previous statement. If it takes 5 m for the colour to return to baseline conditions, would it not be likely that there must be chemicals within the effluent after 2 m of discharge? It is also stated within the Executive Summary, pg. xxxiii, par. 3, that â?oit is anticipated that the effluent plume will not be visible when it reaches the waterâ?Ts surface.â? It is clearly stated that it is anticipated, not known. Should a plume of any type be visible, it will have direct and lasting effects on our tourism industry as the Caribou - Wood Islands ferry to PE Island will pass directly by the discharge point. This is an example of only one direct consequence and does not speak to the many others including the fishery, recreation usage, environmental effects and general reputation of the province. Again, assumptions simply is not strong enough when an issue as important as this is at stake. Furthermore, as stated in on Pg. 21, Section 3.0 Regulatory Environment, Disposal at Sea DAS: â?oDetailed design has not been completed for the construction of the marine outfall and pipeline. Underwater geotechnical investigations and underwater habitat surveys are planned to inform pipeline routing and construction methodology.â? Seeing as this has not been completed, it would appear to be impossible to accurately determine what the water quality or plume distance will actually be from the discharge point. Further footnotes within Table E.1.1-1: Summary of the Significance of Project-Related Residual Environmental table state: â?oAn update of NPNS air dispersion modelling was undertaken. The facility is expected to be in compliance with the provincial and federal air quality criteria for both existing and future conditions with the new ETF operational. Follow up and monitoring using Northern Pulpâ?Ts current regulated source emission testing program will verify the environmental effects predictions.â? The blaring question in the above statement is who will be doing the monitoring of emission testing? As has been historically proven NPNS nor the government can be trusted to monitor or truthfully report test results within a timely manner. Again, the term â?ois expected to be in complianceâ? is used. This is not a certainty so the legacy of NPNS polluting our air beyond acceptable levels will simply be compounded. Additional footnotes of the above noted table also state: â?oIt is not predicted that the installation of the pipeline will result in long term serious harm to fish or fish habitatâ? . Again, the key term to consider in the above statement is â?oIt is not predictedâ?¦â? This is far from a certainty and the repercussions of this assumption will be devastating and long-term to not only the environment but the entire economy of the province. Finally, the same footnotes of the above noted table also state: â?oEnvironmental Effects Monitoring EEM and a Follow Up and

Monitoring Plan, including toxicity testing of treated effluent and water quality sampling, will be completed to monitor the potential effects of the effluent discharge. In addition, NPNS has had a Toxicity Prevention and Remediation Plan in place for many years which provides a structured approach for addressing treated effluent toxicity problems, should they occur.â? It would be irresponsible and unethical for NPNS to be the sole Stewart in this vital role, that of gatherer and retainer of this information and in turn deciding when Remediation Plans would be implemented. Again, this would need to be overseen by an independent third party with total transparency. Unfortunately, the government has not proven that they have the best interests of their electorateâ?Ts health in mind when such monitoring of air and effluent has needed to be maintained in the past, so another regulating body may have to do the monitoring. As noted on Pg. 46, Project Description, Section 5.2.2.10, Hazardous Material Use and Storage, the effluent will include the following chemicals: urea, phosphorus, sodium hydroxide, sulfuric acid and an anti-foam agent to support its process. These are not chemicals that we wish to be in the waters where we swim, fish and boat in. Nowhere in the document does it discuss the very real possibility of the effluent causing hypoxic conditions within the waters of the Northumberland Strait. Nor does it appear to discuss the effects of warmer effluent entering sensitive ecosystems other than to state the distance it will take for the water to reach an ambient temperature or the on-going challenges this will create with climate change. On pg. 32, Section 4, Alternatives Considered for Conveyance of Treated Effluent, Table 4.2-4: Alternatives Considered for Final Discharge Location or Method, states that Pictou Harbour is unacceptable as a final discharge location as: â?oPreliminary modelling indicated that Pictou Harbour has limited mixing with the Northumberland Strait â?" water in Pictou Harbour tends to stay within the Harbour. Though treated, effluent would therefore result in the accumulation and increasing concentration of residual contaminants contained in the treated effluent, over time. Given the discharge rate, effluent contaminant accumulation could result in negative effects on the Harbour over time.â? As stated above, there is clearly an admission that effluent contaminates create negative effects over time. It goes on to state that discharging effluent into Boat Harbour is also not acceptable as: â?oThis option would see the release of treated effluent continue from the same location as the BHETF presently discharges. This would mean that, even if the discharge characteristics remain the same or improve, there would be no appreciable changes to existing conditions today in the local communities and in the Strait.â? The aim must be to improve the current conditions, not have â?ono appreciable changesâ? . Yet this proposals response is to continue to dump effluent into the Strait, just at a different location. The toxins within the effluent remain, despite what were are being told of the disbursement rate. As evidenced by the above noted table, it would appear that the Caribou Harbour location for the discharge point of the effluent is viewed as the best of the four locations that were considered for discharge into the Northumberland Strait. However, this does not go to reason that this means of effluent treatment and disposal is safe or acceptable to the environment, the fishery, tourism or the well-being of the people who live, work and recreate within the Strait and surrounding area. It can only be comprehended that out of four really bad options, this is the best of the worst, which simply isnâ?Tt acceptable. Appendix E1, pg. 17, par. 4, states: â?oStatistical analysis of flow directions at CH-B revealed that 85 of the time flow is either in the southeast or northwest directions.â? Appendix E1, Pg. 27, par 2, Section 4.0 Conclusions, states: â?oThe cumulative effects by the end of the one-month assessment periodâ?¦â? There is an admission that not all of the effluent will be disbursed by off-shore currents , yet there appears to be no measurement of what the total concentration of residual contaminants that enter Caribou Harbour will be. The above statement also shows that such testing was only done over a very short period, one month, so any actual long-term results are not taken into account. Pictou Harbour is clearly stated as being an unacceptable discharge location, yet despite this,

Caribou Harbour which is of similar in size, is very shallow and has a very diverse ecosystem, is being considered as an acceptable discharge location. Based on over 40 years of personal experience, tides and currents running up Caribou Harbour can be strong and extreme. It is therefore not our belief that 85 of the currents will be off-shore and result in the disbursement of effluent further out into the Strait. Regardless of the volume and frequency of the prevailing currents, effluent will regularly enter into Caribou Harbour with each tide and whenever the currents are running inland. Effluent and the toxins within will not be effectively disbursed due to the size, depth and confinement of the harbour. Eutrophic conditions have noticeably increased within Caribou Harbour in recent years. The nutrient-rich effluent from the ETF will simply compound this problem and put the entire Northumberland Strait at risk which could have devastating effects on the fishery. Climate change, with resulting increasing water temperatures will simply exacerbate this issue. At the end of Pictou Harbour is the Waterside Beach which is enjoyed by both local folks and tourists from all over the world. Behind the beach, and facing the harbour is a wetland which is fed by no more than a few small culverts underneath the causeway entering Caribou Island. Drainage of these wetlands is therefore limited. It is likely, therefore, that toxins from the effluent would accumulate within this as well as the many other wetlands within the harbour. In the case of Waterside, there could potentially be higher than acceptable toxins leaching into a very popular and highly used recreation area. In relation to the fishery, Appendix R, Scientific Literature BKME Effects on Lobster, Pg. 1 A Summary of the Scientific Literature Related to the Effect of Bleached Kraft Mill Effluent on the American Lobster Homarus americanus states: â?oNote: This report uses the Stantec Preliminary Receiving Water Study for Northern Pulp Effluent Treatment Plant Replacement, Pictou Harbour, Nova Scotia report Stantec, 2017 and the Stantec Addendum Receiving Water Study for Northern Pulp Effluent Treatment Facility Replacement Prokect-Additonal Outfall Location CH-B, Caribou Point, Nova Scotia Stantec, 2018 as the basis for determining the location, composition and behaviour of the released treated BKME. It is important to note that the values and distances in the Stantec reports Stantec 2017, Stantec 2018 have been generated through modelling and not through onsite testing. Therefore, if modeling predictions prove to be inaccurate, then the predicted impact on lobsters as described in this report are invalid.â? Therefore, the information as stated in the findings of this report all hinge on Stantecâ?Ts modelling reflecting real world conditions, which cannot be validated as â?oDetailed design has not been completed for the construction of the marine outfall and pipeline.â? Pg. 21, Section 3.0 Regulatory Environment, Disposal at Sea DAS As stated on pg. 11 of the above Appendix under the heading â?oRecommended Scientific Researchâ? it states: â?oStudies to more accurately assess the potential for impact to adult lobsters including lethality, behavior, and sublethal impacts are recommended to be carried out with current treated BKME.â? â?oCompleting studies of lobster larvae with todayâ?Ts treated BKME would allow for confirmation and better understanding of potential lethal and sublethal effects. Therefore, the previous article on the Effect of Bleached Kraft Mill Effluent on the American Lobster cannot be verified as being accurate until studies are completed using BKME from the new ETF, making the study irrelevant. Finally, in addition to what we feel are questionable and potentially bias conclusions of the report, there are the following key points that we feel need to be considered more deeply before a final decision can be made: â?¢ A fully independent, thorough, scientific and environmental assessment of the potential ramifications of the project needs to be completed, taking into account the impending federal regulations that will soon be coming into effect. This review should be allowed to take as much time as is necessary. â?¢ The 30 day timeline set out for the public to fully evaluate and respond to this proposal and future environmental assessments is much too short and needs to be extended. Likewise, there is not possibly enough time for the Minister to review all concerns and evidence from the public so as to make such an important decision that could potentially affect

generations to come. â?¢ A decision to allow Northern Pulp to proceed with their proposal could have deep and lasting adverse effects to the local fishery, tourism, recreation and entire economy not only of Nova Scotia, but that of the entire Northumberland Straight including New Brunswick and Prince Edward Island as well. If the fishery were damaged as a result of Northern Pulpâ?Ts proposal, the province may open themselves up to potential lawsuits from not only the local fishing and tourism industry, but other provinces as well. Tourism, which is vital to the economy of the area will undoubtedly take a serious blow, as a big reason those that come to visit the area are for the beaches and perceived clean waters within the area. If there is damage to the fishery, potentially no one along the Strait could make a living from the sea. â?¢ In the last few years, municipal, provincial and the federal governments have all invested heavily to clean up municipal sewage from being dumped directly into the oceans, harbours and waterways of Nova Scotia communities. Yet here we are considering allowing a corporate entity to dump potentially worse effluent into one of the most ecologically diverse and sensitive waters in our province. By allowing this project to move ahead, it will have a direct and long-lasting effect as to how Nova Scotia is viewed within the world. Do we wish to be seen as a banana republic or do we wish to diversify our economy and ensure that we leave as clean and preserved an environment as possible to our children and future generations? The potential loss of NPNS and its effects will be long gone by the time our children are adults. The potential devastating environment effects of allowing the proposed ETF and discharge of effluent into the Northumberland Strait could last for generations and beyond. Our oceans cannot continue to be dumping grounds. Is the risk worth the potential irreversible damage to the environment, economy, and health of the people of Nova Scotia and beyond? We resolutely feel that it is not, and in the interests of all Nova Scotians, we feel it is your duty and responsibility not to allow this project to move forward. REQUEST: For this reason, we are requesting that the Minister orders an Environmental Assessment Report. Respectfully submitted, *Please acknowledge receipt of these comments.

Subject: In support of Northern Pulp"s EA application
Date: March 6, 2019 8:18:02 PM

I am writing in support of the Environmental Assessment application submitted by Northern Pulp for its new treatment facility.

A lot has been said about Northern Pulp and its impact on the local community. I stand in agreement with many, including Unifor, that Boat Harbour must close and be cleaned up to respect Pictou Landing First Nations people and their land. I also know there are many positives about having 300 good-paying jobs in Pictou, supporting thousands more across Nova Scotia, particularly in rural communities.

The Nova Scotia Environment Act is an essential piece of legislation designed to protect our shared environment and guide our economic development. The Act rightly spells out its purpose through a set of principles for sustainable development that should guide its application, including:

------> The linkage between economic and environmental issues, recognizing that long-term economic prosperity depends upon sound environmental management and that effective environmental protection depends on a strong economy.

In this situation, science should determine the best path forward. Nova Scotia, along with the rest of Canada, has among the highest global standards for environmental stewardship in the forestry sector.

The job of government and every person we elect to represent us in government is to find the best way forward when there are many competing and sometimes opposing interests. Communities across Canada manage to find a fair balance where good mill jobs coexist with a prosperous fishing industry and thriving communities.

We can and must find this balance for Pictou. There is a lot at stake: jobs, the environment, and respect for First Nations. We can and must find a solution that supports all three.

Thank you.

Communities across Canada manage to find a fair balance where good mill jobs coexist with a prosperous fishing industry and thriving communities.

We can and must find this balance for Pictou. There is a lot at stake: jobs, the environment, and respect for First Nations. We can and must find a solution that supports all three.

Thank you.

I am writing in support of the Environmental Assessment application submitted by Northern Pulp for its new treatment facility.

A lot has been said about Northern Pulp and its impact on the local community. I stand in agreement with many, including Unifor, that Boat Harbour must close and be cleaned up to respect Pictou Landing First Nations people and their land. I also know there are many positives about having 300 good-paying jobs in Pictou, supporting thousands more across Nova Scotia, particularly in rural communities.

The Nova Scotia Environment Act is an essential piece of legislation designed to protect our shared environment and guide our economic development. The Act rightly spells out its purpose through a set of principles for sustainable development that should guide its application, including:

------> The linkage between economic and environmental issues, recognizing that long-term economic prosperity depends upon sound environmental management and that effective environmental protection depends on a strong economy.

In this situation, science should determine the best path forward. Nova Scotia, along with the rest of Canada, has among the highest global standards for environmental stewardship in the forestry sector.

The job of government and every person we elect to represent us in government is to find the best way forward when there are many competing and sometimes opposing interests. Communities across Canada manage to find a fair balance where good mill jobs coexist with a prosperous fishing industry and thriving communities.

We can and must find this balance for Pictou. There is a lot at stake: jobs, the environment, and respect for First Nations. We can and must find a solution that supports all three.

Thank you.

They've had their chance to change. 5 years is more than enough time to make a plan. Time to get rid of them if they don't comply. It's a horrible decision to have to make, agreed, but surely there are more life-supporting ways to live in our beautiful Province that support and glorify what we've been given. Let the chips fall where they may!!!
Sincerely,

Subject: Northern Pulps effluent treatment EA - concerned citizens /
Date: March 6, 2019 9:06:00 PM

Environmental Assessment Branch
Nova Scotia Environment
P.O. Box 442

Email: EA@novascotia.ca

Dear Ms. Miller:

Re: Northern Pulp Nova Scotia - Environmental Assessment Registration Document- Replacement Effluent Treatment Facility

The Northern Pulp Nova Scotia Replacement Effluent treatment Facility has many concerns for me and my spouse. As residence of Pictou County, Nova Scotia this issues hits us right in our backyard. I myself am a second generation fishermen and father of two - a three year old and a one month old new born.

Besids my knowledge as a fishermen I am also a Red Seal Tradesmen trained as an Industrial Mechanic (Millwright) which gives me more insight into the industrial workings of a pulp mill.

In Northern Pulp's EA submission, there are many issues that are of great concern for me that need more review and information to insure the heath and safety for both the people of Nova Scotia and the Northumberland Strait to which we fish and share with surrounding Provinces. I am asking that you, as the Minister for Nova Scotia Environment, order an environmental assessment report of Northern Pulp's proposed effluent treatment facility for the following reasons.

1. Protection of Fish and Fish Habitat:

Since I am a lobster licence holder, the new treatment facility outfall is a major concern - what affects will it have on lobsters and their habitat as well as the lobsters reproduction system which includes their larvae. This information is so important because it is what will allow the survival and future sustainability of our industry. In

Appendix R of Northern Pulp's EA is where you find the lobster study information which is very limited. Here in the executive summery it states *". It is important to note that the values and distances in the Stantec reports (Stantec 2017, Stantec 2018) have been generated through modelling and not through onsite testing. Therefore, if modeling predictions prove to be inaccurate, then the predicted impact on lobsters as described in this report are invalid.*

This statement here concerns me as to how valid the receiving waters study is as well the lobster study. This area needs much much more information and in-depth studying to ensure our lobster and larvae are not harmed from the effluent leaving the outfall location.

2. Scallop Buffer Zone:
While on the topic of lobster, I would like to bring to your attention a link to the DFO website that describes our scallop buffer zone. Here is how the buffer zone reads as to the conditions for the commercial fishers licence set out by DFO and Enforced by DFO fishers officers as to the fisheries act and is found as Scallop condition 7: *No person shall fish for scallops in that portion of scallop fishing area 24 in those waters adjacent to the Province of Nova Scotia within one [1] nautical mile from the nearest point of land in the counties of Cumberland, Colchester, Pictou, including Pictou Island in the Northumberland Strait, and Antigonish.*

With this pointed out I would then like to refer to Northern Pulps EA, registration document- section 8, page 382 figure 8.12-10 and then the wording on page 384 where they state the outfall location is outside of this buffer zone. If Northern pulp worked with DFO more, they would have been shown and explained that their figure in there EA was incorrect and that the scallop buffer zone is one nautical mile from any point of land. This means their outfall is located inside a marine refuge area which is intended to protect the juvenile American lobster http://www.dfo-mpo.gc.ca/oceans/oeabcm-amcepz/refuges/sfa-zpp-eng.html.

Here are other limitations within scallop buffer zones that are set out by DFO.

Prohibitions:
- Scallop dragging.

- No other human activities that take place in this area are incompatible with the conservation of the ecological components of interest.

3. Total Suspended Solids

- The outfall location is located just off the Caribou Harbour channel and the accumulation affects from the suspended solids in the effluent is another huge concern. One of the first meeting with Northern Pulp and the fishers was held at the Pictou County Wellness Center in early December of 2018. At this meeting KSH solutions stated when asked the following question "Where does the heavy solids go?", his response was, " Away". Well on page 84 of the EA document, Table 5.6-1 the total suspended solids (TSS) is 48mg/L . When you do the long hand and work that out for their daily water usage of 85 million litres a day that is just over 4 tons of solids sent out into the Northumberland Strait daily. This is unacceptable. Four ton of solids won't just go away as KSH stated. The accumulative affect and build up is unknown and needs to be addressed.

4. Shell Fish Closure Zone:

Also a concern not addressed in Northern Pulp's EA is what will or what is the probability of a shell fish closure zone around the outfall. Will it be based on depth and volume of water affected? Will it be left up to DFO, not a Northern Pulp issue, but only to be a issue and concern to the fishermen? The area of the proposed outfall is one of the last remaining herring school breeding/ spawning ground for which I fish during the fall herring season 16F. As fishers we have drastically reduced our quota to continue to protect and look after the herring stocks for generations to come. As DFO knows the herring stocks are in very poor shape and as a precautionary measure, have cut quota in hope to rebound the stocks.

What is this outfall going to do to these herring spawning grounds? This is just one more reason that more in-depth studies need to be done to these very critical species.

These are just a few of my concerns as a fisher, but working full-time this winter as a Millwright and with a new born in the house, having time to study this EA in such a short time has been challenging.

5. Power Boiler

Now my next few points of concern are with the burning of the sludge and what will be taken out of the new effluent treatment system to be burnt in there power boiler and sent out into the air - the

power boiler that does not have a precipitator! This is the same power boiler that failed emissions tests in 2015, 2016 and 2017. As stated in a news article in the The NG News, dated Jan 22 2018, the reason for the failure of the emission limits was because of what was burned in it -
"These included changes to what went into the boiler, and how it was burned, which led to more efficient burning of that material and fewer particles leaving the boiler.

One significant improvement was to reduce the amount of sawdust and shavings, and to increase the size of the bark put into the power boiler. That had a significant improvement on performance"

If this boiler is what is going to be burning the sludge it concerns me that this was not addressed fully. How they will get there mixture right to pass any emission limits test? How will the particular mater be taken out of the air? I feel Nova Scotia Environment needs more information on this matter to insure public heath is not at risk.

6. Plant Drainage

Now my finial point that I'm going to mention and touch on is an in Plant issue that deals with there drainage and cleaning of their systems like the digester, pumps, and their pipe lines within the plant that are full of green liquor, brown liquor, white liquor , black liquor and any other chemical substances that are used in the pulp making process. During shut-down periods, these substances get flushed with acid for cleaning purposes. During these shut-downs or during emergency break-downs within the plant, at any given time, these substances are flushed down a drain and out into Boat Harbour. Any process interruption is drained off and sent down a drain out into Boat Harbour as well.

No where in Northern Pulp's EA does it mention a process for kraft interruption or their cleaning processes for the items mentioned above. The EA does not mention how the new system will handle these chemicals in their raw formate or how the microorganisms that are used in the AST system will interact with these chemicals. This is a major concern because these types of incidents happen far too often in this plant and more information should be addresses to what will the affects be on the AST system. Any slight mix up in their process will affect there AST system which then affects the outfall discharge.

I want to thank you for your time in reading my submission and hope that you take my concerns as serious as I do for the heath and well being of the Northumberland Strait. That all species and their larvae are protected and studied to ensure they will be around for years to come. If fishermen are held to respect Marine Refugee Areas to insure safety of the juvenile lobster, so should Northern Pulp. There

should be no risk put on any species in the Northumberland Strait that could cause adverse affects to a commercial fisheries and to human recreational enjoyment. Let's get this assessment done right and protect the water and the air from harm that can not be reversed. I look forward to hearing from you with regards to these issues.

Thank you

Subject: Northern Pulp Effluent Treatment Plant
Date: March 6, 2019 9:13:57 PM

Good day,

I believe the gouvernement of Nova Scotia would be grossly negligent given the planets' climate crisis to consider allowing any chemical pulping of any product to continue in a way that is harmful to the environment.

The pulp mill has been a boil to Pictou since it's inception. Though it bears with it a few positions, the pollution it produces has too negative effect on it's residents and it's wildlife. The folks that work there could be re-trained to produce an organic sustainable product, that doesn't require the pollution of the straight that is the livelihood of so many others, not to mention a tourist attraction for both NS and PEI.

I implore you to only consider the health of your citizens and the future of your planet when you consider the next life of this facility.

Respectfully,

Citizen of Canada

Project: replacement_effluent_treatment_facility_project Comments: The replacement effluent treatment facility at Northern Pulp has received a fair bit of media attention during the development of the project. I am writing to urge anyone involved in the review of the project to remember that the review must be based of science and regulations, and not emotional decisions. The project is designed to meet or exceed all current requirements for pulp and paper effluent in Canada, regulations which every pulp mill operating in the country must meet. The effluent will no doubt have an impact on a very limited area of the straight, however any effluent from any treatment facility, be it a municipal facility, or an industrial facility will have an impact on its receiving waters. The design of the treatment facility and pipe is such to minimize this impact. Again, please follow the science, and regulation when evaluating this project. Name: Email:

Subject: Northern Pulp Waste Proposal
Date: March 6, 2019 9:37:10 PM

Hello,

My name is Nova Socian born and raised in Halifax. I am sending this email to express my concerns over Northern Pulp and their new waste proposal.

Every year I patiently wait for spring time to enjoy one of the things I love most about our province; the Northumberland Strait. From The beautiful beaches, to the only rivers left in our province that are home to the last of the wild Atlantic Salmon.. To think that Northern Pulp and their proposal to pipe their effluent into the Strait is even being considered, disappoints me deeply. The last 50 years we cannot erase..but it is time for change.

I have always planned on staying in my home province and rasing a family here. I am afraid of losing the opportunity to show my future children what our beautiful province has to offer. I am afraid of the increasing and alarming risks to human life in the surrounding area of Pictou County and beyond.

Thank you for taking the time to listen to my concerns, and I hope for future Nova Scotians that you will do all you can to put forward a provincial and federal assessment.

Thank you,

B3H 1J3

To the Minister of the Environment,

I am writing regarding Northern Pulp's proposal to pipe effluent from their plant at Abercrombie out into the Northumberland Strait through Caribou Harbour.

My family have owned cottages at Moodie Cove for over one hundred years. We share this cove, and the beautiful Lighthouse Beach, with the Pictou Landing First Nation. We, like the PLFN, have suffered from the air emissions and water pollution coming from Northern Pulp and Boat Harbour for over 50 years. As successive generations of children have come to play at the beach, we have noted, even in our small cove, the effects of eutrophication and warming in the Strait. There is less biodiversity: the tidal pools are empty of creatures. The mud is black and oozing at low tide, and the shellfish are dead near the tide lines. There are fewer fish. It is clear that Northern Pulp, and its predecessors, Scott Paper and Kimberley Clark, have poisoned this place, its people, and all its living creatures. It is a beautiful place, but it is blighted.

I am writing to you to tell you that the proposed pipeline will deliver the same destruction only a few kilometres down the shoreline. The whole Strait is under threat from Northern Pulp's plans to spew its effluent into prime fishing grounds and a vulnerable ecosystem.

In this letter, I will outline some of my many grave concerns about Northern Pulp's plan. These include:

1. The actual safety and maintenance of any pipeline, both over land and underwater.
2. The failure to take ice scour into account in the current pipe models
3. The effects of high effluent temperatures on an already-warming Strait. There is a lack of climate-change modeling to account for higher

ocean temperatures.
4. The lack of current, peer-reviewed studies on the effects on human health from both this proposed pipe and the burning of sludge and its contribution to toxic air emissions
6. The lack of specific detailed information about the content of this future effluent to be piped into the Strait.
7. The lack of any current, peer-reviewed studies to demonstrate the lack of toxic effects from the effluent on lobsters or other fish in the Strait and the fact that this proposal claims to meet current regulations when in reality, the regulations themselves are outdated and weak.
8. The fact that our province, in making plans for our environmental future, needs to apply the precautionary principle.

The fact is that to our knowledge, Northern Pulp's current effluent pipe has leaked at least twice since 2014. It was this first leak, and the spillage of over 47 million litres of effluent onto the sacred burial grounds of the PLFN that precipitated the signing of the Boat Harbour Act. Northern Pulp, despite previous legislation and regulations that should have forced them to monitor their equipment with the utmost diligence and meticulousness, failed to discover their own failure. And even more stringent requirements four years later did not produce any better effects: a neighbour, walking their dog, discovered that the current pipeline had leaked yet again.

Surprisingly, no official government reports are available to let the public know the amount, and the damage resulting from, October 2018's effluent spill. Should Northern Pulp carry out its plan to place an even more contentious and unwanted pipe along the #106 and out into Caribou Harbour, I fear that such a pipe would not only be subject to the poor maintenance record of its own corporation, but also to potential sabotage from angry citizens. How safe is a pipe, either overland or underwater, when so many cannot countenance its presence in their community and over their watershed?

The real dangers of ice in the shallow waters of the Strait also pose a significant threat to an underwater pipe. According to a report from the Canadian Coast Guard on Ice Climatology and Environmental Conditions (CCG, 2012), ice rafting is a frequent occurrence. In this case, huge sheets of ice can drift or be blown up to override each other and form stacks along the shoreline. In addition, ice scouring along the shallow bottom poses a risk to pipelines, outfalls, diffusers and submarine cables.

There is no section of this report that addresses eventual ice scour or ice rafting and the definite damage it would do to a pipe spewing effluent in to the Strait at shallow depths.

The current EA proposal estimates that the temperature of the effluent exiting into the Strait via the pipe could be up to 37 degrees in the summer and 23 degrees in the winter. The current modelling accounts for an area of dispersal, and estimates that the temperature changes could be negligible in a wider area beyond the pipe. However, recent media reports this week brought forth research that demonstrates that there are marine heatwaves sweeping through the world's oceans as a result of rapidly accelerating climate change.

According to an article in The Guardian from March 4, 2019, "Global warming is gradually increasing the average temperature of the oceans, but the new research is the first systematic global analysis of ocean heatwaves, when temperatures reach extremes for five days or more." In addition, the article states that "The scientists compared the areas where heatwaves have increased most with those areas harbouring rich biodiversity or species already near their temperature limit and those where additional stresses, such as pollution or overfishing, already occur. This revealed hotspots of harm from the north-east Atlantic to the Caribbean to the western Pacific." Ocean systems are increasingly battered by multiple stressors.

The double-barreled punch of a high nutrient load along with higher temperatures will be absolutely devastating for the Strait. Boat Harbour currently buffers these stressors by lowering the temperature of the pollutants and removing a great deal of the solid biomass. With current ocean research demonstrating that our waters cannot adjust, cannot adapt and are indeed suffering much like our forests are with the effects of climate change, how can we justify adding up to 90 million litres of effluent per day into an already-stressed ecosystem?

Another grave concern is the fact that as this EA is a class 1 proposal, limited information is provided about the plan to collect and burn the sludge that will accumulate in the proposed EFT. No Human Health Risk Assessment has been carried out to ascertain additional dangers to human health should the sludge be burned in the stacks belonging to NP. These are stacks which have repeatedly failed emissions testing regulations in previous years. As it seems, according to the EA, the actual content of this sludge is not entirely certain. How can we risk burning it and emitting it into the air breathed by tens of thousands?

According to the EA document Section 9-15, At this time, it is only possible to identify candidate COPCs [contaminants of potential concern] that may be evaluated should a HHRA [Human Health Risk Assessment] of the project be a regulatory requirement. This is due to the fact that chemical process engineering design work is continuing and there is presently uncertainty regarding the likely chemical composition and characterization of the marine treated effluent discharge (including the potential

concentrations of substances present in the effluent." As I am to understand this, there is no current certainty about what the effluent will actually contain. Furthermore, according to page 489: "At this time, effluent chemistry characteristics (***including the specific substances present in treated effluent and their anticipated concentrations***) will not be known with certainty ***until the project is operational***". In other words, we are to take this EA proposal at its word despite the fact that we don't know what they will be burning in the stacks, or indeed, what exactly they will be spewing out into the Strait.

The proposed Northern Pulp pipe outfall location in Caribou Harbour is a critically important fishing and spawning ground for lobster, rock crab, herring, ground fish, and many other species. Current toxicity tests are based on a "kill test" scenario, where the number of trout left in a bucket of effluent determine how dangerous the effluent might be to the species affected. This is simply not good enough in 2019. The idea that NP's effluent "passes regulations" is simply inadequate and hollow. Greg Egilsson, Chair of the Gulf NS Herring Federation and who fishes very close to the proposed pipe outlet, estimates that within a radius of just a few kilometres, there are 86 lobster fishermen, of whom 10 to 15 are First Nation, and more than 22,500 traps are set in the area (Halifax Examiner). The deep channel where they want to place the pipeline is crucial for lobster and herring larvae, and that herring spawning stock are already depleted.

In fact, according to the paper "Bleach Chlorine Mills and the Impacts on Marine Life" (Effluents from Pulp Mills Using Bleaching. Environment Canada 1991), " Seventy-five percent of Canadian bleached pulp mills discharge effluents that are acutely lethal to fish, sometimes at concentrations as low as 3.2% effluent. A few individual chlorinated organic compounds in these effluents approach or surpass concentrations that cause mortalities in aquatic organisms ranging from algae to fish." In other words, the "kill test" is absolutely inadequate, and more stringent regulations must be applied immediately, and this EA proposal should be required to submit to these, not simply the limp regulations they've "adhered" to so far.

The FOIPOP obtained by environmental lawyer Jamie Simpson (Ahern, Brendan"Environmental lawyer says correspondence inside Northern Pulp contradicts company claims to the public" The Chronicle Herald 28 Feb, 2019) contains correspondence within NP that indicates clearly that the mill itself knows that despite their claims to the contrary, the new ETF would be worse than the old facility because of the elimination of the Boat Harbour Basin. Boat Harbour achieves a "polishing" of the effluent and a removal of a substantial amount of solids. What is pumped out into the Strait through this new proposed pipe is not, in fact, "state of the art": it is worse by far. Northern Pulp might be proposing a newer system, but the location is much riskier. Because of this, more toxins (though, as the report admits, still "unknown") will

reach the Strait.

Finally, I beg you to scrutinize the EA proposal put forth by Northern Pulp with utmost care and concern. The same such care and concern were not given to the PLFN, who have endured fifty years of environmental racism with the appropriation of Boat Harbour and subsequent destruction of their air and aquatic environments.

Please be reminded that the Federal Government published a document entitled "A Framework for the Application of Precaution in Science-based Decision Making about Risk" [Privy Council Office (PCO), 2003]. This paper addresses the application of precaution in its various forms - "precaution", "the Precautionary Principle" or "the precautionary approach" - all of which have three basic components: the need for a decision; a risk of serious or irreversible harm; and a lack of full scientific certainty. This guiding document requires that precaution must preside over all decision phases. Precaution must be clearly linked to scientific analysis, and cannot be applied without an appropriate amount of assessment of scientific factors and consequent risks.

SImply the fact that this nearly 2,000 page EA proposal was dumped on the general public with less than 50 days to comment is in itself a cause for grave concern. How can external, peer-reviewed studies be mounted in such a short amount of time? How can the public find time, and expertise, needed to comment effectively?

The 1999 Canadian Environmental Protection Act entrenches the "precautionary principle" in its preamble, where it recognizes that the "Government of Canada is committed to implementing the precautionary principle. Where there are threats of serious or irreversible damage, lack of full scientific certainty shall not be used as a reason for postponing cost-effective measures to prevent environmental degradation." In addition, section 76.1 of CEPA 1999 specifically directs the Ministers to apply a weight-of-evidence approach and the precautionary principle when conducting and interpreting the results of assessments of existing substances. We do not even know for certain, based on the EA proposal at hand, what these “existing substances” are, or in what quantities they might exist.

The government’s precautionary principle must supersede any social, ethical or even political or economic considerations. We can no longer afford to allow the economy to trump our fragile environment. We must, above all, apply caution first.

Please, do not approve this Environmental Assessment for Northern Pulp.

Sincerely,

Subject: In support of Northern Pulp"s EA application
Date: March 6, 2019 9:52:55 PM

I am writing in support of the Environmental Assessment application submitted by Northern Pulp for its new treatment facility.

A lot has been said about Northern Pulp and its impact on the local community. I stand in agreement with many, including Unifor, that Boat Harbour must close and be cleaned up to respect Pictou Landing First Nations people and their land. I also know there are many positives about having 300 good-paying jobs in Pictou, supporting thousands more across Nova Scotia, particularly in rural communities.

The Nova Scotia Environment Act is an essential piece of legislation designed to protect our shared environment and guide our economic development. The Act rightly spells out its purpose through a set of principles for sustainable development that should guide its application, including:

------> The linkage between economic and environmental issues, recognizing that long-term economic prosperity depends upon sound environmental management and that effective environmental protection depends on a strong economy.

In this situation, science should determine the best path forward. Nova Scotia, along with the rest of Canada, has among the highest global standards for environmental stewardship in the forestry sector.

The job of government and every person we elect to represent us in government is to find the best way forward when there are many competing and sometimes opposing interests. Communities across Canada manage to find a fair balance where good mill jobs coexist with a prosperous fishing industry and thriving communities.

We can and must find this balance for Pictou. There is a lot at stake: jobs, the environment, and respect for First Nations. We can and must find a solution that supports all three.

Thank you.

Subject: Comments on Northern Pulp Replacement Effluent Treatment Facility for Environmental Assessment
Date: March 6, 2019 10:32:35 PM

March 6, 2019

Dear Sir or Madame,

Re: Comments on Northern Pulp Replacement Effluent Treatment Facility

Please acknowledge receipt of this letter: e-mail: @eastlink.ca

In August 2011 I moved to Pictou from Ontario outside of Ottawa. I am a retired . When moving to Pictou I was not concerned about the Mill since the province I had lived in had strict environmental enforcement and heavy fines, often 1 million dollars or more. It was a mistake for me to assume that Nova Scotia would be similar.

When the ETF project was first proposed I attended a Northern Pulp information open house. Since then, the pipe route has substantially changed. The first route was mostly underwater. The current plan is above land, underground and underwater. Due to the change in the route I had many more questions about the project. Northern Pulp should have held another open house so members of the public could get their questions answered about the new route. Therefore, there has not been adequate information provided to the public or adequate public consultation.

Furthermore, the Citizens' Committee for Northern Pulp is not accessible to the public as the company will not reveal who is on the committee. one of the founders of the face book group, Clean Up the Pictou County Mill, was refused this information from Northern Pulp more than once. When minutes of Citizen's Committee meetings are published there are no names, not even the name of the chair person. This is not accepted practice and highly unusual. A copy of minutes is attached in the appendix.

The main issue I will focus on is the pipe route going near the watershed for Pictou drinking water, the history of past pipe blow outs and leaks and the quality of the effluent. The later two can both have an effect on our drinking water. The second issue I will focus on is burning the sludge.

I am very concerned about the proximity of the pipe route to watersheds for Pictou drinking water. Section 9.1.2 page 493 of the RETF states:

As the current proposed pipeline route traverses a drinking water supply area, there is a potential that accidental releases from the effluent pipeline in this area (should they occur) could potentially impact potable water supplies.

In the section of the ETF document entitled executive summary page XXXV it states:

In summary, based on the results of this environmental assessment registration with planned mitigation and the implementation of best practices to avoid or minimize adverse environmental effects, the wastewater treatment facility projects effect on the environment during all phases is rated as not significant.

Northern Pulp can only estimate what the chemical composition will be for the effluent. They claim this information will be not be known for certain until the new facility is operational. Yet they tell us there will be no adverse environmental effects. By this time it will be too late. We are to believe them that everything will be fine. Their poor environmental record tells us otherwise, major leaks in the effluent pipe, numerous failed air quality tests and ash slurry spills. None of their antiquated equipment was replaced until your Department told them to. Please refer to the Appendix I which details Northern Pulp's environmental record at the end of these comments.

My concerns for drinking water for Pictou relates to future pipe breaks and pipe blow outs. There has been a history of several of these occurrences in the current pipe going to Boat Harbour. The leaks speak to lack of monitoring of the effluent pipe, as well as poor maintenance and lack of preventative measures. Northern Pulp states that leaks are normally not part of an environmental assessment. However, in view of the leaks that have occurred I want you to take this in to consideration.

It is not acceptable that the pipe go anywhere near the watershed for Pictou drinking water. The residents of Pictou will not allow this to happen. The town of Pictou cannot risk a leak damaging their drinking water supply. Northern Pulp will have to propose a new route to totally avoid this area.

Let us look at the monitoring system for leaks that Northern Pulp is required to have and how this system failed to detect the leak in October 2018 which is still under investigation by your department:

Section 7 of Northern Pulp's Industrial Approval states that:

d) The Approval Holder shall monitor flow at Point A, the end of the effluent transmission pipe, on a continuous basis. This data shall be recorded daily and tabulated monthly

e) The Approval Holder shall operate and maintain real time flow monitoring equipment at the end of the effluent transmission pipeline which is designed to immediately notify the Approval Holder in the event of a total loss of flow or a reduction of flow below normal operating conditions

f) The Approval Holder shall immediately investigate any flow reduction or loss notification received from equipment outlined in Condition 7(e). These incidents, together with the reason for the loss or reduction of flow causing the alarm, shall be recorded and tracked monthly

g) The Approval Holder shall immediately notify the Department of a loss or reduction of flow which results or may result in a release of untreated effluent to the environment.

According to their Industrial Approval Northern Pulp currently has to have a system to monitor the flow at the end of the pipe. None of the breaks or blow outs in the pipe were discovered by Northern Pulp. All were discovered by residents of Pictou Landing First Nation and Pictou Landing. In 2014 there was environmental damage done at Pictou Landing First Nation when the pipe blew out. The most recent effluent leak on October 21, 2018 was discovered by William Palmer and his wife when were out for a morning walk. For a Nov 6, 2018 article in the Halifax Examiner entitled *Containing Northern Pulp's Mess,* author, Joan Baxter spoke with Mr. and Mrs. William.Palmer who have lived near Indian Cross on Pictou Landing since 1985. Quoting Joan Baxter " as Palmer told me, he and his wife have discovered "all" of the leaks near Indian Cross Point — six of them — since they moved to the property there in 1985. The mill had been on annual shut down for a day when the leak was discovered on October 21, 2018 so it is still not known how much of the fluid spilled was pulp effluent or other chemicals used in maintenance."

If Northern Pulp installed a monitoring system, per their Industrial Approval, obviously the monitoring system did not work properly to alert the company of a leak. The leak in October 2018 was discovered the day after Northern Pulp's annual shutdown. If the Northern Pulp monitoring system measures a drop in water pressure one system is not adequate. Perhaps cameras have to be used on land and under water cameras in the ocean. Once the project is operational the ETF filing states there will be monitoring but provides no further details. This is not good enough. A monitoring system to detect leaks needs to be detailed in their proposal as well as any other monitoring systems.

Section 9.1 Human Health page 489 of the ETF for an environmental assessment states:

At this time, effluent chemistry characteristics (including the specific substances present in treated effluent and their anticipated concentrations) will not be known with certainty until the project is operational.

In a CBC Halifax radio program on February 25, 2018 environmental lawyer from Halifax spoke about information he obtained through the Freedom of Information Act. In an email between Northern Pulp's Technical manager and Dillon Consulting, written on Nov. 29, 2017, Manager " Effluent going in to the Northumberland Strait will be worse than today because of all the polishing going on in Boat Harbour. " During this radio program lawyer further noted that the DOE told NP they have to specify toxins that will persist over time and this information has not been provided.

You cannot approve this project without knowing what the chemical composition of the effluent will be and the long term effects of toxins..

In 2014 when the old precipitator was not working properly, the air quality in Pictou was so bad I could not open my house windows for months. Some tourists who had reservations did not spend one night in Pictou (I volunteered at the Visitor Information Centre). In retrospect I should have worn a mask anytime I was outside. No community should have to live with such poor air quality.

Construction will have a negative effect on tourism which Pictou businesses depend on. There will be delays in traffic in Pictou by the first rotary coming in to town,(the newer second rotary is not shown on the map that Northern Pulp has filed with the pipe route) to and from the Ferry as well as delays in the Ferry to and from PEI. This is clearly stated in the document. I would like more detail on what they mean by delays. Up to how many hours? Will some Ferry trips be delayed until the next scheduled Ferry trip? Will the Ferry be delayed for a day or days ? If there are major delays in the Ferry Pictou will not receive as many tourists. The year that only one Ferry was running tourists who visited the Visitor's Information Centre in Pictou were down 30%. (I volunteered there). The disturbance to the sea bottom to dig up and lay the pipe will disrupt fishing in the area. The two most important means of income in this area are fishing and tourism. We cannot risk potential damage to our fisheries, tourism, our beaches or our drinking water supply.

<u>Burning of Sludge</u>
Northern Pulp cannot state with certainty the chemical composition of the effluent until their replacement facility is operational. Yet, they assert that it will meet or be below all regulations.

At Boat Harbour the effluent is currently treated for up to 30 days. It is my understanding that during this long treatment most of the heavy metals and hazardous chemicals sink in to the sludge. The treatment ponds are drained, the sludge is removed and then put in to a very large container cell.

The new proposal has the effluent treated for only about 24 hours. Then Northern Pulp is proposing to burn the sludge. They have disclosed what they expect in the air emissions when the sludge is burned. However, they also state they will not really know until the system is operational. I am concerned about the chemical and heavy metal concentration in the sludge being burned. Northern Pulp has a terrible history of at least 14 times they did not pass air quality tests. Furthermore, when they have failed air quality tests they are not shut down. They continue to operate. In the meantime residents have been exposed to cancer causing chemicals.

Having lived in Ontario for over 55 years, I have been shocked that Northern Pulp does their own testing and knows when Stantec, the testing company, will be arriving.No company should be allowed to do their own testing. When the company has failed air quality tests they should have been shut down immediately to investigate and solve the problem and then new air quality tests done within a week. The public does not know the results of the tests until a minimum of one month after the testing. It used to be 3 months. In the meantime when an air quality test has been failed, we have been exposed to toxic cancer causing air emissions without knowing it. This is unacceptable. Northern Pulp ran their power boiler for months with no pollution control equipment on it. The pollution control equipment was at the plant but they did not install it until a few months after they were told to. I cannot understand why any government department would allow this company to operate their power boiler with no pollution control equipment. Ontario would have shut them down immediately until the pollution equipment was installed. For a company that is on Canada's List of Environmental Offenders with a terrible environmental record Northern Pulp seems to have been given far too much latitude.

In summary, in view of Northern Pulp's poor environmental record, I have concerns about the pipe route for future pipe breaks or blow outs and Northern Pulp's inability to detect leaks. As well, the quality of the effluent will be worse than what comes from Boat Harbour. I also have concerns about the chemical emissions from the burning of sludge,as well as the impact on our tourist and fishing industries.

I am asking the Honorable Margaret Miller not to approve Northern Pulp's project. This project could damage our fishing, tourism, beaches, air quality, and Pictou drinking water. As a resident of Pictou since 2011, I am totally opposed to the pipe route going over the watershed for our drinking water. I am also opposed to the effluent pipe going in to the Northumberland Strait and burning the sludge. .Residents of Pictou have the right to breathe clean air and drink clean water. We are counting on the Department of Environment to protect us.

In 1967 when Scott Paper opened there were very different considerations at play. Today we know how fragile our environment is and how we must make decisionsto protect it now and for future generations.

Please do not approve this project.

Thank you for your consideration.

Pictou, Nova Scotia

Appendix I

Northern Pulp list of failed emission tests, Ministerial Orders, Ministerial Directives, pipe blow outs, leaks, spills, warning reports, legally binding orders etc.. This list may not be complete due to my time constraints. It starts after Northern Pulp took over Neenah Paper at the end of March in 2011.

Summary from April 2011 to October 10, 2018

14	*Failed air emission tests*
2	*or more Pipe blowouts / leaks **
1	*Ash slurry spill*
8	*Directives*
1	*Legally binding order*
5	*Ministerial Orders*
2	Warning Reports
1	Federal Fine $225,000. **

*Due to time constraints for this response I could not determine how many of 5 other leaks at Indian Cross since 1985 occurred after April 2011.

** **Placed on list of Government of Canada's Environmental Offenders Registry. Convicted of Pollution Prevention provisions (subsection 36(3)) of the Fisheries Act**. Refer to: https://environmental-protection.canada.ca/offenders-registry

Details

Fall 2011 Exceeding emissions power boiler particulate 634 mg/Rm3 standard 500 mg/Rm3

Feb 20, 2012 Directive under the Environment Act that the mill "provide written notification that the construction or installation of the power boiler air pollution control equipment has been completed." In his Directive to Northern Pulp, Inspector Specialist Marc Theriault also noted that the mill had broken Prohibition section 67 of the Environment Act, in that "No person shall knowingly release or permit the release into the environment of a substance in an amount, concentration or level or at a rate of release that causes or may cause an adverse effect... "

Spring 2012 Exceeding emissions power boiler particulate 921 mg/Rm3 standard 150 mg/Rm3t

Fall 2012 Exceeding emissions recovery boiler particulate 462 mg/Rm3 standard 375 mg/Rm3

March 7, 2013 Directive for Northern Pulp to "complete an engineering study for the recovery boiler air pollution equipment...and provide an implementation schedule by September 30, 2013." Another inspection report, dated March 7th, 2013, also written by Theriault, notes that "Stantec's Fall 2012 Source Emissions Testing Report...indicates particulate emissions exceeded the limit outlined...[for] total reduced sulphur concentrations." The USA's Environmental Protection Agency notes that

Sulphur Dioxide, especially when combined with other particulate matter (like that which comes out of Northern Pulp's stacks on a daily basis), can cause or worsen respiratory diseases, can aggravate existing heart disease and can lead to premature death.

Fall 2013 Exceeding emissions recovery boiler particulate 666 mg/Rm3 standard 375 mg/Rm3t

November 4th, 2013 Directive for Northern Pulp to provide data on the total reduced sulphur levels on a monthly basis and a detailed description of the work being done to improve sulphur emissions.. Theriault's third report notes that they are still exceeding the Total Reduced Sulphur

February 9, 2014 Ash slurry spill reached Pictou Harbour.

June 10, 2014 Pipe blew out on Pictou Landing First Nation releasing 47 millions of litres of **"toxic"** pulp mill effluent.

Summer 2014 Exceeding emissions power boiler particulate 236 mg/Rm3 standard 150 mg/Rm3 Exceeding emissions recovery boiler particulate 544 mg/Rm3 standard 375 mg/Rm3t

August 21,2014 Issued a legally binding order directing Northern Pulp to replace its precipitator and get its emissions in line.

Fall 2014 Exceeding emissions recovery boiler particulate 390 mg/Rm3 standard 375 mg/Rm3t

April 7,2015

Issued Warning report because information required by Condition 14c of Approval was not submitted on time. Exceeding emissions power boiler particulate 155 mg/Rm3 standard 150 mg/Rm3 Exceeding emissions recovery boiler particulate 833 mg/Rm3 standard 375 mg/Rm3 322% of limit

May 28,2015 Ministerial Order to install precipitator and provide significant amount of information over the next 5 months. Northern Pulp shut down on May 30, 2015 and did not start up again until the precipitator was installed and operating.

June 25, 2015 Issued Directive dated June 15, 2015 and Warning Report dated June 25, 2015 because particulate emissions from the exceeded approval limit during the winter of 2015

September 2015

Exceeding emissions power boiler particulate 190 mg/Rm3 standard 150 mg/Rm3 127% of limit

October 26, 2015 Environment Act Directives

1. Pursuant to Envronmental Act 122A(1) the following action(s) must be completed by November 30, 2015 Northern Pulp shall ensure an Independent third party engineering evaluation be completed for the entire power boiler system … The evaluation shall recommend the necessary operational modifications and/or capital upgrade Intended to lead to lower emissions and to contribute to achievlng compliance with the power boiler emission llrnlts In Approval 2011-078857-A01.

2. Pursuant to Environment Act 122A(1) the followlng actlon(s) must be completed by December 31, 2015 Within 30 days of the completion of the next scheduled source testing as required In 9(ac) of Approval 2011-o76857-A01, Northern Pulp Nava Scotia Corporatlon shall ensure that a final report on source testing Is completed and submitted to the Department that Is consistent with the requirements of Approval 2011..076657-A01.

Jan 20, 2016

Conviction: Federal: Pollution Prevention provisions (subsection 36(3)) of the Fisheries Act **Amount of fine(s):** $225,000.00

June 2016 Exceeding the allowable emissions stack test

September 12, 2016 Summary Offence Ticket $697.50 because the particulate emissions from the Power Boiler exceeded the approval limit in testing in Spring 2016.

November 21, 2016 Summary Offence Ticket Sept 12, 2016 was withdrawn in Pictou Court due to faulty testing equipment

December 2016 Exceeding emissions power boiler particulate 157 mg/Rm3 standard 150 mg/Rm3 105% of limit

May 31, 2017 Directive dated May 31, 2017 and Warning Report dated May 31, 2017 because particulate emissions from the Power Boiler exceeded the approval limit during the fall of 2016

June 2017 Exceeding the allowable emissions power boiler particulate 224 milligrams per reference cubic metre. The boiler permit allows 150 mg/Rm3. 149% of limit

Ministerial .Orders 1 October 13, 2017, Northern Pulp Nova Scotia Corporation shall submit to Nova Scotia Environment (NSE) a detailed report which explains the work planned for the scheduled October 2017 shutdown intended to lead to lower particulate matter emissions and to contribute to achieving compliance with the power boiler emission limits in Approval 2011-076657-A01.

2. On or before November 15, 2017, Northern Pulp Nova Scotia Corporation shall submit to NSE a detailed report which explains the work completed during the scheduled October 2017 shutdown intended to lead to lower particulate matter emissions and to contribute to achieving compliance with the power boiler emission limits in Approval 2011-076657-A01.

3. On or before December 15, 2017 or within two weeks of receipt, Northern Pulp Nova Scotia Corporation shall submit to NSE the Jansen and Megtec reports (including conclusions and recommendations) and/or any other reports for the two audits completed on the power boiler and/or power boiler emission control equipment in the summer of 2017.

4. Effective the date of this Ministerial Order (MO) and up to January 30, 2020, Northern Pulp Nova Scotia Corporation shall post all power boiler particulate matter emissions results (i.e. The Source Testing Results - Power Boiler-Particulate Matter tables in the third-party consultant reports that are associated with Condition 9(h) of Approval 2011-076657-A01) on the Northern Pulp Nova Scotia Corporation website and/or other forums for public access. Each power boiler particulate matter emissions result

shall be posted within thirty (30) days of receipt of the associated final source testing report submitted by the third-party consultant

Feb 9, 2018 ash slurry leak reached Pictou Harbour The Directive says the mill, located at Abercrombie Point near Pictou, must submit a plan to prevent further discharges of power boiler ash slurry into a ditch northwest of the facility's power boiler ash pond by June 29.

October 21, 2018 Pipe leak at Indian Cross discovered by a resident. This leak is still under investigation. It took over 2 weeks to clean it up. Northern Pulp's monitoring system did not detect the leak.

Norther

Northern Pulp Minutes of last meeting of the CLC Committee Meeting Dec. 19th, 2018. .

Everything seems perfect and the Effluent leak gets just a two line mention.

Date: December 19th, 2018
Location: Northern Pulp Pineo Boardroom
Attendees: NPNS Executive, CLC Committee Chair, NPNS Employee Representative, Representatives from Pictou, Moodie Cove, Abercrombie and Greenhill.
Regrets: Pictou Landing First Nation and Pictou Landing
Introductions & welcome members – introduction of new Abercrombie member.
Review of 2018 Environmental Plan and Introduction of 2019 Environmental Operating Plan
Water & Wastewater Objectives
• No effluent toxicity incidents in 2018.
• Dioxins and Furans again non detect as per the Regulations in 2018 (non-detect for last several years).
• BOD 1,200 kg/day range. TSS 1,500 kg/day range. Both well below regulated limits.

Air Objectives
• Ambient Air Monitoring stations located at Green Hill and Pictou Landing.
• No exceedances reported for 2018.
• Stack testing results for Power Boiler and Recovery Boiler located on PEC website, NPNS page.
• Recovery Boiler and Power Boiler particulate under regulated limits for 2018.

Action item: N/A for Recovery Boiler particulate testing on NPNS website should be noted and explained with *. Testing frequency outlined in the IA is now less than 4 times/year based on several years of low results.
Solid Waste Objectives
• Fulfill government requirements around solid waste regulations.
• Determine realistic ways of diverting solid waste away from landfill.
• Continue to segregate out domestic waste systems.
• Continue NPNS waste recycling program.
Woodlands Objectives
• Participate in the annual Sustainable Forestry Initiative Advisory Committee meeting
• Maintain current certifications held. ISO14001 Woodlands Environmental Management System and Chain of Custody (SFI, PEFC).
Other Objectives
• Maintain annual updates to environmental preparedness and response manual.
• Attend environmental courses or conferences where applicable.
• Continue to maintain an active Community Liaison Committee.

Pulp line break
Discovered land leak on Oct 21, 2018. No effluent entered the river. Consultant hired to evaluate and monitor the spill site. NPNS following all consultant recommendations – some complete, others in progress.
Cap and Trade
This program limits the amount of greenhouse gases NPNS can emit. Provincial government is trying to put a price on carbon gases. Nova Scotians will pay more for electricity and fuel beginning in January 2019. NPNS falls under the industrial sector of the cap and trade system.
Effluent Treatment Centre Replacement Environmental Assessment Process
• Initial EA submission planned for Fall 2018.
• Spring 2018 discovered ice scour on the route including the outfall location along with another shipwreck. June 2018 needed a new extension route. Outfall pipe required to be buried in deeper water.
• Spring 2018, hearing from community and stakeholders, NPNS took time to research alternate route. Began looking at Caribou route as an alternative. Completed a receiving water study for the new outfall location in deeper water.
• December 2018; filed an injunction against fishers to get survey boat work completed. Temporary injunction granted on December 18. Safety plans need to be developed to put surveyors back in the water.
• Treatment technology selected and purchased.
• MBBR Moving Bed Biofilm Reactor was purchased as an upfront step in the Activated Sludge Treatment (AST) process chosen. Well known vendor with proven technology.
• Oxygen Delignification study complete; project will follow after the treatment plant is completed.
• CLC members given two Eco Metrix studies that will form part of the EA submission. Members asked to review and comment.
1. EEM Monitoring Program.
2. Baseline Monitoring.
Action item: Incorporate CLC comments into the two Eco Metrix studies.
• Proposed pipeline will run along route 106 and runs alongside Pictou's watershed. CLC raised concern as it could affect town water in the event of a pipeline leak. EA will address concerns of Pictou town.
• CEAA, Fisheries & Oceans, Health Canada, Transport Canada and Environment Canada are all involved with NPNS EA submission.
• CEAA stated in May 2016, NPNS did not require a federal assessment.

Action item: Find a better way to share information on project delays with the public.

Continuous Improvement
In 2018 84 employees submitted ideas that were implemented on ways to improve NPNS operation and/or costs.
Communications
• Social media campaign continues, recent ads include stakeholder support, industry partnerships (Elmsdale Lumber, Darrin Carter Logging Ltd)
• Ongoing media relations strategy: Proactive when opportunities present (11th million tonne, Fill the Can Foodbank Fundraiser); with respect to effluent treatment facility projects – proactive and reactive measures.
• PEC, NPNS consistently communicating with Unifor Atlantic & National representatives to discuss collaboration efforts regarding ETF.
• Continued sponsorship of major events such as Summer Street Golf Scramble 2019; Coldest Night of the Year 2019.
Government Relations
2018 – 2019 Strategy
• Continue to broaden communication messaging audience.
• Inform employees with updates. Distribute internally all communication products released to public.
• Liaise with Atlantic Canada forest industry stakeholders.
• Continue to engage retirees.
• Expand audience reach with social media platforms.
• Implement phased communications plan focused on ETF.
Woodlands
Lahey Forestry Review
• Released in August 2018
• 80 meetings, 160 attendees and 250 written submissions were presented.
• 70 page report recommending change has been adopted.
• Took into account ecosystems and biodiversity.
• Triad model approach to forestry.
• 30% of forest is to be left natural from crown owned lands for conservations.

• 15 – 20 % is intensive forestry and can be clear cut.
• 30% of land is owned by private woodlot owners.
• Lahey put forth 45 recommendations in a package deal. No cherry picking.
• All recommendations were adopted.
Action item: Arrange for a tour of the Debert nursery in the spring/summer of 2019.
Comments from CLC members:
• Fishing and Forestry should continue to co-exist together.
• Most of the concerns around the county are about the effluent pipe.
• Some information on Facebook and around the coffee shops is wrong and misleading.
• Some people already have their minds made up and don’t care about facts.
• Political overtones playing on public fear.
• Government is in conflict. A federal assessment would take it out of the NS provincial governments’ hands.
• PLFN would need to support an extension to the BHA.
• Building trust is a long term process. The info presented today should be given to the public as there was not a large attendance at the information sessions in December 2017.
• Try to explain our plans in plain language so the public is able to understand some of the more complex work being done by NPNS.
• Focus more on the federal regulations that govern the industry.

Meeting adjourned.

The End

I am writing in support of the Environmental Assessment application submitted by Northern Pulp for its new treatment facility.

A lot has been said about Northern Pulp and its impact on the local community. I stand in agreement with many, including Unifor, that Boat Harbour must close and be cleaned up to respect Pictou Landing First Nations people and their land. I also know there are many positives about having 300 good-paying jobs in Pictou, supporting thousands more across Nova Scotia, particularly in rural communities.

The Nova Scotia Environment Act is an essential piece of legislation designed to protect our shared environment and guide our economic development. The Act rightly spells out its purpose through a set of principles for sustainable development that should guide its application, including:

------> The linkage between economic and environmental issues, recognizing that long-term economic prosperity depends upon sound environmental management and that effective environmental protection depends on a strong economy.

In this situation, science should determine the best path forward. Nova Scotia, along with the rest of Canada, has among the highest global standards for environmental stewardship in the forestry sector.

The job of government and every person we elect to represent us in government is to find the best way forward when there are many competing and sometimes opposing interests. Communities across Canada manage to find a fair balance where good mill jobs coexist with a prosperous fishing industry and thriving communities.

We can and must find this balance for Pictou. There is a lot at stake: jobs, the environment, and respect for First Nations. We can and must find a solution that supports all three.

Thank you.

March 6, 2019

Honourable Margaret Miller
Minister of Environment
Province of Nova Scotia

Dear Hon. Miller:

Re: Northern Pulps Replacement Effluent Treatment Facility Project

This letter is one of many that I hope will be written to you from the people of the Province of NS that are concerned about what is happening in Pictou County with Northern Pulp and our waters.

I am a life long resident of Pictou area and 4th generations in the fishing industry and I also have had family in the logging industry.

Have been educated in this province and presently work with municipal government but for over 10 years I owned and operated a Bed & Breakfast in the Town of Pictou. I consider myself very lucky to have grown up in this area and the Province of Nova Scotia and I am a proud Maritimer that cares about what happens to our environment and our province.

The document submitted by Northern Pulp is 1700 pages long and the public has been given 30 days to respond to this lengthy and technical detail report. A lot of this report is above the average persons understanding but still was good to be available to the public although many feel there are some things left out and one concern is the mercury content.

Although there are many concerns my biggest concern is the effluent along with the thousands of litres of warmer water that will be pumped into the Northumberland Strait. This will kill lobster larvae and god knows what else; it's inevitable and would directly breach Section 36 of the Federal Fisheries Act. A federal assessment is inevitable. The fact is that the sea bottom, where Northern Pulp plans to dredge to bury the pipe in Caribou Harbour and the Northumberland Strait, is federal land, which I believe should necessitate a federal assessment. A full Federal assessment study should be done on the marine environment with the millions of litres of effluent that will be discharged into the Northumberland Strait once the pipe hopes to be in place. Our waters are under federal protection. Also enough evidence has shown that the likely hood that it will cause adverse effects or environmental with effects to our eco system. This is very concerning to us all.

Also, many people worry that the provincial government cannot fairly assess this effluent treatment plan for a pipe to enter into our ocean. The province should step aside because of the conflict of interest and the Canadian Environmental Assessment Agency be given this due to the Province of Nova Scotia is really an employer to Northern Pulp. I feel the government should no longer be subsidizing a foreign owned company.

Bleached Kraft mills are killing us and damaging our environment, maybe its time changes are to be made. Do we really need to have pure white paper and toilet paper at such a cost to us all and if so then a better way of doing so needs to be looked into and not to be killing our province and water to provide this?

Please do not let our province choose money and a foreign owned company over our water, air , food and our health.

Sincerely,

, Pictou Co. NS

Subject:	Proposed Project Comments
Date:	March 6, 2019 11:17:41 PM

Project: replacement_effluent_treatment_facility_project Comments: As minister of the environment I strongly feel that this project requires alternate solutions. This is a great opportunity for a pulp mill and province to invest in a closed loop system and look at how this may be an advantage economically for the company. Continually our province makes decisions based on fear of loss of jobs instead of being at the forefront of innovation and creating long term jobs. We are about to fix boat harbour and introduce an entire new set of problems. Should this project move forward it will certainly be an instant regret and another future problem and cost for the province. I spent my youth on these shores and am now an avid fly fisherman. The eminent loss of Atlantic salmon habitat alone would be enough to reject this project. It is certainly enough to require a full environmental assessment. There is so much investment from all parties to market and fight for something we all no will be detrimental to this sensitive ecosystem. All of th is private and public money should be going towards finding a solution that solves the problem. Please make this a defining point in your career where you reflect back on this decision with pride. C a must. F is the right choice. c an environmental-assessment report is required - An environmental assessment report is a much larger report, or series of reports, analysing the environmental issues raised by the entire project. This report would be produced within 2 years, and is then followed by a public review period, a review either by a Panel or by the Minister, and a decision would be made at the end of that process. The whole process could take up to 3 years or more to complete. f the undertaking is rejected because of the likelihood that it will cause adverse effects or environmental effects that cannot be mitigated Name: Email: @hotmail.com Address:

The job of government and every person we elect to represent us in government is to find the best way forward when there are many competing and sometimes opposing interests. Communities across Canada manage to find a fair balance where good mill jobs coexist with a prosperous fishing industry and thriving communities.

We can and must find this balance for Pictou. There is a lot at stake: jobs, the environment, and respect for First Nations. We can and must find a solution that supports all three.

Thank you.

Caribou Island, NS,

Environmental Assessment Branch
Nova Scotia Environment
P.O. Box 442
Halifax, NS, B3J 2P8

March 5, 2019

Good morning ladies and gentlemen,

This letter has been prompted by Northern Pulp Nova Scotia's Replacement Effluent Treatment Facility Environmental Assessment Registration Document.

WHO WE ARE

My name is and I live on Caribou Island with my wife,

Through my various promotions with Scott Paper Limited, a distant cousin of Scott Maritimes, I worked in their New Westminster, B.C. mill which manufactured paper towels, bathroom and facial tissue. Some of these were produced from its own groundwood pulp, which was bleached with hydrogen peroxide.

Although I prospered with the company, after 5 years in Toronto I decided to return to Halifax to better raise our family. It was a difficult decision as over 18 years I had grown considerably within Scott Paper Limited, one of the most reputable companies on the Toronto Stock Exchange. We now live full-time and work on Caribou Island.

NPNS' RETF PROPOSAL PERPLEXITIES

I have several concerns, particularly the following that I would like you to take into account when deciding on the merits of accepting NPNS' RETF proposal as is.

A.

It is truly astonishing how over a half-century of producing mill effluent, there is so little science from Northern Pulp on determining the array of compounds that are part of its effluent, despite world renowned oceanographic institutions — the Bedford Institute of Oceanography and Dalhousie University's Department of Oceanography — nearby.

Possibly the following statements from NPNS' Replacement Effluent Treatment Facility Environmental Assessment Registration Document (RETF EARD) may offer an explanation.

Presently, there is no regulatory requirement to conduct a human health risk assessment (HHRA) study in association with the NPNS project. The project is currently in a Class 1 EA Process in Nova Scotia that does not specifically require the completion of a HHRA (Human Health Risk Assessment) in advance of registration of an EA.

NPNS' RETF EARD 9.0 Page 489

So,

At this time, effluent chemistry characteristics (including the specific substances present in treated effluent and their anticipated concentrations) will not be known with certainty until the project is operational.

ibid 9.1 Page 489

Nevertheless, NPNS has advanced, from Australia, the Toxikos 2006 study 'Comment on Bell Bay effluent and potential impact on nearby seal colonies' for a future Human Health Evaluation. NPNS regularly states the mill effluent in the Toxikos report is comparable to that of its own projected operation, and therefore the risks to human health are negligible:

The Toxikos (2006) HHRA was a highly conservative assessment that substantially overestimated exposure and risk to potential human consumers of fish and shellfish that may be influenced by the effluent diffuser discharge in Bell Bay. The authors concluded that there were negligible risks to human health from consuming any marine food item harvested in the vicinity of the effluent diffuser, for any of the substances that were assessed in the HHRA.

Ibid 9.1 Page 491

However an audit of the Toxikos (2006) study's methodology by Dr. Andrew W. Wadsley was released in May 2007, with the following contradictory conclusion:

This review found that calculation errors, use of inappropriate parameter values, failure to include background dioxin concentrations, and failure to use the permitted maximum limit of dioxin in the pulp mill effluent, results in an underestimation of dioxin concentrations by a factor of 1,390 in the Human Health Risk Assessment and by a factor of 90 in the Marine Impact Assessment. The impacts of these errors are far reaching and invalidate all of the quantitative ecotoxicological analyses prepared for assessment under the Tasmanian Pulp Mill Assessment Act 2007 and for assessment of the pulp mill project under the Australian Environment Protection and Biodiversity Conservation Act 1999.

http://citeseerx.ist.psu.edu/viewdoc/download?doi=10.1.1.582.2806&rep=rep1&type=pdf

The Wadsley audit was cited in 2010 by the Tasmanian Times

https://tasmaniantimes.com/2010/08/why-tasmania-needs-a-science-reform-commission/

which also included this paragraph:

In an article by Charles Waterhouse from The Sunday Tasmanian on 24 September 2006 were excerpts from a leaked DPIPWE draft review of Toxicos' assessment on impacts on marine life from the proposed Gunns Pulp Mill.

The draft states:

'Toxicos fails to conclude or describe the risk to seals of bioaccumulating dioxins from exposure to pulp mill effluent. Evidence exists that the effect of exposure is significant, "therefore the Toxicos implication is misleading and their conclusion false". Toxicos states that dioxins are not significantly bioaccumulated by fish. This statement is profoundly inaccurate, misleading and directly contradictory to references cited by Toxicos and Toxicos statements. The method used to determine the risk of bioaccumulation in fish is inappropriate. The assessment using effluent concentration by Toxicos is invalid and misleading and all conclusions based on this information are unsubstantiated. Toxicos demonstrates a complete lack of understanding of the meaning of biomagnification.'

The conclusions from the Toxidos (2006) study and the Dr. Andrew W. Wadsley's audit are so contradictory that a thorough Human Health Risk Assessment is called for prior to releasing NPNS' effluent into the Northumberland Strait as its impact on *sensitive aquatic organism, marine mammals, birds, fish and humans* may be significant.

B.

Should any of the *sensitive aquatic organism, marine mammals, birds, fish* be adversely impacted, would the repercussion on Nova Scotia's fishing industry be at all similar as to when Alberta discovered in 2003 one black Angus cow to have bovine spongiform encephalopathy (mad cow disease) which caused the United States to immediately close its borders to Canadian beef and cattle which in turn caused about another 40 countries to follow suit?

https://globalnews.ca/news/1830438/timeline-canadas-2003-mad-cow-disease-crisis/

C.

The effluent's proposed outfall location is a particularly poor one. On the western side of the proposed outfall, the Caribou Island lighthouse is less than a couple of

kilometers away. Attached below is the Nautical Chart for the Caribou Harbour and it is clear how shallow the harbour is at this point. I recall one concerning experience while circumnavigating the island on my Expedition sailboat, a laser hull with a single self-furling sail, and running aground while attempting to get out of the incoming ferry's way.

On an incoming tide, especially as the current at this point circles clockwise, a good portion of the effluent will flow into the harbour; and whatever solids that are in the effluent will likely settle on the shallow shores, possibly edging Caribou Harbour towards becoming another Boat Harbour.

http://fishing-app.gpsnauticalcharts.com/i-boating-fishing-web-app/fishing-marine-charts-navigation.html?title=CARIBOU+HARBOUR+boating+app#12/45.7600/-62.6850

It is clear that the proposed plan B water route has not been surveyed nor sampled.

The Water Quality data off Caribou Island is from Pictou Harbour,

This section provides an overview of water quality sampling in Pictou Harbour in 1990, 1995 and 1998 (Dalziel et al. 1993; JWEL 1996; ENSR 1999). Pictou Harbour was used as a proxy for Caribou Harbour with respect to water quality, in the absence of available water quality data for Caribou Harbour.

NPNS' RETF EARD Environmental Effects Assessment 8.11.2.4 Page 143

Surely the Environmental Assessment Branch, Nova Scotia Environment should request the NPNS' proposed plan B water route to include a survey and sampling of this very different Caribou Harbour.

In conclusion, I would like to say that we have been blessed to build a home on the shores of the Northumberland Strait. The Waterside beach is large and magnificent. We get lobsters and scallops harvested off our strand by a fisher friend and occasionally we share our neighbour's oysters from her licensed but

still secret oyster bed in Caribou Harbour. In the fall we watch the northern gannets dive into herring schools, marvel as red-throated loons moult their red plumage, enjoy the night-ballet of lit herring-boats knowing that winter is fast approaching. We shall feed the crows, pheasants, chickadees and snow buntings. Some years gray seals give birth on the ice off the Hamilton Point. In late spring, we will witness fawns and now less frequently kits. In the summer, children and parents will build sand castles by the water's edge. By August, when it is too hot in New Glasgow, Trenton, Stellarton, Westville and Pictou, families will come to cool off in the Strait's balmy waters.

We have shared this wonderful corner with Korean, French, Chinese, Afghani, British, Austrian, Angolan, Portuguese, Iranian, Mauritanian, Turkish, American and Canadian friends who have all expressed what a beautiful spot this Caribou paradise is. It is truly one of Nova Scotia' unsung treasures. Please protect Caribou Harbour and the Northumberland Strait for Nova Scotians, our children, our fishers and the friends of Nova Scotia.

Yours sincerely,

N.S. ENVIRONMENT

The Honourable Margaret Miller
Minister of Environment
minister.environment@novascotia.ca

Dear Minister Miller,

Re: Northern Pulp's Replacement Effluent Treatment Facility Project

I am writing in response to Northern Pulp's Replacement Effluent Treatment Facility Project. I am a resident of in Pictou County, where I have lived for the past years, raised my children, planted and harvested gardens. My home borders on the Caribou River; at high tide I can canoe down river, under the Waterside bridge, to the ferry side of Caribou Island. It is in very close proximity to where the proposed effluent pipe would be located.

It is very evident, as I have canoed those waters over the years, how closely connected all these waters are. The Caribou River is brackish (the salt water from the Strait floods the river at high tide) bringing salt water, seaweed, crabs, the occasional seal. It is clear how closely connected this river is to the waters on the other side of the bridge, to the waters of Caribou Harbour, as they rise and fall at high and low tide.

I taught elementary school in and every morning, as I drove the Shore Road over two bridges, I saw how interconnected all these waters are.

This river is home to trout, smelt, great blue herons, eagles, kingfishers, to name but a few.

I lived in Pictou when we first arrived, years ago, where the odor of the mill made people close windows and avoid going outside. , there were days when the smell made you close your car windows and want to leave town.

During these years, I have been aware of a multitude of issues with the mill:
effluent spills
pipe breakages and leaks
pollution in the air
the death of Boat Harbour
the impact of the mill's pollution on Pictou Landing
the huge amount of water the mill consumes every day
the huge amount of effluent discharged every day
health problems that people in the area have reported (a study was done by Dr. Daniel Reid decades ago)
the clearcutting of Nova Scotia

Many of these are issues no mattter how the effluent is disposed of. But I want to speak specifically to the proposal at hand. There are major gaps in the information:
There has been no study about the effects on lobsters.
There is no information in the proposal about what the effluent will be composed of.
The effluent will be more dangerous than the current Boat Harbour because of polishings.
Toxins that will accumulate over time have not been addressed (The Department of Environment has said that the current level of toxins already don't meet current standards.)

There is no specific route for the pipe, so there can be no review of the safety of the route. (As far as we know, the proposed route runs a pipe along the Causeway, through Pictou's watershed, beside the road to Caribou Harbour, around the end of Caribou Island . . .)

These are all identified risks that need more investigation.

When therei s a breakage in the pipe, and there are breakages in all pipes, it will be an ecological disaster, affecting drinking water, the fishery, the tourist industry, our homes, the life of fish, animals, and plants. The effect will be widespread, as tides and currents spread the effluent, and disastrous.

We know what resulted at Boat Harbour, and we know how important our environment is for our survival, as a country, as a province, and as a country. We know that we cannot afford to take a chance. We know that we need a further, and federal, assessment of Northern Pulp's Replacement Effluent Treatment Facility Project.

I ask you to reject this proposal. If you refuse to reject it, I ask you to make no decision before further assessment.

Sincerely,

, Nova Scotia.

February28,2019

I am writing to you to ask you reject the proposal by Northern Pulp to dump 90 million litres per day of effluent into the Northumberland Strait.

I have a BFA and work as a fisher in the Northumberland Strait. I moved to Pictou County as a child in 1967 when my father took a job with the opening of the pulp mill. Fifty years ago good wages seemed like the only important thing. Now we see the adverse health effects that those decisions, made half a century ago, have on those we love.

I have struggled deeply to write this letter. I want you to feel how devastating your decision could be on this area and the people that call it home. I cannot believe that in 2019 we are even considering allowing a foreign company to destroy an ecosystem that provides such solace to so many, in harmony with a lucrative fishing industry. They say when you know better, you do better. WE SEE BOAT HARBOUR....we see the millions that is going to cost to clean it .....we know better. DO NOT LET BOAT HARBOUR HAPPEN AGAIN. Not to our Strait.

The Northern Pulp propose project must be rejected because:

1) No current data regarding the significant adverse effect that the proposed outfall will have on the area has been done. I have seen firsthand how extremely sensitive to wind and weather and the resulting silt has on lobster and crab fishery in this area.
I remember when the adjacent area formerly known as Little Entrance was permanently filled in by a storm in 1979 making Munroes Island no longer an island. Data about tides in this area, used by NP, predates this event. Thus making it impossible to predict the current tidal patterns in the area.

QUOTE:" **2.1.2 Physical Oceanography**
Even though some oceanographic and hydrometric data are 20 to 30 years old, it is reasonable to believe that the amplitude and direction of tides and currents did not appreciably change to affect the results of this study. Similarly, ocean water temperature and salinity are relatively constant characteristics and are unlikely to have significantly changed over the past 30 years. "
(Northern Pulp Environmental Assessment Report)

QUOTE :"Two channel entrances once defined Caribou Harbour, the Big Entrance between Caribou and Monroe's Island where the PEI ferry passes through, and the Little Entrance at the eastern end of the harbour. In 1979, a massive storm swept already encroaching silt into Little Entrance and closed this second passage permanently.

The 100 ft wide channel was the deepest point in Caribou Harbour separating Munroe's Island from the mainland.

In 1937 construction began at Caribou Harbour on a ferry terminal to serve traffic between Nova Scotia and Woods Island, PEI. Some say that the project's dredge was dumped too close to shore creating more silt. Construction of terminal altered the sediment patterns along the northern side of Munroe's Island and also affected the Little Entrance."
(This research was supported by the Social Sciences and Humanities Research Council This project was developed by Katherine Knight of York University)

2) The proposed area borders an extremely popular Caribou/Munroes Island provincial park and nature reserve. I see the pleasure that it brings to locals and tourists to be able to walk on such a pristine place.

QUOTE:" When some people want a vacation, complete with history, scenery and great experiences, they call a travel agent. Those who want to experience all this and more without breaking the bank visit Caribou/Munroes Island Provincial Park in Pictou County.

Visitors to the Caribou/Munroes Island park can enjoy the mile- long sand beach and warm salt water swimming. There is also a walking trail along the beach that leads to Munroes Island, which was a farm until the 1940s and is now a wilderness reserve. Eagles, ospreys, seals, herons and many other species of birds are seen on the 10-kilometre round trip."

(https://novascotia.ca/news/release/?id=20030626004
Natural Resources (to July 2018) NATURAL RESOURCES--Caribou/Munroes Island Provincial Park A Perfect Stop)

3) The Northumberland Strait proposed area has not been thoroughly studied. The research is for the Pictou Harbour proposal.

QUOTE:" **1.3 STUDY AREA**

The study area (***Figure 1-1***) comprised an area of 46 km x 42.5 km (***Table 1-1***), encompassing the surrounding waters of the estuary of East River, Pictou Harbour, Pictou Road, Boat Harbour, and offshore into the Northumberland Strait." (Northern Pulp Environmental Assessment Report)

The elements that led to the rejection of the proposed Pictou Harbour site are present at the new Caribou Point proposed site. Caribou Point is extremely shallow water. It is location of commercial and recreational fishing, as well as home to migrating birds. No information is provided on the significant effect daily distribution of effluent would have on this area.

QUOTE:" File: 121414584 2.32

The potential outfall location initially proposed by KSH at approximately 500 m from the mill and outlet of the Pictou Causeway (HWY 106) was not considered further in this study for the following reasons:

• It was located in a shallow water in the range of 3 to 4 m. This depth range did not meet the criteria for preferred water depth for a discharge point for the effluent, including a likely reduced capacity for effluent mixing in the receiving environment at these depths.

• The presence of environmental sensitivities in the general vicinity of this location. These sensitivities include gaspereau fisheries and migratory bird habitat particularly in the winter." (Northern Pulp Environmental Assessment Report)

4) Public consultation was for the Pictou Harbour site proposal not the current Northumberland Strait proposal.

Nothing less than a full rejection of the Northern Pulp Effluent project is acceptable. No extension should be given. Northern Pulps' own EP report states that they knew about the closing of Boat harbour since 2015.

QUOTE:" ***2.1.3*** **The Boat Harbour Act**
In June 2014, there was a leak of untreated effluent due to a breach in the transmission pipeline from NPNS to the exis□ng BHETF. This leak prompted conversa□ons between the Province and Pictou Landing First Na□on (PLFN), eventually culmina□ng in a commitment to close the BHETF and remediate the area. The introduc□on of the *Boat Harbour Act*, which received Royal Assent on May 11, 2015, prohibits the use of the provincially-owned facility for the receipt and treatment of effluent from NPNS a□er January 31, 2020." (Northern Pulp Environmental Assessment Report)

I am including photos because I want to put a face on the people whose lives and futures you hold. I want you to see the Northumberland Strait as the place of beauty that we do. Not as the environmental dump it is proposed to be.

We are counting on you to do the right thing.

The mouth of Caribou Harbour.

March 2 2019

Northern Pulps proposal to pump effluent into the Northumberland Strait must be rejected because of the significant adverse effect that it will have on the Strait.

I was born and raised in Pictou county. I have fished the waters of the Northumberland Strait for years. There was a time when we did not think much about the effects our actions had on the ocean. We see now firsthand how fragile the ocean is. We now work with DFO to preserve an ecosystem, an industry and a way of life. We have reduced our lobster trap numbers from 300 to 280, stopped fishing single trap trawls and are increasing the carps size. We have also increase the web size of our herring nets to allow the small fish to go free. In recent years we have seen the Northumberland Ferries Limited and the town of Pictou implement sewage systems, so that they no longer dump their sewage into the ocean . Land owners along the Strait have built sea walls to stop erosion and the accompanying sediment. And these changes are working. The last several years have seen an increase in lobster catches in our area. Sustained scallop seasons.

Proving that our oceans and fishery are sustainable is very important to the world. Dumping industrial waste into the ocean does not constitute Sustainability. This is a step backwards for Nova Scotia ...for Canada.

"Our Oceans, Our Future
As Canada's Minister of Fisheries and Oceans, it gives me great pleasure to present Canada's Oceans Strategy. This far-reaching policy framework will make Canada's vision for modern oceans management a reality.

As a country bordered by three oceans, Canada is truly an oceans nation. Today we see an ever increasing number of demands on oceans and their resources. While traditional fishing and marine transportation continue to be of prime importance, they are now joined by other uses, such as aquaculture development, oil and gas exploration and development, recreational and commercial fishing, and eco-tourism. Canada's oceans also support important features of Canada's social and cultural identity. Managing these demands is critical to the protection of the marine environment and the long-term sustainability of Canada's oceans and their resources.

On January 31, 1997, the Government of Canada brought the Oceans Act into force, making Canada the first country in the world to have comprehensive oceans management legislation. The Act authorizes the Minister of Fisheries and Oceans Canada to lead the development of a national oceans management strategy, guided by the principles of sustainable development, the precautionary approach and integrated management."

source: Robert G. Thibault
Fisheries and Oceans Canada, Oceans Directorate, *Canada's Oceans Strategy,* 2002, Cat. No. Fs23-116/2002E, Ottawa - Ontario: Fisheries and Oceans Canada 2002, iii

My fishing grounds are the waters along Caribou Island. It is an extremely fragile area. It is extremely sensitive to water temperature changes. If we get a Nor-Eastern the water becomes brown with sediment. It takes several days for the sediment to clear and fish to return. Northern Pulp proposes to dump 90 million litres of effluent per day on this area. Northern Pulp estimates that the propose pipe will dump 48mg of Suspended Solids per litre into the Strait. **For a grand total of 4.32 tonnes of Suspended Solids per day.** This is daily. That is 1,576 tonne per year. The area will never have a break / never be given a chance for it to recover. *The long term effects of this have to be studied.*

"*(5.6.1* Replacement ETF Effluent Discharge

Adsorbable Organic Halides (AOX) mg/L 7.8
Total Nitrogen (TN) mg/L 6.0
Total Phosphorus (TP) mg/L 1.5
Colour TCU 750
Chemical Oxygen Demand (COD) mg/L 725
Biochemical Oxygen Demand (BOD5) mg/L 48
Total Suspended Solids (TSS) mg/L 48
Dissolved Oxygen (DO) mg/L >1.5
pH - 7.0 to 8.5
Temperature oC
25 (winter)
37 (summer)
Total Dissolved Solids (TDS) or Salinity g/L 4
Additionally, the project is designed with key established water quality guidelines and/or will meet ambient water quality (current background) at the edge of a standard mixing zone (CCME 2009 - Canada-wide Strategy for the Management of Municipal Wastewater Effluent)."
source:(NP EP Proposal)

The sediment from the construction of the pipe alone will be catastrophic. We have witness firsthand the significant adverse effect that the construction of the Confederation Bridge, in 1993,had on the fishery. It has taken about twenty three years for lobster stocks to return up to 90km away. This was a finite project, with a recovery time. The proposed NP is a constant 4.32 tonnes per day! Every day.

I've always had a since of pride about living in Nova Scotia, Canada. I've felt that we were moving forward towards a greener country. Northern Pulps proposal to dump effluent into the Northumberland Strait is a step backwards. **I am asking you to Reject the proposal on the grounds that the significant adverse effects cannot be mitigated.**

Subject: In support of Northern Pulp"s EA application
Date: March 7, 2019 1:04:38 AM

I am writing in support of the Environmental Assessment application submitted by Northern Pulp for its new treatment facility.

A lot has been said about Northern Pulp and its impact on the local community. I stand in agreement with many, including Unifor, that Boat Harbour must close and be cleaned up to respect Pictou Landing First Nations people and their land. I also know there are many positives about having 300 good-paying jobs in Pictou, supporting thousands more across Nova Scotia, particularly in rural communities.

The Nova Scotia Environment Act is an essential piece of legislation designed to protect our shared environment and guide our economic development. The Act rightly spells out its purpose through a set of principles for sustainable development that should guide its application, including:

------> The linkage between economic and environmental issues, recognizing that long-term economic prosperity depends upon sound environmental management and that effective environmental protection depends on a strong economy.

In this situation, science should determine the best path forward. Nova Scotia, along with the rest of Canada, has among the highest global standards for environmental stewardship in the forestry sector.

The job of government and every person we elect to represent us in government is to find the best way forward when there are many competing and sometimes opposing interests. Communities across Canada manage to find a fair balance where good mill jobs coexist with a prosperous fishing industry and thriving communities.

We can and must find this balance for Pictou. There is a lot at stake: jobs, the environment, and respect for First Nations. We can and must find a solution that supports all three.

Thank you.

I am writing in support of the Environmental Assessment application submitted by Northern Pulp for its new treatment facility.

A lot has been said about Northern Pulp and its impact on the local community. I stand in agreement with many, including Unifor, that Boat Harbour must close and be cleaned up to respect Pictou Landing First Nations people and their land. I also know there are many positives about having 300 good-paying jobs in Pictou, supporting thousands more across Nova Scotia, particularly in rural communities.

The Nova Scotia Environment Act is an essential piece of legislation designed to protect our shared environment and guide our economic development. The Act rightly spells out its purpose through a set of principles for sustainable development that should guide its application, including:

------> The linkage between economic and environmental issues, recognizing that long-term economic prosperity depends upon sound environmental management and that effective environmental protection depends on a strong economy.

In this situation, science should determine the best path forward. Nova Scotia, along with the rest of Canada, has among the highest global standards for environmental stewardship in the forestry sector.

The job of government and every person we elect to represent us in government is to find the best way forward when there are many competing and sometimes opposing interests. Communities across Canada manage to find a fair balance where good mill jobs coexist with a prosperous fishing industry and thriving communities.

We can and must find this balance for Pictou. There is a lot at stake: jobs, the environment, and respect for First Nations. We can and must find a solution that supports all three.

Thank you.

Thank you.

If NPNS closes it will put the whole community in an economic crisis. Pictou County cannot afford to lose these jobs and many people would have to leave here to find work elsewhere. These are good paying jobs and they need to stay here.

Project: replacement_effluent_treatment_facility_project Comments: To whoever this may concern I am against a pipe flowing into the strait , I know you only consider the jobs and the economy but for the sake of 300 jobs why do you want to kill thousands of people . This proposed pipe will go directly across the water table for the town of Pictou and surrounding communities . This pulpmill has never given a damn about people . I myself have hauled paper from this mill back when it was owned by Scott in those days we could eat at the cafeteria and when it was smoke smog or steam down low to the ground you drove into the mill where you load and you could stay in there so you were not trying to tie down the load in the smog . Then along came Nima who now stopped us from going to the cafeteria or even use the washroom and no more tying down the loads inside out of the smog , along comes sinar mars and now you had to sit outside in the smog to put the loads on or tie them down outside .. I was in boat harbour this past fall cleaning out one of the settling ponds and I asked if they were giving us a course on contaminants they said no none needed , I only worked 2 days and had sores on my face around my eyes and red and sore eyelids .. why ??? ,, they had to replace me because I refused to go back there you think that just pumping it into the sea is good . I did not touch the sludge I hauled to northern pulp as I call it THE BLOB ... Subject: Northern Pulp"s Replacement Effluent Treatment Facility Project
Date: March 7, 2019 1:18:18 PM
Attachments: image001.png
EA Letter.pdf
NNS Intake Pipe.pdf
Importance: High

Dear Minister:

Re: ***Northern Pulp's Replacement Effluent Treatment Facility Project***

I am writing to you as a concerned citizen, a lobster fisherman and business owner. As an owner of North Nova Seafoods Ltd (NNS) a seafood processing plant located in Caribou I am concerned on a number of levels – for the community, the plant workers jobs, the fishermen and the direct effects on the plant operating processes.

This plant operates year-round processing a variety of species including Lobster, Snow Crab, Rock Crab, Jonah Crab, Shrimp, and Herring. Throughout the year the plant employs over 150 people here in Pictou County with direct wages paid out each year over three million dollars.

As part of the process here in the plant there is an intake pipe out in the harbour that takes water into the plant used during the cleaning process. The plant has many wells on site that are also used during the processing, but this is not enough water to support the plant. The intake pipe is necessary for the plant to operate. The water is tested regularly to ensure that it is cleared to use. This is a very sensitive issue as the plant is making a ready to eat product and there are obviously strict CFIA guidelines that are followed here. This intake pipe will be a mere few kilometers away from where the proposed effluent pipe is going. With a proposal to discharge 70-90 million litres of treated effluent from a bleached kraft mill every day this will obviously shut the plant down from using the intake pipe anymore for the necessary water to operate. I have included some pictures to give you an idea of exactly what we are looking at with the pipes.

On top of the jobs that the plant provides it also supports hundreds of fishermen with T4's issued to them in the 10's of millions of dollars each year. NNS

operates its own private wharf right here in Caribou in front of the processing plant. This wharf supports over 60 local fishermen. NNS then puts trucks on the roads all year long going to about 10 wharfs directly here in the Straight then over another 50 throughout NS from Cape Breton to Yarmouth and into PEI and NB. NNS and myself as a lobster fisherman is very concerned about the harm to fish and fish habitat that could result from Northern Pulp's proposal to discharge 70-90 million litres of treated effluent from a bleached kraft mill every day through a 10.5k pipe into the prime fishing grounds of the Northumberland Strait.

Thousands of families from all three provinces, including First Nation communities in those provinces, make their living from these fisheries. Many fishermen come from families which have fished for generations. They have made changes to help keep our waters clean, so that their children and grandchildren can fish also. Owner-operator fishermen are an important part of our regional economies. Fishermen generate many jobs in our communities. They buy their supplies locally, and they spend their profits locally.

I am also concerned about the continued health of the Northumberland Strait, which attracts thousands of tourists, visitors and summer residents who fish, dive, swim and boat in its beautiful waters. The Northumberland Strait is a key part of life and the economy of Pictou County and draws people to our area.

I am further concerned about the health of people living close to Northern Pulp. For decades air emissions from the mill have been a problem affecting residents' health and local businesses. Northern Pulp has frequently failed stack emission tests. The new treatment proposal would add additional air emissions to an already bad situation.

I believe this project requires a more rigorous review than it will receive from the province of Nova Scotia, which has decided to require only a Class 1, 50-day review, including only 30 days for public comment.

The government's past handling of effluent from this mill has resulted in one of the most contaminated sites in Canada, Boat Harbour. I want to see a strong, science based review of this project which will protect the present and future health of our Strait and the economy which depends on healthy waters.

Sincerely,

Controller

@nnseafoods.ca

Dear Minister:

Re: ***Northern Pulp's Replacement Effluent Treatment Facility Project***

I am writing to you as a concerned citizen, a lobster fisherman and business owner. As an owner of North Nova Seafoods Ltd (NNS) a seafood processing plant located in Caribou I am concerned on a number of levels – for the community, the plant workers jobs, the fishermen and the direct effects on the plant operating processes.

This plant operates year-round processing a variety of species including Lobster, Snow Crab, Rock Crab, Jonah Crab, Shrimp, and Herring. Throughout the year the plant employs over 150 people here in Pictou County with direct wages paid out each year over three million dollars.

As part of the process here in the plant there is an intake pipe out in the harbour that takes water into the plant used during the cleaning process. The plant has many wells on site that are also used during the processing, but this is not enough water to support the plant. The intake pipe is necessary for the plant to operate. The water is tested regularly to ensure that it is cleared to use. This is a very sensitive issue as the plant is making a ready to eat product and there are obviously strict CFIA guidelines that are followed here. This intake pipe will be a mere few kilometers away from where the proposed effluent pipe is going. With a proposal to discharge 70-90 million litres of treated effluent from a bleached kraft mill every day this will obviously shut the plant down from using the intake pipe anymore for the necessary water to operate. I have included some pictures to give you an idea of exactly what we are looking at with the pipes.

On top of the jobs that the plant provides it also supports hundreds of fishermen with T4's issued to them in the 10's of millions of dollars each year. NNS operates its own private wharf right here in Caribou in front of the processing plant. This wharf supports over 60 local fishermen. NNS then puts trucks on the roads all year long going to about 10 wharfs directly here in the Straight then over another 50 throughout NS from Cape Breton to Yarmouth and into PEI and NB. NNS and myself as a lobster fisherman is very concerned about the harm to fish and fish habitat that could result from Northern Pulp's proposal to discharge 70-90 million

litres of treated effluent from a bleached kraft mill every day through a 10.5k pipe into the prime fishing grounds of the Northumberland Strait.

Thousands of families from all three provinces, including First Nation communities in those provinces, make their living from these fisheries. Many fishermen come from families which have fished for generations. They have made changes to help keep our waters clean, so that their children and grandchildren can fish also. Owner-operator fishermen are an important part of our regional economies. Fishermen generate many jobs in our communities. They buy their supplies locally, and they spend their profits locally.

I am also concerned about the continued health of the Northumberland Strait, which attracts thousands of tourists, visitors and summer residents who fish, dive, swim and boat in its beautiful waters. The Northumberland Strait is a key part of life and the economy of Pictou County and draws people to our area.

I am further concerned about the health of people living close to Northern Pulp. For decades air emissions from the mill have been a problem affecting residents' health and local businesses. I am writing in support of the Environmental Assessment application submitted by Northern Pulp for its new treatment facility.

A lot has been said about Northern Pulp and its impact on the local community. I stand in agreement with many, including Unifor, that Boat Harbour must close and be cleaned up to respect Pictou Landing First Nations people and their land. I also know there are many positives about having 300 good-paying jobs in Pictou, supporting thousands more across Nova Scotia, particularly in rural communities.

The Nova Scotia Environment Act is an essential piece of legislation designed to protect our shared environment and guide our economic development. The Act rightly spells out its purpose through a set of principles for sustainable development that should guide its application, including:

------> The linkage between economic and environmental issues, recognizing that long-term economic prosperity depends upon sound environmental management and that effective environmental protection depends on a strong economy.

In this situation, science should determine the best path forward. Nova Scotia, along with the rest of Canada, has among the highest global standards for environmental stewardship in the forestry sector.

The job of government and every person we elect to represent us in government is to find the best way forward when there are many competing and sometimes opposing interests. Communities across Canada manage to find a fair balance where good mill jobs coexist with a prosperous fishing industry and thriving communities.

We can and must find this balance for Pictou. There is a lot at stake: jobs, the environment, and respect for First Nations. We can and must find a solution that supports all three.

Thank you.

This community and the surrounding area need these jobs.
The environment is a very important issue however a short extension for the Mill would be a small price to pay in relation to how long it has already been operating.

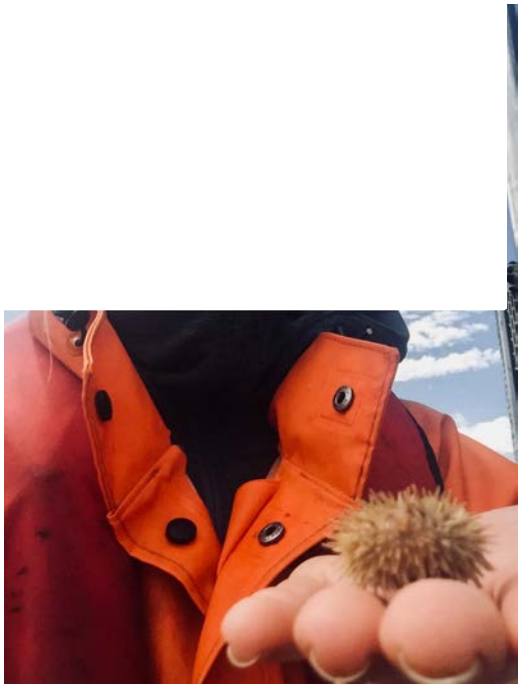
Google: Northern Pulpâ?Ts environmental documents: missing mercury, a pulp mill that never was, and oodles of contradictions Im sure youve read this excellent investigation of Northern Pulps effort to convince the province, via your department, of their due diligence. Sorry to say, its doo-doo diligence and smelt it and scooped it up. Its in the trash of corporate obfuscation which I trust you will empty. I will add my passion heat regarding the ownership of Northern Pulp and why we should not allow this company to grow its unethical roots in the land of the Acadian forest, as it unmercifully uproots its contents, so vital to our and other species health and wellbeing, without regard to the ecological nightmare its creating, as it has done in Indonesia in the Borneo Rainforest. Regarding the mills relevance, the labour union rep. at the mill spoke during CBCs Information Morning broadcast from Pictou a month ago about the owners deep pockets. These deep pockets are filled with the blood from his destructive clear-cutting onslaught in the Borneo Rainforest, which obliterated the Penan people, destroyed the orangutans and hundreds of thousands of other floral and faunal habitat to enhance our own billionaires thirst for profit as they fill their processed junk foods with the blood money palm oil that replaced earths lungs thousands of potential cures for dis-ease--including cancer-- that lie in the richest of biological wonders--the rainforest ecosystem and the survival of our closest along with chimpanzees relative species --the orange ape. The owner of Northern Pulp is not doing Nova Scotia any favours in the long run which is getting shorter every year as more clearcutting takes place. You must be a cog in the wheel of convincing the employees of this company that there is support and life after this plant closes. Like the tide, dozens of enterprises in tourism, heritage, fisheries, farming, ecotourism and vital clean corporations will move their families and their operations into Pictou County when they see its health, beauty and sustainability restored by your department. That is your legacy, Minister Miller. Do you want it or not? Northern Pulpâ?Ts environmental documents: missing mercury, a pulp mill th... Honourable Margaret Miller, Minister of Environment
Environmental Assessment Branch, Nova Scotia Environment
P.O. Box 442 Halifax, Nova Scotia B3J 2P8

Minister Miller,



I am contacting you in relation to Northern Pulp's Replacement Effluent Treatment Facility Project. I am addressing you as someone who makes their living in the fishing area 26A in the Gulf of St. Lawrence. These fishing grounds encompass the area of the southeastern part of Northumberland Strait between Nova Scotia and Prince Edward Island and the western half between Prince Edward Island and Cape Breton. Firstly I would like commend each of the members in my community who are addressing the issue in of Northern Pulp's presence on The Northumberland Strait. I have never publicly expressed my feelings regarding the environmental atrocity that is Northern Pulp but cannot go without taking this opportunity to make this personal appeal to you. My community is often regarded as being divided but many have been brought together by their concern over the treatment of our waters & residents. I could not be prouder to be from Nova Scotia except that our representation is truly failing us by supporting an industry over its own citizens. You have been disregarding the voices of a concerned community. **I urge you to recognize your support of Northern Pulp over the people of this area as the destruction of the cultural heritage of communities along the Northern Shores of Nova Scotia & take commendable action in requiring an environmental assessment report (EAR) to be conducted Canadian Environmental Assessment Agency (CEAA).** Together with the supported of obedient Provincial Governments the pulp mill operation in our community have a continuous track record of negating our community and neglecting our environment. Nova Scotia's culture was formed by our & continues to develop from the interactions within environment of our scenic coastlines. **I demand you address the environmental effect of Northern Pulp's operation on the culture of Northern Nova Scotia by stepping away from the situation & ordering an EAR of the proposed area from the CEAA before any actions can taken in relation to the proposed pipeline.**

I can attest that the culture contained & surrounding the area of the proposed pipeline is boundless compared to the value of the pulp produced at Northern Pulp in Abercrombie, Nova Scotia. I was raised in a 'fishing family' in Pictou County, Nova Scotia; graduating from in Alma from Northumberland Regional High School where I received my first formal education on the injustices related to the area's pulp mill through a law class. At the time my peers & I would get inundated with the presence of sulfur and other pollutants in the air as we learned. I continued my studies at Dalhousie University's School of Nursing learning the significance of social and cultural determinants of health. After attending a lecture on environmental racism I discussed the concept with my Father; while he had never heard the terminology before that he was very much aware of its effects on the coastline. When I developed the Northumberland Strait was the therapeutic entity that sought me through. I could be dead but I'm a fisherman. The Strait taught me how to transition through life; it gifts me with joy, gratitude & some pride in myself. My Father forced me onto the water each morning & into having a purpose. I will never find the words to describe how pushing off of our wharf, spending the day the day on my water & returning home with bounty healed me. I've been vegetarian for fifteen years & I've never eaten a lobster. As a child I watched my Grandfather & Father struggle with daily catches that were in the double digits poundwise. Today we benefit from the environmental effects of a warming planet; there is no better feeling knowing you're top boat & I love seeing my Brother & Grandfather floating as we sail in with catches that are ten times what they were in the early 2000s. I know programs in the area are benefiting us too but we as a society must address the environmental conundrum that is the Northumberland Strait. A decade has passed since I first brought up the environmental racism with my Father yet there is significant distress in the area regarding the multitude of issues caused by Northern Pulp's continued operation. My father has remained a positive example for me by continuously expressing his belief that the conversation regarding these issues must be solution-focused. My sister's partner is a engineer technician at Northern Pulp and my partner works the forestry which is heavily dependent on the funding provided by the pulp and paper industry. As a family I feel like we have done very well by maintaining respectful discussion regarding the operation of Northern Pulp. However I am deeply distressed by the Provincial Government's delinquency in caring for our waters & am now asking you to consider the direct environmental effects on the culture of this area as your personal decision. **I urge you to hand off the responsibilities of an EAR to the CEAA before the situation worsens.**

I make my living on the Northumberland Strait in more than one way. I am a deckhand, working alongside my Brother, Father & paternal Grandfather out of Skinner's Cove in River John, Nova Scotia. Since 2017 I have supplemented my income by working in the tourism industry as a server at The Pictou Lodge; an institution built in 1926 that accommodates those visiting the area. Here I meet people from all over the world who are travel to our beautiful shoreline because of the nature of The Northumberland Strait. Hearkening first hand accounts of what Come-From-Aways cull on our shores frames the global perspective on Nova Scotia as a whole. These conversations have defined how fortunate I feel to live & work here; I have a great love for the sea. I assure you that our culture and waters are worth more than pulp. If Northern Pulp

continues to operate alongside a submissive provincial government I know the tourism industry this area has worked to build up will collapse with the environment; No one wants to vacation in a cesspool. **The culture here is informed by the environment which will be affected if you permit Northern Pulp to operate without and EAR conducted by the CEAA.**

My partner & I have both grown up in homes that our Great-Great-Grandfathers had lived in. We have both acquired knowledge informed by a multi-generational relationship with this environment. His family has been farming the shoreline of Caribou Harbour since arriving here from Scotland in the early 1800s. This area is the proposed site of Northern Pulp's pipeline. **I encourage you to think of it as ground zero & your legacy by acknowledging the significant cultural value of the Northumberland Strait in handing off responsibility of an EAR to the CEAA.** The culture of this area is indubitably conjoined with commercial fishing which both of our families sustained themselves from. In 1939 my Grandfather was born in a farmhouse very near Skinner's Cove & has been sailing 'The Strait' since childhood. The first vessel he operated was one he had fashioned by welding two car hoods together. He continues to fish has witnessed the coastal transformation of this area over his lifetime. Fishing beside my Brother, Father and Grandfather gladdens my heart in ways that I cannot express in words. I fear that I am at the end a line and will be unable to pass on my knowledge and skill set to a future generation because my government doesn't value the very environment it exist within. My Grandfather's experience is quintessential to who I am as a person; part of this experience is how this environment has been altered by the undeniable results of a changing, polluted environment. He recalls bluffs that have eroded, forests that no longer exist & much, much colder waters. I know our commercial fishing operation will be unsustainable if the mill pollutes our beautiful Strait. I am disgusted by the multitudes of wrongdoings by industry & governments alike since the mill began its operation in Abercrombie. **There must be an objective, independent EAR completed by the CEAA of the Northumberland Strait to address the environmental effects of Northern Pulp's operation on the scenic coastline to identifying how these effects will impact the socio-economic conditions on our culture which has significant historic and future value.**

Those of us who live, work & play on The Northumberland Strait can palpate the environmental effects of the unsustainable pulp & paper industry. There is no wonder why. For a short period during the 1970s my Grandfather supported his family by working at Canso Chemicals, the company who made “the caustic” required for the pulp mill. During this time my Grandfather had a continuous cough, skin rash & eye irritation. At that time he sought the opinion of his family physician Dr. Skinner regarding his ailments who told my Grandfather he was insane for working there. My grandfather has always reported to me that he felt helpless and silenced as Canso Chemicals released straight, untreated waste into Pictou Harbour during early morning hours. He left his employment at Canso Chemicals knowing that they waited until children were sleeping in their beds to illegally dump toxic effluent. If you think you know what dangers are present in under Our waters you have no sense of the situation whatsoever. **An EAR of the Northumberland Strait must be conducted by the CEAA to determine the environmental effects of pulp production in Abercrombie before any decisions regarding future production in the area. In vivo veritas.**

By conforming to Northern Pulps demands I ensure you that you will be forever regarded as the executioner of a culture. I know this community & you are unprepared for dealing with the consequences of not handing an EAR to the CEAA. **Take action by washing your hands clean of any decision-making by electing the CEAA to do an EAR at the proposed site.** I assure you that otherwise the Provincial Government will overloaded: there will be an impassable, occupied causeway. I believe a reasonable answer to having effluent dumped in my workspace is having it tanked & dumped where those responsible for that work. If you expect this community to live & work in effluent I would expect the same from you. **Order an independent EAR conducted by the CEAA or you will be unleashing an inferno of anguish on this community & our culture beyond anything you could possibly conceive of.**

With some hope,

Project: replacement_effluent_treatment_facility_project Comments: I believe that Northern Pulp should be permitted to put an â?oon siteâ? effluent treatment plant, and that the effluent should be discharged into the Northumberland Strait via a pipeline / diffuser system. The mill and the fishermen have co-existed for over 50 years, with the mill effluent going into the Northumberland Strait via Boat Harbour. I had an opportunity to visit the Boat Harbour treatment facility about 2000-2001, when it was being managed by . I saw a treatment facility that was well run, meeting all the government guide lines of the day. If the effluent treated on site at the mill, exceeds government guidelines, then it should be allowed to go out in to the strait. No one in the fishing community seems to be in dire straits. They all seem to be driving newer vehicles, and living in nice homes. If you ask a fisherman how the fishing is, they all have the same responseâ?"â?onot as good or better than last yearâ? as if the average person knew how well they did last year. If the mill is forced to close because they cannot discharge effluent into the Northumberland Strait, not only the employees at the mill, and all those who supply product to the mill will be affected. I believe the housing market will take a substantial hit, and with that the tax base will be eroded in many areas of Nova Scotia, particularly in Pictou County. This may also lead to a reduction in income earned by many, resulting in lower taxes for the province, which will lead to reduced services in health care, schools and roads, to mention a few. I do not believe tourism will be greatly affected by discharging effluent into the Northumberland Strait. We have a very short tourist season in all of Nova Scotia, and I believe the income generated by tourist is far exceeded by the income generated by the mill. I feel very confident saying 100 of the people who are against the discharge of effluent into the Northumberland Strait are the same people who wipe themselves, in the morning, with a product that has its start in a mill similar to Northern Pulp, so, if they are adamant about changing their lifestyle then they should think about going back to what I used as a child when using the facilities â?" a page out of an Eatonâ?Ts catalogue. Subject: In support of Northern Pulp"s EA application
Date: March 7, 2019 2:38:05 PM

I am writing in support of the Environmental Assessment application submitted by Northern Pulp for its new treatment facility.

A lot has been said about Northern Pulp and its impact on the local community. I stand in agreement with many, including Unifor, that Boat Harbour must close and be cleaned up to respect Pictou Landing First Nations people and their land. I also know there are many positives about having 300 good-paying jobs in Pictou, supporting thousands more across Nova Scotia, particularly in rural communities.

The Nova Scotia Environment Act is an essential piece of legislation designed to protect our shared environment and guide our economic development. The Act rightly spells out its purpose through a set of principles for sustainable development that should guide its application, including:

------> The linkage between economic and environmental issues, recognizing that long-term economic prosperity depends upon sound environmental management and that effective environmental protection depends on a strong economy.

In this situation, science should determine the best path forward. Nova Scotia, along with the rest of Canada, has among the highest global standards for environmental stewardship in the forestry sector.

The job of government and every person we elect to represent us in government is to find the best way forward when there are many competing and sometimes opposing interests. Communities across Canada manage to find a fair balance where good mill jobs coexist with a prosperous fishing industry and thriving communities.

We can and must find this balance for Pictou. There is a lot at stake: jobs, the environment, and respect for First Nations. We can and must find a solution that supports all three.

Thank you.

I trust all the professional ocean and fishery scientist professionals that work on all of our behalves everyday in Nova Scotia, will do their very best work in resolving any concerning question anyone may have.

Project: - Choose - Comments: Just a few questions 1 Was it ever considered to change over from the kraft process to a different process that may be less environmentally damaging? If so how quickly could it have been done and at what cost? 2 Is it possible to dig three parallel sets of 10 holding tanks 30 tanks in all. Each holding tank would be 500 metres wide by 150 metres long by 4 metres deep and contain the daily outflow of effluent. Then the effluent in tank one possibly could be cleaned and sent to tank 2 and so on . By the time it had gone through tank ten or holding area 10 the effluent through filtration, reverse osmosis, aeration,chemical treatment, bacterial treatment and other cleansing processes would it not be fairly clean water and if so then allowed into Northumberland Strait. Perhaps fewer than 10 holding tanks, perhaps 8,would be required. The other two parallel sets of holding areas would be put into use when the first set needs to be cleaned and refurbished. Question 3 Could the waste product garnered after cleaning the holding tanks be safely disposed of? We need to safeguard our environment in a creative way so that SUSTAINABLE fishing, farming and forestry practices can be carried on. Name: Email: @ns.sympatico.ca

Subject: In support of Northern Pulp"s EA application
Date: March 7, 2019 2:50:42 PM

I am writing in support of the Environmental Assessment application submitted by Northern Pulp for its new treatment facility.

A lot has been said about Northern Pulp and its impact on the local community. I stand in agreement with many, including Unifor, that Boat Harbour must close and be cleaned up to respect Pictou Landing First Nations people and their land. I also know there are many positives about having 300 good-paying jobs in Pictou, supporting thousands more across Nova Scotia, particularly in rural communities.

The Nova Scotia Environment Act is an essential piece of legislation designed to protect our shared environment and guide our economic development. The Act rightly spells out its purpose through a set of principles for sustainable development that should guide its application, including:

------> The linkage between economic and environmental issues, recognizing that long-term economic prosperity depends upon sound environmental management and that effective environmental protection depends on a strong economy.

In this situation, science should determine the best path forward. Nova Scotia, along with the rest of Canada, has among the highest global standards for environmental stewardship in the forestry sector.

The job of government and every person we elect to represent us in government is to find the best way forward when there are many competing and sometimes opposing interests. Communities across Canada manage to find a fair balance where good mill jobs coexist with a prosperous fishing industry and thriving communities.

We can and must find this balance for Pictou. There is a lot at stake: jobs, the environment, and respect for First Nations. We can and must find a solution that supports all three.

Thank you.

We must not forget our women ...you came from a mother who is a woman .so please let s not betray them..LOVE

Project: replacement_effluent_treatment_facility_project Comments: Please make sure an in-depth assessment in done before this project can go forward, preferably pushing it to a federal level assessment. Ideally, the pipeline will not be able to be installed at all, as Northern Pulp has been harming our community for over fifty years, and to put toxic effluent in the strait would be absolutely detrimental to fisheries, tourism, and the health of many people in Pictou County, NS, and on either side of the Northumberland Strait. People over profit. Environment over industry. We can create clean jobs, it just takes government initiative. We the people have no choice but to put our faith in the provincial government, and you, Margaret Miller. Please dont let us down by polluting our province and choosing the pulp mill over Nova Scotias citizens as we have seen for so long. Thank you. #nopipe #savethestrait Name:

I am originally from Pictou N. S. now living in the town of Hinton Ab. Which also has sawmill as well as a pulp mill. I see every day how pulp mill and communities can coexist and high environmental standards up held. Their is a balance to this problem that must be found for all involved please let work together and find a solution as we have in Hinton thanks

Project: replacement_effluent_treatment_facility_project Comments: March 7, 2019 Honorable Minister Miller, The legislation the current Liberal government introduced last year, Bill C-69, which has passed the House of Commons and is currently with the Canadian Senate, contains important new measures to strengthen environmental protection and Indigenous participation. The current new treatment facility proposal and associated environmental assessment submitted by Northern Pulp would have triggered a Federal Assessment under this new Act. The new treatment facility, which includes a pipeline direct to the Northumberland Strait to dispose of their estimated 62 to 90 million liters of â?~treatedâ?T effluent per day, will cause harm to the marine ecosystem. The triggers that would have directed Northern Pulpâ?Ts submitted EA to be designated a federal assessment, are inclusive of health, social, economic, gender-based and long-term impacts on Indigenous peoples, when you consider the potential impacts this toxic effluent will have on the Northumberland Strait and the associated fisheries. This includes the health of the people potentially impacted, directly or indirectly via the consumption of contaminated seafood, air emissions specifically PM 2.5, mental health, deleterious substances, dioxins and furans, methyl mercury, etc. Northern Pulps proposal includes burying the effluent pipe 4.1 kilometers beneath the seabed, which is federal land. As Section 67 of current CEAA 2012 Act, sets the framework for the environmental assessment of projects being carried out on federal land that are not considered designated projects and for which a full environmental impact assessment under the Regulations Designating Physical Activities is not required. As the seabed of the Northumberland Strait and Caribou Harbour are federal crown land it is subject to requirements under section 67 of CEAA. Section 67 states as follows: â?¦..an authority must not carry out a project on federal lands, or exercise any power or perform any duty or function conferred on it under any Act of Parliament other than this Act that could permit a project to be carried out, in whole or in part, on federal lands, unless: a The authority determines that the carrying out of the project is not likely to cause significant adverse environmental effects or b The authority determines that the carrying out of the project is likely to cause significant adverse environmental effects and the Governor in Council decides that those effects are justified in the circumstances under subsection 693.â?T Based on the current CEAA 2012, this project is subject to review by a federal authority in order to determine whether the carrying out of the project will cause significant adverse effects on the surrounding environment, or if any potential significant adverse effects are justifiable. Northern Pulps submitted EA does not include a study on the impact to lobster or herring larvae, or bivalve shellfish including scallops. Also note, requesting a federal assessment are approximately 20 of the Canadian Senate, the government of Prince Edward Island, a working group of 3000 fishermen including Pictou Landing First Nations, all the local MLAâ?Ts, as well as thousands of concerned citizens including many local physicians. You obliviously are aware of the conflict of interest our provincial government has, as the government is both the funder either directly or indirectly, and regulator. Our provincial government remains liable for damages caused by this effluent, including the inevitable damage this new effluent treatment proposal will cause. The damages to Boat Harbour, as well as the impounded western section of the Pictou Harbour, caused by the Pictou Causeway, built to encourage the mill to come here, will amount to many hundreds of millions to remedy. This new proposal and associated damage it may affect on the fisheries, of not just Nova Scotia, but New Brunswick and P.E.I. as well, could potentially amount to billions. If Northern Pulp is so confident in their new treatment

facility, I wonder if they would consider assuming the risk and associated cost to compensate the fishermen of three provinces, in the event the effluent does what fishermen expect it to do? Considering Northern Pulp has not performed any actual lobster or herring larvae studies and have no idea as it pertains to the detrimental impact the effluent will have regarding bio accumulative effects on the numerous bivalve shellfish, finfish, lobster, crab, or any of the associated species larvae. Please designate this for a federal review. Name:

March 7, 2019

The Hon. Margaret Miller
Minister of Environment

Dear Minister Miller:

I am writing in relation to Northern Pulp's Replacement Effluent Treatment Facility Project.

My name is I grew up in the Town of Pictou and now live on the Sunrise Trail along the beautiful Northumberland Strait for almost 34 years.

When the pulp mill first started production I was only 10 or 11 years old and the smell from the mill was almost unbearable. I can remember gagging all the time because the smell was so bad and so strong it took my breath away and it has not improved much over the years. When I was a teenager I used to go swimming at Lowden's Beach which was located directly across from the Lighthouse Beach in Pictou Landing. Lowden's Beach was a beautiful beach at that time but it was not long before the dark scum from Boat Harbour ruined the beach. The mill still has that awful smell and numerous visitors have not stayed or will not stay in Pictou because of the smell. This drives people away from this area and hurts the tourism industry.

Pictou County is an area that has a beautiful shoreline with many beaches that locals and cottagers enjoy during the summer months. I have noticed that the Northumberland shore has changed over the last 34 years. The waves and tides are much higher than they used to be and the winds are changing by getting stronger. I have seen winter sea ice buildup on the shore numerous times over the years where it has moved huge rocks. We should not underestimate the power behind these ice flows that are so strong. The forces of Mother Nature should not be taken lightly because the weather is something we cannot control.

I refer to the Nova Scotia Environment Act because it is important to note this project will cause **adverse effects or significant environment effects.** It will create negative effects on the environment that cannot be remedied. In Northern Pulp's Environmental Assessment Registration Document it states,

> "At this time, effluent chemistry characteristics (including the specific substances present in treated effluent and their anticipated concentration) will not be known with certainty until the project is operational. Due to uncertainty regarding effluent composition and approximate concentrations of substances present in the future treated effluent (which will not be verified until the project is operational), the identified candidate COPC's in effluent are considered preliminary at this time." (Consulting, January 2019)

This is unacceptable and clearly not a reality because we now have an unknown variable that we are supposed to believe will have no effect on our environment and the Northumberland Strait's ecosystem. It will not only effect people livelihoods but most importantly the environment. Northern Pulp does not know if the effluent can be remedied and once the process starts it will continue until a time they no longer require a pipe in

the Northumberland Strait. It is hard to fathom that Northern Pulp thinks the residents of Pictou County truly believe the environment will not be harmed. It will be too late to worry about the eco-systems, the fisheries and tourism that will all suffer because of such a poorly executed project. To expect the residents to put their trust and faith in such an unconceivable plan that Northern Pulp is going to run a pipe out into the Northumberland Strait right through the center of a marine ecosystem is beyond comprehension. I cannot even think of any words that would express the negative impact this will cause to the environment and to sacrifice the environment for industry is just morally wrong.

Northern Pulp has also provided the same data specific to the Pictou Harbour project on the Caribou Harbour project. There is no data provided on long term effects from the effluent flowing into Caribou Harbour and Northern Pulp did not hold public consultations for the Caribou Harbour Project. We do not know the impact this project will have on the tourism industry but the fishery is definitely understated by Northern Pulp **assuming** there will be no effect or **highly unlikely** there will be no effects.

I cannot stress enough the importance of local knowledge from the residents who have lived with the pulp mill in their neighborhood for over 50 years. PLFN has been living with this toxic waste in their backyard so they know more than anyone what it has done to the fish and wildlife they have hunted over the years. All you have to do is ask the fishermen who have been fishing on the Northumberland Strait for hundreds of years with fishing gears passed down through the generations. They know these waters and the ecosystems that are vitally important to the marine environment and the fishermen who fish these waters. The fishing industry provides economic growth and sustainability to Pictou County and we cannot overlook the forest industry that has to start sustaining our forests for the future or there will no nothing left to harvest. It only took 1 cow to cripple the beef industry in Canada so we do not want a repeat in the fishing industry. The fishermen pride themselves on the Atlantic Lobster Fishery so I cannot imagine putting a pipe out into the Northumberland Strait for Northern Pulp's effluent would even be considered.

> A statement from the project's Executive Summary as follow:
> "It is **not predicted** that the installation of the pipeline will result in **long term** harm to fish or fish habitat. " (Baxter)

The consultants for Northern Pulp went so far as to find a project similar to the Northern Pulp project. In Joan Baxter's article in the Halifax Examiner she states:

> "The consultants looked for a project that was similar to the NPNS project, which had undergone a human health risk assessment, so they could compare the potential human exposures and risks associated with a marine treated effluent discharge from a kraft pulp mill.
> For this Northern Pulp chose a study done by Toxikos Consultants in 2006 for a highly controversial pulp mill proposed for Bell Bay, Tasmania. It would be impossible to check the veracity of the study because the mill was never built." (Baxter)

Northern Pulp had 5 years to come up with a plan when Boat Harbour closes in January, 2020 but the community only has 30 days to make a response to a document with so many pages to comprehend.

It is very troublesome that Northern Pulp's pipe route is going through the Town of Pictou's watershed. If there is ever a leak that effluent is going directly into the water source for a town. Northern Pulp's latest leak in 2018 was found by residents whose property borders the Boat Harbour system and there has been no information available on the effects or how much of the effluent was leaked before it was found.

The residents of Nova Scotia have been paying for this environmental disaster for over 50 years and the time has now come for it to end. The taxpayers of Nova Scotia have spent hundreds of millions of dollars on this pulp mill and we deserve better than the 50+ years of toxic waste.

Lastly the treatment of the PLFN from previous and present owners of Northern Pulp is truly heartbreaking. How do you right a wrong after years of environmental abuse and the lies the PLFN were told before the mill was even built and continued throughout the course of over 50 years? Boat Harbour is situated in the PLFN backyard and it has been used as a dumping ground for far too long. The Pictou Landing First Nation's countdown clock is ticking because there will be no extension and Boat Harbour is going to close on January 31, 2020.

In conclusion the only acceptable option is to move forward with a Federal Assessment. Trust is such a small word that had many consequences in regards to the pulp mill in Pictou County. Assumptions and predictions do not qualify for a Class 1 Assessment.

Regards,

Subject: Support for Northern Pulp Environmental Assessment
Date: March 7, 2019 4:04:30 PM

I am writing in support of the Environmental Assessment application submitted by Northern Pulp for its new treatment facility.

A lot has been said about Northern Pulp and its impact on the local community. I stand in agreement with many, including Unifor, that Boat Harbour must close and be cleaned up to respect Pictou Landing First Nations people and their land. I also know there are many positives about having 300 good-paying jobs in Pictou, supporting thousands more across Nova Scotia, particularly in rural communities.

The Nova Scotia Environment Act is an essential piece of legislation designed to protect our shared environment and guide our economic development. The Act rightly spells out its purpose through a set of principles for sustainable development that should guide its application, including:

------> The linkage between economic and environmental issues, recognizing that long-term economic prosperity depends upon sound environmental management and that effective environmental protection depends on a strong economy.

In this situation, science should determine the best path forward. Nova Scotia, along with the rest of Canada, has among the highest global standards for environmental stewardship in the forestry sector.

The job of government and every person we elect to represent us in government is to find the best way forward when there are many competing and sometimes opposing interests. Communities across Canada manage to find a fair balance where good mill jobs coexist with a prosperous fishing industry and thriving communities.

We can and must find this balance for Pictou. There is a lot at stake: jobs, the environment, and respect for First Nations. We can and must find a solution that supports all three.

Thank you.

Project: replacement_effluent_treatment_facility_project Comments: This application should be rejected for the following reasons: â?¢ Partially treated effluent is not acceptable for the otherwise pristine waters of the Northumberland Strait. The present effluent from Boat Harbour is already beyond acceptable, and I understand that the suspended solids in the proposed effluent will be even higher than the present Boat Harbour situation. â?¢ Pumping partially treated effluent into the Northumberland Strait has the potential of contaminating the waters of five of Canadaâ?Ts provinces. â?¢ The fisheries at stake in these five provinces are too valuable to be put at risk. To: Environment Assessment Web Account
Subject: Northern Pulp Replacement Effluent Treatment Facility Project
Date: March 7, 2019 4:46:03 PM

March 7, 2019

To Environment Minister Margaret Miller

I would like to voice my *strong opposition to the Northern Pulp's proposed replacement effluent treatment facility project*, which will pump 85 million litres of hot toxic pulp effluent daily through pipeline across sensitive watersheds, directly out into the Northumberland Strait, one of Nova Scotia's most important lobster and fishing/breeding grounds. This area is also important for recreation, and tourism, with beautiful coastlines with gorgeous beaches.

As a cottage owner in Pictou County for over 20 years, I am being asked to trust that the research has been exhaustive, and thorough, and that I have nothing to worry about based on a company with a dismal track record.
Dillon Consultings' 'executive summary' of the Environmental Assessment report developed on behalf of Northern Pulp, indicates that not one single item within the submission would have any significant 'Residual Environmental Effect Predicted'. Not one out of 18 areas affected (including marine habitat, ground water, wildlife, plant life...etc) will have any residual effect; including no effect during construction, no effect during ongoing operation, no effect during ongoing maintenance, no effect during accidents, no affect during malfunctions, no affect during unplanned events! Sounds a bit unbelievable. Take a look, or a smell of Boat Harbour, an environmental **racism** disaster.

What exactly will be coming out of the pipe and dumping into the Northumberland Strait? How can we possibly know, when they don't even know. The Dillon EA report referred to above has the following statement:
'At this time, effluent chemistry characteristics including the specific substances present in the treated effluent and their anticipated concentrations will not be known with certainty until the project is operational'
This statement is not comforting.
What we do know according to "Appendix E", is the 85 million litres a day of treated effluent will be up to 37 degrees C in the summer and 25 degrees C in winter. This is a problem in a lobster and fishing breeding ground. The fresh water, and the warmth of the water effect lobster habitat. What is its affect on fish, shellfish and birds? This area has a large and diverse number of birds that depend on a healthy environment.

The past handling of effluent from this mill has resulted in one of the most contaminated sites in Canada, Boat Harbour. I want to see a strong, science based review of this project which will protect the future health of our Strait and it's inhabitants, both great and small. The economy of Nova Scotia depends on healthy waters and quality seafood.

I am also concerned regarding the bio-solids that are removed as part of the treatment system. According to Guy Martin, the principle consultant with KSH Consulting in Montreal and lead engineer for the design in the construction of the waste water treatment plant for Northern Pulp," the solids that are lost within the production and the bio-solids that are removed as part of the treatment system, those will be pressed and the current plan is to use them as fuel in the mills part boiler."
We need to know that all mercury, will be removed before burning because of how harmful inhalation of mercury vapour is. Mercury vapour can produce harm on the nervous, and immune systems.Damage by mercury to the lungs can prove fatal.

I also believe there is a conflict of interest happening here. The Canadian government has put up millions of dollars into this company. How can this project be looked at objectively? Perhaps the environmental assessment should be handed over to the Canadian Environmental Assessment Agency

Additional information is required before any decisions can be made on Northern Pulp's proposal. Please give Pictou County a chance to thrive with clean air and clean water.

Regards,

Subject: Proposed Project Comments
Date: March 7, 2019 5:05:01 PM

Project: replacement_effluent_treatment_facility_project Comments: Madam Minister: I write today to express my disgust with your ministry even remotely considering allowing Northern Pulp to proceed with their recently registered proposal to relocate their Effluent dumping site from Boat Harbour to the Pristine waters of the Northumberland Strait. This proposal will pass through Caribou Harbour where my wife and I live in what we believed would be our retirement home which we purchased in .At that time we had no advance warning that we would have to face the threat of having to deal with the negative impact of living on the waters that will be polluted with potentially hazardous chemical and solid waste effluent being disposed of directly into the waters that our condominium fronts on. These are tidal waters and are subject to significant storm surge which brings sediment up from the bottom and will wash ashore onto the land where our condo was built. A total of 31 other condos, the majority of which are owned by seniors will also be impacted as will the beaches of Caribou Monroes Island Provincial Park.The land upon which a total of 32 ground level condos are located is a waterlot Grant meaning that the Condo property extends out into Caribou harbour and must be recognized as Private property. Neither the Government of Nova Scotia nor Northern Pulp have a legal right to cause harm to private property. Like a majority of the condo shareholders in this project, we are seniors who may well be forced to proceed with legal action to protect our homes. The properties here will also likely see diminished value as a result of the aforementioned proposal. PM TRUDEAUS recent remarks saying that the Nova Scotia Government has the lead with respect to this matter suggest our only hope to save our homes lies with you and your government. I appeal to your sense of fairness and justice in making your final decision on the outcome of your deliberations.The people of Pictou County have had to live with this pollution producing company ever since it began operations some 50 years ago. Enough already. As for the job loss factor, your Government showed no such concern when the Trenton works facility was shut down however, that shutdown put more employees out of work than the mill shutdown will impact. The forestry industry can be repurposed to produce valuable products without the associated pollution. I note that the Boat Harbour Remediation project will cost NS taxpayers $217 million, however, it is unlikely that the Northumberland Strait could be similarly remedied. If the Northumberland Proposal is approved, it will totally negate the Northumberland Costal Restoration project which I believe is also Government funded. Waste, waste and more waste ought to be the Liberal campaign slogan in the upcoming provincial election which your government has little to no hope of winning should it approve the Northern Pulp proposal.It appears your government has more interest in protecting the interests of foreign investors than it does the citizens who vote you into power. Any counter argument respecting job losses can be offset by job creation that would arise from repurposing the Nova Scotia Forestry industry, or redirect the provinces pulp wood supply to the Port Hawkesbury mill which is currently experiencing shortages of raw materials. Madam Minister If I inadvertently drop a kleenex onto the streets of any community I would most likely be charged and convicted of littering. Yet your government is considering allowing a profit motivated Foeign Company to pollute the waters of the Northumberland Strait with what could be the equivalent of quadrillion of kleenex and chemical waste into the waters along its coastlines in both PEI AND Nova Scotia. The results of the CEAA assessment of the Boat Harbour remedial project will demonstrate clearly the potential environmental disaster Northern Pulps proposal and your failure to protct our environment could cause. It is my belief

that you ought to wait upon the findings of CEAAs assessment at Boat Harbour prior to granting Northern Pulp Authorization to proceed with their outrageous proposal. You have the power to prevent this disaster. Exercise that power. Respectfully submitted,

I am writing in support of the Environmental Assessment application submitted by Northern Pulp for its new treatment facility.

A lot has been said about Northern Pulp and its impact on the local community. I stand in agreement with many, including Unifor, that Boat Harbour must close and be cleaned up to respect Pictou Landing First Nations people and their land. I also know there are many positives about having 300 good-paying jobs in Pictou, supporting thousands more across Nova Scotia, particularly in rural communities.

The Nova Scotia Environment Act is an essential piece of legislation designed to protect our shared environment and guide our economic development. The Act rightly spells out its purpose through a set of principles for sustainable development that should guide its application, including:

------> The linkage between economic and environmental issues, recognizing that long-term economic prosperity depends upon sound environmental management and that effective environmental protection depends on a strong economy.

In this situation, science should determine the best path forward. Nova Scotia, along with the rest of Canada, has among the highest global standards for environmental stewardship in the forestry sector.

The job of government and every person we elect to represent us in government is to find the best way forward when there are many competing and sometimes opposing interests. Communities across Canada manage to find a fair balance where good mill jobs coexist with a prosperous fishing industry and thriving communities.

We can and must find this balance for Pictou. There is a lot at stake: jobs, the environment, and respect for First Nations. We can and must find a solution that supports all three.

Thank you.

In regards to northern pulps plan to pipe effluent into the Northumberland strait, I think this plan should be stopped, this day and age we should be moving to more green environment friendly ways to conduct business, we should not leave a environment disaster for our children, the risk to our water our fisheries and our air we breathe is to important to risk with this plan. The ice in the Northumberland strait would destroy this pipe, and monitoring of what comes out of pipe would have to be done daily and if test results are bad ,then it's to late the damage is done our ecosystem will already be destroyed much like boat harbour. Also the plan to burn soilds in there boilers is akin to environmental terrorism that the people of this area should not have to endure, also the way this plan was put in place was very divisive for pictou county, pitting family against family, neighbors versus neighbors, its time this government came up with plan to help the people of pictou county and this pipeline into our ocean playground is not the answer. Please help stop the environmental terrorism that the people of pictou county have to endure. This plan should undergo the highest level of scrutiny possible to help alleviate the concern that so many people have that have endured this crisis for over 50years, please help pictou county stand up to this foreign owned company that has been treating its neighbors with disdain. Whether it costs a billion dollars or more the only answer is build a closed loop system that will not pollute our waterways with a toxic waste water pipeline into our oceans. Thank you,

Our forest industry is vital for positive growth in Nova Scotia and to achieve this we need to have a positive path forward and without Northern Pulp continuing to operate I don’t think it would be achievable. I am in full support of Northern Pulp to keep operating with a new Effluent Treatment system. Thank you

Je vous écris pour appuyer la demande d'évaluation environnementale présentée par Northern Pulp pour sa nouvelle installation de traitement.

On a beaucoup parlé de Northern Pulp et de ses répercussions sur la collectivité locale. Je suis d'accord avec beaucoup de gens, y compris Unifor, pour dire que Boat Harbour doit être fermé et nettoyé pour respecter les Premières Nations de Pictou Landing et leurs terres. Je sais aussi qu'il y a beaucoup d'avantages à avoir 300 emplois bien rémunérés à Pictou et à soutenir des milliers d'autres en Nouvelle-Écosse, particulièrement dans les collectivités rurales.

La Loi sur l'environnement de la Nouvelle-Écosse est reconnue comme une loi essentielle conçue pour protéger notre environnement commun et guider notre développement économique. La Loi énonce à juste titre son objet au moyen d'un ensemble de principes de développement durable qui devraient guider son application, notamment :

------> Le lien entre les questions économiques et environnementales, en reconnaissant que la prospérité économique à long terme dépend d'une saine gestion environnementale et qu'une protection efficace de l'environnement dépend d'une économie forte.

Dans cette situation, la science devrait déterminer la meilleure voie à suivre. La Nouvelle-Écosse, tout comme le reste du Canada, possède l'une des normes mondiales les plus élevées en matière de gérance environnementale dans le secteur forestier.

Le travail du gouvernement et de chaque personne que nous élisons pour nous représenter au gouvernement consiste à trouver la meilleure voie à suivre lorsqu'il y a de nombreux intérêts concurrents et parfois opposés. Les collectivités d'un bout à l'autre du Canada parviennent à trouver un juste équilibre où de bons emplois dans les usines coexistent avec une industrie de la pêche et des collectivités prospères.

Nous pouvons et nous devons trouver cet équilibre pour Pictou. Il y a beaucoup en jeu. Des emplois. L’environnement et le respect des Premières Nations. Nous pouvons et nous devons trouver une solution qui soutient les trois.

Merci.

Project: replacement_effluent_treatment_facility_project Comments: I believe that the following comments stated in para 3 of section 9.1 of the companys registration documentsum up the reasons why this project should not be given approval: At this time, effluent chemistry characteristics including the specific substances present in treated effluent and their anticipated concentrations will not be known with certainty until the project is operational. How can a project of this magnitude be allowed to proceed when the company does not even know what items will be contained in its effluent? The proposed area where the effluent will be discharged is very sensitive. It is an important fishing and recreational area. If something detrimental were to result from the emissions, it would devastate the areas environment, along with its fishery and tourism economy. This project is far too important to be looked at under this quickie assessment. I believe it should be rejected out-right, or at the very least a more in-depth environmental assessment report be conducted. When I was a student in an environmental science course, I wrote a paper about the devastating effects caused by the Sydney Steel Plant dumping toxins into the infamous Sydney Tar Ponds. I implore you to do everything in your power to prevent a future student from writing the same type of report about Northern Pulps emissions into the Canso Strait. Thank you. Name:

Subject: In support of Northern Pulp"s EA application
Date: March 7, 2019 7:40:33 PM

I am writing in support of the Environmental Assessment application submitted by Northern Pulp for its new treatment facility.

A lot has been said about Northern Pulp and its impact on the local community. I stand in agreement with many, including Unifor, that Boat Harbour must close and be cleaned up to respect Pictou Landing First Nations people and their land. I also know there are many positives about having 300 good-paying jobs in Pictou, supporting thousands more across Nova Scotia, particularly in rural communities.

The Nova Scotia Environment Act is an essential piece of legislation designed to protect our shared environment and guide our economic development. The Act rightly spells out its purpose through a set of principles for sustainable development that should guide its application, including:

------> The linkage between economic and environmental issues, recognizing that long-term economic prosperity depends upon sound environmental management and that effective environmental protection depends on a strong economy.

In this situation, science should determine the best path forward. Nova Scotia, along with the rest of Canada, has among the highest global standards for environmental stewardship in the forestry sector.

The job of government and every person we elect to represent us in government is to find the best way forward when there are many competing and sometimes opposing interests. Communities across Canada manage to find a fair balance where good mill jobs coexist with a prosperous fishing industry and thriving communities.

We can and must find this balance for Pictou. There is a lot at stake: jobs, the environment, and respect for First Nations. We can and must find a solution that supports all three.

Thank you.

Subject: Proposed Project Comments
Date: March 7, 2019 7:46:58 PM

Project: replacement_effluent_treatment_facility_project Comments: Nova Scotia Environment, I am writing to express my disapproval of the Replacement Effluent Treatment Facility Project proposed by Northern Pulp, a foreign owned company globally recognized for their environmental exploitation. Because of the mills history and that of its owners, I urge this agency to be skeptical of assertions made in the proposal. Northern Pulp has made public their desire to continue operating the mill only where it is economical. The potential environmental exposure to the harmful contaminants of the effluent, the impact on a commercial fishery that contributes multiples more in jobs and dollars to the province than the pulp mill, and ultimately the impact on the health of the population in the region are all areas which cannot be appropriately addressed scientifically on an only if it is economical basis. These are real concerns effecting tens of thousands of people where the science indicating no harm will be done has to be beyond questioning as there is no way to reverse the environmental impact of this project after it has commenced. With 5 years advance notice to close Boat Harbour, Northern Pulp was given a significant lead time to satisfy the concerns of stakeholders in this project. Yet they chose not to perform conclusive and evidence based scientific research, such as exposing those species in the Northumberland Strait of concern to fisherman to effluent in a fish toxicity test or assessing the impact of cumulative exposure to diluted concentrations. The reason they have not performed these inexpensive and transparent tests is because the science does not support them. This is also the fish toxicity test they so frequently cite as an acknowledgement of their environmental responsibility. The reality is that the regulations to which they are subjected have not developed at a rate comparable to the level of environmental awareness of the citizens of Nova Scotia. An effluent test allowing 49 of fish subject to the effluent to die is in no way an environmental regulation, but an industry negotiated threshold acknowledging that they cannot operate profitably by treating the effluent to a better concentration. This agency is tasked with protecting the environment and I expect it to do so by denying this proposal. Finally, I believe the provincial government has failed to acknowledge that the Northumberland Strait is regulated under the Fisheries Act and is therefore federal jurisdiction. I believe anything short of a federal environmental assessment on this project, as was done on past proposals submitted by the mill, would be insufficient and could only be attributed to the common belief that there is no way this project would pass a federal environmental assessment. I kindly request that this project be recommended for a federal assessment. Thank you for hearing my concerns. Name: Email: @gmail.com Address:

Project: replacement_effluent_treatment_facility_project Comments: My concerns are the unaccountable loss of several tons of mercury in the 1970â?Ts near PLFN. There was an estimated loss of 10-15 tons over a 10-year period Montreal Gazette archives. The peak was 5 tons of mercury in 1975 Canada Press 1977. In my opinion, we are tempting fate with this amount of Methyl Mercury in the ground. JIF Consulting has found 3 areas of mercury in the groundwater surrounding Pictou Landing. Methyl Mercury bio-accumulates in seafood. Humans who consume seafood that contains Methyl Mercury can develop Minamata disease. This is a devastating disease that was first encountered in Minamata Bay in Japan where humans developed this disorder after consumption of toxic seafood. There is no treatment for this disease. Pregnant mothers transfer this Methyl Mercury to the placenta and in turn to the developing fetus causing severe brain damage. In Canada, we have had Minamata disease diagnosed in Ontario, at the Grassy Narrows and White Dog First Nations communities. This developed after Dryden Pulp and Paper spilled 10 tons of mercury into their river. Pumping toxic effluent directly into the Northumberland Strait is not an acceptable alternative for all the above reasons. The effluent will not be toxin free no matter how it is treated and will bio-accumulate in bi-valves mussels, scallops, oysters and lobsters. Seafood will be contaminated. The archaic expression dilution is the solution to pollution is no longer acceptable. Humans are at risk! We have the most pristine cold waters. In 2017 the value of our seafood exports was $2.0 billion. Infrastructure at Halifax Stanfield Airport has begun to increase with holding areas for lobster and with 3-5 air cargo shipments to China per week, as well as lights to Seoul, Korea. Why would we want to put this at risk? In 2013 the WHO declared PM 2.5 carcinogenic to humans. Once in the air it can stay in the air for days to weeks and it can travel hundreds to thousands of miles. The new precipitator installed on the recovery boiler addresses a percentage of the PM2.5. The main boiler has no precipitator, but has scrubbers. These mechanisms require constant maintenance to operate with high efficiency. The results of the operating efficiency should be transparent and made public and tested more frequently. We are concerned about our local lumber industry and how they would be forced to adapt if The Mill ceases to operate. The lumber industry will change in the upcoming year when the new laws will be enacted regarding sustainable forestry practices. It will be a reshaping of the lumber and forestry Industry and these industries will need direction and support from the community and the federal government. It is never Wealth over Health it is always Health over Wealth. This information has been exposed over and over again. Fifty years of environmental racism is shameful and it is time to resolve this issue. Honour the Boat Harbour act. We need a Federal Assessment, not just a Provincial assessment. No more extensions. Peopleâ?Ts Health and High Quality standards of environmental protection should be our goal. We have to live with Industry. We donâ?Tt have to live with industry that pollutes. Northern Pulp doesnâ?Tt know what is in their effluent and there are just too many unknowns to accept the consequences. Name: Email: @live.ca Address:

Attachments: 2014 Larvae experiment.docx
letter from . UPEI.docx
letter from Dillon.docx

As a citizen in Pictou I am writing to express my concern with the idea of pumping treated effluent into the Northumberland Straight.

For the last 14 years I have been Pictou Lobster Stock Enhancement Research Project run by the Northumberland Fisheries Museum. The hatchery was commissioned in 2004 primarily to attempt to repopulate the lobster stock in LFA 26a located outside Pictou harbour where the stock level had severely dropped. This drop coincided with the years that the pulp mill effluent pipe in Pictou Harbour was leaking effluent.

Following the break in the effluent pipe from the mill in 2014 I conducted an experiment to see the effect on lobster larvae. (see attache file: 2014 Larvae experiment.doc)
As you will see, the conclusion at the end of the experiment was 100% stagnation in growth. This would lead to death on a stage I larvae.

In January 2018 I read comments in favor of the Northern Pulp plan from a As he was shown as an expert, I sent him my experiment data and received the attached file.(letter from). As you will read he had no knowledge with lobster larvae and his final comment is:. **I would encourage pressing the mill for increased testing on this basis. This should be done with graded concentrations of effluent, along with modeling of the effluent plume to truly assess the risk.**

Following this I sent my concern to Northern pulp and Dillon Consultants. In April I received the attached reply (see attached letter from Dillon) where I was lead to believe this would be checked out.
Thank you for submitting your lobster larvae experiment. As a part of the Environmental Assessment process, industry experts have been hired at each stage of
the process, with the understanding that Northern Pulp wants to find a path forward that protects the environment while also allowing for the mill to continue operations.

I have not been able to find where any further studies have been done or that the effect of effluent of lobster larvae has been taken into consideration.
As you can see from my experiment, our pulp mill effluent posses a sufficient risk to lobsters by the high morality of larvae. This need further study and must be taken into account prior to any approval of the project.

Thank you for the opportunity to express my concerns.

LARVAE EXPERIMENT 2014, LSERP

Experiment: Effects of effluent collected from tidal pond on Pictou Landing shoreline following the break in the effluent pipe from Northern Pulp.

Date: Summer 2014

Location: Pictou Lobster Hatchery

Conducted by: , director, and a summer student,

Method: Two conical 25-liter tanks were filled with 21 liters of hatchery sea water from Pictou harbour.

Each tank 1 and 2 were aeriated to maintain oxygen levels.

Water temperature of each tank maintained between 19 and 21 C

250 ml of collected effluent was added to tank 1. It is noted that effluent was collected in shoreline pond following one tide change, concentration was not tested.

20 lobster larvae, 3 to 8 hours old stage I, where added to each tank.

Small amount of live brine shrimp added each day for nutrient.

Observations: Day 1- to 3, all larvae in both tanks swimming and look well.

Day 4- tanks 2 larvae showing signs of molting. Tank 1- no change.

Day 5- tank 2- most larvae at stage II but numbers at 18. Tank 1 uneaten brine shrimp indicated larvae not eating

Day 7- tank 2 numbers down to 15

Day 14- Tank 2 numbers down to 10 mostly at what appeared to be stage III.

Day 21- Tank 2 numbers at 4 stage IV, Tank 1 still had 20 larvae at stage I.

Experiment was stopped after 28 days after no change in either tank.

Conclusions: Diluted effluent did not kill lobster larvae in 4 weeks, however they did not develop but stagnated at the stage I with zero growth which would lead to 100% mortality.

Northern Pulp Nova Scotia, Effluent Treatment Facility Replacement Project Update

Dear

Thank you for engaging with the Environmental Assessment (EA) study for Northern Pulp's replacement Effluent Treatment Facility. The feedback we receive during the EA study process is important and will continue to guide the environmental planning for the project.

Responses to Your Comment

Lobster Larvae Experiment

Thank you for submitting your lobster larvae experiment. As a part of the Environmental Assessment process, industry experts have been hired at each stage of the process, with the understanding that Northern Pulp wants to find a path forward that protects the environment while also allowing for the mill to continue operations. Expertise has been sought in engineering and environmental sciences.

The findings you have provided have been passed on to the team for their consideration. Please note that the experiment as described was conducted on untreated effluent from a pond that was not tested for concentration of parameters. This is not a direct comparison to the impacts that treated effluent will have on lobster larvae. Under Pulp and Paper Effluent Regulations, effluent must be treated before discharge to ensure fish are not harmed. In the future, the effluent pipe from Northern Pulp will carry treated effluent whereas now the pipeline carries untreated effluent. We do appreciate you sharing your findings, and ask that you share any other information you believe will be relevant to the EA.

Sharing Information

In Spring 2018 we will return to the community with another series of Open House sessions which will provide answers to questions raised during the initial phase of engagement and present the recommended environmental plans and seek feedback. Indigenous community and stakeholder engagement will also be ongoing through the next phase of the project.

If you have further questions or comments, please contact the project team at npns.effluenttreatmentfacility@dillon.ca, 1-877-635-8553 x 5050 and/or visit the

Subject: Re: Pictou pulp mill

Thank you for sharing this with me, I find the results very interesting. Little or no research has been done with lobster and pulp mill effluent. We are doing some research with some locally used pesticides and lobster in collaboration with homarus and even with common pesticides, this is the first American lobster data available. They are not the easiest critters to work with.

Please understand that I based my comments on what we know from 30 years of pulp and paper research, assuming the mill would meet the effluent quality standards that are possible with advanced biological treatment, and that the dilution of the effluent in an area with the highest tidal exchange in the strait is likely to be great. I qualified to the reporter that I felt it was valid to have concerns, and if those concerns or great, which they are, most testing and information should be required before going ahead. But one cannot control what parts reporters put in print. I don't find all of the information provided by the mill to be sufficient myself. But on the balance, the possibility of a very limited area of impact is possible or even probably.

The science out there is not perfect, you can't test every organism with every effluent. No two pulp mill effluents are the same. I simply made comments on best available evidence based on pulp mill around the world. There are still a few pulp mill effluents out there that have significant effects, while some do not (see attached paper) however we can limit those effects with proper treatment. That by the way is not just a matter of having a fancy treatment system, it involves recycling all liquors in your pulping process, avoiding spills in the mill that can disturb a treatment system for a month, and operating that treatment system properly. The more complicated the treatment system, the harder it is to operate. This involves an environmental ethic and culture within the mill. Judging by some of the politics going on, that is perhaps not good.

While your experiments would not meet the rigor of scientific peer review, I do believe that they present interesting and valid preliminary evidence. I would encourage pressing the mill for increased testing on this basis. This should be done with graded concentrations of effluent, along with modeling of the effluent plume to truly assess the risk. I would be happy to participate in such with in collaboration with a fisheries organization such as Homarus.

Regards

To: Environment Assessment Web Account
Subject: Northern Pulps Replacement ETF Project
Date: March 7, 2019 8:45:47 PM

Dear Environment Minister Margaret Miller;

We are writing to express our concerns about Northern Pulps Replacement ETF Project as descried in their EA application to the N.S. Department of the Environment. We have lived along the West River in Pictou County approximately 15 kilometers from the pulp mill for forty-seven years and have first hand knowledge of its effects on the surrounding community related to air quality and water pollution. We have stated our primary concerns below.

1. On page 45 Sect.1-7 of the Registration Document, Northern Pulp states that it plans to burn large volumes of sludge from their new wastewater treatment system in the existing power boiler. This power boiler has exceeded emission limit levels in the past according to test results posted on Northern Pulps website and does not have a precipitator as is required by other jurisdictions. It is reasonable to conclude that burning toxic sludge in a boiler with filtration issues could adversely effect air quality. Pictou County already has some of the highest rates of cancers in the country.

2. According to Northern Pulps application, the treated effluent will contain solids (pg.84 table 5.6-1 of the EA document lists the amount as 4 tons daily) which were previously settled out in the Boat Harbour tailing ponds. Northern Pulp hasn't identified in their EA application, which toxic chemicals and heavy metals will be in these solids. How can scientists and regulators study the effects this effluent would have on marine life if they do not know what is in it? Your decision should be based on science but there is no science here.

Any contamination of lobster and fish exported under the Atlantic Canada brand, could destroy the reputation of that industry.

The issues raised by Northern Pulps Replacement ETF Project are very troubling. The missing information regarding the identification of toxins and chemicals in the effluent could result in serious health risks to Pictou County residents from dangerous air emissions. There could also be consequences to marine life from these unidentified solids settling on the ocean floor of the Northumberland Strait.

We are therefore requesting that you require Northern Pulp to provide this information before their application is considered and that you then order an Environmental Assessment Report on this project.

Respectfully;

From:
To: Environment Assessment Web Account
Subject: NORTHERN PULP REPLACEMEMT EFFLUENT TREAMENT PROJECT
Date: March 7, 2019 8:56:02 PM

No extension! No pipe!

I wish to express my concerns with Northern pulp causing further air and water pollution.

Northern pulp say there will be "no significant environmental effect". Referring to the canadian environmental protection act; kraft mill effluent has significant effects on aquatic life. Effluent is toxic. Northern Pulp says that they dont really know what the chemistry of the effluent will be. We have heard this before and seen the contamination from leaks and now in our air. Mercury, furans and dioxins found!
Pumping toxic effluent directly into the Northumberland Strait is not an acceptable alternative. The effluent will not be toxin free no matter how it is treated and will bio-accumulate in bi-valves (mussels, scallops, oysters) and lobsters. Seafood will be contaminated. When the pipe leaks the water shed or our land will be contaminated.
I am also concerned with the idea they have on burning sledge. Please stop this.

Fifty years of environmental racism is shameful and it is time to resolve this issue. Honour the Boat Harbour act. We need a Federal Assessment, not just a Provincial assessment. No more extensions.

People’s Health and High Quality standards of environmental protection should be our goal.

We have to live with Industry. We don’t have to live with industry that pollutes.
Please do not allow this industry to distroy our earth any longer.

RE: Northern Pulp's Replacement Effluent Treatment Facility Project

Dear Minister Miller,

I write to you on behalf of the Council of Canadians, a grassroots social justice organization with more than 100,000 supporters across Canada concerned with protecting our water and environment for future generations. We are working to eliminate the social harm and inequality that climate change perpetuates, and the historical injustices that Indigenous people and people of colour have experienced in the present day.

The Council of Canadians calls on the Nova Scotia government to reject the proposed Northern Pulp Replacement Effluent Treatment Facility Project based on the following:

Concern: Lack of evidence provided by proponent on risk
Northern Pulp's submission does not prove a lack of significant risk, and is missing critical data on many issues. One example of this is mercury, which is recognized by Health Canada to have significant risks to human health. Northern Pulp hardly mentions their site on Abercrombie Point is contaminated with mercury and disrupting this contamination on a site surrounded by water requires extreme caution and a full examination (reference Joan Baxter's article in the Halifax Examiner: *Northern Pulp's Environmental Documents: missing mercury, a pulp mill that never was, and oodles of contradictions*, March 5, 2019).

The company's claims that damage will be minimal, there will be no significant residual damage in any situation (whether by normal operation or accident), and whatever damage done can be mitigated, are not quantified. There is insufficient evidence to know exactly how broad that damage will be, hence the company's claims are not credible and should not be accepted.

Fishing is a major part of this community, and the economic backbone of not just Nova Scotia but the other two provinces who would be impacted by the proposal – Prince Edward Island and New Brunswick. The tourism industries in the Maritime provinces are also vital, part of this being dependent on outdoor recreation, which is also highly valued by the people who live

here. The reality is that once ecosystems are damaged, they are not easily healed; just as damaging one part of the system inevitably impacts the whole. As such, we do not accept that monetary compensation is appropriate mitigation for damaging an ecosystem and a sustainable industry.

Per Nova Scotia's Environment Act (*Purpose of the Act,* 2.b.ii.), "the precautionary principle will be used in decision-making so that where there are threats of serious or irreversible damage, the lack of full scientific certainty shall not be used as a reason for postponing measures to prevent environmental degradation."

Concern: Lack of Indigenous consent

According to the United Nations Declaration on the Rights of Indigenous Peoples, Indigenous peoples have a right to free, prior and informed consent. We expect that Nova Scotia Environment will go above and beyond the base expectations to ensure the appropriate level of consultation occurs moving forward, specifically around issues of consent.

It is clear that Pictou Landing First Nation (PLFN), both the elected leadership and the community, are opposed to this proposal and want the government to keep its promise of closing the current effluent treatment facility. They want Boat Harbour closed on schedule, and they do not want the risks to the fisheries that piping effluent into the Northumberland Strait represents.

Years ago, the concerns of PLFN about how effluent would affect their community were ignored. All of their concerns proved to be accurate. We believe their concerns are accurate today too.

Concern: Lack of community consultation, inadequate time for meaningful community response

The community was not consulted on the actual project submitted by Northern Pulp for environmental assessment. Any public consultation was on a somewhat similar ETF proposal discharging into a completely different location. In addition, a 30-day period for public consultation on 2000 pages of previously undisclosed information does not fulfill requirements for meaningful public review and input.

Concern: Climate change

Oceans are already stressed by climate change. Scientists warn that the Gulf of St. Lawrence is warming more rapidly than almost anywhere on Earth. Adding additional stressors to a system that is already stressed is not wise. The Northumberland Strait is an area that requires additional protection, not additional degradation.

This past October, The United Nations' Intergovernmental Panel on Climate Change released its dire warning that we have just over 11 years to curb GHG emissions before the Earth's climate tips past a point of no return. Industry creep is such that government is willing to risk other billion-dollar industries as well as the global climate for this fundamentally undemocratic and unsustainable industry.

What we do need is a just transition to a sustainable economy, and specifically for the hundreds of workers employed by Northern Pulp. We also need to knit all the climate solutions we know into a more compelling and tangible vision to protect our oceans and our planet.

Conclusion

This project is simply not worth the risk. The precautionary principle means it is incumbent on the Nova Scotia government to err on the side of caution.

A bigger picture reflection on this, such as Joan Baxter's "The Mill" (in chapter 16: The Politics of Pulp, for example) or Dr. Ingrid Waldron's "There's Something In the Water: Environmental Racism in Indigenous and Black Communities," points to a failure by successive provincial governments to protect the people of Pictou Landing First Nation and the broader community, and environment in and around Boat Harbour and the Northumberland Strait. Although you have a task at hand with specific considerations, please keep these bigger issues in mind.

The Council of Canadians calls on you to reject the proposed Northern Pulp Replacement Effluent Treatment Facility Project. If you don't feel you can do this with the evidence before you, please call for a full Environmental Assessment report on this proposal. Either way, **we support the closure of the effluent treatment facility in Boat Harbour on schedule.**

Sincerely,

| The Council of Canadians

Subject: Replacement Effluent Treatment Facility Project
Date: March 7, 2019 9:54:50 PM

Dear Minister:

I am writing in regards to Northern Pulp's Replacement Effluent Treatment Facility Project.

My family has fished the grounds off the east end of Pictou Island for four generations.

obtained my Fishing Masters IV, and now fish lobster with my father in the Northumberland Strait.

In section 9-15 of the EA it is stated that "there is presently uncertainty regarding the chemical composition and characterization of the marine treated effluent discharge." On page 489, the report admits that "effluent chemistry characteristics will not be known with certainty until the project is operational." Despite this uncertainty the Executive Summary states "No Significant Residual Environmental Effect Predicted" during any portion of the project to any aspect of the environment. They then conclude "It is not predicted that the installation of the pipeline will result in long term serious harm to fish or fish habitat."

The lack of certainty in the effluent composition has obvious concerns as to how the environmental risk assessment was modelled by the company. Without knowing the composition of the effluent, how can the effect on the environment be measured. 87 million litres of treated effluent with an unknown chemical composition is to be discharged daily into the ocean and across the board they predict no significant effect. This indicates to me that no accurate modelling was completed by the company and that they clearly do not respect this province's environment, nor intelligence.

My family has enjoyed many summer vacations playing on the beach and swimming in the Northumberland Strait. Last year my wife and I got married on Pictou Island, and hope to raise our family in a clean environment without fear of pollution and contamination.

It is clear to me that this project has a large likelihood of causing adverse effects to the environment that cannot be mitigated. I urge you to order a full environmental assessment before moving forward on this proposal, if at all. I would be proud to see my home province focus on transitioning this community to prosper in a way that values the environment we live in and the health of our people.

Thank you for your time and consideration.

Pictou, Nova Scotia

Project: replacement_effluent_treatment_facility_project Comments: My husband and I have a great concern over the effluent from Northern Pulp which will be spewed into the Northumberland Strait from Northern Pulp if their proposal goes through. We live at Braeshore, Pictou County, N. S. Our residence is very close the beach where we enjoy swimming in the summer and walking along the beach with family and friends. We also enjoy watching the lobster fishermen haul their traps during the season. It would be a terrible shame for the fishermen to lose their jobs because of the contaminated water which would be caused by Northern Pulps proposal which I understand, there would be 70 to 90 million liters of treated effluent still containing toxic substances spewed into the Strait daily. When we moved into our house here in Braeshore in the early I took a walk to the beach just before dark one evening and all along the shoreline was knee high foam with a brownish ting which I thought at the time came over from Boat Harbour, acros s the water from us, where the effluent was being pumped from Scott Paper which the pulp mill was called at that time I took photos of the foam just in case I may need them sometime and still have them in my possession. I also sent copies at that time to the Department of the Environment but never heard back from them. Let us keep our beautiful Northumberland Strait free from contamination from Northern Pulp. Thank you. Name: Email: @eastlink.ca Address:

Subject: Proposed Project Comments
Date: March 7, 2019 10:18:39 PM

Project: replacement_effluent_treatment_facility_project Comments: Northern Pulp effluent treatment facility Volume of effluent 82,500 cubic meters/day is 57,300 litres per minute, system maximum. 70,000 cubic meters/day is 48,600 litres per minute, the rate which is most commonly created during the normal operations which the plant manager reported to me in conversation. Please note: the volume of one cubic meter is 1000 litres. The Northern Pulp Nova Scotiaâ?Ts proposed average daily waste water is 62,000 cubic meters per day of effluent, which is a rate of 43,056 litres per minute of liquid waste from the the Northern Pulp Mill and is also 717 litres per second. The volume of liquid waste from he Northern Pulp Mill is extremely high. The upper maximum waste effluent suggested by Northern Pulp could reach 82,500 cubic meters of daily effluent which would be 954.8 litres per second entering into the clarifiers and then subsequently entering the environment. The current effluent temperature from Mill production to the Boat Harbour Effluent Treatment Facility is at 40- 42 degrees Celsius. There is no known heat loss for the current pipeline although it is likely more than a kilometre in length. However, current effluent streamâ?Ts flow rate and its polyethylene/polypropylene piping likely prevents any heat loss, because the Mill is in steady state operations/production. The proposed treatment system will rapidly reach a steady state heated condition. The proposed treatment tanks will not be able to cope with the magnitude of heat thermal energy to significantly make a difference within 24 to 48 hours of steady state operations. The heat loading is 700 to 900 litres per second at 40 to 45 degrees Celsius. Heat exchangers as proposed can not handle the energy associated with the time limits of the system. A 1,000,000 L one million litre storage tank may have the capacity to store Northern Pulp liquid waste effluent for 20 minutes /- 1 minute. At 40,000 L/minute of NP liquid waste effluent, fills a 1,000,000 L storage tank within 25 minutes /- 1minute, assuming it was empty at before hand. The in-ground basins proposed for the Northern Pulp Nova Scotiaâ?Ts effluent treatment clarifiers are at 12,000,000 litres which is approximately four 4 hours holding capacity. With 700 to 950 litres per second entering the clarifier, the turbulence within the clarifier and heat loading will nullify its capacity to remove heavy solids dropping from the waste water suspension or remove floating solids from the turbulent waters given foaming issues. The addition of defoaming agents while helping to cut bubbles, the effluent flow rate will overpower a defoaming agent. The kraft digestion process of the pulp wood fibres, the sulphites, the hydroxides, the heat, and the off-gasing of the oxide s of sulphur will be a huge issue. The proposed 11.4 km pipeline which is 36 inches inside diameter will contain 7,479 cubic meters of waste effluent, or approximately 7.5 million litres of effluent should a catasrophic pipe failure occur. This environmental risk is significant, given the communities have no experience with large effluent pipeline failure. The 7.5 million litres of effluent does not include headwater effluent that would continue to be pumped or gravity fed from the Mill should the transmission pipeline fail. The proposed 12 million litre clarifiers have a maximum four hour capacity to treat the effluent. The current Boat Harbour Effluent System has approximately seven to ten days by comparison. The open clarifiers will pose a very significant occupational health risk to Northern Pulp Mill workers/employees. The daily exposure limit to hydrogen sulphide H2S is less than 1 part per million ppm. The three clarifiers will off-gas hydrogen sulphide from 5 to 50 ppm depending upon winds. Hydrogen sulphide toxicity is not well addressed given labour regulations. This one gas can be potentially deadly as 100 ppm H2S with be fatal within 30 seconds. The effluent treatment facility does not address hydrogen sulphide gas emissions. Clarifiers The primary stage

clarifier may remove 2.3 grams of suspended solids per litre of waste water with an on-going rate of only 0.3 grams per litre clarification as stated. Already stated, the in coming turbulent flow by the 700 to 950 Litres/second inbound waste waters into the clarifiers will negatively impact settling, raking or screening actions of the on-going success in the clarifier systems. Clarifiers work best with a calm steady state fluid, where there is little turbulence and there are more than 12 to 24 hours for heavy solids to fall from a mechanical suspension and lighter weight solids can float to the waterâ?Ts surface to be skimmed off. Clarifiers work on the differences in specific gravity and do not address water soluble chemicals... Little discussion is made of wood fibres and the inorganic composition of the water waters. The process chemicals in a Kraft pulp digestion process are all water soluble. The waste wood fibres lost in the waste waters, float due to the specific gravity. The first stage clarifier does not describe any wood fibre retention, nor the capture of water soluble chemicals. The clarifier is designed to capture only dense total solids which may or may not settle out in the very turbulent clarifier environment. Waste matter from the clarifiers will be diverted to a sludge tank and ultimately to the Power Boiler para 5.2.2.8. The text as presented is misleading. It states: Pressed sludge/solids containing water will be combusted in the power boiler to produce heat. The text should state any water component of the waste sludge is totally released to the atmosphere. While the power boiler, produces stream and electricity, any moisture in the combustion chamber can only exit via the chimney and into the atmosphere of Pictou County. Should this same moisture contain soluble sulphites, sulphides and related process chemicals, these will all be made airborne by the combustion process. Please also note: The combustion/power boiler is the least equipped for pollution abatement. Marine Pollution at Caribou Harbour The Caribou Harbour opening suggested for the effluent diffuser is adjacent to Northumberland Ferry vessel route. This means the visitors to Nova Scotia or leaving the Province via the ferry service will be subjected to high concentrations of sulfur dioxide gases and related sulfur oxides arising from the effluent diffuser. The effluent water exiting the proposed diffuser apparatus with be toxic to marine life. With respect to ferry users, the effluent is â?ofreshâ? water not salt water , very hot 25 to 35 degrees Celsius and very gasified. This will result in the effluent rising to the surface of the Northumberland Strait water immediately. The notion that these waters will mix uniformly by natural blending is misleading. The differences in temperature and specific gravity will cause the effluent to create a continuous rift pattern which will prevent wishful mixing/blending as suggested by Northern Pulp. The analogy is higher industrial chimneys from factories were thought to better diffuse airborne pollution. Scientists and engineers now know this does not occur in fact. The proposed position of the effluent diffuser is immediately upstream of the Caribou Provincal Park, the Pictou Lodge and across the harbour is the Pictou Landing First Nations lands. As the Northumberland Strait tides fall twice daily the Northern Pulp effluent will be mixing and flowing toward these locations. The smell of oxides of sulfur, sulphur dioxide, hydrogen sulphide and related kraft pulp wastes will greatly impact breaches, cause undue respiratory stress for humans and other mammals on, in or adjacent to the Northumberland Strait. Marine Habitat 717-949 litres of Northern Pulpâ?Ts liquid effluent will enter the Northumberland Strait per second. The Biological Oxygen Demand BOD, the pH and maybe physical attributes, may have been pretested. The BOD usually requests a laboratory test which requires at least an hour of lab time to perform the testing. Stopping production because of a failure of BOD testing all not happen due to the safely to the workers and the plant processes. Compliance issues will be next to impossible to evaluate as the waste water will be entering a saltwater environment well below the surface waters. 717-949 litres of very hot water per second will be entering the Northumberland Strait. The huge temperature variation with receiving waters of 25 to 35 degrees Celsius will be lethal to marine life. Northern Pulp Management suggest they expect this lethal impact to be spread over an area of 100

meters/any direction from each diffuser. However tidal action, thermal rifts and the specific gravity difference will cause the warmer waste waters to rise, having a larger impact on fish and marine mammals. The inorganic waste chemicals from the NP Millâ?Ts operations, will impact shellfish life and subsequent marketing. Little work has been done to accurately quantify waste metals for the Millâ?Ts operation. The quantities of iron, nickel, chromium, molybdenum and other ingredients within stainless steel and chromium plated steel roller surfaces have left an impact in Boat Harbour. Having tested the embankment soils and having had a third party test laboratory analyze the soil samples, there was a noticeable trend likely from eroded stainless steel, worn pipes, worn roller surfaces, etc.. that 50 years of operations has lead to chronic heavy metal waste/pollution rather than an acute issue. Should Northern Pulp and this kraft pulp process operate for another 25 years or more, the inorganic elemental pollution needs to be addressed as part of current evaluation. The lead, tin, antimony, cadmium from bushing/metal bearings, chromium from hard electroplated chromium rollers, chromium/nickel from stainless steel piping, cadmium plated bolts and fasteners, all these metal suffer daily erosion, corrosion and cavitation which will impact the Northumberland Strait lobster fishery. The oxides of sulfur, the changes in salinity, water temperature, turbidity will impact fish habitat and the migration of fish stocks within the Strait. Northern Pulpâ?Ts Environmental History Paper Excellence and Northern Pulp Nova Scotia operated the kraft pulp mill without an electrostatic preceptor for more than a year without reporting its failure to the community or its regulator. Northern Pulpâ?Ts Power Boiler has failed emissions testing. The Northern Pulpâ?Ts Recovery Boiler failed emissions testing. Regardless of failed airborne pollution testing, the Mill operations continued until appropriate shutdowns could be scheduled well after directions/Ministerâ?Ts Orders were given to the Mill management. The proposed size of the first and second stage clarifiers and the â?oBAS technology may appear interesting to the environmental assessment decision makers. However, there is only a four hour residency of waste waters to remain in holding tank system. However with waste waters of 700 - 950 litres per second entering each of the first and second stage clarifiers, this flow rate will cause extreme turbulence. The magnitude of the waste water flow rate limits the capacity of the clarifiers. Furthermore the off-gasing of hydrogen sulphide from the clarifiers will create a process that is difficult to understand and control as well as potentially deadly to workers exposed to the open clarifiers. The recent Mill Management, while perhaps willing invest to operator training, most likely will under resource this waste treatment system as previously demonstrated. The waste treatment proposal only addresses the BOD/COD, pH attributes of the waste waters. The off-gasing from sulphites/sulphides/oxides of sulphur, wear metals, inorganic chemical iron, nickel, chromium, cadmium, sodium sulphide, sodium sulphates pollution, and the huge thermal pollution issues are not addressed by the proposed plan of action. The high density polyethylene or polypropylene piping system to transport the waste water effluent to the final marine site will effectively insulate the waste waters and prevent heat loss. The daily loss of 62,000,000 to 82,500,000 litres of hot water 35 to 40 degree Celsius into the environment is â?ocriminal. Conclusions: The proposed effluent treatment system is undersized for the clarifiers and the current daily waste water volumes. Once effluents have passed the clarifier system, there is little opportunity for subsequent remediation should BOD testing indicate an issue. BOD testing requires an hour to complete in an onsite laboratory test, which only provides three hours to stop production of the Mill should a compliance issue arise. Waste effluent at 35 degrees C. or more will enter the Northumberland Strait killing marine life. This effluent thermal loading alone is deadly, regardless of BOD/COD/ heavy metals, total suspended solids, etcâ?¦ The projected waste water path via the diffusers, does not accurately address the thermal toxicity to marine life, the foul smelling oxides of sulphur by-products, the chronic heavy metals contamination from the Millâ?Ts equipment, piping, pumps, chromium electroplated rollers, presses etc. which will

enter the Northumberland Strait. The waste waters are out of the visual sight of the Mill Management, its response teams, and could have days of non compliant waste disposal before regulatory processes would require immediate shutdown of the proposed waste treatment system. This would be at the expense of fisherman, marine life, and a valuable coastal zone area for tourists, residents and endangered marine mammals. Lastly An Industrial Approval should not be considered by the Province of Nova Scotia for the continuing operations of the Northern Pulp Nova Scotia Limited the Mill until the Mill replaces the existing kraft caustic digestion technology and implements a closed loop water pulping process: such that there is little or no waste management issue, no need to dump waste process chemicals and spent waters into the marine environment of Pictou County, the Pictou Landing First Nations or the Strait of Northumberland. Sincerely Chemist

Subject: Proposed Project Comments
Date: March 7, 2019 10:22:19 PM

Project: replacement_effluent_treatment_facility_project Comments: March 6, 2019 Environmental Assessment Branch Nova Scotia Environment P. O. Box 42 Halifax, NS B3J 2P8 Dear Minister: I am writing regarding the Northern Pulp filing for Environment Assessment for their proposed effluent pipe into the Northumberland Strait. I have been a fisherman for 37 years and I have some concerns that enough study has not been done and a Federal Environment Assessment should be done so the everything that can be done will be. First - Where NP plans to put their pipe and run their effluent into the Strait it is in an area where the tides meet at the Bell Bouy. The effluent will be taken in all different direction with the the rising and falling tides. Second - NP have not stated what will be in the effluent when it comes out off the pipe into the Strait. If the Minister does not know - how can she be 100 sure that nothing will be harmed? Not the marine life, not the ecosystem or even the people swimming in the water. All along the coast there are a number of beaches that residents and tourist visit and enjoy. Just down the shore from the Caribou wharf, where the purposed pipe will be, there is a Provincial Park where there is also a camp ground. Last summer they had the most campers they ever had and they come there from all over and the beach is a big draw. If the effluent pipe is there no one would want to swim or even be on the beach which would be a terribly loss for the area. ` Third - if the pipe is going to be buried, how will they know if it has broken or leaked. We know that there was a pipe break carrying effluent and it was only detected by a person out walking. What if it happens where no one would notice - how would they know and what would the ramifications be it it leaked for a long time? There is heavy ice in the Northumberland Strait most winters, how could the pipe survive the heavy pressure that would be applied to it. How can the people enjoy the water for swimming, digging clams and fishing on Caribou Island, Pictou Island and all along the shore if they do not know what is in the water? Taking a big risk with their health. I strongly urge that you make a choice for a Federal Assessment to make sure that our environment is not ruined by NP effluent. Thirty days is not long enough for everyone to reply to the finding that could cause thousands of days of destruction to our marine life. Pictou, Nova Scotia. Name: Email: @gmail.com Address: :

Subject: In support of Northern Pulp"s EA application
Date: March 7, 2019 10:39:49 PM

I am writing in support of the Environmental Assessment application submitted by Northern Pulp for its new treatment facility.

A lot has been said about Northern Pulp and its impact on the local community. I stand in agreement with many, including Unifor, that Boat Harbour must close and be cleaned up to respect Pictou Landing First Nations people and their land. I also know there are many positives about having 300 good-paying jobs in Pictou, supporting thousands more across Nova Scotia, particularly in rural communities.

The Nova Scotia Environment Act is an essential piece of legislation designed to protect our shared environment and guide our economic development. The Act rightly spells out its purpose through a set of principles for sustainable development that should guide its application, including:

------> The linkage between economic and environmental issues, recognizing that long-term economic prosperity depends upon sound environmental management and that effective environmental protection depends on a strong economy.

In this situation, science should determine the best path forward. Nova Scotia, along with the rest of Canada, has among the highest global standards for environmental stewardship in the forestry sector.

The job of government and every person we elect to represent us in government is to find the best way forward when there are many competing and sometimes opposing interests. Communities across Canada manage to find a fair balance where good mill jobs coexist with a prosperous fishing industry and thriving communities.

We can and must find this balance for Pictou. There is a lot at stake: jobs, the environment, and respect for First Nations. We can and must find a solution that supports all three.

Thank you.

Subject: MY EA Submission for Northern Pulps Replacement Effluent Treatment Facility Project
Date: March 7, 2019 11:13:41 PM
Attachments: This is to advise that on February 7.docx

To the Nova Scotia Minister of Environment,

Please find a Word Document attached of my submission to the Northern Pulp Replacement Effluent Treatment Facility Project.
If at all possible could you please notify me of receipt. I thank you for your time and appreciate the opportunity to speak on this very important matter to all Nova Scotians and our good neighbours in Prince Edward Island and New Brunswick.

Most Sincerely,

This is to advise that on February 7, 2019, Northern Pulp Nova Scotia Corporation (Northern Pulp) registered the Replacement Effluent Treatment Facility Project for environmental assessment, in accordance with Part IV of the Environment Act.

This is my submission to Northern Pulps EA.

A big undertaking a lot of information, well over 1600 pages and could cause a great impact on the environment, so where to start?

How about classification first?

Class 1 undertakings are usually smaller in scale and may or may not cause significant environmental impacts or be of sufficient concern to the public.

Class 2 undertakings are typically larger in scale and are considered to have the potential to cause significant environmental impacts and concern to the public.

Do you really feel this is a small scale undertaking....if so why is there over 1600 pages to explain?

Given the damage to Boat Harbour and what it will take to clean it up, is it to be considered a non significant environmental impact?

If so, then why a Federal Class II to clean it up?

If it takes a Federal Class II to clean up a mess, then it should it not take a federal Class II to move it, from one location to another?

Plus in your Class II classification under Category it says Industrial Faculties it says

#3. Pulp Mill, Which should indicate anything to do with a Pulp Mill. It does not say Class I for Mods, It classifies the whole facility as a Class II.

The Effluent

Dillion Consulting said this.

In an email between Northern Pulp's technical manager and Dillon Consulting, a Toronto-based consulting firm, written on Nov. 29, 2017 the technical manager said in reference to the effluent coming from the proposed Northumberland Strait pipeline, "some say effluent quality will be worse than today because of all the polishing that is happening across the Boat Harbor basin—and they are correct to some extent."

On page 489- 90-91 Section 9.1 they state

At this time, effluent chemistry characteristics (including the specific substances present in treated effluent and their anticipated concentrations) will not be known with certainty until the project is operational. Some other current areas of uncertainty include limited recent or current baseline

environmental media and marine food item chemistry data, and limited data on traditional marine food item harvesting and consumption patterns within the PLFN community

The Toxikos (2006) HHRA was a highly conservative assessment that substantially overestimated exposure and risk to potential human consumers of fish and shellfish that may be influenced by the effluent diffuser discharge in Bell Bay. The authors concluded that there were negligible risks to human health from consuming any marine food item harvested in the vicinity of the effluent diffuser, for any of the substances that were assessed in the HHRA. This study considered numerous substances, but through a multi-step screening process, ultimately selected only four COPCs for assessment (i.e., cadmium, mercury, selenium, PCDD/F). The Toxikos (2006) screening procedure is addressed further in Section 9.2.4.2.1.

It is believed that the assumed effluent chemistry characteristics and composition as well as the effluent diffuser design for the Tasmania project are similar to what is proposed and designed for the NPNS project (KSH Consulting, Personal Communication). Both mill facilities utilize ECF bleaching processes, and this will not change for future NPNS mill operations.

I question where the Department of Environment would allow Effluent that is quoted by the Firm Dillion Consulting to be not only less treated as what is presently coming out of Boat Harbour, but also containing unknown substances and quantities, until it is actually going out into the Strait without a Class II assessment.
I also question why Northern Pulp who continue to state that there are dozens of Bleach Kraft Mills in Northern America, that they would chose a Toxicology Report done for a Paper Mill in Bell Bay, Tasmania that was never even built ?

How can you use a report that had no real effluent to test, but simply an assumed and imaginary waste product?

Further to add, because such Mill was such an environmental risk the banks refused to back financing to have it built.

So why not a Toxicology report from one of the dozens in operation here in North America?

This is a very serious question the Nova Scotia Department of Environment should be asking.

If Northern Pulp and Dillion Consulting are using such a report to base their confidence in this treatment faculty to be a successful operation, then I think that should be waving enough red flags and blaring sirens to tell you this needs a much deeper investigation.

If the same information could not pass the litmus test to build a Billion Dollar state of the art Pulp Mill, then surely it should also fail the test to build a treatment plant for a Mill that is over fifty years old.

Effluent Volume.

5.2.2.9 of the Dillion Report
The maximum effluent flow rate of 85,000 m3 /day was used for the analysis of effluent water quality following treatment. The highest flow rate represents the most challenging conditions for plume dispersion at the discharge point and is therefore considered to be worst case. Flows lower than the maximum daily effluent flow will result in improved mixing. The current annual average flow is 63,600 m3 /day for comparison.

Dillion says they are using 85,00m3/day as worst case scenario and saying the daily average is 63,600 m3/day for their comparison. Yet In February of 2016, Nova Scotia Environment has said it had resolved the outstanding issue of an Appeal by Northern Pulp. In doing so it allows NP to take a daily maximum of 92,310m3/day. If this can be the case then the worst case scenario presented by Dillion is untrue and the plume will spread further and be of worse quality.

Temperature of Effluent

5.2.2.9 of the Dillion Report as per table 5-2-1

Temperature oC 25 (winter) 37 (summer)

Although we see nothing in the Dillion report as to Lobster larvae and the effects on them by the Effluent I give you this information.

Lobster larvae and the Waste Water Pipe into Northumberland Strait The writer of this has just completed researching some of the many studies done about how Cold water Lobster hatch and eventually become Market size . Female lobsters develop eggs that adhere to the shell overwinter and hatch the following late June into July. These larvae live in the top 2 meters of the water for about 20 to 30 days while they grow through three stages and finally reach stage 4 and then fall to the water bottom where they live in the mud /sand / rocks for at least 5 years and reach a weight of 500 grams (1 LB.) . Each shell moult sees the lobster gain about 40% in weight. By year 6 to 8 they reach 750+ grams and can be caught and sold. Some are not immediately caught and live to be much larger. It is the life of the hatchlings or larvae that was my research. It's a lengthy story but I'll shorten it to this summary ; Cold water Lobster are found from the coast of Gaspe down along the eastern shores of N.B. / NS and along the north shore of N.S. and around Cape Breton . Water temps during the hatching months ranges from 10C at Gaspe to about 15C down off Caribou, Chance Harbour, Little Harbour and beyond. The PEI shore has similar temps. Larvae live well in 10C water and better in temps up to 14 C . After that temp there is a lot of mortality until at 22C none survive. The warmer the water the faster they grow and rate of survival lowers a lot. If they survive until stage 4 size they drop down to the floor of the water and make homes among the rocks, mud , sand where most will live for another 5 years - moulting each year and increasing weight about 40% at each shell moult . By years 6 to 8 they have reached a weight of 1.5 lbs. and become legal catch. Some escape and live on for many more years. The temperature of the waste water from the proposed pipeline from the Pulp Mill across the Pictou Harbour and out to Northumberland Strait is estimated to be 25C in cooler months to 37C in warmer summer months. All 70 to 90 million litres. This being flowed into 15C N . Strait water will gradually warm the coastal waters the larvae live in. Every degree above 15C will shorten the life of a cold water lobster larvae. When the temperature reaches 16.5C survival rate lowers until at 22C none survive.

Dispersion of the Effluent

5.3.1.11 Dillion Report

Marine Outfall Construction

The terminus of the effluent pipe consists of an outfall location with a three-port diffuser, situated at a depth of approximately 20 m.

Initially in the public presentations and diagrams shown we were told that the pipe would have the Effluent exiting through six port diffusers. Now it has become three. With this reduction to three ports that would mean that the exit flow of the effluent would be at a greater force and not spread over as great an area as with six diffusers. Thus making much of data given about dispersal of the Effluent would not seem to be relevant.

This very questionable effluent quality and quantity is enough to say that there is just too much risk to damaging the fisheries to not make the decision to have a Class I Provincial, but rather insure it is a Class II Federal Assessment.

As we are now not talking about the possible loss of a Billion Dollar Mill, but instead a possible loss of a Multi Billion dollar Industry. Again I say the risk is too great for such a weak assessment. Give it the due diligence it deserves.

To not go into a lengthy letter I will leave the effluent as the most in depth of my submission. The rest i will just present as bullet points that I feel are also a strong indicator of needing a Class II Federal Assessment.

- They say Non Significant effect on Migratory Birds. Yet within 1500 ft of leaving Northern Pulp Property the route of the Pipe will attempt to pass through a large nesting colony of Cormorants, which in Nova Scotia is a protected species.

- They say Non Significant effect on Groundwater. Can they be sure of this with at least two serious pipe leaks? More importantly since they have plans to run the pipe over the Town of Pictou's Watershed. To also add without Community or Council meetings to inform us of this, but letting the Town and the Citizens find out through a media release of a meeting that took place between PLFN and Fishers.

- The proposal calls for the pipe to go underwater at Caribou Harbour and run out into the Strait for 2.1 KM.
  They do understand that the Caribou Harbour by simply viewing the Marine Chart at
  http://fishing-app.gpsnauticalcharts.com/i-boating-fishing-web-app/fishing-marine-charts-navigation.html?title=CARIBOU+HARBOUR+boating+app#12/45.7600/-62.6850

  Quite dramatically shows that the greater majority of the harbour is less than 5 meters deep and the bottom is a shift and moving sandbar.
  It also has a busy Ferry Terminal that uses a Channel for the Northumberland Ferry Service to Move in and out through. This Channel gets dredged every few years, so having a pipe run anywhere close by would be detrimental to not just the ability to dredge, but also the possibility of pipe damage due to dredging.

  A further danger for damage to the pipe would be the Ice in the winter. From information gather from the Canadian Seabed Research. Ice Scouring is common in the Strait and it comes with great force at times creating deep cuts or grooves in the sea bed.

  There were 133 ice scour events reported from the SSS data collected in 2014. Scour measurements were taken from unscoured, smoothed seabed datum to the deepest point of the scour. The ice scour events identified occurred in water depths from 2 to 13 m. Scour was most frequent in water depths of 4 to 5 m. Sediment transport within the Northumberland Strait highly influences scour degradation and the extent of infilling that occurs (CSR 2015).
  In terms of ice scour orientation, the majority of occurrences were found between 120 and 140 degrees azimuth, which is aligned with the predominant currents in the Strait. Ice scour lengths were predominantly in the 10 to 70 m range (76 % of occurrences), with a few occurrences exceeding the 100-m threshold. The width of most ice scour marks was less than 4 m (81 % of occurrences). Further details regarding ice keels and their distribution in the Northumberland Strait can be found in Obert and Brown (2011).

- As for a possible failure in the system where an accidental occurrence happens one must realize with the length of the pipe now extended to over fifteen Kilometers, that means there could be 100s of thousands of liters of Effluent that could be above legal allowable limits in the pipe. I see no plan in place to have this Effluent safely removed before it ends up in the Strait especially in winter. So just how would an accident of this nature be dealt with? Also if there is a failure in any section of the underwater pipe or it's Diffusers during the Winter when Ice is in the Strait, how is that to be rectified? Does the Northern Pulp Shutdown until the Ice is gone and the pipe can be repaired.

I will now end this letter of submission as I think there is more than enough proof here and questions ask that need to be answered seriously and concise before even the thought of a pipe being laid is given. There is so much more that I can present to you, like the burning of the dried sludge and the damage being done to our forests and on and on.

If the Mill closes, it will not be the loss of the Forest Industry, the forest will still be there. Of course there will be job loss, as unfortunate as that may be for some, Pictou County and Nova Scotian's will come together to help and other jobs will be found through reinventing our forest resources. That is what we do in this great Province of ours.

But if the pipe goes in we do risk two other Industries, those being the Fisheries and Tourism. Both of these will not return if the pipe fails. If the fish are gone there is no reinvent a harvest that is not there. The failure in the Strait will spread to the rest of Nova Scotia, PEI and New Brunswick, because we go by Atlantic Seafood Products and one tainted fish to the world means they are all tainted.

Once word gets around of the pollution then tourists will not come as they flock here mainly for the fact as our License Plate says...Canada's Ocean Playground.

I am really hoping that for the very first time in the History of Pictou County and the Mill, decisions will be made for the right reasons like the health of our communities and of our land and waters.

Most importantly not decisions made for anyone's personal gain or the gain of any Political Party, or Business, big or small.

I thank you for taking the time to read my submission.
Please do the right thing for Nova Scotia and Nova Scotians.

Most Sincerely,

From:

Subject: Re: Comments on Northern Pulp's Replacement Effluent Treatment Facility Project Environmental Assessment
Date: March 7, 2019 11:50:34 PM
Attachments: CH-B.png

Dear Minister of the Environment,

I am writing in concern regarding the Northern Pulp Replacement Effluent Treatment Facility Project. I am a property owner on Caribou Island and have spent a lot of time over the past 30+ years exploring the area; whether it be swimming, canoeing, windsurfing or combing the beaches and tidal flats. I am very familiar with Caribou Island and surrounding areas, and feel that I can offer some insight into this assessment that may be of use.

On a personal level and on behalf of my fellow members of the Nova Scotia Windsurfing Association, I would like to address the risk of direct human contact with the effluent in the vicinity of the proposed outfall location CH-B. While this proposed outfall location is stated to be 4km from shore, it is in fact roughly 2km from both Caribou Island and Munroe's Island, both of which contain provincial parks (see attached map). I have been windsurfing off Caribou Point for over 20 years and it just so happens that this proposed outfall location is a typical gybe (turning) point when sailing in this area under common wind directions. High speed turning on a windsurf board can commonly lead to spectacular crashes and sometime force unwanted ingestion of water. As a result, this sea water can be trapped within the ear canal or sinus cavity for an extended period of time. As hilarious as this may sound, it happens frequently during a day of sailing. For this reason, I would like this project's assessments to not discredit the human exposure factor at this location simply due to assumed remoteness. I insist that a more complete assessment be required in order to address the human health risks as a result of direct and prolonged exposure to effluent laden seawater.

I would also like to see specific studies regarding the potential intrusion and accumulation of effluent-borne contaminants affecting the water quality in Caribou Harbour, Caribou Rivers and other nearby tributaries. Given my experiences within these waterways, I can attest to the significant incoming tidal currents passing the proposed outfall boundary, pushing water into Caribou Harbour many kilometers upriver of Big and Little Caribou River and into various lagoons and saltwater marshes. I worry that the constant ebb and flow in this area could lead to long term accumulation of pollutants, which could be detrimental to the health of these sensitive and important ecological areas that are home to a diverse range of aquatic and avian life.

It should be noted that this proposed outfall site was chosen late in 2018, and appears to have not undergone any detailed analysis of a baseline water quality analysis the area. As stated in section 8.2.1, the Pictou Harbour water quality data is being used as *"a proxy for Caribou Harbour with respect to water quality, in the absence of available water quality data for Caribou Harbour)*" Using Pictou Harbour as a baseline is contradicted in 9.2.1 stating that Pictou Harbour and other surrounding areas are prohibited from local shellfish harvesting due to water quality issues whereas in Caribou area "*there are several active recreational and commercial fisheries in the area and there are also currently four provincially licensed marine shellfish aquaculture operations (all for American Oyster) in the vicinity of Caribou and Munroes Island, which are located relatively near to the location of the proposed effluent diffuser (CH-B)*." The fact that a commercial bi-valve fisheries exists in this area and are prohibited in the "proxy" reference area is evidence enough of the dissimilarities that should warrant that specific baseline measurements are performed in the new outfall location.

I general the most glaring gaps within this proposal are the constant omissions of studies, which are cited to be due to the lack of time to perform studies or having current information

available. Within this proposal there is consistent language of uncertainty and broad assumptions made using far reaching parallels or outdated data. Given the level of concern, it is only fair that more rigour and certainty be included within this assessment up front. It is clearly stated within section 2.0 of the proposal that the only biological field studies completed were on Northern Pulp Nova Scotia premises and have not considered the pipe corridor or marine environment whatsoever. It is obvious that the proposed route and outfall location chosen in the fall of 2018, could not be properly assessed for reasons beyond the cited "*seasonal constraints and by physical opposition and obstruction".* This is no excuse for omissions of proper studies, in regards to the most vulnerable and largest impacted areas of the project. Follow-up studies are promised, however, according to a recent Auditor General report, our provincial regulator's current track record indicates poor enforcement and monitoring of these projects as they progress. We simply need more detail upfront given what is at stake here.

I strongly urge you to delay your decision on the approval of this project and demand a more thorough Environmental Assessment Report to be completed by NPNS. Within this report I would expect to see a complete and relevant HHRA, updated environmental studies and more opportunity/time for input from the local communities, First Nations, concerned citizens, and the collective Maritime Fisheries from all neighbouring provinces.

Subject: Northern Pulp

Hi,

Since I had a difficult time finding the Environment department and don't know if I have the correct department, please refer to the correct department. This is the last day for comments and must be received TODAY.

Northern Pulp had four years to make changes, and did not. Our forests have been destroyed, waters polluted, animals wondering in cities due to displacement, at the hands of Northern Pulp.

This company even tried to prevent the book THE MILL from being placed in book stores, why I read it and all employees in this department should also read! A quote from GM and President of Scott Paper in the 1960s (Northern Pulp now) , "They can't believe how stupid the government of Nova Scotia is and are still laughing in Philadelphia in 2016."

If you allow effluent pumped in our waters again, we all know it will be a tragic disaster.

Northern Pulp has been given our resource and taxpayer's money for years and is concerned with profits only,
Unrestrained Capitalism at its worst! It's time to listen to us (those who vote) and I'm one of them!

Thank you

Subject: Support for Northern Pulp Environmental Assessment
Date: March 8, 2019 1:13:02 AM

I am writing in support of the Environmental Assessment application submitted by Northern Pulp for its new treatment facility.

A lot has been said about Northern Pulp and its impact on the local community. I stand in agreement with many, including Unifor, that Boat Harbour must close and be cleaned up to respect Pictou Landing First Nations people and their land. I also know there are many positives about having 300 good-paying jobs in Pictou, supporting thousands more across Nova Scotia, particularly in rural communities.

The Nova Scotia Environment Act is an essential piece of legislation designed to protect our shared environment and guide our economic development. The Act rightly spells out its purpose through a set of principles for sustainable development that should guide its application, including:

------> The linkage between economic and environmental issues, recognizing that long-term economic prosperity depends upon sound environmental management and that effective environmental protection depends on a strong economy.

In this situation, science should determine the best path forward. Nova Scotia, along with the rest of Canada, has among the highest global standards for environmental stewardship in the forestry sector.

The job of government and every person we elect to represent us in government is to find the best way forward when there are many competing and sometimes opposing interests. Communities across Canada manage to find a fair balance where good mill jobs coexist with a prosperous fishing industry and thriving communities.

We can and must find this balance for Pictou. There is a lot at stake: jobs, the environment, and respect for First Nations. We can and must find a solution that supports all three.

Thank you.

Attachments: minister letter.docx

Attached is a letter to Minister Miller in regards to Northern Pulp

Thank you

Dear Minister McKenna,

I am writing to you in relation to the Northern Pulp's Replacement Effluent Treatment Facility Project. My name is and I live in Caribou River Nova Scotia. My family has a history of being fishermen in this area, and currently my father, grandfather, uncle and myself are all employed in the local industry, two of whom are license owners. Combined, we own over 80 years of personal knowledge of the fisheries within the talked about area. More personally, coupled with working on fishing boats, I have been employed by multiple fisheries science organizations, including The Gulf Nova Scotia Fleet Planning Board, and the Fishermen Scientists Research Society, that conduct work throughout the Northumberland Strait. Included with my family knowledge, and personal work experience,

The Proposal by the Northern Pulp company affects me a great deal, due to my great involvement with the local fisheries in all aspects. My personal fishing endeavors, as well as all my immediately family work to make a living on the Northumberland Strait, and this proposal is of great threat to our way of life. The strait maintains a way of life for many people in this area, as we all depend on this beautiful body of water to support our lives and well being.

I would like to raise three separate points as to why I object to the pipe proposal, first of which would be the whole idea of pumping this so called treated effluent directly into the marine environment. Living in and fishing in this area for my entire life, I have observed that the proposed area of discharge is subject to extremely strong tidal flows. The theory behind changing proposals, as stated on page 33/34 is that the Pictou harbor area was not selected because it did not have enough tidal flows and that nutrients etc. could build up in the harbor and over time become harmful. The key here to me, are the words over time. This means that these chemicals in certain amounts are harmful, because over time they would accumulate. This statement also applies to the proposed outfall, because even though the area is subject to more tidal flow, therein lies the problem. The tide will go out and move the effluent and mix it, but then what will happen when the tide comes back in? This tidal flow can be confirmed, because whenever we are fishing, and someone loses a buoy, marking where their traps are located, it can normally be found further along the shore, by another fisherman, or even on the beach by a passerby. The tide coming in will already have the effluent in it and be subject to accepting more effluent from the pipe, and therefore, will start to accumulate, essentially causing the same problem that northern pulp was trying to avoid with the change of outfall location. Throughout the entire document, Northern Pulp only mentions the term Bioaccumulation once, and that's in the definitions page, at the very first of the report. This to me, is blatant ignorance. With increased nutrients in the water column, and to think the effluent will not make its way to the top of the water column is ludicrous, the process of photosynthesis will take in those extra nutrients will therein be passed along the food chain and be biomagnified. This will lead to the eventual time when the nutrients will be too high and become harmful, and they will already be passed through the entire food chain. This idea ca n also be visualized more clearly if you take into the consideration the suspended solids within the effluent. On page 84 in table 5.6-1 Of the report, it claims that there will be 4.8 grams/liter of effluent. If this is pumped at the maximum of 85,000 cubic meters per day, this would equal out to be over 4 tons of suspended solids per day. Where will those suspended solids go? Do they disappear? This process will not just stay in the

immediate outfall site, pumping such a large amount of effluent will begin to displace the water already occupying that space, and the affected area will begin to grow, magnifying these adverse impacts to a much greater area than is indicated in the Northern Pulp document. This relatively simple concept is a blatantly overlooked by northern pulp, who seem to be employing the "tides will take the effluent away and then it won't be our problem anyway" and that is just unacceptable. In this day and age, to have such a close-minded approach is disastrous, and I am not willing to put my future way of life into the hands of an organization so blinded by reality.

Secondly, I would like to raise an issue with the effluent itself, that being the proposed temperature of the effluent when it exists the pipe. On page 46 of Northern Pulp's report, is the table that comprises of the anticipated daily maximum effluent water quality. In this table it states that the temperature of the effluent will be 37 degrees Celsius in the summer, and 25 degrees Celsius in the winter months. This is just too warm. It is unacceptable to be pumping anything into the Strait at this temperature, as it can be extremely harmful to the ecosystem. There was a study conducted on the ambient temperature done by the Gulf Nova Scotia Fleet Planning Board in 2017, where the sent-out temperature probes throughout the Strait, from April to late fall, and throughout that entire time, there was not a single temperature recorded that was above 23 degrees. This includes the height of summer. (these probes were on the sea floor and not the water's surface.)[1] This means that the effluent emitted from the pipe is at least 10 degrees warmer on average. It doesn't take a scientist to figure out that water with a 10-degree difference is vastly different and could potentially cause a lot of problems. I believe there is not sufficient research on the potential impacts to the lobster populations with relation to temperature. Appendix R in Northern Pulp's report consistently cites a paper from the 1960's that deals with lobster larvae exposure to effluent. Would it not be better to do some updated research on the subject? Also in appendix R, its stated that larvae as well as adult lobsters will be unaffected within a certain distance from the diffuser? How can this be? will there be a fence holding all the effluent in? introducing a constant flow into the area will permanently change the makeup, and this will be a constantly changing number? Eventually that 2-10 meters could be 2-10 miles? How do we know for sure? There is very little research conducted in this area. This effluent is not going to stay in one spot, and will spread like a disease, and I'm not willing to risk that disease killing off one of the most commercially important fisheries in the province.

My last point that I would like to bring up, would be section 4, on page 25/26 where it states that Northern Pulp would not be able to remain competitive. This is a very loose term, that being competitive. What exactly does that mean? Does that mean that they immediately lose money and would have to shut down? Or simply mean that their profit would not be the same as it would be with the current pulp it produces. In that section it cites appendix B. Upon reading that appendix, it claims high wood use as well as electrical costs would make it not viable for their company. This seems to be very misleading, because after a quick google search of Northern Pulp’s own website, they claim to be almost entirely self-sufficient, because they use their own power generation facility to produce 90% of their electrical needs.[2] So, which is it? Seems that citing electrical costs as a means of not being able to switch to a different product and change operation systems, is a round about way of saying they won’t make as much money, because they only pay 10% of their electricity in the first place. It would not appear to be very good business practice if paying for more than 10% of your electricity consumption would cause the business to close. It appears to me, that looking at changing products and systems for the

Northern Pulp Mill Is more a matter of unwillingness based on very grey area terms, versus an idea that it is not possible.

Based on these three points,

1) The tides providing lasting impacts that can cause the toxins to spread and become bioaccumulated and potentially toxic over time
2) The potential threat to lobster fisheries and other fisheries due to the extremely elevated temperature of the effluent, coupled with the lack of research into the fisheries and the impact this project could have
3) The shady reasoning provided by Northern Pulp that they have investigated other options

I think a decision such as this should be forwarded to the federal government. The province should be willing to defer the decision making process, because it affects people that are not in their jurisdiction to begin with, coupled with the idea that such an important decision should be more thoroughly looked at, and not just a 30 day assessment when there is the possibility for much more research to ensure the well being of not only hard working people but also ensure that the animals and creature of the Northumberland Strait are safe and are able to thrive in their natural habitat. This request is not only founded on it being a big decision, but in fact that the Government of Nova Scotia has been helping fund the design and planning for this project, and that, therefore, would be a conflict of interests and hence the decisions should be handed over to the Federal Government.

Subject: Proposed Project Comments
Date: March 8, 2019 8:35:00 AM

Project: replacement_effluent_treatment_facility_project Comments: This mill after 50 years of cause pollution and illness in pictou needs to be closed. This application should be rejected for the following reasons: Â· Partially treated effluent is not acceptable for the otherwise pristine waters of the Northumberland Strait. The present effluent from Boat Harbour is already beyond acceptable, and I understand that the suspended solids in the proposed effluent will be even higher than the present Boat Harbour situation. Â· Pumping partially treated effluent into the Northumberland Strait has the potential of contaminating the waters of five of Canadaâ?Ts provinces. Â· The fisheries at stake in these five provinces are too valuable to be put at risk. There are so many pieces of legislation that should prevent this mill from polluting, but all have failed. No wonder people have so little faith in the system. Name:

Subject: Northern Pulp 's Replacement Effluent Treatment Facility Project
Date: March 8, 2019 9:10:15 AM

Dear Minister

I am writing this note in regards to Northern Pulp's Replacement Effluent Treatment Facility Project.

Our family are proud Nova Scotians with strong connections to Pictou and Pictou Island for many generations. Three of our four children are currently raising families in this wonderful province. We want them to remain in a province that respects the environment , the people , the forests and their the marine species that are part of the food chain.

We are proud that the current government has recognized the damage to Boat Harbour caused by the effluent from Northern Pulp. We applaud the government's commitment to righting this wrong.

Two wrongs however do not " make a right". The planned process to discharge Northern Pulp's effluent in to the Northumberland Strait is wrong. The current and future health and safety of people , marine life and the environment must have the greatest weight in the decision making process.

How can a daily dump of nearly 100 million litres of effluent, of unknown composition, not have a negative impact? How could any additional toxins in our environment and food chain be deemed safe in a globally warming environment? What is the risk assessment associated with constructing and maintaining a 15.5 km pipeline going overland and then through Caribou Harbour ? Why do we as a province continue contributing to the all the questionable decisions that have allowed the Northern Pulp Mill to begin and continue operations ?

The Class 1 Assessment is not adequate.

Please support those impacted directly and indirectly by the closure of Northern Pulp to develop new opportunities that support the recent sustainable forestry report released by the government.

Please give us reason to continue to be proud Nova Scotians who encourage our children to raise their families here , contribute to our economy, sustain our fisher heritage, protect our natural resources and support sustainable industries that protect our future. Please allow us to be proud of the principles and values of this government that become evident in your decision making process.

Thank you for your consideration.

Wife of a fisher
Mother of a fisher
Mother of four children who have grown up in Kentville , Town of Pictou and Pictou Island
Friend of many fishers and pulp mill workers
Grandmother to little children whom I hope and pray can be proud of their Pictou Island, Pictou County and Nova Scotian heritage and what we leave behind in this world

Subject: Mercury not addressed in the Northern Pulp EA
Date: March 8, 2019 9:20:08 AM

Hello Premier McNeil, Minister Miller, and Mr. Fraser,

I have concerns around the construction of NPNS's proposed new ETF next to the former Canso Chemicals plant could disturb the mercury remaining at the site and lead to its spread in the environment, now or in the future.

The Canso Chemicals property is known to be contaminated with mercury. It contains "on-site secure landfills" built between 1992 and 1999. The landfills contain free mercury from contaminated soils as well as mercury-contaminated materials generated from the demolition of the old Canso Chemicals buildings. Mercury is also known to have seeped into bedrock on the site.

Mercury is an environmental toxin which is persistent and bio-accumulative. It does not "go away" and can build up in the environment and in the food chain. There is no known safe level of human exposure to mercury.

Plans for Northern Pulp's new ETF show that the clarifiers and the activated sludge basins with depths of seven metres and greater would sit very close to the former Canso Chemicals site. There is a possibility that mercury from the contaminated site could seep into the treatment system and end up in the sludge that will be burned, or in the effluent released into the Strait.

The EA submitted by NP does not address any of these serious health risks. This proposal should not be approved as it stands now based on the serious risk presented to the people and the environment.

Thanks

Subject: In support of Northern Pulp"s EA application
Date: March 8, 2019 9:38:40 AM

I am writing in support of the Environmental Assessment application submitted by Northern Pulp for its new treatment facility.

A lot has been said about Northern Pulp and its impact on the local community. I stand in agreement with many, including Unifor, that Boat Harbour must close and be cleaned up to respect Pictou Landing First Nations people and their land. I also know there are many positives about having 300 good-paying jobs in Pictou, supporting thousands more across Nova Scotia, particularly in rural communities.

The Nova Scotia Environment Act is an essential piece of legislation designed to protect our shared environment and guide our economic development. The Act rightly spells out its purpose through a set of principles for sustainable development that should guide its application, including:

------> The linkage between economic and environmental issues, recognizing that long-term economic prosperity depends upon sound environmental management and that effective environmental protection depends on a strong economy.

In this situation, science should determine the best path forward. Nova Scotia, along with the rest of Canada, has among the highest global standards for environmental stewardship in the forestry sector.

The job of government and every person we elect to represent us in government is to find the best way forward when there are many competing and sometimes opposing interests. Communities across Canada manage to find a fair balance where good mill jobs coexist with a prosperous fishing industry and thriving communities.

We can and must find this balance for Pictou. There is a lot at stake: jobs, the environment, and respect for First Nations. We can and must find a solution that supports all three.

Thank you.

Subject: Registration of Undertaking - Northern Pulp - Written Comments Submission
Date: March 8, 2019 9:40:12 AM

Good Day,
After reading a few of the articles in the Chronicle Herald in respect to Northern Pulp's (NPNS) registering their EFT project - and with a diffused discharge of upward of 60 million litres a day of treated effluent to be discharged into the Northumberland Strait.
I have, as a resident living on our one and only ocean, in another region of the province on the Eastern Shore within the noted MPA, a few concerns and questions please.
Please note... I am no way an expert on the subject - just a concerned citizen.
1) If Dillon Consulting, EcoMetrix Inc. and NPNS are confident in the effluent NOT having any significant impact on the ocean bed and species of marine life - of not being affected; are these people willing to put their words where their mouth is - ie.
They (EcoMetrix Inc.) having performed lethality tests on Rainbow Trout by placing 10 trout in a bucket of pure treated effluent and determining the effluent to be deemed safe as it were, if half of the 10 trout did not die within 96 hours.
So the question comes to mind... are they willing to drink, let's say a half dozen glasses of this effluent to prove they are correct...is anyone who has this opinion of the treated effluent willing to drink glasses of this effluent? We are expecting our fish on and off our shorelines to be okay with it. So did British Columbia years ago and then reporting how many Salmon were affected with cancer in the Fraser River later on.
2) Have we, as a province contacted someone such as Dr.Boris Worm - Marine Ecologist and Killam Research Professor at Dalhousie, a speaker on CBC radio - along with being a scuba diver himself...
Have we asked for a non biased educated opinion of someone such as him - if not perhaps we should !!
3) Are we as a province educated enough to make the final decision that the fish, lobster, any marine habitat for that matter that is fished and with having this food put on our tables 100% confident that this end product will have no significant impact on our health. Are we prepared for future lawsuits?
I for one, who each year few times purchase lobsters in Pictou with other family members...will no longer be doing so.
I am a two time breast cancer survivor who was advised by Oncologists that with no cancer in my family and at the time notably being subjected to chemicals - this was a primary reason of the cancer.
This is also chemicals you are willing to put in our ocean.
4) Is there no way at all this effluent that is discharged daily - can it not be recycled - for the lack of a better phrase - is it possible for the plant to filter, recycle etc. this effluent and reuse it themselves. Has this option been scrutinized at all?
These are my thoughts and questions as a resident and concerned citizen of our beautiful province.
Just trying to keep it that way.
Thank you for time,

Subject: Northern Pulp Treatment Facility Replacement Submission Comments
Date: March 8, 2019 9:48:09 AM

Dear Minister Miller

I would like to ask that you, read this message and respond with next steps your Department is prepared to take to protect our Northumberland Strait's ecology, the livelihoods in three provinces that are dependent on it and our future oceans health. I would also ask that those copied read this correspondence being my local MLA, Randy Delory, our Federal Minister of Environment, the Honorable Catherine McKenna responsible for our oceans and my local MP Sean Fraser.

There are many aspects to this submission that I am uncomfortable with. First of all the timelines have been pushed and pushed to the point that the urgency has created a atmosphere of confusion based on quick responses by Northern Pulp which do not adequately address the environmental concerns that need to be addressed. There is critical data that I feel is not available to ensure we and our strait are properly protected from this waste. The waste has been determined by Northern Pulp to be "acceptable" and in fact this is a better solution than the existing process. The make up of the waste has not been clearly identified and mention of mercury has been suppressed if not avoided. This is only one toxic substance that must be thoroughly investigated as to the effect on the health of the Strait as well as the local community and those consuming the sea food from this area. Long term effects are not mentioned. Broad based terms such as "acceptable" and "minimal" do not do this toxic stew credit. We cannot accept the risk of damage to our lobster and other sea creatures in larval and adult forms, without a clear and concise path of study without ambiguity. It is unfortunate that Northern Pulp has waited this long to correct the Boat Harbour waste disposal process and the people of NS should not be held accountable for their lack of response over the past several years. In some ways I also hold the NS Government responsible in lack of urgency many years ago and letting this environmental disaster get to this point. We must now pit those supported by the plant to the industries dependent (in three provinces) on the Strait's health. I find the submission is fraught with ambiguity and essentially written with bloated text to disallow proper assessment over the 30 day period allowed. The whole idea of dumping this waste directly into the Strait flies in the face of what our Federal Gov't has committed only recently. Recall the quote by Jonathan Wilkinson, Minister of Fisheries, Oceans and the Canadian Coast Guard:

"The health of our oceans is in danger and the time to act is now. Hundreds of thousands of Canadian jobs rely on sustainable oceans. Our Government is working with our international partners, including those in the G7, to combat illegal fishing, support ocean science, and tackle marine plastics. This way, we can protect our beautiful coasts and build prosperous, stronger, and more resilient coastal communities. Healthy oceans mean a healthy, thriving and growing Canadian economy."

It is important to restate, healthy oceans mean a thriving and growing Canadian economy. We need more protections for our coasts, and not allowing a toxic stew to be dumped directly in the Strait will go towards achieving this. Sustainable economies do not base themselves on an unending attack on our natural resources. The NS Government needs to look at different approaches to grow our economy.

I feel that it is the responsibility of the NS Government to take all the precautions necessary to protect our environment and marine industries. If you do not do this who will? Given the above it is in the interests of the populace at large, the environment that cannot speak for itself, and our fellow Canadians in NB and PEI that the Proposal be rejected and continue on the path of closing the existing treatment facility.

Kind regards

Subject: Proposed Project Comments
Date: March 8, 2019 10:04:11 AM

Project: replacement_effluent_treatment_facility_project Comments: March 8, 2019 IN RESPONSE TO: Dillon Consulting Limited 2019. Northern Pulp Nova Scotia environmental assessment registration document: replacement effluent treatment facility. https://www.novascotia.ca/nse/ Prepared by

Dalhousie University. Professor. Department of Community Health and Epidemiology, School for Resource and Environmental Studies, Rowe School of Business Dalhousie University. Assistant Professor. School for Resource and Environmental Studies. *Explanation of key topics provided below, when comments become available for public viewing. Dear Honourable Margaret Miller, Minister of Environment, The following is a response to the misrepresentation put forth by Northern Pulpâ?Ts Environmental Assessment EA of the scientific contributions our study, Pilot study investigating ambient air toxics emissions near a Canadian kraft pulp and paper facility in Pictou County, Nova Scotia Hoffman et al. 2017, provides. We would appreciate that you consider our rebuttal. This was a â?opilotâ? study as indicated by the title and subsequent sections of the study therefore, it was not meant to provide causal evidence to implicate the presence of airborne VOCs as solely emanating from Northern Pulp â?othe millâ?, as the EA suggests. Nevertheless, we were interested in documenting VOC-related air quality in the vicinity of the mill, given that pulp mills are present across rural Canada. Publicly accessible Environment and Climate Change Canada ECCC data VOC concentrations [Granton NAPS ID: 31201, located southwest of the mill], and local meteorological conditions [Caribou Point] http://climate.weather. gc.ca/climateData/ http://maps-cartes.ec.gc.ca/rnspa-naps/ were examined using temporal 2006â?"2013 and spatial analytic methods to investigate prioritized air toxic ambient VOC concentrations near a pulp plant to determine whether these emissions concentrations were in the range of US EPA air toxic levels EPA 2015d https://www3.epa.gov/ttnamti1/files/ambient/airtox/nattsworkplantemplate.pdf. Results highlight associations with wind direction and the Granton NAPS siteâ?Ts ambient VOC concentrations in relation to the location of the mill. Compared to all other wind directions, prevailing winds from the northeast and the mill typically resulted in higher VOC concentrations for all compounds, except carbon tetrachloride, suggesting that the mill is likely a contributor to increased concentrations however as stated in the study, the origins of VOCs are â?oinconclusiveâ?, and â?oother local sources likely contribute to air toxics emissionsâ?. The millâ?Ts EA states that â?o[this study] did not attempt to rule out contributions from other potential sources of VOCs in the areaâ?, which is clearly not a true statement - other potential local emission sources were discussed in detail in the publication. Figure 1, for example, is a map displaying other local point source emitters in the community e.g., tire manufacturing facility, coal-fired thermal electrical generatin g station. VOCs 1,3-butadiene, benzene, and carbon tetrachloride routinely exceeded EPA air toxics-associated cancer risk thresholds, regardless of whether the mill contributed to these VOC levels, and is a significant finding that warrants further investigation. The EAâ?Ts statement: â?oWhen other study uncertainties are considered [â?¦] there is no current air quality issue with the seven targeted VOCs in the Pictou County areaâ? is misleading. Due to the limited number of sampling sites, the problem with the location of the sampling site in relation to the location of the mill, and the short duration of our study, we explicitly identified the need for further investigation on this question. As commonly identified by environmental researchers, absence

of evidence is not necessarily evidence of absence. Therefore, the limitations caused by sparse data does not necessarily mean there is no problem with air emissions in this community and there is no justification for this erroneous con clusion, as stated in the EA. The EA statement, â?oThe seven VOCs are not known based on literature review to be associated with pulp and paper mill activities and air emissions to any significant extentâ?, is both unclear and undefined. Furthermore, the EA does not specify how the literature was reviewed/cited to support this statement. According to the millâ?Ts own self-reported NPRI report in 2012, 143.18 tonnes of VOCs were atmospherically emitted on-site ECCC 2012. An estimated 3.195 tonnes of benzene were released to the air from a stack higher than 50 m and 0.022 tonnes were released within 50 m of the ground. Benzene can combine with chlorinated hydrocarbons associated with the Kraft bleaching process to form a range of toxic compounds which can be volatilized. Although trichloroethylene, tetrachloroethylene, and carbon tetrachloride were not officially reported to have been released by Northern Pulp, these VOCs may become airborne through evaporation from pulp and paper wastewater Soskolne and S ieswerda 2010. Boat Harbour the millâ?Ts effluent treatment facility may therefore contribute to ambient concentrations of VOCs. The major chlorinated hydrocarbon emitted into the air from bleached kraft pulp mills of concern is chloroform, which is produced by heating a mixture of chlorine and either chloromethane or methane EPA 1985. However, we address other local and area sources which likely contribute to the observed VOC concentrations, which warrants further investigation. We note that direct links between 1,3-butdiene and vinyl chloride with pulp and paper industries have not been reported in the scientific literature to date. With regards to the EA statement, For the carcinogenic inhalation TRVs that were applied, the authors did not adjust these values from the default USEPA target cancer risk level of 1 in 1 million to the target cancer risk level that is current public health policy in Nova Scotia and most other provinces i.e., 1 in 100,000. Thus, the TRVs for carcinogens cited in the paper should have been ten times higher than indicated. This correction would alter the conclusions of the study substantially in that for the seven VOCs considered, there would be no to negligible exceedances of the TRVs that were appliedâ? , their proposal is not relevant given that Health Canada has no formal standards for air toxic emissions, and we were not looking at environmental remediation sites only background community concentrations. In contrast, the US NATA process is based upon a 2005 scientific risk assessment process well laid out by EPA which established the cancer risk levels to which the ECCC da ta were compared Hoffman et al. 2017. Furthermore, it should be stated that our study was published in an excellent, internationally-recognized environmental science peer-reviewed journal Environmental Science and Pollution Research and met the journalâ?Ts quality control standards. To reiterate the value of this study: â?oDespite study limitations, this is one of few investigations documenting elevated concentrations of certain VOCs air toxics to be associated with pulp and paper emissions in a community. Findings support the need for more research on the extent to which air toxics emissions exist in pulp and paper towns and contribute to poor health in nearby communities.â? Various recommendations were put forth to improve the rigor and validity of the present study e.g., a field component consisting of real-time measurements of ambient air toxics a comprehensive risk assessment to investigate uncertainties that have implications for risk estimates in the present study. Furthermore, we addressed various limitations and gaps in air quality monitoring, not only locally but nationally, and provided recommendations how air quality management could be improved to support informed public health decisions e.g., epidemiological research of human exposures to air toxics emissions in the ambient Pictou environment with appropriate considerations, as outlined more strategically placed air monitoring stations evaluation of a wide-suite of air toxics - topics ECCC and applicable stakeholders should consider. To the contrary and to our surprise, the Granton NAPS station has been decommissioned. This information vacuum only

emphasizes the need for more research on these questions. In summary, the intent of this pilot study was to address local air quality conditions in a Nova Scotia rural community, which clearly indicates the need for further investigation. Moreover, this pilot study serves as a precursor to gaining awareness, so that government agencies adopt more stringent air quality regulations and monitoring programs to ensure health of all citizens is safeguarded and prioritized. *Explanation of key topics Hoffman et al. 2017: â?¢ There is growing concern about the toxicity of volatile organic compounds VOCs Cicolella 2008, their presence in air, and the consequences of long-term, low-dose exposure to these agents. Airborne VOCs are varied and widespread pollutants e.g., hydrocarbons, aromatics, and some chlorinated compounds and are increasingly recognized as important precursors to PM2.5 and ground-level O3 formation through photochemical reactions Ryerson et al. 2001. Many VOCs are included in the US Environmental Protection Agency EPA air toxics list. â?¢ â?oAir toxicsâ? are defined as â?othose pollutants that cause or may cause cancer or other serious health effects [â?¦] or adverse environmental and ecological effectsâ? EPA 2015a. â?¢ Ambient air monitoring in the US is conducted in accordance with the Clean Air Act CAA Clean Air Act 1970. CAA amendments identify 187 air toxics, which form the basis for EPAâ?Ts approach to regulating emissions EPA 2015a. Of these, EPA identified 30 air toxics that pose the greatest potential health threat in urban areas EPA 2015b. Using the risk-based principles outlined in CAA, EPA developed the National Air Toxics Assessment NATA, a comprehensive evaluation tool that prioritizes efforts to regulate emissions of air toxics EPA 2015c. Such a rigorous initiative has not been implemented in Canada, where no federal guidelines exist for ambient air toxics. Yet, some of these air toxics, as noted in our publication, have been identified as associated with increased risks for chronic disease. See, for example, Paul Villeneuve et al. 2013 https://www.ncbi.nlm.nih.gov/pubmed/23369806 which showed an increase risk of cancer mortality associated with elevated ambient air benzen e concentrations in urban Toronto. â?¢ NATA calculates concentration and risk estimates from a single yearâ?Ts emissions data. The risk estimates assume a person breathes these emissions each year over a lifetime or approximately 70 years. NATA only considers health effects from breathing these air toxics. It ignores indoor hazards, contacting or ingesting toxics, and any other ways people might be exposed.â? https://www.epa.gov/national-air-toxics-assessment/nata-overview â?¢ The National Air Pollution Surveillance NAPS program was established to monitor and assess ambient outdoor air quality at various urban and rural areas across Canada. This program focuses primarily on the criterion air pollutants nitrogen dioxide, ozone, PM2.5 and sulphur dioxide. Several EPA-designated air toxics are routinely quantified in Canada however, at a subset of NAPS monitoring sites. â?¢ VOCs selected for analysis in this investigation were based on EPAâ?Ts list of 30 urban air toxics EPA 2015b and National Air Toxics Trends Station Work Plan Template EPA 2015d. Therefore, this investigation represents one of the few peer-reviewed published studies on record about airborne VOCs in rural Canada. Project: replacement_effluent_treatment_facility_project Comments: To Whom It May Concern: I am writing to express my strong support for Northern Pulp Nova Scotia in its efforts to build a new effluent plant and in support of their request that they be given an adequate extension beyond the time-line in the Boat Harbour Act to allow them to complete this task without a shutdown. I have been in the finance business servicing the forestry, transportation and construction sectors for over thirty years and am also a woodlot owner. I am very familiar with the amount of economic activity generated by a mill such as Northern Pulp. The forestry industry in Nova Scotia is very integrated with each part of it depending on the other. Northern Pulp provides the largest market by far for the by-products of our lumber mills which depend on these sales for their very survival. Northern have also been very beneficial to small woodlot owners. When a person does intensive forest management, commercial thinning, etc. and removes low quality wood, Northern Pulp provides a market for that product, so the landowner can afford to do that type of forest improvement. They provide a market for our low-quality wood at a fair price. They also provide access to silviculture funding for land owners. Northern Pulp in not only a driver of our forestry industry and our rural economy, it is a driver for all of Nova Scotia. They are the largest single customer of the Port of Halifax accounting for roughly 40 of the port business. Without the volume of forestry related freight going out there will be a lot less incentive for ships to come in so it is easy to see that the economic spin-off from this operation is as important to our urban economy as it is to the 100â?Ts of rural communities that depend on the forestry industry. Without this pulp mill, a number of sawmills in NS will be forced to shut down and the demand for our forestry products will collapse and in turn, so will the prices for them. Without viable markets our forestry contractors and truckers will be bankrupted, and our woodlot owners will have no economic incentive or financial resources to manage their land properly. Forest land will be devalued. The jobs from this industry create tax dollars that are much needed to support the demands of Nova Scotians for better health care, education and infrastructure. As a Chronical Herald article once said, â?oyou canâ?Tt build an economy off of whale watching and BBâ?Ts.â? To be prosperous our economy needs industry that actually creates wealth. No one, including myself, argues with the fact that there needs to be a new more efficient effluent plant and that the current practice of dumping that waste in Boat Harbour must stop. That being said, Northern Pulp didnâ?Tt create this situation. They inherited it not 10 years ago when they purchased the mill, a purchase made on the basis there being a lease of the Nova Scotia government owned effluent plant in place until 2030. Since their purchase, they have vastly reduced emissions from the mill largely at their own expense. They are attempting to build a state-of-the-art treatment facility that will replace Boat Harbour with an unreasonable, arbitrary deadline while being fought every step of the way by various interest groups. In summary, Northern Pulp is critical to the survival of our forestry industry and its closure would also be a very substantial body blow to our economy as a whole. If the Boat Harbour effluent plant is unavailable it cannot go on hot idle as Stora did when it ran into difficulty. If this plant shuts down, even for a short time, it is done. After 30 years of effluent going into Boat Harbour, the incremental harm done to the environment by an extension to allow Northern Pulp the required time for the environmental review, permitting and construction etc. does not justify making this mill close. Northern Pulp needs to be given the time needed to navigate the process and to finally build and commission this state-of-the-art effluent plant and be one of the long term economic drivers our economy needs and be able to continue to

generate the wealth we as Nova Scotians desire and deserve. I strongly support that their proposed effluent plant be approved and that there is an extension of the Boat Harbour Act deadline to give Northern Pulp the time to complete the task. Regards,

Project: replacement_effluent_treatment_facility_project Comments: I strongly support giving Northern Pulp an extension to construct their treatment facility. They currently meet or exceed current regulations and the new facility will improve the effluent. The province needs more wealth producing industries that employ highly skilled, well paid Nova Scotians and all the supporting jobs and industries. We all consume products made from Kraft pulp every day, tissue, toilet paper, paper bags, diapers, paper, etc.so why would we not benefit from this plant. There are many hundreds of such plants in the world, the closest in the middle of Saint John, New Brunswick, they all have an odour and they all have an effluent flow, many discharge into lakes and rivers and most are much larger than this mill. Canada has some of the toughest environmental regulations in the world. I agree Boat harbour should be shut down, lets stop complaining and move forward and solve this. NORTHERN PULP NOVA SCOTIA ENVIRONMENTAL ASSESSMENT REGISTRATION DOCUMENT
Replacement Effluent Treatment Facility

Public Input Submission

.(Health Education)

@gmail.com

Firstly, I acknowledge the economic benefits Northern Pulp brings to the community, volunteer sector and non-profit groups. For 22 years, I have called Caribou Island my home. Within my line of vision in the harbour, I see Farming, Fishing (sport and commercial), Forestry, Tourism, and Active Living co-existing and integrated. I do not see the Northern Pulp pipeline and outfall as compatible with the highest and best use of Caribou Harbour and the Northumberland Strait. The "quality" of the partially treated effluent is by Northern Pulp's admission not expected to be an improvement from that of Boat Harbour i.e. temperature, salinity, TSS etc. The elements that are not treated onsite at the proposed ETF will still be at polluting levels in the pipeline for example BOD's and then dispersed in the Northumberland Strait by dilution and will negatively impact the Marine environment. There is no indication that pipeline leak prevention monitoring is different from Boat Harbour – visual. For damage by ice, ice scour, or malfunction from sediment, the diffusers will be checked by divers but no frequency is indicated other than annual. **To come into a sensitive ecosystem with minimal monitoring is unthinkable**. As to air emissions, there is inadequate information as to the new sludge burning in the power boiler at maximum production, the emissions and the impact to existing scrubber? Precipitator? capacity. More recently, a significant methyl mercury contamination is reported to exist adjacent to the proposed replacement ETF. There is not enough clarity about heavy metals and the potential health impacts.

I request that the Caribou option be rejected by the Honourable Minister because of the significant environmental effects that can't be mitigated:

Please note that the map used in the Executive Summary does not show Gull Spit as a notable geographic feature. The Canadian Hydrographic Services nautical chart used by Makai Engineering in Appendix F, Figure 1 shows only half of Caribou Harbour but does indicate the presence of Gull Spit which relates to the **narrow silting harbour entrance.** A nautical chart shows water depths, land elevations, North orientation, marshlands, tidal information, watercourse feeding Caribou Harbour. **I request that the Honourable Minister and any other reviewers of the application be made aware of what appears to be an oversight in the Executive Summary as it could impact one's understanding of the significance of Gull Spit to the harbour flushing capacity and sedimentation.** Without Gull Spit noted, the map in the Executive Summary implies a wider harbour entrance.

The ferry channel is dredged regularly due to sedimentation. A May 2008 Transport Canada report about the most recent ferry dredging is found at: https://www.canada.ca/en/news/archive/2008/05/federal-government-improves-caribou-nova-scotia-ferry-terminal.html. The proposed NP pipeline marine portion of the 15.5 km route would run parallel to the ferry channel. In pipeline construction, 4.1 km of a trench 3 metres deep and 10 metres wide would increase sedimentation in the harbour and off of Caribou Point. The description of armour stone to cover the proposed pipe could also change the sediment patterns in the harbour and off of Caribou Point : creating a new artificial "reef(s)" that crosses the harbour perpendicular to the harbour entrance and then parallel to the Caribou Island south shore. Gull Spit at the harbour entrance is a significant feature as is the Nature Preserve, Munroe's Island (opposite Gull Spit) which is part of the Caribou Provincial Park. Approximately 30 years ago, the Little Caribou Entrance to the harbour was still open but is now connected to Caribou Park because of sedimentation. The modelling in the Receiving Water Study which used July 2016 conditions shows that outfall effluent would be inside the harbour. *(Appendix E1-E2 Figure 2.11 CHB Discharge Simulated Effluent Concentration for Typical Tide – Slack High Tide at 11:00 July 22; Figure 2.12 CHB Discharge: Simulated Effluent Concentration for Typical Tide – Ebb Tide at 1400 July 22)* Yet in the application, there is no mention of the flushing capacity of the harbour. A mussel farm license was rejected approximately 18 years ago due to inadequate flushing. **Effluent sediment in Caribou Harbour would impact /reduce / eliminate prospects for existing and future non-polluting socioeconomic development.** To add another source of sediment in the harbour and environs is short-sighted and an avoidable negative impact. The impact of the 25-37 degree effluent as a 15.5 km thermal heat pump isn't addressed nor is the broad impact of cooling effluent in the strait and the currents created or altered by the diffusers and the temperature differential of the effluent and the receiving waters. Whether property sellers on the harbour would need to highlight effluent as one of the disclosure items has not been addressed and neither negative property value and tax base impact nor the quiet enjoyment of current owners.

In addition to the fishers who are based at the Caribou wharf, **Caribou Harbour has 4 Oyster licenses** – verified as current on the NS Department of Fisheries website. The pamphlet I recently obtained at NS Fisheries and Aquaculture, "Harvesting Shellfish in Atlantic Canada" 2004, indicates that "Three federal government agencies work together to deliver the CSSP (Canadian Shellfish Sanitation Program) : Environment Canada, the Canadian Food Inspection Agency and Fisheries and Oceans Canada." "An international reputation for quality and safety". Also, the application does not include what Priority Substances (Canadian Environmental Protection Act, Priority Substances List Assessment Report No. 2, Effluents from Pulp Mills Using Bleaching 1991) are in the effluent when it exits the diffusers. **Backflow of effluent to the harbour** is possible because of the harbour's Easterly exposure, including Nor'easter's. High sustained winds with tides and surges flooding land of low elevation and saltwater marshes. The food chain that is impacted and can't be mitigated because of the scope of the Caribou Harbour ecosystem, impacts food security. There are also climate change predictions for low lying land of at least 1.5 metres.

I was aware of **2 sunken ships in Caribou Harbour** so did a scan of some public records **(Eastern Chronicle, Pictou Advocate, Maritime Museum of the Atlantic, The News) and**

found <u>not 2</u> but 22 reports of strandings and wrecks – a listing is attached. There were also 3 ferry crossing points from Caribou Island to "the mainland" years ago – one at the West end , one mid-island and one at the East end I don't know if there is evidence of old wharf pilings at the East end of the island but there are at the other 2 locations. This information relates to **Section 10.2.8 Discovery of a Heritage Resource.** The **Special Places Protection Act , Historical Sites & Monuments Board of Canada and the Heritage Trust of Nova Scotia** also need to be considered for ensuring that the Marine Heritage of Caribou Harbour and area is not sacrificed.

The ferry service operates from May 1 - December 20 between Caribou Harbour and Wood Islands PEI. There is no mention of the impact of pipeline construction sedimentation to accelerating the next channel dredging timeline or whether the contents of effluent sediment will curtail or complicate the ferry channel dredging in the future. The ferry is the only direct connection between PEI and Nova Scotia. Both provinces emphasize the natural setting and recreational activities in tourism promotion. **The ferry interacting with the effluent plume isn't addressed in the application; for example: colour, odour, froth and aerosolizing of the effluent** – potential negative impact to the iconic tourist experience that reaches beyond the ferry ride. Pictou Island is experiencing success as a recreational destination and that ferry also operates out of Caribou Harbour.

"Those who fail to learn from history are condemned to repeat it" – Winston Churchill, 1948. In 1994, an effluent pipeline proposal into the Strait was refused. What is different today? However, Jean Francois Guillot, Vice President Operations East with Paper Excellence Canada, owner of Northern Pulp stated in a *Northern Pulp Press Release, March 6, 2019.* "Northern Pulp's new wastewater treatment facility **will ensure no untreated wastewater ever leaves the site** and will then continue our practice of releasing treated wastewater into the Northumberland Strait." Honourable Minister, the promise is highly dependent on the criteria for the definitionof treated and pointedly omits the same assurance for the pipeline and effluent which is in my understanding no way close to the quality of the Middle River which is supplied to Northern Pulp for processing – defining "treated" to align with the public's understanding of treated isn't clear and wouldn't be further clarified until after operations are well underway. The comparison of the borrowed Middle River prior to diversion for processing, compared to the partially treated effluent at the outfall, then at the 360 degree? 100 metre mixing zone isn't addressed in the application. I disagree with Northern Pulp's standard for considering the effluent treated and ready for the pipeline. If onsite the processing allows for cooling of product and adjustment of process substances/chemicals, **why does the design of the Effluent Treatment Facility determine it as "pipeline ready" when the effluent is still at polluting levels when it leaves the ETF?** Who has the **Liability** for the effluent which escapes or is expelled offsite, on land and/or in the marine environment? This is not addressed in the application and isn't that related to mitigation? Reversing the effect may not be possible so is a significant environmental effect. There is an old saying about closing the barn door after the horse is out.
The implication is that "new" or "replaced" means improved. What I've understood is that the effluent will be the same and TSS will be increased, therefore **not an improvement**. I believe this is misleading to the public and may have affected understanding and responses about this application. The temperature and salinity are not managed onsite. Public engagement sessions about the Caribou site could have provided this distinction. The Nov. 2017 engagement panels

are not all applicable to the Caribou option. Because there was no public engagement session, I request that the Minister allow time for public comment on any new information following the Honourable Minister's decision. If thought could be given to the variety of literacy levels, that would make the information more accessible.

"One of the most environmentally responsible mills in Canada". Northern Pulp promotes it's smaller footprint for partially treating it's effluent onsite but doesn't acknowledge and to my understanding doesn't include the continuation of that footprint as the pipeline is laid adjacent to Pictou's watershed or the **pipeline's end destination in lobster grounds at risk for losing international certification for the Maritime lobster fishery.** The footprint comparison is a false assurance as is the comparison to other mills which can't be compared reliably to this unique setting.

Negative effects for emissions from burning the sludge are unclear. There must be a thorough analysis of what will be burned, the by-products, the precipitates and the potential health effects before adding to our air.

Caribou River Cottage Lodge, Pictou Lodge, Waterside Beach Provincial Park, Munroe's Island & Caribou Provincial Park, the Fisheries including the Caribou Harbour Oyster Licenses, Gull Spit narrowing the harbour entrance, the 22 ship groundings/ wrecks, the sedimentation conditions that already exist, the Pictou Watershed, no improvement to the effluent, location of the outfall in an ecologically sensitive area, the fluctuating ice conditions with no indication of protection of the diffusers from ice scour, the lack of an early warning detection plan for leaks or pipeline/diffuser loss of integrity, the migratory bird flyway, the numerous sensitive salt water marshes, dune grasses, edible beach plants, the flushing challenges of the harbour, the low lying farmland that is flooded by tides and surges, negative impact to cottage rentals and property values / transactions / leases just as the province has simplified short term rentals, the ferries that are being improved to "green" standards churning through the effluent plume, the present and future uses that are in direct opposition to the polluting presence of the effluent outfall. Algae impact to Caribou Harbour is an example of how the balance may be tipped before any testing occurs. In appendix J1-1 the prediction for algae effect in Caribou Harbour won't occur until "after" the pipeline is commissioned. There is no indication in the application as to how this could be mitigated after the fact. Would the pipeline be closed or continue to be permitted to pollute if testing post commissioning determined issues not in keeping with the predictive modelling? Local knowledge is relevant to this application. There is insufficient time for this project to meet the legislated obligations to PLFN for January 31, 2020.

I do not support the acceptance of this application. This is not a grandfathering of an operation. Relocation of the effluent outfall adds new layers of complexity and risk.

Respectfully submitted,

March 8, 2019

Caribou Harbour Ship Groundings and Wrecks

Caribou Island at Hector Centre , Pictou, NS 2019-02-28 The local papers are a source of marine incidents. To be noted, the list of **22 incidents** is not exhaustive.

Map of Caribou Harbour from Illustrated Historical Atlas of Pictou County Nova Scotia, J.H. Meacham & Co., 1879 shows 3 entrances to Caribou Harbour. 1 at the west end referred to as Ford at Low Tide (a sandbar). Little Caribou entrance referenced with the HILDA was at the southeast of today's (2019) Munroe's Island. Both of those have since silted in and the one remaining entrance - "Big Entrance" - is regularly dredged for the ferries to PEI.

The News July 16, 2015, Excerpted from Past Times, John Ashton.

"... Pictou County has had accounts reported of buried treasure within its seacoast and landmass. Some are very well known, such as the buried gold of Caribou Island. The story has been passed down for generations and attempts have been made over the years to retrieve the riches. Supposedly, in 1755 a French frigate buried a large cache of gold destined to pay the soldiers at Quebec. They built a "well of stone" and deposited the bullion deep within its rock walls. Over the years attempts have been made to recover the fortune, but have proved unsuccessful. Ghostly sightings at night have been reported of French sailors walking about the beach near Gullrock Lighthouse protecting their stash."

"Another well-known buried treasure story was reported in Rev. George Patterson's A History of the County of Pictou, 1877. A French war ship containing salvaged treasures had escaped the British attach on Louisburg, Cape Breton, in 1758. The French vessel was chased into Caribou Harbour and eventually beached at a little inlet off the Little Caribou River. Instructions were left with the Mi'Kmaq First Nation people that if discovered by the English, the craft was to be burned. The father and uncle of Pictou Deputy Sherriff Thomas Harris found the abandoned French ship. When they returned with implements to move her, she had been torched. Forty-four years later a vessel was reported travelling up the Caribou River at night and in the morning the people of the area discovered a shallow hole dug at the head of tide where all clues point to a buried treasure dig. This author visited this site in 2007 and could see the actual areas that had been dug and examined by treasure seekers...."

From:
To: Environment Assessment Web Account
Subject: Addendum to my submission to proposal for NP replacement ETF
Date: March 9, 2019 10:31:30 PM

I request the following references I had misplaced be added to my submission - context for some of my comments.

Table 4.2-4 Pg 67-68 " Preliminary modelling indicated that Pictou Harbour has limited mixing with the Northumberland Strait - water in Pictou Harbour tends to stay within the harbour. Though treated, effluent would therefore result in the accumulation and increasing concentration of residual contaminants contained in the treated effluent over time. Given the discharge rate, effluent contamination accumulation could result in result in negative effects on the harbour over time." The application does not support why Caribou Harbour was clearly deemed better than the Pictou Harbour site even in **Table 6.7-1.** Nor did it illustrate an overlay of nautical maps of both sites to clearly show Caribou Harbour as inferior to the already rejected site. The statement does confirm that when Northern Pulp uses the term "treated effluent" or "treated wastewater" throughout its application and in public engagement , that **when treated, the effluent will accumulate and concentrate residual contaminants over time.** The distance between the 2 points is less than 6 km. An average walker can do that distance in an hour and a half. If compared by modelling for an average current, the time from effluent outfall would be less than that.

Appendix I-1 "all treatment will occur on site" - this contradicts the admission that the effluent will accumulate and concentrate residual contaminants over time. Dilution postpones, not treats and is retrogressive. Together with today's (March 9/2019) report in the Halifax Examiner that a Dalhousie researcher is claiming misrepresentation of her air emissions report in the application, the application has gaps.

Appendix I-1 Panel 6 Footprint "Can the process fit on the mill property, without impacting adjacent natural features and property owners?" There is an omission that the part that doesn't fit on the property, namely the pipeline and the effluent coming from it, would have impacts on adjacent natural features and property owners. The term footprint is not sufficiently defined and skews the understanding of the degree of benefit being claimed by Northern Pulp.

2.4 "....potential environmental effects of the project have been considered for all phases of the project including those potentially arising from credible accidents, malfunctions, and unplanned events." Ship groundings and wrecks are part of the history of the CHB option but no mention in the assessment and no indication of updated , effective monitoring , for the effluent parameters and integrity of the pipeline and diffusers.

2.5.2 Env. Protection Measures " Siting of the marine outfall to minimize the potential impact to marine water quality." Contradictory to I-1 that all treatment will occur on site.

Please note in Appendix E1, Figures 2.11 and 2.12 must be zoomed to more accurately see the simulated effluent in CHB. There is no scale and it isn't entered on a nautical chart. The other figures in that section.are likely the same. Without that, the key is of limited benefit unless the reviewer knows to zoom in. Very limited, and misleading to a reviewer not familiar with CHB. It would be more transparent and credible to cue the reader to zoom to view and to indicate the altitude.

Appendix E3 2.2 Far-Field Modelling Results "Modelling provides relatively higher dilution and less potential effluent impact on Caribou Harbour water. ...transported predominently with the off-shore currents in northwest and southeast directions. The effluent intrusion into Caribou Harbour is predicted to be minimum" The words in this statement are indefinite and more of a wait and see. Given what is at stake environmentally, this too low a standard to go forward with this application.

4.2.5.3 Marine Civil Engineering Geotechnical Considerations "Caribou Island has not had this study".
5.3.1.10 Appendix F Pipe Installation "Removal and disposal of dredged material is not anticipated." The 4.1 km long, 3 metre wide trench for the 1 metre pipe will displace seabed material. The 2008 ferry dredging under Transport Canada's jurisdiction was barged and disposed on land. What information was not included in the application to explain why there would not be removal and disposal?
Land to Marine (Near Shore) Connections "The near shore portion of the pipeline will require planning and management of worksite construction and logistics affected by water depth, fluctuating tidal levels, and ice scour." The application does not indicate why this would be acceptable at CHB but not at Pictou Harbour less than 6 km.away - a conflicting unsupported statement.
5.6.2 Air Contaminant Emissions "Potential for odour to be perceived." This is not sufficiently described.
5.7.2.7 Marine Environment 5th bullet refers to protecting the pipeline from ice scour but doesn't address diffuser protection. This would be an oversight and an error with negative consequences.
6.5 "Engineering considerations for Caribou Harbour" These are not clearly laid out to show the distinction from Pictou Harbour which is more detailed. This is a significant gap for reviewers and can't support CHB as a viable option, just as for the rejected Pictou Harbour option.
Table 6.6-1 Typo? I believe the year would be 2019, not 2018 (Native Council of Nova Scotia shows January 10, 2018)
Table 6.7-1 Effluent quality "Point C results and the discharge from the proposed facility will be similar." The proposed ETF will not be improving the effluent state.
"Fresh water from Middle River makes its way to the Northumberland Strait whether NPNS uses the water or not, therefore the same volume and fresh water mixing occurs naturally." This is a **false** statement. What is "natural" (from my understanding of the term) is the Middle River entering Loch Broom, then Pictou Harbour, then the Strait - fresh water and saltwater mixing occurring along the way by tides and currents and temperature and salinity ambient. The Northern Pulp manmade intervention is **not natural.** In the application, the Middle River is diverted at Loch Broom, to use in mill processes including the proposed ETF, then pumped from the mill site for 15.5 km via pipeline with the last 4.1 km on the seabed before being discharged at velocity from 3 diffusers set 25 meters apart and 100 more metres before predicted to be at ambient temperature and salinity.
7.0 Integration of Study Components "Under the nearshore effluent dispersion scenario, the potential effects zone based on the sublethal toxicity testing is within 323 metres of the discharge at Boat Harbour. Under the offshore effluent dilution scenario, the potential effects zone extends to greater lengths (to ~ 7.3 km)". The accumulation would still occur but in an extended zone. The modelling uses the 85% figure for predominant southeast and north west flow. There is no comment on the modelling of the other 15% which I believe would include winds and currents that come up the harbour from any easterly direction. There would also be currents intersecting from the west across the north shore of Caribou Island. There is no mention of this as part of the modelling.
Many residents who live elsewhere far and wide for the winter have been away during this process. Although I registered face to face in Nov 2017 at the New Glasgow engagement session, by email and online, I didn't receive the update notifications volunteered by Northern Pulp - not one. **Appendix I1 Panel 17 "**We are particularly looking for your input on the recommended route and outfall area (Nov. 2017). I did give input to the Pictou option and again with the Caribou option but didn't receive a response except for one where NP defended

its history of effluent into the strait as a given for the future.
I believe there must be a solution to safe, non-polluting effluent management that doesn't infringe on others. Caribou Harbour and the Northumberland Strait isn't an acceptable choice.
As a stakeholder, I don't give permission for effluent or residue on my property.
Thank you for adding my reference points to my submission.

Subject: In support of Northern Pulp"s EA application
Date: March 8, 2019 11:07:52 AM

I am writing in support of the Environmental Assessment application submitted by Northern Pulp for its new treatment facility.

A lot has been said about Northern Pulp and its impact on the local community. I stand in agreement with many, including Unifor, that Boat Harbour must close and be cleaned up to respect Pictou Landing First Nations people and their land. I also know there are many positives about having 300 good-paying jobs in Pictou, supporting thousands more across Nova Scotia, particularly in rural communities.

The Nova Scotia Environment Act is an essential piece of legislation designed to protect our shared environment and guide our economic development. The Act rightly spells out its purpose through a set of principles for sustainable development that should guide its application, including:

------> The linkage between economic and environmental issues, recognizing that long-term economic prosperity depends upon sound environmental management and that effective environmental protection depends on a strong economy.

In this situation, science should determine the best path forward. Nova Scotia, along with the rest of Canada, has among the highest global standards for environmental stewardship in the forestry sector.

The job of government and every person we elect to represent us in government is to find the best way forward when there are many competing and sometimes opposing interests. Communities across Canada manage to find a fair balance where good mill jobs coexist with a prosperous fishing industry and thriving communities.

We can and must find this balance for Pictou. There is a lot at stake: jobs, the environment, and respect for First Nations. We can and must find a solution that supports all three.

Thank you.

Subject: Northern Pulp Pipe Proposal
Date: March 8, 2019 11:08:45 AM

Dear Minister McKenna,

I am writing to you regarding Northern Pulps Replacement Effluent Treatment Facility Project.

My name is . I have lived in Nova Scotia for my entire life. I come from an extensive line of fishermen that have fished the waters of the Northumberland Strait for years and years. I have grown up in the fishery, and am currently employed by my father, whom I help run a commercial license. The fishery is important for my family, as my brother has recently purchased a commercial license of his own and we are all employed in the Fishery. This setup is very common in this area, and many people depend on the Strait to make a living and it is key to our way of life. The potential impact of this project has the possibility to absolutely ruin my way of life and cripple my family and friends. Its these reasons that I am so invested and concerned about this project.

I wish to raise three points of concern with the project.

First, as a fisherman I am concerned, that the proposed effluent pipe will be a detriment to the local fisheries, including that of lobster, rock crab and herring. The proposed outfall location is premium breeding grounds for all of these fisheries, and are of grave importance to the local area, as well as the entire economy of Nova Scotia. I feel as though there should be a greater deal of importance placed on protecting these fisheries. The science provided in Northern Pulps proposal is outdated, being conducted in the 1960's. Our industry is under constant pressure to evolve and become more sustainable and improve our fishing methods as well as our conservancy methods. How can a large corporation, who is not even Canadian owned, come in and attempt to infiltrate our waters, and not be subject to more severe outside pressures to ensure that what they are doing is not only scientifically acceptable but also morally right. Just because they claim that the effluent technically passes whatever loose requirements imposed by the federal pulp and paper mill guidlines, does not mean that is morally right to be pumping anything into the ocean. All levels of government have been claiming that we need to protect the ocean, that we need to cut down on pollution and begin to care for our environment because we won't have it forever. How can someone say this but then consider pumping effluent full of toxins into the ocean. The Government can't have it both ways and are going to have to step up to the plate. Is big industry more important than the health and well being on not only the Environment and ecosystem of the Northumberland Strait, but as well as the health and well being of the people that live there. Nova Scotia is considered Canada's ocean playground, and that's for good reason, the province is surround by the ocean. But what happens if Northern Pulp wants to start pumping their effluent into that playground? No ones going to want to play there anymore.

A separate point I would like to bring up is the monitoring of the pipe and its wellbeing. My main point being that how will the pipe be monitored? They claim that the accidental

release of effluent can occur. There is an example of this in the fall of 2018 when a ruptured pipe was discovered by a passerby in the Pictou Landing First Nations area. How can Northern Pulp claim to monitor their systems when a pipe rupture was undetected on land, let alone if the pipe was buried in the sea floor. I feel as though this risk needs to be better assessed because the potential for effluent to leak throughout the pipeline is very high. This applies for both the sections, land and ocean. This can pose problems for the fisheries and the marine ecosystem in the marine environment, but just as big a problem on land as the pipe is running right through the town of Pictou's water shed. I am sure the residents of Pictou do not want any effluent in their drinking water. Risking these aspects seem to be a very great risk that Northern Pulp is willing to take. I feel as though if the effluent leaking and entering the environment is seen as a problem, why is the idea of pumping it into the Northumberland Strait seen as an acceptable means of disposing of effluent in the first place?

Finally, this entire process, with the timelines put forth in the entire process, is once big farce. Northern pulp has had 5 years, to put together this large report on the entire project. That's fine. Where I draw the problem is that we as a concerned public, have only a fraction of that time, to formulate any concerns and put them forth to the government. In fact, the time line for concerns is only 30 days. This to me is a gross miscalculation. It is a hardly fair that the public has so little time to critique and raise concerns on a project that could potentially have a lasting and detrimental impact on the entire Northumberland Strait region, including that in neighboringprovinces of New Brunswick and Prince Edward Island. This raises an aside to my main point. That being that why is the Government of Nova Scotia the one to make the decision when the Northumberland Strait is a body of water the impacts three separate provinces. As a fisherman, everything I do is monitored and controlled by the federally department of fisheries and oceans. They control everything in the fishery, as a federal body. So why does this decision that has the potential to impact everything mentioned above, being made by a provincial government? This does not seem right. Especially when you take into consideration that the Government of Nova Scotia has funded the planning and design of this project, and as well has helped the Pulp Mill with monetary funding and aiding them over the years with extended boat harbor leases or example, so that they can continue their environmental racism uninterrupted. All this seems to lead to the conclusion the that Government of Nova Scotia is unable to make this decision with a clear and concise conscience and therefore should defer and have the choice put into the hands of the Federal Government so that a more thorough investigation and assessment can take place so that everything is out in the open and there will be no more secrets and fear in the community. Because right now there is fear and division. And all this could be fixed by the Government if they aid on the side of caution, and don't give into the Mill once again. Don't let them have their way anymore. This project should be a Federal issue. No more romance between Northern Pulp and the Provincial Government.

Restating the three reasons that I oppose this project,

1) Lack of sufficient research regarding the Fisheries
2) Lack of monitoring and potential disastrous leaks
3) An underhanded process that only helps Northern Pulp and the overlooking of the Nova Scotian Government that this is a Federal issue

These points are a handful of reasons that I believe this project should be handed over to the Federal Environment Minister. This entire project should be subject to extreme scrutiny and not be taken lightly. A decision that impacts three separate provinces and millions of people should have to be approved by simply a few days' worth of thinking and processing. I plead that the Federal Government be involved, and the that the Northumberland Strait be taken care of and not be put at risk.

Thank you

Project: replacement_effluent_treatment_facility_project Comments: Partially treated effluent is not acceptable for the otherwise pristine waters of the Northumberland Strait. The present effluent from Boat Harbour is already beyond acceptable, and I understand that the suspended solids in the proposed effluent will be even higher than the present Boat Harbour situation. â?¢Pumping partially treated effluent into the Northumberland Strait has the potential of contaminating its waters and destroying the lucrative fishery and important recreation industries of the area. It is important to strongly reject this Project as the people of NS are still dealing with the destruction at Boat Harbour and certainly do not need the threat of a similar occurrence in the Northumberland Strait!! Project: replacement_effluent_treatment_facility_project Comments: I am writing to express my strong support for Northern Pulp Nova Scotia in its efforts to build a new effluent plant. I believe they must be given an adequate extension beyond the time-line in the Boat Harbour Act to allow them to complete this task without a shutdown. Northern Pulp provides the largest market for by-products of our lumber mills providing small wood-lot owners who remove low quality wood through intensive forestry management and commercial thinning a market at a fair price for this product. Northern Pulp in not only a driver of our forestry industry and our rural economy, it is a driver for all of Nova Scotia. As the largest single customer of the Port of Halifax with roughly 40 of the port business. Without the volume of forestry related freight going out there will be a lot less incentive for ships to come in so it is easy to see that the economic spin-off from this operation is as important to our urban economy as it is to the 100â?Ts of rural communities that depend on the forestry industry. Without this pulp mill, our forestry contractors and truckers will be greatly impacted, and woodlot owners will have no economic incentive or financial resources to manage their land properly. Forest land will be devalued, and jobs in these, and other industries will be lost. This industry generates tax dollars that are much needed to support health care, education and infrastructure for those who live and want to live here. There needs to be a new more efficient effluent plant and that the current practice of dumping waste in Boat Harbour must stop. However, Northern Pulp inherited this situation less than 10 years ago when they purchased the mill, with the commitment that the Nova Scotia government owned effluent plant would be in place until 2030. Since their purchase, they have vastly reduced emissions from the mill largely at their own expense and are attempting to build a state-of-the-art treatment facility that will replace Boat Harbour with an unreasonable, arbitrary deadline while being fought every step of the way by various interest groups. As a parent of young professionals who want to live and work in Nova Scotia, I am very concerned that this type of action will make it impossible for them to raise their families here. After 30 years of effluent going into Boat Harbour, the incremental harm to the environment by an extension which would allow Northern Pulp the required time for the environmental review, permitting and construction does not justify forcing this mill close. Northern Pulp needs to be given the time needed to navigate the process and to finally build and commission this state-of-the-art effluent plant and be one of the long-term economic drivers our economy needs and be able to continue to generate the wealth we, as Nova Scotians, desire and deserve. I strongly support the proposed effluent plant be approved, and an extension of the Boat Harbour Act deadline be given to allow Northern Pulp the time to complete the task. Project: replacement_effluent_treatment_facility_project Comments: I have studied the executive summary for this project and the science certainly supports this project and the continued operation of the Northern pulp mill. To that end an limited extension to the Boat Harbour facility operation is warranted. In granting that, the PLFN people MUST be considered with guarantees and compensation for their contribution to the long term economic viability of Pictou County and Nova Scotia as a whole. Subject: In support of Northern Pulp"s EA application
Date: March 8, 2019 12:28:40 PM

I am writing in support of the Environmental Assessment application submitted by Northern Pulp for its new treatment facility.

A lot has been said about Northern Pulp and its impact on the local community. I stand in agreement with many, including Unifor, that Boat Harbour must close and be cleaned up to respect Pictou Landing First Nations people and their land. I also know there are many positives about having 300 good-paying jobs in Pictou, supporting thousands more across Nova Scotia, particularly in rural communities.

The Nova Scotia Environment Act is an essential piece of legislation designed to protect our shared environment and guide our economic development. The Act rightly spells out its purpose through a set of principles for sustainable development that should guide its application, including:

------> The linkage between economic and environmental issues, recognizing that long-term economic prosperity depends upon sound environmental management and that effective environmental protection depends on a strong economy.

In this situation, science should determine the best path forward. Nova Scotia, along with the rest of Canada, has among the highest global standards for environmental stewardship in the forestry sector.

The job of government and every person we elect to represent us in government is to find the best way forward when there are many competing and sometimes opposing interests. Communities across Canada manage to find a fair balance where good mill jobs coexist with a prosperous fishing industry and thriving communities.

We can and must find this balance for Pictou. There is a lot at stake: jobs, the environment, and respect for First Nations. We can and must find a solution that supports all three.

Thank you.

Installing a treatment facility on mercury-contaminated land at Abercrombie Point with an effluent pipe to release treated effluent directly into fishing grounds in the Northumberland Strait would be environmentally damaging; this action would adversely affect marine life and the waters it inhabits and on which it depends. Please reconsider and reject this proposal. Thank you.

RE: Northern Pulp's Replacement Effluent Treatment Facility Project

Good Day Minister Miller,

The Clean Ocean Action Committee (COAC) was formed in 2015, as a consortium of vessel owners, Captians, crew members, fish plant owners, operators and workers whose livelihoods are completely depend on a healthy, sustainable ocean and bountiful fish stocks. We represent over 9,000 individuals totally dependent on the renewable fishery resources on the Scotian Shelf, Georges Bank and the Bay of Fundy. COAC formed to provide fishers and fish processors a unified voice to promote the maximum protection for the renewable ocean resources that have formed the backbone of Nova Scotia's coastal economy for over 300 years.

This letter is to inform your "Environmental Assessment Branch" that we stand in solidarity with the Pictou Landing First Nation and the fishing and tourism industries of the Gulf of St. Lawrence and Northumberland Strait in opposition to the proposed Northern Pulp "Replacement Effluent Treatment Facility Project" and that we call on the Nova Scotia Government to reject this plan outright.

Just as with the oil and gas industry on the Scotian Shelf, Northern Pulp's environmental assessment submission does not prove a lack of significant risk and their report is missing critical data on many essential issues. The report contains insufficient evidence to assess exactly how broad any damage might be and gives no clear indication on what might be done to mitigate this damage should it occur. The company's claim that damage will be "minimal" is not credible and is not supported by the data presented within the report. There is no evidence indicating that the Northumberland Strait or even the Gulf of St. Lawrence can absorb the massive amount of toxic effluent which the Northern Pulp effluent project intends to pump into our fishing and lobster grounds. The Strait and the Gulf of St. Lawrence are already in a state of environmental stress brought on by the accelerating process of climate change. To add the

massive new insult of Northern Pulp effluent to these waters borders on criminality and cannot and should not be permitted. The Nova Scotia Government should be looking for ways to reduce environmental stresses in the Strait not proposing new processes which promote pumping in effluent which will only magnify and exacerbate existing problems.

The fact that Northern Pulp has not, with all the time allotted to them, developed a credible plan to clean up Boat Harbour and deal with their effluent is an insult and a slap in the face to all Nova Scotians. If Northern Pulp continues to refuse to develop and implement a functional and environmentally sustainable effluent treatment plan which does not include pumping toxins into Northumberland Strait we call on the government to stick with its deadline, to implement “The Precautionary Principal” and to close the Boat Harbour plant on the agreed upon date of January 31, 2020.

Most Sincerely,

Clean Ocean Action Committee

Project: replacement_effluent_treatment_facility_project Comments: Voters and other residents who care about Nova Scotias economic and ecological future stand opposed to Northern Pulps Effluent Treatment plan. I want to be counted among those who affirm that the evidence points to the fact that the days of allowing massive pollution of our province â?" and others â?" by business interests must now come to an end. For best results, a moratorium on such practices is decades overdue, but it is better to stop now than never. Please disallow this plan, and insist that the Boat Harbour treatment area close on schedule. Clean and sustainable business is the future of Nova Scotia, and our region. There is no longer room for businesses who pollute our air and water we need them to sustain the life of this and future generations. Thank you for listening! Name: Email: @gmail.com

Project: replacement_effluent_treatment_facility_project Comments: It seems clear to me that the Northern Pulp Replacement Effluent Treatment Facility Project lacks significant data, fails to address the concerns expressed by the community and blatantly ignores the set timeline for the project. The government must reject Northern Pulpâ?Ts proposal and close the effluent treatment facility on schedule. Northern Pulpâ?Ts submission does not prove a lack of significant risk, and is missing critical data. In the proposal Northern Pulp admits that they do not know what will be coming out of the pipe. How can they claim there is no significant risk to the environment, to the fisheries and ecosystem of the Northumberland Strait and the people of Pictou County when they do not know the chemical composition of the effluent? When questioned by CBC television on their recent visit to Boat Harbour the representative from Northern Pulp aknowledged that the effluent will be no better than what is being released into Boat Harbour now. Boat Harbour is a disaster and currently subject to provincial Class 2 and a federal environmental assessment because of the dangerous mix of chemicals and the difficulty involved with removal and remediation. Their proposal to pump that mix of toxins directly into the Strait is simply unacceptable. As recently reported in the news, despite internal recommendations by Northern Pulp contracted consulting firm and marine biologist for a study on the potential impact of effluent on lobster larvae, no testing was done. This is a basic failure by the company to do their due diligence. The response from the companys spokesperson, that they would start testing once the new system was in place, is insufficient and insulting to all concerned. We cannot use the Northumberland Strait as a testing grounds for their pulp waste. The proposal to burn the dewatered sludge in the power boiler is also of significant concern. Issues with the power boiler, first noted to be problematic in 2006, have never been addressed. Particulate matter emissions have been exceeded from that aging stack on numerous occasions. Not knowing what chemicals will be in the sludge, coupled with a glaring lack of properly functioning pollution-abatement equipment in the stack that will be burning it, could spell much worse air quality for local residents. There is little mention of the mercury contamination on the former Canso Chemicals site directly adjacent to the proposed location of the new treatment facility. Disrupting this contamination on a site surrounded by water requires extreme caution and a full examination, but there is little mention of this in the proposal. There is insufficient evidence to know exactly how broad any damage might be. The companyâ?Ts claim that damage will be â?ominimalâ? is not credible and should not be accepted. Fisheries, tourism and outdoor recreation are important economic factors and should not be put at risk. Scientists warn that the Gulf of St. Lawrence is warming more rapidly than almost anywhere on Earth. Adding additional stressors to a system that is already stressed is not wise. The Northumberland Strait is an area that requires additional protection, not additional degradation. The companies request for an extension on the Boat Harbour act should also be rejected. The timelines were clear from the day the legislation was introduced. The mill is owned by a multi-national company that owns pulp mills around the world. They should have had no problem calling on the expertise available to them to complete this project on time. I know jobs will be an issue in this decision. I would simply say that the government should look at the amount of money provided to the mill over the years and commit to providing a similar amount to future business development in Pictou County. The mill claims that Pictou County will be lost without them, but I see a beautiful, historic town of Pictou that cannot attract citizens, businesses or tourists because of the cloud of toxic air from the mill. This project is simply not worth the risk. The precautionary principle means it is incumbent on

the Nova Scotia government to err on the side of caution. Reject the proposed Northern Pulp Replacement Effluent Treatment Facility Project. If you donâ?Tt feel you can do this with the evidence before you, please call for a full Environmental Assessment report on this proposal.

Subject: Proposed Project Comments
Date: March 8, 2019 2:22:56 PM

Project: replacement_effluent_treatment_facility_project Comments: The current Northern Pulp facility has operated under various ownership for over fifty years and since that initial startup, has progressively made improvements to lessen environmental impact. The EA submission by NPNS for construction and implementation of a new effluent treatment facility outlines a system far superior to that of which has ever been utilized at the Abercrombie site since 1967 and would be at the pinnacle for this type of technology when compared to any facility of this type on a global scale. There is no doubt that the current Boat Harbor site must be reclaimed after 50 years of operation as an effluent treatment facility, however, there must also be an allowance for an EA to be completed and consideration given to NPNS to complete the necessary work in a reasonable timeframe in order to install a state of the art treatment facility. In addition to the environmental considerations which must be assessed, the economic impacts must also be considered. With the legislated deadline for closure of the Boat Harbor site less than one year away, is it is undeniable that an effluent treatment facility project of this caliber cannot be completed within the timeline for closure as outlined in the Boat Harbor Act. Without an approved EA and extension to utilize the Boat Harbor treatment facility site, it would most certainly be catastrophic to the operations of the NPNS facility. The potential closure of Northern Pulp would affect the very foundations of the forestry/sawmilling sector in the Province of Nova Scotia, causing widespread mill and forestry operation closures, massive layoffs and a trickle effect of spinoff businesses feeling the negative impact of these closures. The overall economic outcome resulting from a closure of the NPNS facility would have a devastating effect on the overall economic status of the Province of Nova Scotia. Whether we want to believe it or deny it, forestry, in all of its facets is a major sector in the Province of Nova Scotia and for well over a century has been the backbone of many rural communities and one of the principal drivers in the provincial GDP. The future of the forestry sector and the economy in the Province of Nova Scotia hinges on responsible decisions in the upcoming months. Name: Email: @mlb.ca

March 8, 2019.

On behalf of the Gulf Nova Scotia Fleet Planning Board, and their Fishermen's Working Group for the Northern Pulp Environmental Assessment, it is our pleasure to provide you with the results of our technical review of the "Northern Pulp Nova Scotia Environmental Assessment Registration Document - Replacement Effluent Treatment Facility," dated January 31, 2019. In our professional opinion, the Project cannot be approved as currently registered. Given the numerous issues, data gaps and information gaps we have identified in the technical review, we recommend that the Minister, as per Section 13 of the Environmental Assessment Regulations made under Section 49 of the Environment Act, determine either that

- the registration information is insufficient to allow the Minister to make a decision and additional information is required (Section 13(1) (a)), or

- a review of the information indicates that there may be adverse effects or significant environmental effects caused by the undertaking and an environmental-assessment report is required (Section 13(1) (d)).

Please do not hesitate to get in touch with us if you have any questions or concerns with the enclosed report.

With best regards,

Project Director
Risk Assessment Specialist, Shared Value Solutions Ltd.

Executive Summary

The Northern Pulp Nova Scotia (NPNS) proposed Replacement Effluent Treatment Facility (ETF) ("the Project") is regulated under the Government of Nova Scotia's Environmental Assessment Branch and is currently being considered a Class 1 assessment under the Province of Nova Scotia's environmental assessment (EA) process. The proposed ETF for the NPNS pulp mill is an AnoxKaldnes BAS™ process that will be designed to treat maximum wastewater flow of 85 MLD (62 MLD avg) and is based on a combination of traditional activated sludge treatment (AST) process with moving bed bioreactors (MBBR) for wastewater treatment. Following the public review period of the Class 1 EA Registration Documents for the proposed ETF, the Government of Nova Scotia's Minister of the Environment must decide if additional project information or reporting is required, or if the undertaking is approved or rejected.

As part of the public review period, Shared Value Solutions Ltd. (SVS), on behalf of the Gulf Nova Scotia Fleet Planning Board, and their Fishermen's Working Group for the Northern Pulp Environmental Assessment, completed a technical review of the Environmental Assessment (EA) Registration Documents provided by NPNS. The review focused on the technical aspects of the proposed Project design, as well as the validity and comprehensiveness of the environmental effects assessment within the EA. The review yielded a number of issues and concerns related to potential environmental impacts. Where applicable, recommendations for each identified issue or concern, based on the professional opinion of SVS, are provided to the Minister herein.

From a plant design perspective, overall, the new proposed plant design appears to offer a more modern, high rate treatment option than the current wastewater facility design based on aerated stabilization basin (ASB) technology primarily using natural basins and poorly designed "release" (i.e., discharge) into the Northumberland Strait. The proposed design appears to offer increased capability to control operations and optimize treatment performance within a modern wastewater treatment plant than the current infrastructure. Waste solids management and closed loop design for clarifier sludge could be an added benefit of the proposed design. However, several issues and concerns were identified related to the ETF design that must be addressed including whether the EFT will be able to meet more stringent discharge regulations being considered in proposed revision to the *Pulp and Paper Effluent Regulations* (target publication date of 2021).

With respect to effluent modelling, the information provided is considered to be lacking or inadequate. A major limitation of the modelling work (Stantec 2017, 2018) has been the use of water quality data that are old, from different years, from different locations, and from Pictou Harbour instead of Caribou Harbour and the CH-B location. In addition, water-column stratification (ambient density) was not considered in the modelling and the non-tidal counter-clock flow gyre existing around Pictou Island (approximately 6 km from CH-B) was not included/combined with the southeast-northwest direction flow pattern. These limitations must be re-evaluated and included in the modelling, as the MIKE 21 and CORMIX predictions on effluent dispersal and effluent build-up are incorrect.

With respect to the potential for adverse environmental effects to occur as a result of the Project, there were numerous issues and concerns identified related to a lack of detailed assessment on the potential impacts to marine life. More specifically, NPNS has attempted to assess impacts using outdated literature, and without conducting any current field or lab assessments to understand both the short-term and long-term impacts of the proposed Project. Further, NPNS is not clear on what the actual effluent will be comprised of when it is released to the Northumberland Strait, nor does it fully consider the cumulative impacts of the known effluent over time. Without knowing the composition of the effluent (i.e., chemical concentrations), and with the lack of relevant existing environmental conditions data, it is unclear how NPNS can make any informed or accurate predictions on the potential adverse environmental impacts of the proposed Project on the marine environment.

Similarly, a human health risk assessment (HHRA) was not completed as part of the EA Registration Document submission. Rather, NPNS completed a Human Health Evaluation (HHE). A quantitative assessment of potential exposures to project-associated chemicals of potential concern (COPC), and resulting human health risks (if any), was not completed. This is, in part, due to the project-specific effluent chemistry not being fully known (result of the chemical process engineering design work not being complete). As such, the chemical composition of the effluent, including chemical concentrations, has not been fully characterized and potential risks to human health have not been quantified.

Based on a review of the socio-economic baseline information provided and effects assessment conducted of the local assessment area's social and economic environment, it is evident that information has been omitted that prevents an accurate analysis of the potential risks the Project will have on the region's economic and socio-economic wellbeing. Dismissals of adverse effects on fish and fish habitat are informed by a reported lack of, or outdated, data and are therefore misleading in assumptions. This, in turn creates a very low level of confidence in the predicted lack of effects on socio-economic related values and interests held by the region's stakeholders, public, First Nations and the fishing and fish processing sectors.

Overall, the EA does not acknowledge or address the magnitude of potential adverse socio-economic effects on the region's commercial fisheries and the thousands of (Indigenous and non-Indigenous) citizens who are dependent on a resilient fishery. Nor does it adequately consider or address the potential for adverse effects to the marine environment and human health. As such, in our professional opinion, the Project cannot be approved as currently registered. Given the numerous issues, data gaps and information gaps identified in the EA, and summarized below, we recommend that the Minister, as per Section 13 of the Environmental Assessment Regulations made under Section 49 of the Environment Act, determine either that

- the registration information is insufficient to allow the Minister to make a decision and additional information is required (Section 13(1) (a)), or
- a review of the information indicates that there may be adverse effects or significant environmental effects caused by the undertaking and an environmental-assessment report is required (Section 13(1) (d)).

Summary of Issues and Recommendations

The following is a summary list of issues and recommendations, as identified in the technical review that follows the Executive Summary. Numbering has been kept consistent between the summary list and main technical review for ease of reference.

Addendum Receiving Water Study:

- **2.1:** NPNS must provide modelling results for the proposed CH-A effluent discharge location.
- **2.2/2.7:** NPNS must provide a study on sea floor ice scouring at, and near, the proposed outfalls CH-A and CH-B and make recommendations on the best location for an effluent outfall diffuser.
- **2.3:** NPNS must provide field verification of the water column stratification, and these measurements, taken at the CH-A and CH-B locations, and other areas, should be part of a water quality survey.
- **2.4:** Provide a water quality study for the CH-A and CH-B locations and other related areas, including Caribou Harbour and the surroundings of Pictou Island, using numerous sampling stations. As part of this study, one or two reference areas should be considered with several sampling stations.
- **2.5:** Provide an explanation as to how to reconcile the input of MIKE 21 July data for use in CORMIX simulations for August–September, and possible implications of this on the study results.
- **2.6:** A rationale for not completing an industry-standard characterization of the effluent plume at CH-A or CH-B must be presented.

Effluent Treatment Facility Design

- **3.1:** Environment and Climate Change Canada has proposed updates to the Pulp and Paper Effluent Regulations (PPER), to account for changes in the pulp and paper industry, as well as to address findings from EEM studies indicating that the PPER do not adequately protect fish, fish habitat, and the environment (ECCC, 2017). NPNS must address whether or not the effluent from the project will meet the requirements of the proposed updates to the PPER.
- **3.2:** More information should be provided on the data collected in the lab trials conducted in Fall 2018 on the NPNS effluent and site visits to the two Kraft mills in Sweden using BAS™ technology in terms of specific water quality data (BOD, TSS, P, N & COD) and relevant regulations (current and proposed).

- **3.3:** Consideration of the non-biodegradable organic fraction within the effluent should be given, with more specific information on components in effluent that contribute to non-biodegradable fraction of COD, and any other efforts that could be considered in the pulp mill process design to lower COD in the mill effluent prior to biological wastewater treatment.

- **3.4:** More information needs to be provided on metal concentrations in the current ASB effluent (Point C) and metal concentrations expected to be found in the effluent of the proposed ETF.

- **3.5:** More detail should be supplied on (1) what "key performance indicators" will be monitored on daily basis, and (2) what monitoring/testing will be conducted on the influent into the ETF; specifically, what water quality and/or operational parameters will be part of this monitoring/testing framework.

- **3.6:** Historical impacts of the Boat Harbour Treatment Facility are of major concern. NPNS must clearly outline how the proposed effluent treatment facility will be designed and operated in a way that will mitigate the potential for similar environmental impacts to occur.

Effluent Modelling

- **3.7:** Summary information should be provided in the main EA text on both the Preliminary Receiving Water Study and the Addendum Receiving Water Study. How Mike 21 and Cormix models were used should be clearly stated.

- **3.8:** NPNS must provide a water quality study for the CH-A and CH-B locations and other related areas, including Caribou Harbour and the surroundings of Pictou Island, based on numerous sampling stations. As part of this study, one or two reference areas should be considered with several sampling stations.

- **3.9:** Provide a brief description in Section 8.11.5 of what the Follow-up and Monitoring Program entails.

Marine Fish and Aquatic Habitat

- **3.10**: In the interest of assessing the impacts to fish with the highest level of scrutiny and precaution, in our professional opinion, it is recommended that the Proponent should approach the EA with an analysis that goes beyond the provision of Serious Harm to a shift in focus on avoiding harmful alteration, disruption or destruction (HADD) of fish and fish habitat. This approach is being contemplated in the proposed *Fisheries Act* amendments under Bill C-68. Given the high level of concern from fisheries groups regarding harmful alteration, disruption or destruction of fish and fish habitat of the Northumberland Strait, and the potential adverse effects of the Project, Northern Pulp must assess the proposed activities and design of the Project in the context of HADD avoidance. This approach enhances the measures described within the EA.

- **3.11:** NPNS needs to provide more detail on spill response and safeguards against potential accidents or malfunctions along the terrestrial portion of the pipeline. Without this information, it is unclear how the Minister can make an informed decision regarding whether adverse effects or significant environmental effects may be caused by the undertaking and whether these effects can be mitigated.

- **3.12:** In our professional opinion, a comprehensive multi-year baseline study on all marine species present within the Northumberland Strait must be completed in order to understand potential adverse impacts that may result from project activities. Robust studies are required to better understand each species, and the potential impacts the project could have on each. This type of baseline study is the foundation of an EA, especially one focused on a project that has the potential to cause serious environmental impacts. The Minister needs to decide "w*hether environmental baseline information is sufficient for predicting adverse effects or environmental effects related to the undertaking" (Nova Scotia Environment, 2018).* We see no evidence of such baseline information in the EA.

- **3.13:** In our professional opinion, a more detailed environmental assessment that considers all potential fisheries in the Northumberland Strait needs to be completed to adequately assess project impacts. The EA should consider every species fished commercially in the area and should look at sensitivities of all of those fish to changes in water quality and negative health effects of contaminants

- **3.14:** The Environmental Management Plan and the Environmental Protection Plan must be completed and circulated for review and consultation with stakeholders prior to the project being approved. The Project should not be approved until all stakeholders have been consulted on all environmental protection measures within the Environmental Management Plan.

- **3.15:** The proponent must provide more detail on what is meant by moving the alignment to the centre of the road, and on which watercourses, in particular, they intend to carry this out.

- **3.16:** In our professional opinion, geotechnical assessments must be completed and reviewed by project stakeholders. This information is required before the Minister can make an informed decision on all potential impacts of the project. In addition, the Environmental Protection Plan must address prevention and emergency response related to horizontal directional drilling.

- **3.17a:** The EA must provide more details on mitigating benthic disturbance and subsequent TSS mobilization during pipe construction in the Northumberland Strait.

- **3.17b:** The EA should examine the possibility of horizontal directional drilling (HDD) to facilitate the placement of the pipe into the Northumberland straight. HDD could reduce the risks of in-water works that could significantly impact fish and benthic communities.

- **3.18a:** The EA must outline species-specific limits of tolerance with respect to the above parameters described as well as upper and lower limits for chemicals specific to mill effluent. A robust assessment of how changes to the marine environment, and the discharge of effluent contaminants, impact species inhabiting the area must be completed in order to understand impacts of the proposed project.

- **3.18b**: The proposed changes to the PPER must be considered when addressing the species-specific effects including a quantitative evaluation of the impact of the proposed changes on the assumptions and conclusions of the EA.

- **3.19:** In our professional opinion, a project of this magnitude warrants comprehensive field work investigations to be completed. NPNS should conduct a comprehensive baseline assessment to characterize current conditions of the marine environment within the project assessment area, including sediment and water quality.

- **3.20**: The proponent should collect and analyze current water quality data, from the proposed outfall location, in order for the EA to adequately assess impacts to the water quality from the project, and to adequately plan for preventing or mitigating those potential impacts**.**

- **3.21:** Northern Pulp must collect current and relevant data on sediment characterization at the proposed outfall location.

- **3.22:** Proper research needs to be completed to understand possible effects of the effluent on herring spawn, including sub-lethal effects. A rebuilding plan for herring is currently being developed to ensure the regrowth of the stock, and therefore any potential impacts to herring spawn must be fully considered in the EA.

- **3.23:** Research must to be completed to understand possible sub-lethal effects of the effluent on mackerel eggs. Currently, the stock is in the critical zone (DFO, 2017) and a rebuilding plan is being developed to ensure the regrowth of the stock. The EA must clearly assess how potential impacts from the project could affect stock regrowth.

- **3.24:** Atlantic sturgeon must be considered in the assessment, and potential impacts to the species identified.

- **3.25:** As stated in Appendix R of Northern Pulp's EA Registration documents, it is recommended that more research be completed on the effect of the effluent on lobster in each life stage. It is important to highlight that the recommendation given in Appendix R regarding more research on the effect of effluent on lobster must be followed through and completed.

- **3.26:** Detailed field assessment on the sea scallops that inhabit the area near the proposed outfall location must be completed prior to the release of the proposed effluent to ensure there

will be no negative effects on the sea scallops. Otherwise, it is unclear how the Minister will be able to determine if adverse effects or significant environmental effects are likely to occur.

- **3.27:** Detailed field and lab work must be carried out as part of a comprehensive EA that assesses and quantifies sublethal, chronic and cumulative effects on lobster larvae. The level of stakeholder concern regarding lobsters warrants the need for increased scientific understandings and fulsome assessment of impacts, in order for the Minister to make an informed decision regarding potential impacts of the project to lobster.

- **3.28:** Individual species cannot be pinpointed to specific locations within the Northumberland Strait. They do have traditional habitat and areas they are commonly found, but individuals are not restricted to these areas only. The ability, and likelihood, of each species to move throughout the Northumberland Strait must be considered and accounted for in a robust environmental assessment.

- **3.29:** The Northumberland Strait must be also assessed as an interwoven and interdependent ecosystem, not only on an individual species by species basis. NPNS must consider these ecosystem impacts in a more comprehensive and robust environmental assessment. Otherwise, it is unclear how the Minister will be provided with sufficient information to make an informed decision about the likelihood of adverse impacts.

- **3.30:** Despite the PPER regulations, given the high level of concern expressed by the public and harvesters, a biological monitoring program should be implemented prior to final commissioning of the proposed treatment plant and effluent outfall. The collection of this baseline information will significantly strengthen the interpretive power of the biological monitoring program as a whole. This baseline information will allow the biological monitoring program data to be analysed in a BACI (Before-After-Control-Impact) framework so that potential effluent related effects can be considered both spatially (i.e., exposure vs. reference) and temporally (i.e., pre-discharge vs post-discharge).

- **3.31:** Again, despite the PPER regulations, in our professional opinion, and due to the high level of concern expressed by the public and harvesters, the biological monitoring program should be implemented and remain continuous as soon as effluent is released to the Strait. Considering the level of concern from stakeholders in the region and coupled with the uncertainty of the effluent composition and the limited collection of existing environmental condition data, it is imperative that NPNS implement a robust continual biological monitoring program prior to effluent discharge and that continues through operations.

- **3.32a:** The EA must consider both lethal and sublethal effects of the Project and must go beyond the provision of “serious harm” to incorporate how effects, other than direct mortality, could negatively impact the fisheries of the Strait.

- **3.32b:** In addition, analysis and monitoring of lethal and sublethal effects should be carried out independently of one another on locally important species such as lobster, crab, herring and Atlantic salmon.

Marine Mammals

- **3.33**: An ERA is required that considers ecological receptors, including marine mammals such as North Atlantic Right Whales, who may be exposed to chemicals of potential concern from the proposed project.
- **3.34**: The assessment of project effects on the marine mammals, sea turtles, and marine birds VEC (Section 8.13) is considered to be incomplete and underscores the need for NPNS to conduct field studies for this project, especially given growing uncertainty regarding the distribution of North Atlantic Right Whales in their summer foraging range.
- **3.35a:** NPNS must provide more detailed information on visual surveying methods and consider completing these in combination with other marine mammal monitoring methods such as the deployment of passive acoustic monitors or aerial (helicopter or drone) surveys.
- **3.35b:** NPNS must provide more information on Marine Mammals Observer (MMO) monitoring requirements, including information on reporting intervals, accessibility of reports to stakeholders, and whether reporting will trigger any adaptive management measures.
- **3.35c**: NPNS should consider requiring marine mammal monitoring during all project activities that require vessel travel.
- **3.36a:** More detailed and definitive information on the vessel traffic (including vessel type, size, route, speed, schedules) that will be required to complete Project activities must be provided and considered in the EA, given potential impacts to marine mammals.
- **3.36b:** NPNS should ensure that observers are present on all Project vessels to identify the presence and location of marine mammals and to ensure appropriate mitigation measures outlined in EA Section 8.13.3.2 are adequately triggered and implemented.

Cumulative Effects

- **3.37:** The EA must assess cumulative effects of the proposed project on the marine environment, in light of current stressors that have already been identified, including increases in surface water temperature and salinity, as well as decreases in oxygen saturation.
- **3.38:** Discussion is required around the interactions between potential impacts from the new ETF discharges from the outfall, and ferry discharges within the harbour and Strait, and in turn the implications for ecological and human health risks, from a cumulative effects assessment standpoint.

Human Health

- **3.39:** A robust and comprehensive assessment of potential health risks (i.e., through the completion of a Human Health Risk Assessment) is required in order to determine if adverse health effects from the project are likely.
- **3.40:** An adaptive management plan should be provided to address discrepancies between project assumptions and predictions, and what is found to occur in the environment once the project begins. This plan should include an assessment of changes to predicted risks to human health, should the project assumptions not hold true.
- **3.41:** The assessment of potential risks to human health associated with the project requires a fulsome understanding of both the exposure concentrations of Contaminants of Potential Concern (COPC) in the marine environment, and the exposure pathways identified as being of concern to human health (i.e., the consumption of fish and shellfish).
- **3.42:** A more robust assessment of baseline conditions (such as water quality, sediment quality, land use patterns, fish consumption rates and other relevant environmental attributes) must be completed prior to project approval, to understand potential risks to human health related to the project.
- **3.43:** NPNS must confirm that the pilot study will be completed to evaluate the potential impacts to air quality due to the combustion of hog fuel and sludge in the power boiler and must outline adaptive management strategies should the results of the air monitoring and pilot study not align with the assumptions and predictions of the current assessment.
- **3.44:** If 2018 air monitoring data are available from Stantec (2019), they should be included in the assessment.
- **3.45:** Details are required regarding adaptive management measures, to address the potential for actual air emissions to be greater than predicted emissions (based on modelling exercises).In addition, further discussion in the EA is needed regarding what is meant by an artifact of model inputs related to modelled exceedances of H_2S (Section 9.2.4.1).
- **3.46:** The potential risks to human health associated with cumulative impacts of the project and current stressors must be considered in the assessment.

Socio-Economics

- **3.47:** Provide information on the pipeline's lifecycle length and anticipated activities for its decommissioning (i.e., expansion, upgrades, replacement etc.)
- **3.48:** NPNS must include VEC, and more importantly, a robust and consistent effects assessment on indicators related on the acknowledged VEC "health of communities" to capture missing elements of health and wellbeing, including the protection of a resilient fishery and associated economies including harvesting and processing plants; employment, analysis of economic risks and/or benefits at community, regional and provincial level; description for, and management plans for anticipated workforce at both construction and operation phases.

- **3.49a:** Apply an actual ecosystem and integrated approach for the effects assessment that considers VEC interdependencies and an economic risk analysis to other economic sectors in the region – fisheries in particular.
- **3.49b:** Provide a detailed description of the region's economic reliance on commercial fisheries, including individual harvester economic baselines and dependencies as they relate to fishing.
- **3.49c:** Provide analysis of the Project's construction and operation phase effect mechanisms and interactions with harvesters' ability to fish (in terms of access); as well as potential risks to fishing economy due to risks to species' habitat, spawning area integrity and health.
- **3.49d:** Describe how individuals within the lobster fishery (and other fisheries) will be compensated or accommodated for losses as a result of the Project's construction and/or operations activities. An explicit acknowledgement of the adverse economic impacts (and in turn social impacts on regional and community wellbeing and health) for fishers when even just a few days of fishing are interrupted is critical for a balanced effects assessment.
- **3.50:** NPNS must provide a balanced and accurate description of the existing regional socio-economic context, including regional health and wellbeing dependencies on the fish harvesting and fish processing sectors. Using complete baseline information, an economic effects assessment is required that carries forward information referred to within the baseline section including: project effect mechanisms and interactions with existing fisheries economic sector, at a granular level i.e., net losses anticipated due to forecasted days of interruptions due to construction and operations); human health effect mechanisms and interactions with economic risks related to fish processing plant operation requirements and interactions with effluent discharges; project workforce requirements; wages and salaries, and supply chain procurement needs during both construction and operations.
- **3.51:** Provide more baseline information describing the specific aspects of the tourism sector within the LAA that have inter-connections with water – either from recreational usage or from drinking and/or other water uses. These details would be relevant within an eco-system approach to the socio-economic impact assessment**.**
- **3.52:** NPNS must provide information and analysis of the following:

    - Discussion and analysis of risks and in turn, potential adverse social impacts to individuals and families who rely on uninterrupted or undisturbed access to the fisheries; including mitigations for avoiding this adverse impact.

    - Identification of positive socio-economic effects from employment during the 21-month construction period as well as operations and maintenance. It is acknowledged that the project description states that no additional jobs would be created during operations as existing personnel would be retrained for the new facility. Both phases of the Project need to be discussed in terms of what economic benefits would occur (even if no change during operations) within the socio-

economic effects assessment. This allows the impact evaluation to demonstrate both the potential negative as well as the potential positive socio-economic impacts that would be predicted as a result of the Project's various activities, including employment generation and associated indirect and induced impacts during the 21 months' construction.

- A description of human and ecological health pathways, project interactions and effect mechanisms within the socio-economic effects assessment including a human health risk assessment (i.e., drinking water within the LAA's wells; recreational water usage; Indigenous community members' land uses, water and wild foods consumption).

- A discussion and demonstrated planning for health and safety considerations of the surrounding communities as related to construction, should there be a temporary, non-resident workforce hired for construction. Include whether the construction workforce will be housed in surrounding local communities and/or within temporary workcamps. How many workers are anticipated to be hired for the construction phase?

- **3.53a:** NPNS must provide discussion and analysis of potential effects to the health and integrity of the region's commercial fisheries based on results of more comprehensive effluent modelling, data upgrades and effects analysis as per the results of this EA's technical review of these inter-dependent VECs.
- **3.53b**: NPNS must provide discussion and analysis of tourism impacts and human health risks related to Indigenous land and resources, and non-Indigenous lands and resources (i.e., drinking water and marine based recreation).
- **3.53c:** NPNS must provide discussion and analysis of potential impacts of pipeline operations and maintenance (specifically integrity digs) on land and resource use for both Indigenous and non-Indigenous citizens.
- **3.54:** NPNS must provide more fulsome consideration, description and commitment for specific mitigation, management and monitoring measure to address both the ecological and social factors related to the Project's activities at construction and operations as listed in previous comments.
- **3.55**: NPNS must provide a balanced and accurate description of the existing regional socio-economic context, included regional health and wellbeing dependencies on the fish harvesting and fish processing sectors. Using complete baseline information, an economic effects assessment is required that carries forward information referred to within the baseline section including: project effect mechanisms and interactions with existing fisheries economic sector, at a granular level (i.e., net losses anticipated due to forecasted days of interruptions due to construction and operations); human health effect mechanisms and interactions with economic

risks related to fish processing plant operation requirements and interactions with effluent discharges; project workforce requirements; wages and salaries, and supply chain procurement needs during both construction and operations.

1.0 Introduction

Shared Value Solutions Ltd. (SVS) was retained by the Gulf Nova Scotia Fleet Planning Board, and their Fishermen's Working Group for the Northern Pulp Environmental Assessment, to conduct a technical review of the Northern Pulp Nova Scotia (NPNS) Environmental Assessment (EA) Registration Document for the Replacement Effluent Treatment Facility (the Project). The purpose of this report is to provide a critical technical review of the EA report prepared by Dillon Consulting Ltd. (Dillon, 2019), which is intended to subsequently inform the Minster's decision regarding project approval. The report aims to outline scientific data gaps and deficiencies in the EA that may result in adverse effects or significant environmental effects, or a lack of sufficient information to determine whether such effects might occur, should the Project proceed.

The review was conducted by:

- . – Risk Assessment Specialist and Project Director (SVS)
- – Aquatic Ecologist and Project Manager (SVS)
- Managing Partner (SVS)
- . – Environmental Scientist and Project Coordinator (SVS)
- – Wildlife Biologist (SVS)
- – Senior Community Development Specialist (SVS)
- Senior Aquatic Scientist (Lebeau and Associates Inc.)
- Wastewater Treatment Specialist

1.1 Review Objectives

The objective of this review is to outline data gaps and deficiencies in the EA. This has been completed using best science and professional judgement. It must be noted, as set out in Section 34(1) of the *Environment Act*, that the Minister must demonstrate that all of the following pieces of information were considered in formulating her decision*:*

- *The location of the proposed undertaking and the nature and sensitivity of the surrounding area;*
- *The size, scope and complexity of the proposed undertaking;*
- *Concerns expressed by the public and aboriginal people about the adverse effects or the environmental effects of the proposed undertaking;*

- *Steps taken by the proponent to address environmental concerns expressed by the public and aboriginal people;*
- *Whether environmental baseline information submitted under subclause 9(1A)(b)(x) [of the Environmental Assessment Regulations, which states "Environmental baseline information"] for the undertaking is sufficient for predicting adverse effects or environmental effects related to the undertaking;*
- *Potential and known adverse effects or environmental effects of the proposed undertaking, including identifying any effects on species at risk, species of conservation concern and their habitat;*
- *Project schedules where applicable;*
- *Planned or existing land use in the area of the undertaking;*
- *Other undertakings in the area;*
- *Whether compliance with licences, certificates, permits, approvals or other documents of authorization required by law will mitigate the environmental effects;*
- *Such other information as the Minister may require*

As such, we expect that the Minister will consider all technical review comments contained within this review during the decision-making process, and address concerns accordingly.

1.2 Project Description

The Northern Pulp bleached kraft mill is located at Abercrombie Point adjacent to Pictou Harbour in Pictou County, Nova Scotia and has been operating, under various ownerships, since 1967. The mill produces bleached kraft market pulp at a rate of 280,000 to 300,000 air-dry tonnes per year (ADt/y). Currently, the mill's effluent is treated at a wastewater treatment plant located in the western portion of Boat Harbour, 3.5 km east of the mills across the East River. The current treatment plant consists of constructed sedimentation basins and a natural basin prepared with baffle curtains. Prior to the effluent being released into the Northumberland Strait via a weir in Boat Harbour, it passes through a large, natural final polishing/ stabilization basin. The *Boat Harbour Act,* which was enacted in May 2015, calls for the use of the current Boat Harbour effluent facility to cease as of January 31, 2020. As a result, a new wastewater plant and effluent discharge will be required prior to the 2020 deadline.

The proposed effluent treatment facility, as described in the Project EA report, will use a biological activated sludge process that combines Moving Bed Biofilm Reactor (MBBR) technology with conventional activated sludge. After the effluent has undergone treatment, it will travel along a 15.5 km long effluent transmission pipeline which follows the Highway 106 right-of-way for 11.4 km, then enters

the water adjacent to the Northumberland Ferries marine terminal and continues for 4.1 km. The effluent pipeline will be buried and weighted down using concrete collars. The effluent transmission pipeline will continue through Caribou Harbor to the Northumberland Strait, where it eventually terminates at an engineered marine outfall northeast of the Northumberland Ferries marine terminal (Figure 1). It is proposed that the effluent pipeline will end at a 50 m long diffuser with three outlets spaced 25 m apart. The proposed outfall will be capable of discharging up to 85,000 m^3 of treated effluent per day, with a peak discharge velocity of 4.6 m/s from each port. The Proponent predicts that the proposed outfall design will result in an approximate dilution ration of 144:1.

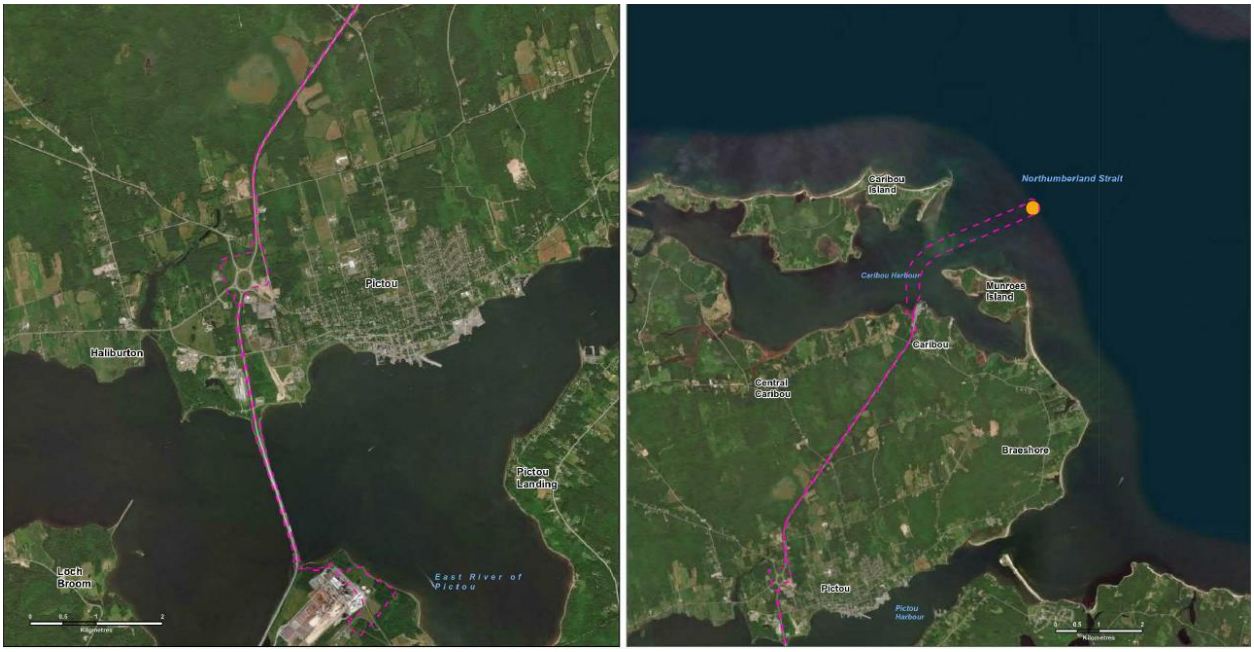

Figure 1. Proposed Project Route and Outfall Location (Based on Figure 1.1-2 of Dillon Consulting, 2019)

Should the Project receive all necessary approvals through the EA review process, it is anticipated that construction will occur for approximately 21 months, commencing after all applicable permits and approvals have been obtained. The Proponent is anticipating construction to start in the second quarter of 2019 but has noted that this will be weather dependent. The operation and maintenance phase of the proposed Project will start immediately after the construction phase, assumed to begin in the fourth quarter of 2020, and is anticipated to continue for several decades.

1.3 Regulatory Context

The NPNS proposed Replacement Effluent Treatment Facility ("the Project") is regulated under the Government of Nova Scotia's Environmental Assessment Branch and is being assessed through a Class 1 Environmental Assessment by the province.

The Government of Nova Scotia defines environmental assessment as the following:

> *"Environmental Assessment (EA) is a decision-making tool used to promote sustainable development by evaluating the potential environmental effects of major developments before they proceed. This is accomplished by involving the public along with various government departments and agencies during the environmental assessment.*
>
> *Environmental assessment also promotes better project planning by identifying and addressing environmental effects at the earliest stages of project development and can save proponents time and money" (Nova Scotia Environment, 2018).*

Projects classified as Class 1 undertakings are deemed to be smaller in scale and the level of concern to the public is considered unknown or uncertain (Nova Scotia Environment, 2018). This uncertainty means that the initial submission made by the proponent in Class 1 EA undertakings is subject to a public review period. Following the public review period, the Nova Scotia Minister of Environment will decide if a more comprehensive review and/ or public hearing process is required (Nova Scotia Environment, 2018).

In addition, following the review period, the Environmental Assessment Branch of Nova Scotia Environment will review all information received during the review. Based on the information received, the branch will proceed to provide the Minister with a report summarizing the issues received. The report will also include a recommendation for the Minister's decision (Nova Scotia Environment, 2018). The Minister has one of five options for a decision, as set out in section 13(1) of the Environmental Assessment Regulations made under Section 49 of the *Environment Act:*

(a) The registration information is insufficient to allow the Minister to make a decision and additional information is required;

(b) A review of the information indicates that there are no adverse effects or significant environmental effects which may be caused by the undertaking or that such effects are mitigable and the undertaking is approved subject to specified terms and conditions and any other approvals required by statute or regulation;

(c) A review of the information indicates that the adverse effects or significant environmental effects which may be caused by the undertaking are limited and that a focus report is required;

(d) A review of the information indicates that there may be adverse effects or significant environmental effects caused by the undertaking and an environmental-assessment report is required; or

(e) A review of the information indicates that there is a likelihood that the undertaking will cause adverse effects or significant environmental effects which are unacceptable and the undertaking is rejected.

In order to reach this decision, the Minister must demonstrate the all of the following pieces of information were considered in formulating her decision as set out in Section 34(1) of the *Environment Act:*

- *The location of the proposed undertaking and the nature and sensitivity of the surrounding area;*
- *The size, scope and complexity of the proposed undertaking;*
- *Concerns expressed by the public and aboriginal people about the adverse effects or the environmental effects of the proposed undertaking;*
- *Steps taken by the proponent to address environmental concerns expressed by the public and aboriginal people;*
- *Whether environmental baseline information submitted under subclause 9(1A)(b)(x) [of the Environmental Assessment Regulations, which states "Environmental baseline information"] for the undertaking is sufficient for predicting adverse effects or environmental effects related to the undertaking;*
- *Potential and known adverse effects or environmental effects of the proposed undertaking, including identifying any effects on species at risk, species of conservation concern and their habitat;*
- *Project schedules where applicable;*
- *Planned or existing land use in the area of the undertaking;*
- *Other undertakings in the area;*
- *Whether compliance with licences, certificates, permits, approvals or other documents of authorization required by law will mitigate the environmental effects;*
- *Such other information as the Minister may require*

The following figure outlines all of the steps within a Class 1 Environmental Assessment.

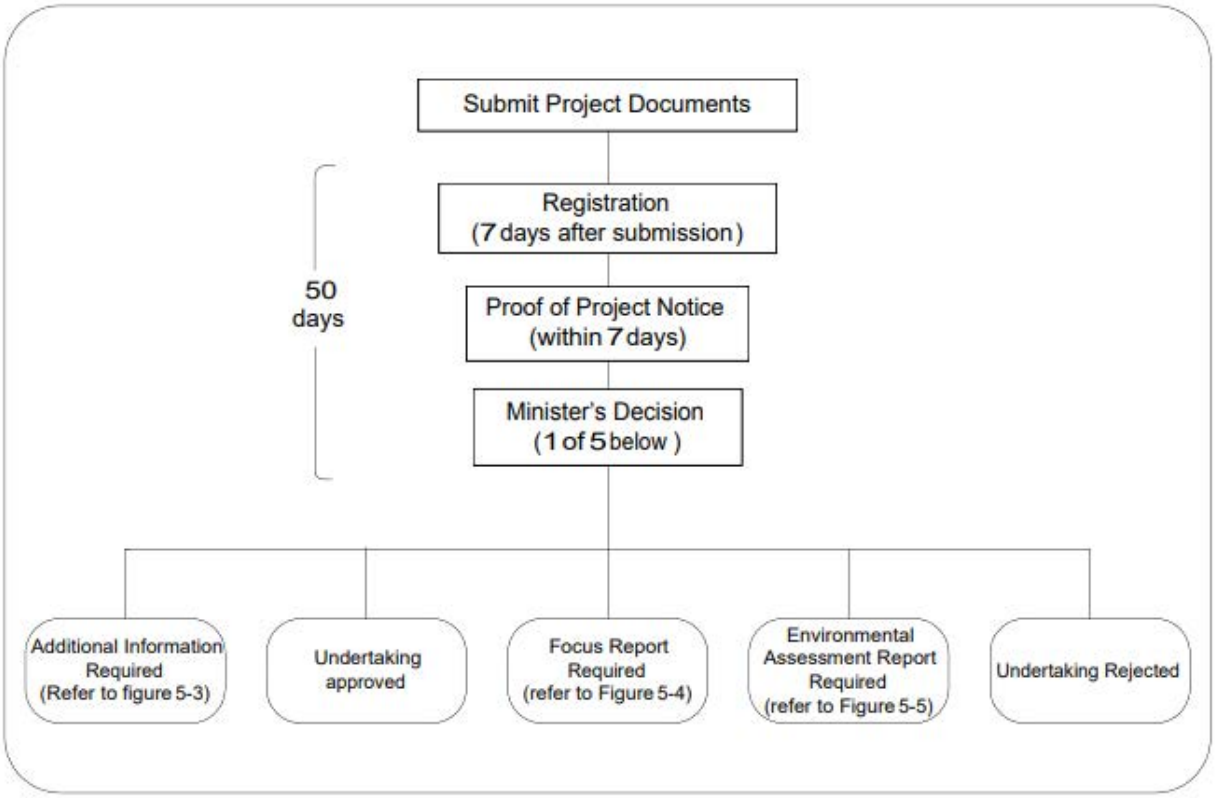

Figure 2. Class 1 Environmental Assessment Process Diagram (Source: Nova Scotia Environment, 2018)

In the context of a Class 1 EA in Nova Scotia, the most rigorous outcome possible is the completion of an environmental assessment report for the Project. The process steps for the completion of an EA report are identified in Figure 3 below.

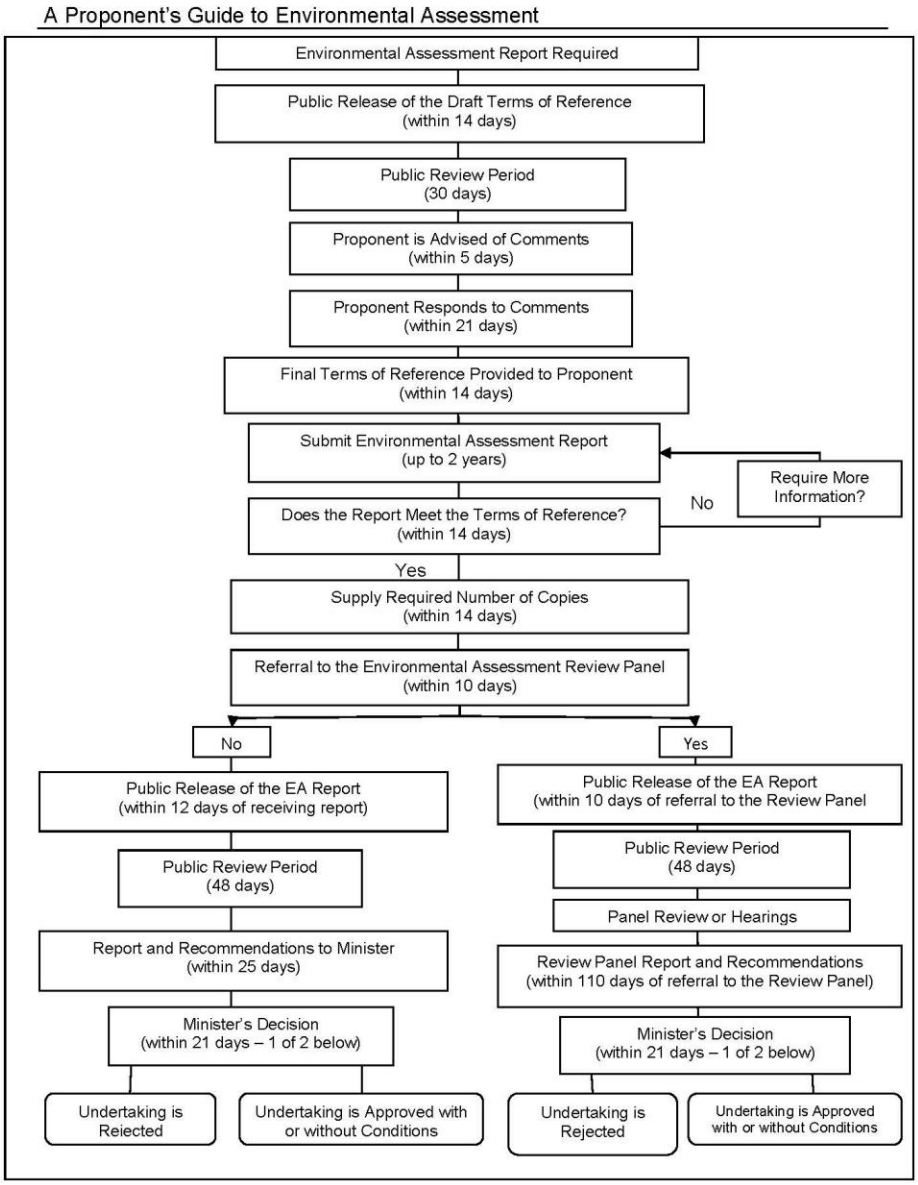

Figure 3. Class 1 EA - Environmental Assessment Report Required (Source: Nova Scotia Environment, 2017)

2.0 Summary of Technical Review of the Receiving Water Study

In preparation for, and to inform, the technical review of the EA Registration Documents, a review of Addendum Receiving Water Study for Northern Pulp Effluent Treatment Plant Replacement Project – Additional Outfall Location CH-B, Caribou Point, Nova Scotia dated December 19, 2018, was completed by Dr. Bernard Lebeau. A summary of the identified issues and concerns from the ARWS is provided below (Section 2.1).

Background

The *Preliminary Receiving Water Study for Northern Pulp Effluent Treatment Plant Replacement in Pictou Harbour* dated August 11, 2017, had identified the discharge location Alt-D as the preferred option, however further studies have provided evidence for seabed ice scour at a water depth of 11 m. This new information deemed the preferred location Alt-D not technically feasible for the outfall. Consequently, Stantec conducted additional modelling and prepared the 'Addendum Receiving Water Study' (ARWS) to investigate other potential outfall locations. The computational domain and boundaries for far-field modelling used in the ARWS are shown in the following figure.

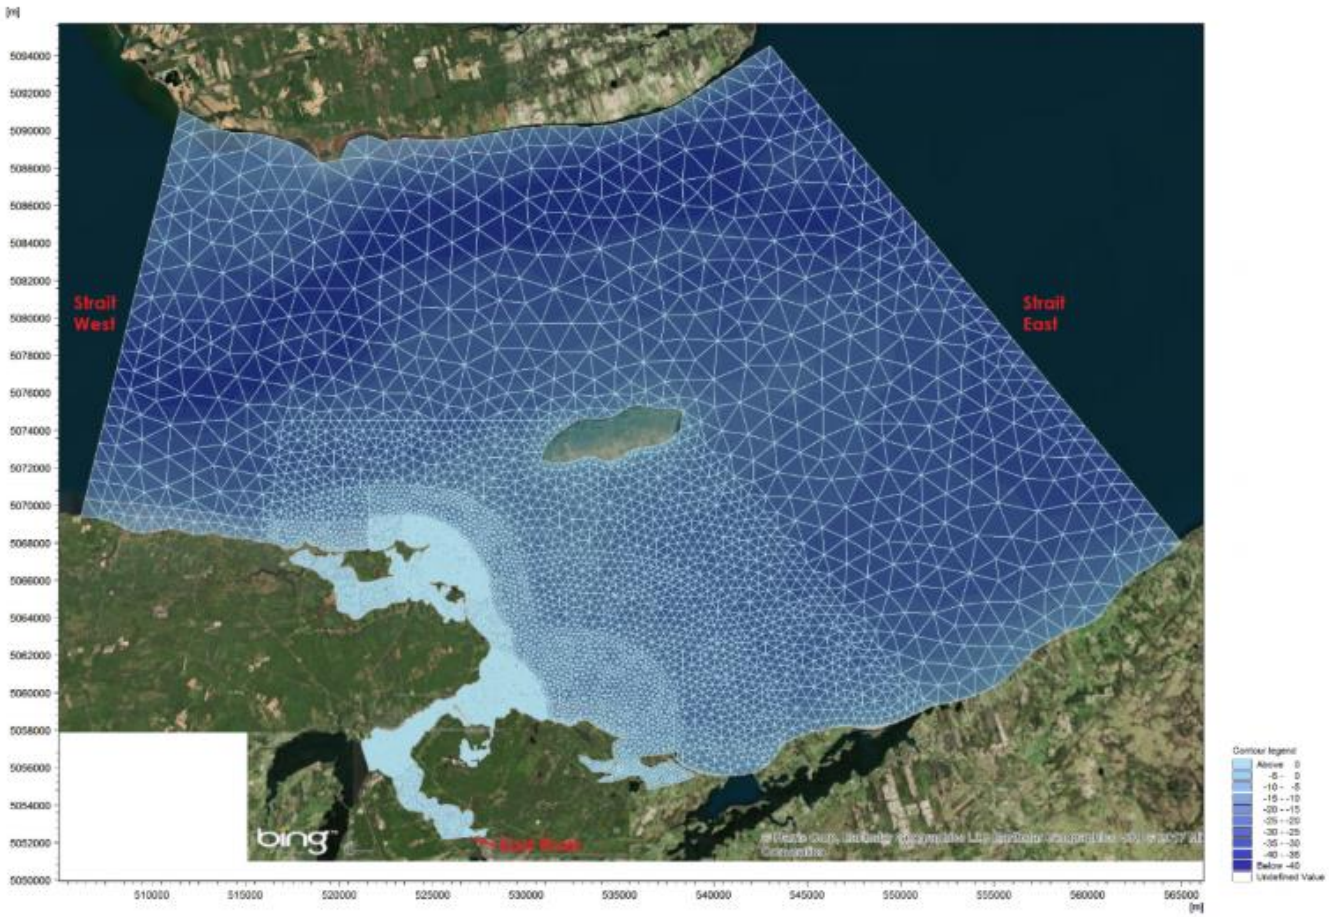

Figure 4. Computational Domain Boundaries for Far-Field Modelling (Source: Stantec, 2018)

The far-field modelling conducted for the ARWS identified two alternate discharge outlet locations, CH-A and CH-B off Caribou Point (see figure below). The two alternate discharge outlet locations are 540 m apart, and in 25 m (CH-A) and 20 m (CH-B) water depths. Further analysis determined that CH-B was the preferred location of the two alternate options, with a preferred diffuser design of three ports, each with a 0.3 m opening, horizontal angle of 0˚, and a vertical angle of 20˚. Outfall CH-B was further analyzed in the near-field modelling portion of the ARWS as the preferred outfall location.

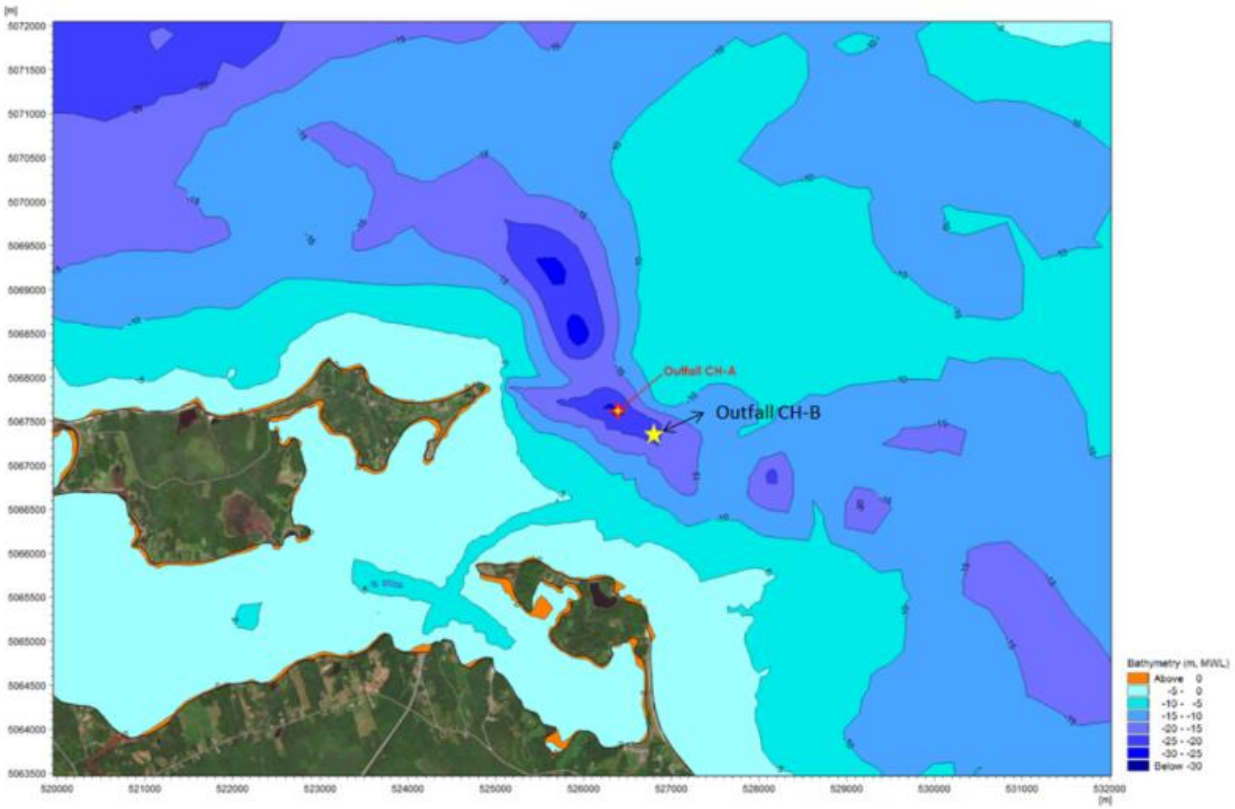

Figure 5. Outfall Locations for CH-A and CH-B

2.1.2 Far-Field Modelling

A two-dimensional (2D) model was used to simulate far-field effluent dispersion at two alternative potential discharge locations (CH-A and CH-B). The MIKE 21 model was used in the assessment.

Issue 2.1: There are no results from the dispersion modelling presented for the effluent discharge at the CH-A outfall location; results from only the CH-B outfall location were presented (Section 2.2, Page 5). How can the reader conclude that the "Dispersion modelling results from effluent discharges from CH-A and CH-B outfall locations indicate that the CH-B discharge provides relatively higher dilution and less potential effluent impact on Caribou Harbour water" without seeing results from the dispersion modelling from the CH-A location? Furthermore, the CH-A location is in 25 m depth, while CH-B location is in 20 m depth. There is ice scouring evidence on the sea floor to suggest that the CH-B location may not be deep enough and that the CH-A may be found to be a more appropriate location. It is of note that divers have reported ice scouring as deep as 20 m (MacCarthy and Egilsson, 2019).

> **Recommendation 2.1:** NPNS must provide modelling results for the proposed CH-A effluent discharge location.

Issue 2.2: "Outfall depth is often a bigger driver than exact position of the outfall" (Page 6). In our professional opinion, the most important driver in this type of study is "ice scouring" (See Section 1.3

Engineering Consideration). If ice scouring exists at or around the CH-B location, that location will not be suitable at the outset.

> **Recommendation 2.2:** NPNS must provide a study on sea floor ice scouring at, and near, the proposed outfalls CH-A and CH-B and make recommendations on the best location for an effluent outfall diffuser.

Issue 2.3: The following comment applies to the PRWS as well as the ARWS. For modelling purposes with both Mike21 and CORMIX, it is important to determine whether a stratification is present in the water column. With stratification of the water column (pycnocline), the effluent plume stops rising and becomes "trapped" at an intermediate depth, therefore reducing dilution. In this case, the effluent plume is expected to be building up and be (much) larger than expected. Therefore, field data must be provided to determine whether stratification exists at or near the effluent outfall. This stratification of the water column is particularly important in estuarine environments, such as the proposed outfall location. The water of the Northumberland Strait is primarily derived from the surface layer of the Gulf of St. Lawrence (AMEC 2007), which means it has more freshwater than ocean water, but also has the deep saline flow from the Gulf Stream that enters through the Cabot Strait. The data available for Pictou Harbour indicates that a stratification of the water column occurs there and yet this phenomenon was not addressed by Stantec (2017). It seems that stratification may be potentially occurring over the entire Strait. Again, field verification of the water column stratification is required at the CH-B location for modelling purposes; otherwise the modelling results presented in the ARWS cannot be assumed to be representative of the future effluent plume.

> **Recommendation 2.3:** NPNS must provide field verification of the water column stratification and these measurements, taken at the CH-A and CH-B locations, and other areas should be part of a water quality survey.

2.1.3 Near-field Modelling

Near-field monitoring was completed to analyse effluent dispersion for the CH-B location, the proposed discharge location which was determined as a result of the far-field modelling results. The Cornell Mixing Zone Expert System (CORMIX, Version 11.0), a three-dimensional model, was used to analyze and assess near-field mixing. Issues and data gaps related to Section 3.0 of the ARWS are as follows:

Issue 2.4: "No historical water quality data are available for Northumberland Strait around the CH-B location. Data from neighboring Pictou Road (Stantec 2017) located about 6 km southeast were used" (Page 16, 2nd paragraph). In this statement, no additional descriptions of the Pictou Road data are provided. The PRWS (Stantec 2017) described the Pictou Road data as background water quality measurements from various studies (data that are between 10 to 29 years old), that were not even within range between sampling years and/or relative locations. The background water quality data needed for the CH-B location must be from that specific area, rather than from other locations, or from an assemblage of other locations, as is the case for the Pictou Road data. It is difficult to base this important study on poor background water quality data that cannot be reconciled in the first place. The background data used are certainly of historical importance, but should not be considered in the

modelling work for establishing background values for water quality parameters and effluent discharge objectives (EDO) to meet applicable water quality standards or environmental quality objectives (EQO) at the mixing zone boundary. Both winter and summer data should have been collected, and the water column at CH-B should have been measured as well to confirm a non-stratification, rather than being simply assumed as non-stratified. The characterization of water quality in the mixing zone (Section 3.2, pages 20 to 26) is only a temporary presentation of cursory information since the available background water quality data are poor. A water quality study for the specific area of the proposed CH-B effluent outfall location is required.

> **Recommendation 2.4:** Provide a water quality study for the CH-A and CH-B locations and other related areas, including Caribou Harbour and the surroundings of Pictou Island based on numerous sampling stations. As part of this study, one or two reference areas should be considered with several sampling stations.

Issue 2.5: The Mike 21 model was run for a full month from July 1 to 31, 2016. To run CORMIX, the "Hydrodynamic information at the CH-B outfall location were obtained from Mike 21" (Page 16, last paragraph). However, as provided in the PRWS (Stantec 2017), "The CORMIX simulations were conducted for "August-September" only." How do we reconcile the input of Mike 21 July data for use in CORMIX simulations for August–September, as assumed (information is unclear and not found in the ARWS)?

> **Recommendation 2.5:** Provide an explanation as to how we reconcile the input of MIKE 21 July data for use in CORMIX simulations for August–September.

Issue 2.6: Within the Environmental Effects Monitoring (EEM) Program, CORMIX model simulations are typically conducted for both winter and summer conditions, using the ambient characteristics at the study locations, etc. With the objective of gaining a more complete understanding of the dynamic processes that occur at the discharge and to obtain accurate estimates of the dilution potential that can be applied to effluent concentrations, the CORMIX model is (most often) used for simulations with varied discharges and ambient conditions. It is unclear if the work by Stantec (2017, 2018) was designed for effluent outfall siting purposes. A rationale for the delay in complete characterisation of the effluent plume at CH-A or CH-B performed under the EEM program, must be presented.

> **Recommendation 2.6:** A rationale for not completing an industry-standard characterisation of the effluent plume at CH-A or CH-B must be presented.

2.1.4 Engineering Considerations

A preliminary description of engineering considerations, and the installation methodology, that could be undertaken as part of the construction of the CH-B outfall option is not provided in the ARWS. This aspect had been provided in the PRWS (Stantec 2017), with a follow up provided briefly in the *Introduction* section of the ARWS.

Issue 2.7: In the PRWS produced by Stantec (2017), marine geophysical and geotechnical notes for Alt-D, located outside Pictou Road in Northumberland Strait, were provided. It was noted that little was

known of the marine sediments that would be encountered along the proposed outfall pipe alignment. In the ARWS Section 1.0 (Page 1), it is reported that subsequent marine geophysical and geotechnical field investigations of the Alt-D location show evidence for seabed ice scour, indicating that this location, with a water depth of 11 m, was not suitable for an effluent outfall. In the ARWS, there are no indications as to whether there is adequate knowledge of the marine geophysical and geotechnical aspects for the new "preferred" CH-B location which is in a water depth of 20 m. The deeper location "might help avoid issues of ice scour" (Page 1, 2nd paragraph). Real data are needed on how far offshore and how deep ice scouring is occurring on the seabed of the Northumberland Strait. Observations by divers have indicated that seabed ice scouring is occurring at 20 m depth (MacCarthy and Egilsson 2019). Therefore, is the proposed depth of 20 m suitable and deep enough to avoid ice scouring? Is the CH-A location at 25 m depth more appropriate? Bottom ice scouring is a most important issue in deciding the location and depth of the future effluent outfall in the Strait. A marine geophysical and geotechnical assessment of the CH-B location may yield similar results as the Alt-D location, and thus the ARWS may not be of use. Consequently, we do not know whether CH-B is an appropriate location for an effluent outfall.

> **Recommendation 2.7:** Provide a study on sea floor ice scouring at and near the proposed outfalls CH-A and CH-B. Make recommendations on the best location for an effluent outfall diffuser.

2.1.5 Summary

In summary, the MIKE 21 and CORMIX modelling work contained in the PRWS and ARWS requires new water quality data with field verifications of water column non-stratification in winter and summer, as well the inclusion of the non-tidal ocean flow that is a counter-clock gyre around Pictou Island. As such, only limited confidence can be given to the modelling results by either MIKE 21 or CORMIX in the PRWS and ARWS. Furthermore, since seabed ice scouring is occurring at a 20 m depth as per diver observations, and yearly maintenance of an effluent diffusor would preferably be kept to a minimum, a focus on the CH-A location may be more appropriate as the preferred option. Future modelling work should present information for both locations, CH-A and CH-B.

3.0 Northern Pulp EA Review Findings

3.1 Effluent Treatment Facility Design

3.1.1 Summary of EA Content

The proposed Effluent Treatment Facility (ETF) for the NPNS pulp mill is an AnoxKaldnes BAS™ process that will be purchased from Veolia Water Technologies. The proposed ETF facility will be designed to treat maximum wastewater flow of 85 MLD (62 MLD avg). The BAS™ technology is based on combination of traditional activated sludge treatment (AST) process with moving bed bioreactors (MBBR) for wastewater treatment. The use of AST is common in Canada and the United States for the

treatment of Kraft pulp mill wastewater. The integration of MBBR with AST for Kraft pulp mill wastewater treatment is not currently employed in North American Kraft pulp mills. However, there are many installations of the BAS™ technology world-wide in the pulping sector, and including, specifically, softwood Kraft pulp mill wastewater systems.

Overall, within the EA, it is indicated that the proposed plant design offers a more modern, high rate treatment option than the current wastewater facility design based on aerated stabilization basin (ASB) technology primarily using natural basins and poorly designed "release" (i.e., discharge) into the Northumberland Strait. The proposed design appears to offers increased capability to control operations and optimize treatment performance within a modern wastewater treatment plant than the current infrastructure. Waste solids management and closed loop design for clarifier sludge is an added benefit of the proposed design.

A 35,000 m^3 capacity spill basin is proposed which would be able to provide 10 to 13–hour storage of mill effluent at full production rates. This basin would be designed with a high-density polyethylene (HDPE) impermeable barrier liner.

3.1.2 Evaluation & Recommendations

Issue 3.1: The purpose of the *Pulp and Paper Effluent Regulations* (PPER) is to manage threats from all pulp and paper mills in Canada to fish, fish habitat, and human health originating from fish consumption (ECCC, 2017). The PPER prohibit the deposition of effluents that are acutely lethal to fish, set limits on suspended solids (SS) and biochemical oxygen demand (BOD), and require pulp and paper mills to carry out environmental effects monitoring (EEM) studies. Environment and Climate Change Canada has proposed updates to the PPER, which came into effect in 1992, to reflect upcoming changes to the pulp and paper industry and to address findings from EEM studies that indicate the PPER do not adequately protect fish, fish habitat, and the environment.

Despite the fact that effluent quality from pulp and paper mills has improved substantially and the level of compliance with PPER has been high, pulp and paper mill effluent has been shown to pose a risk to fish, fish habitat, and the environment. For example, 99.9 percent of BOD and SS samples from the 77 mills directly depositing effluent to water bodies were compliant with the PPER in 2015. However, EEM studies demonstrated that effluent from 70% of pulp and paper mills are impacting fish and/or fish habitat, and 55% of these effluent deposits pose a higher risk to the environment (ECCC, 2017). To address these findings, the proposed updates to the PPER include:

- Reductions to BOD and SS discharge limits;
- Setting limits for phosphorous and nitrogen discharge to reduce nutrient enrichment;
- Setting effluent temperature limits to protect fish-bearing waters;
- Setting discharge limits for chemical oxygen demand (COD); and

- Setting pH range limits (ECCC, 2017).

The PPER are also being updated because the pulp and paper industry is diversifying to include bio-products (e.g. bio-fuels, bio-chemicals, and nanomaterials derived from wood) and the PPER only apply to traditional pulp and paper products. Stand-alone bio-product facilities would instead be subject to the *Fisheries Act*, which could create regulatory uncertainty in the industry (ECCC, 2017). Proposed updates to the PPER to manage bio-product impacts to the environment include setting limits for new deleterious substances (e.g. nitrogen and phosphorus) and lowering BOD and SS limits (ECCC, 2017).

> **Recommendation 3.1:** Environment and Climate Change Canada has proposed updates to the PPER, to account for changes in the pulp and paper industry, as well as to address findings from EEM studies indicating that the PPER do not adequately protect fish, fish habitat, and the environment (ECCC, 2017). NPNC must address whether or not the effluent from the Project will meet the requirements of the proposed updates to the PPER.

Issue 3.2: It is unclear in the EA document if the proposed ETF plant design using BAS™ technology will be able to meet more stringent discharge regulations being considered in proposed revisions to the *Pulp and Paper Effluent Regulations* which have a target publication date of 2021. Changes being considered in the revised PPER include reductions to current BOD and SS discharge limits in addition to setting allowable discharge limits for phosphorus, nitrogen and chemical oxygen demand (COD) that are not within the current PPER regulation.

The EA outlined that visits to two pulp mills in Sweden that operate Veola BAS™ wastewater treatment plants *"confirmed that the proposed Veolia BAS™ treatment system will provide the required treatment needs for NPNS to meet current and anticipated future regulations." (Section 4.2.1, p.29).* No further information was provided in terms of effluent quality at these mills, or regulatory requirements for discharge water quality at these locations.

In Section 5.2.2, p.40, it is stated *"The ETF is designed to treat the NPNS effluent to meet the Pulp and Paper Effluent Regulations before entering the transmission pipeline and exiting NPNS property."* No reference is made here to potentially more stringent water quality objectives that will have to be met under a revised PPER in 2021.

> **Recommendation 3.2:** More information should be provided on the data collected in the lab trails conducted in Fall 2018 on the NPNS effluent and site visits to the two Kraft mills in Sweden using BAS™ technology in terms of specific water quality data (BOD, TSS, P, N & COD) and relevant regulations (current and proposed).

Issue 3.3: The proposed ETF with BAS™ technology is outlined in the EA to be able to "*provide a more reliable facility by protecting the AS system from upset conditions, reduce nutrient consumption, and allow for low effluent total phosphorus (TP) and total nitrogen (TN), and improve the AS effluent sludge settling characteristics*." (Section 5.2.2.1, p.40). There is no consideration given within the treatment technology assessment and selection related to the non-biodegradable organic fraction within the pulp mill effluent that would be tied to COD discharge limits that may be proposed in modernized PPER.

Recommendation 3.3: Consideration of the non-biodegradable organic fraction within the effluent should be given, with more specific information on components in effluent that contribute to non-biodegradable fraction of COD, and any other efforts that could be considered in the pulp mill process design to lower COD in the mill effluent prior to biological wastewater treatment.

Issue 3.4: There is no information provided in the EA regarding expectant metal concentrations in the AST effluent. There is metal data provided in Appendix M4 on samples collected in December 2018 and analysis done by Maxxam Laboratories. However, each water quality test report is tied to a sample ID placed by analytical lab; there is no information provided on where these samples were taken.

Recommendation 3.4: More information needs to be provided on metal concentrations in the current ASB effluent (Point C) and metal concentrations expected to be found in the effluent of the proposed ETF.

Issue 3.5: Within the section on Accidents, Malfunctions and Unplanned Events (Section 10), mitigation strategies are proposed that would prevent accidental release of off-specification effluent to the receiving environment. Focus of mitigation would be on identification of potential deviation from standard quality of the mill effluent into the ETF. Daily monitoring of key performance indicators of the ETF is also highlighted to provide response and management to changes of the influent to the ETF.

Recommendation 3.5: More detail should be supplied on (1) what "key performance indicators" will be monitored on daily basis, and (2) what monitoring/testing will be conducted on the influent into the ETF; specifically, what water quality and/or operational parameters will be part of this monitoring/testing framework.

Issue 3.6: Historical effluent impacts from the Boat Harbour Treatment Facility, have been described in the Environmental Effects Monitoring (EEM) Cycle 7 Interpretive Report (Ecometrix, 2016). It is understood that the new treatment facility process differs from that of the Boat Harbour Facility. However, it is unclear if NPNS has assessed the potential (if any) for similar ecological impacts to occur from the proposed treatment facility.

Recommendation 3.6: Historical impacts of the Boat Harbour Treatment Facility are of major concern. NPNS must clearly outline how the proposed effluent treatment facility will be designed and operated in a way that will mitigate the potential for similar environmental impacts to occur.

3.2 Effluent Modelling

3.2.1 Summary of EA Content

The EA document does not convey a description of the effluent modelling methodologies or studies through the main text. The effluent modelling work is referred to in the text in very few sections and for the most part often referred to as Appendix E. This Summary of EA Content section provides the limited EA content main text related to the effluent modelling. The effluent modelling studies for Northern Pulp

Effluent Treatment Facility Replacement Project (i.e., Preliminary Receiving Water Study [Stantec 2017] and the Addendum Receiving Water Study [Stantec 2018]) were reprinted as Appendix E3 and Appendix E1 respectively in the whole EA document.

What is known from the effluent modelling work in the entire main text is mostly contained in the Executive Summary. "Water quality has been assessed through modelling of the treated effluent discharge. Through the analysis it has been determined that under 'worst case' conditions water quality at the end of the mixing zone for the three-port diffuser will reach ambient conditions within less than 2 m from the diffuser in terms of total nitrogen, total phosphorous, TSS, DO, pH, and salinity. Colour will return to baseline conditions within 5 m of the diffuser. Temperature will be within 0.1 °C of background at the end of the 100-m mixing zone." The same text is reprinted in Response to Key Issues identified Section 6.7, Table 6.7-1, 9th page.

The Effluent Quality section (5.2.2.9) briefly mentions that a maximum rate of 85,000 m^3/day was used in the analysis of effluent plume dispersion, representing a worst-case scenario. The annual average flow is predicted to be 63,600 m^3/day. Table 5.2-1 provides the anticipated daily maximum effluent quality and is reprinted from Appendix E3. (The same table is repeated as Table 5.6-1).

Also, the Outfall and Diffuser section (5.2.4) briefly mentions that the "diffuser pipe will be 50 m long, with three outlets ('port') spaced 25 m apart. Each port will be 0.3 m diameter connected to a 1.0 m tall riser pipe with an elastometric duckbill check valve opening at the end. The outfall will be capable of conveying discharge up to 85,000 m^3." (Note: m^3 is in fact m^3/day). It is reported that "The spacing and sizing of ports for the diffuser will achieve an approximate 144:1 dilution ratio". It does not say that the 144:1 dilution ratio is at a 100 m distance from the diffuser (important modelling constrain and CCME requirement). Overall, there was no mention that the above engineering/marine sciences, in regard to the outfall diffuser, was calculated from the effluent modelling studies presented in Appendix E.

The Valued Environmental Component (VEC); Harbour Physical Environment, Water Quality and Sediment Quality section (7.2) is presented in Table 7.4-1, which is of interest to regulatory agencies, the public, stakeholders and First Nations. Also, it is noted that no field work was conducted in this study and that all the information used for this VEC (and the effluent modelling work) was derived from the available literature and other studies. Therefore, all the information is from different perspectives, locations, years, seasons, months, etc.

In the Harbour Physical Environment, Water Quality and Sediment Quality section (8.11), potential effects are provided with an overview of existing environmental conditions in the Northumberland Strait and Caribou Harbour (the location of the effluent outfall), as well as Pictou Harbour. The latter location is used for its existing studies on water quality "in the absence of water quality data for Caribou Harbour" (section 8.11.1). Effluent modelling results are presented in the Characterization of Residual Effects section (8.11.3.3), under Operation and Maintenance (Page 350). The text in this section is repeated from the Executive Summary paragraph mentioned above. It concludes that "Any effects due to the discharge of treated effluent would be localized at the diffuser as the three-port diffuser and the high currents present in Northumberland Strait will aid in dispersion of treated effluent. Thus, significant

residual effects to water quality or sediment quality … are not likely." While these conclusions are based on the CORMIX modelling for near- and far-fields, it is not mentioned other than referring to Appendix E. The same applies for the Mike 21 far-field modelling results, which are the cumulative effects after a one-month simulation period of effluent discharge from the outfall location CH-B off Caribou Point. However, "results indicate that there are few traces of relatively high diluted effluent after a period of 30 days." The last paragraph reads "The modelling of the plume dispersion used very conservative assumptions, including maximum daily effluent flow rate for 30 days, summer conditions with lower wind speeds, waves and warmer ambient temperatures that are not favourable for plume mixing, and no decay of effluent quality, which represent an exaggerated condition where normally some decay is expected to occur."

Under the Follow-up and Monitoring section (8.11.5), it is noted that NPNS will conduct an EEM program for future effluent outfall in Caribou Harbour and is referenced to Appendix G only.

In brief, the above paragraphs are the extent of the EA main text content regarding effluent modelling, with annotations.

3.2.2 Evaluation & Recommendations

Issue 3.7: Appendices E1, E3, G and H, which relate to effluent modelling are lacking integration with the EA main document. The content of the EA main document is difficult to accept because of the absence of this important information. Additionally, reference to this information are few to none. This is apparent from the Summary of EA Content provided above.

> **Recommendation 3.7:** Summary information should be provided in the main EA text on both the Preliminary Receiving Water Study and the Addendum Receiving Water Study. This information should be tied directly with the information provided in the main EA text. How Mike 21 and Cormix models were used should be clearly stated in the main EA text.

Issue 3.8: There is a lack of field work, particularly in obtaining new water quality data and a field verification of water column non-stratification in winter and summer, as input to customize the hydrodynamic models (Mike 21 and CORMIX) for the CH-B location of the future effluent outfall. It is understood that the modelling aspect was performed with considerable professional judgment. However, the use of the water quality information available from Pictou Harbour (taken from several sources published in different years and from different locations), as a proxy to the Caribou Harbour data, brings considerable doubt to the validity of the studies and main EA text (e.g.,Table 5.2-1 or 5.6-1). To have a so-called "conservative approach" is important, nonetheless a reliable and convincing data set on water quality for the study is essential.

> **Recommendation 3.8:** NPNS must rovide a water quality study for the CH-A and CH-B locations and other related areas, including Caribou Harbour and the surroundings of Pictou Island based on numerous sampling stations. As part of this study, one or two reference areas should be considered with several sampling stations.

Issue 3.9: In view of the issues above (Issues 1 and 2), there is no mention in the EA main text that future field work and data collection will be performed to verify the hydrodynamic modelling results of the effluent mixing and dispersion. Under the Follow-up and Monitoring section (8.11.5), it is only noted that NPNS will conduct an EEM program at the effluent outfall diffuser, with reference to Appendix G. Once again, the main text does not convey a brief description of what the follow-up and monitoring entails. It entails a full EEM characterization of effluent plume which will be performed using the CORMIX model during summer and winter conditions, flood and ebb currents and slack tides, with field confirmation using Rhodamine WT. It is of great interest to regulatory agencies, the public, stakeholders and Indigenous Communities to be aware of the up-coming work. In addition, NPNS states that biological monitoring will be performed to include water and sediment quality sampling, as well as benthic invertebrate community and fish population sampling to assess conditions and health over time.

> **Recommendation 3.9:** Provide a brief description in Section 8.11.5 of what the Follow-up and Monitoring Program entails.

3.3 Marine Fish and Aquatic Habitat

3.3.1 Summary of EA Content

The EA describes marine fish and fish habitat in the context of consideration of the ecological value provided to marine ecosystems, the socio-economic importance of fisheries resources and potential interactions with the Project and project activities on marine fish populations. Marine fish are protected under the federal *Fisheries Act*, which includes provisions to protect the productivity of, and prevent "serious harm" to, commercial, recreational, and Aboriginal (CRA) fisheries.

Marine fish, and their habitat, are closely linked to the surrounding physical environment, as well as water and sediment quality, all of which could be impacted by the proposed Project. The main fisheries of importance, as described in the EA, include lobster, sea scallop, herring and rock crab, among other lesser species fished. The Northumberland Strait is a known migration corridor for many species (Rondeau et al. 2016). Commercially important species known to occur in the marine local assessment area (LAA) include rock crab, lobster, sea scallop, herring, mackerel, and tuna.

American Lobster, *Homarus americanus,* is caught throughout the central and eastern portions of the Northumberland Strait. Lobster habitat overlaps with both the proposed route of the effluent pipeline and the location of the marine outfall. American Lobster stock status reports provided by DFO (2013) in the southern Gulf of St. Lawrence show that the Northumberland Strait is a secluded system based on larval recruitment compared to the rest of the southern Gulf of St. Lawrence. With respect to lobster larval transport, eggs that are released are reliant on the current within the Northumberland Strait for transport and have a period between 3- 12 weeks in which the larvae's destination is a result of the direction of the current (Chasse and Miller, 2010). Lobster larvae are retained in the Northumberland Strait for up to 120 days, with some individuals actually settling west of where they were released rather than east. These locations indicate specific circumstances where there are east-to-west currents, some of which have been known to last days to weeks in duration (Hanson and Comeau 2017). The complexity

of larval transport within the Strait highlights the relationship that exists between the provinces in relation to the lobster fishery.

Herring is caught along the shoreline of New Brunswick and Nova Scotia in the Northumberland Strait,

including the Pictou area. There is overlap with herring fishing and the location of the marine outfall. Concern has also been raised about the effects of the marine effluent pipeline on herring spawning from the commercial fishing industry (PEI Standing Committee on Agriculture and Fisheries, 2018). Herring stocks are currently of concern to DFO, and attempts are being made to manage this fishery to avoid becoming at risk in the area (PEI Standing Committee on Agriculture and Fisheries, 2018).

Marine fish can be affected by activities and components of the Project during construction, operation and maintenance phases. The Project has the potential to impact marine fish populations and fish habitat (e.g., adult fish, juveniles, eggs and larvae, invertebrates and marine plants) directly through injury and mortality, or indirectly through the alteration or destruction of their habitat. The current environmental assessment of marine fish is focused on changes in marine fish populations, which includes any physical injury or mortality on fish that is attributable to the Project, and any destruction or alteration of habitat from disturbance of the marine environment.

The EA states that project-related construction, operation and maintenance activities may result in adverse environmental effects such as changes to marine fish habitat and fish populations in the PFA. The proponent claims that it is not anticipated that changes would extend beyond the PFA and that any changes in fish habitat would persist only over the life of the Project and not beyond. The potential change in fish populations is attributable to direct and indirect disturbance/change of habitat and increased mortality risk.

3.3.2 Evaluation & Recommendations

Issue 3.10: The *Fisheries Act* focuses on protecting the productivity of CRA fisheries including a prohibition against causing “serious harm” to fish that are part of or support a Commercial, Recreational, Aboriginal (CRA) fishery (Section 35 of the *Fisheries Act*) and proponents of projects that cause serious harm to fish are required to offset that harm to maintain and enhance the productivity of the fishery. The deposition of a deleterious substance is also prohibited under Section 36(3) of the *Fisheries Act*.

Overall, the EA approaches the assessment of impacts to fish and fish habitat with very limited analysis and examines project activities in the context of “Serious Harm” as described in the Fisheries Act, as opposed to going beyond the limited provisions of the current version of the Fisheries Act. The provision of Serious Harm has been widely regarded as providing limited protection to fish habitat and does not account for all impacts to fish or fish habitat.

> **Recommendation 3.10:** In the interest of assessing the impacts to fish with the highest level of scrutiny and precaution, in our professional opinion, it is recommended that the Proponent should approach the EA with an analysis that goes beyond the provision of Serious Harm to a

shift in focus on avoiding harmful alteration, disruption or destruction (HADD) of fish and fish habitat. This approach is being contemplated proposed *Fisheries Act* amendments under Bill C-68. Given the high level of concern from fisheries groups regarding harmful alteration, disruption or destruction (HADD) of fish and fish habitat of the Northumberland Strait, and the potential adverse effects of the Project, NPNS must assess the proposed activities and design of the Project in the context of HADD avoidance. This approach enhances the measures described within the EA.

Issue 3.11: *Section 5.2.3.1 – Land-based Pipeline Portion:* The land-based pipeline portion extending from NPNS property to the edge of shore at Caribou Harbour will be approximately 11.4 km in length. The pipeline will be buried for the majority of the route. Based on the proposed design, there will be one area where the pipeline will be exposed and will cross the spillway of the Pictou Causeway, where it will be suspended and attached to the exterior of the bridge due to limited roadway width. The exposed area will be protected from damage by existing guide rails.

The EA does not describe the protections or safeguards that will go into an aerial or exposed stretch of pipeline along the causeway. It does not appear that NPNS has considered the impacts of effluent release spills that do not reach the diffuser. Very limited information is provided in terms of spill response or emergency planning. Should a spill event occur at the aerial location, effluent could be released into the harbour prior to reaching the diffuser and could cause adverse impacts to fish and fish habitat.

> **Recommendation 3.11:** NPNS needs to provide more detail on spill response and safeguards against potential accidents or malfunctions along the terrestrial portion of the pipeline. Without this information, it is unclear how the Minister can make an informed decision regarding whether adverse effects or significant environmental effects may be caused by the undertaking and whether these effects can be mitigated.

Issue 3.12: The EA states that a significant adverse residual environmental effect on marine fish and fish habitat is one where project related activities cause a significant decline in abundance or change in distribution of a marine fish population within the Northumberland Strait. One such change would be that natural recruitment may not re-establish the population to its original level within one generation. However, NPNS also states that no field work was conducted as part of this EA. Without understanding the current larval lobster population, there could be five to seven years of impacts that would go undetected until the current cohort reaches maturity.

> **Recommendation 3.12:** In our professional opinion, A comprehensive multi-year baseline study on all marine species present within the Northumberland Strait must be completed in order to understand potential adverse impacts that may result from project activities. Robust studies are required to better understand each species, and the potential impacts the Project could have on each. This type of baseline study is the foundation of an EA, especially one focused on a project that has the potential to cause serious environmental impacts.

Issue 3.13: The EA states that the main commercial, recreational and aboriginal fisheries are lobster, sea scallop, herring, mackerel and tuna. Beyond those species identified in the EA, the Northern Pulp EA

failed to mention Atlantic halibut, soft shell crab, American eel, gaspereau and silver sides. A complete list of species fished should have been composed with actual field-based studies and research concluded on their tolerance ranges, sensitivities and how different contaminants in the effluent could negatively affect that species. Each individual species has a different mechanism for expelling toxins from their body, thus comparing one species to another does not provide and accurate assessment of impacts.

> **Recommendation 3.13:** In our professional opinion, a more detailed environmental assessment that considers all potential fisheries in the Northumberland Strait needs to be completed to adequately assess project impacts. The EA should consider every species fished commercially in the area and should look at sensitivities of all of those fish to changes in water quality and negative health effects of contaminants

Issue 3.14: *Section 5.3.1 – Construction Phase:* The EA states that throughout project construction, environmental monitors will enforce construction specifications and site-specific environmental mitigation measures that are proposed for the Project's Environmental Management Plan (EMP). The EA states that a series of plans and guidance documents such as an Waste Management Plan (WMP), an Environmental Protection Plan (EPP), and an Emergency Response and Contingency Plan (ERCP) will be incorporated into the EMP. Applicable best practices, restrictions and details from the EMP will be included in the construction drawings so that construction methodology is in compliance with the EMP. The Proponent has not adequately addressed many construction-related issues in the EA that may have significant consequence to the aquatic environment. A robust Environmental Protection Plan will be imperative to minimize and address an impacts from construction.

> **Recommendation 3.14:** The Environmental Management Plan and the Environmental Protection Plan must be completed and circulated for review and consultation with stakeholders prior to the Project being approved. The Project should not be approved until all stakeholders have been consulted on all environmental protection measures within the Environmental Management Plan.

Issue 3.15: *Section 5.3.1 – Construction Phase*: As part of construction of the proposed Project, the effluent pipeline will "cross" watercourses and wetlands. The proposed Project does not intend to include in-watercourse or in-wetland crossings. Rather, at potential "crossing" locations of watercourses or wetlands, those sensitive environments will be avoided, where technically feasible, by adjusting the alignment toward the center of the road. In some cases, an alternate approach may be used to go under the watercourse/wetland. There are a number of freshwater fish species that occupy or use the watercourses along the pipeline route. Atlantic salmon, spawn in a number of the watercourses crossed by the pipe. It is unclear in the EA how the Proponent intends to complete these watercourse crossings along the terrestrial portion of the pipeline. The EA states that they will adjust the alignment of the pipe to "the centre of the road" to avoid instream work. This plan is not clear in the drawings provided within the EA Registration documents. The construction of the pipe over and around these watercourses is of major concern and must avoid disturbance and/or disruption of fish life cycle.

> **Recommendation 3.15:** The proponent must provide more detail on what is meant by moving the alignment to the centre of the road, and on which watercourses, in particular, they intend to carry this out.

Issue 3.16: *Section 5.3.1 – Construction Phase*: For watercourse crossings along the pipeline route, the option of using a Horizontal Directional Drill (HDD) is proposed to avoid in-water works. It is stated in the EA that the technical feasibility of an HDD installation is determined by the distance to be drilled, the diameter of the pipeline, and the subsurface conditions. However, it is also stated in the EA, that geotechnical information has not be gathered in order to determine whether HDD is feasible at the various crossing locations. Inconsistent bedrock and overburden conditions present impediments to the use of HDD technology. Without a comprehensive geotechnical assessment of the crossing locations that are proposed to be drilled, issues can arise when carrying out the HDD. In particular, without understanding the substrate that is to be drilled, the possibility of an inadvertent release of drilling fluid (frac) may occur. Fracs are highly impactful to fish and fish habitat as they may result in the release of large plumes of drilling fluid that can kill fish and can cover or destroy fish habitat both in the watercourse and in the marine environment.

> **Recommendation 3.16:** In our professional opinion, geotechnical assessments must be completed and reviewed by project stakeholders. This information is required before the Minister can make an informed decision on all potential impacts of the Project.

In addition, the Environmental Protection Plan must address prevention and emergency response related to horizontal directional drilling.

Issue 3.17: *Table 8.12-7: Mitigation Measures to Reduce or Avoid a Change in Marine Fish Populations:* There is no description of how negative impacts resulting from the laying of pipe will be mitigated during the Construction Phase. The mitigation tables merely provide standard measures that have no site-specific relevance on minimizing the impacts of pipe construction in open water. The table states that the duration of in-water work will be managed to the shortest time that is practical. The proposed actions are very unclear and do not outline what is actually practical or feasible. The likelihood of impacting benthic species, as well as mobilizing sediment and increasing turbidity, is very high during construction. Its unclear how NPNS plans to mitigate these disturbances to fish habitat.

The EA does not include sufficient analysis of construction methodologies that would reduce the risk to benthic species, as well as fish species in the area. Elevated levels of sediment and turbidity can reduce the productivity of aquatic systems by decreasing primary productivity. Further, levels of suspended sediment have been determined to be acutely lethal to fish ranging in the thousands of mg/l of TSS while sublethal effects begin in the hundreds of mg/l sediment (Birtwell et al. 1999). The construction of the pipe could result in fish mortality if not adequately mitigated. The EA does not provide a detailed plan to minimize impacts of sedimentation to fish and fish habitat.

> **Recommendation 3.17a:** The EA must provide more details on mitigating benthic disturbance and subsequent TSS mobilization during pipe construction in the Northumberland Strait.
>
> **Recommendation 3.17b:** The EA should examine the possibility of HDD drilling to facilitate the placement of the pipe into the Northumberland straight. HDD could reduce the risks of in-water works that could significantly impact fish and benthic communities.

Issue 3.18: The EA states that routine effluent discharge from the effluent outfall diffuser will cause a project-related change in water quality. The treated effluent will contain water quality parameters of concern including absorbable organic halides (AOX), total nitrogen (TN), total phosphorus (TP), color, biochemical oxygen demand (BOD), total suspended solids (TSS), dissolved oxygen (DO), pH, and water temperature. Potential effects of the effluent, as presented in the EA, could result from an increase in temperature, nutrients (nitrogen and phosphorus), and/or TSS, a change in color, chemical and BOD, DO, and/or pH; and/or a reduction in salinity from the discharge of relatively freshwater effluent into the Northumberland Strait.

The discharge of effluent containing elevated levels of TSS could also cause a change in sediment quality near the diffuser due to settlement of suspended sediment. A change to any of these parameters can have detrimental effects on the fisheries. The EA does not provide a detailed analysis of species-specific limits and tolerances with respect changes in water and sediment quality as a result of effluent discharge.

Further, the Pulp and Paper Effluent Regulations only stipulate the monitoring of a few parameters and are not always protective of the aquatic environment (ECCC, 2017). In fact, Environment and Climate Change Canada is currently reviewing the regulations to address such issues (ECCC, 2017).

> **Recommendation 3.18a:** The EA must outline species-specific limits of tolerance with respect to the above parameters described as well as upper and lower limits for toxins specific to mill effluent. A robust assessment of how changes to the marine environment, and the discharge of effluent contaminants, impact species inhabiting the area must be completed in order to understand impacts of the proposed Project.
>
> **Recommendation 3.18b:** The proposed changes to the PPER must be considered when addressing the species-specific effects including a quantitative evaluation of the impact of the proposed changes on the assumptions and conclusions of the EA.

Issue 3.19: The description of the existing physical environment conditions of water and sediment quality within the LSA is based on the results of previous research and existing scientific literature and environmental assessments. No field work was conducted as part of this EA Registration. This is a major data gap identified in the EA. It is unclear how potential impacts related to the Project will be characterized without a robust understanding of current baseline conditions.

> **Recommendation 3.19:** In our professional opinion, a project of this magnitude warrants comprehensive field work investigations to be completed. NPNS should conduct a comprehensive baseline assessment to characterize current conditions of the marine environment within the project assessment area, including sediment and water quality.

Issue 3.20: Pictou Harbour was used as a proxy for Caribou Harbour with respect to evaluating water quality, in the absence of available water quality data for Caribou Harbour. The EA only provides an overview of water quality sampling in Pictou Harbour in 1990, 1995 and 1998 (Dalziel et al. 1993; JWEL 1996) with no actual current or historical data from the proposed location at Caribou Harbour. The EA relies on data that are roughly 30 years old to make assumptions on the potential impacts to marine life

from the current Project. The EA registration documents lack of representative and current water quality data is a major gap.

> **Recommendation 3.20:** The proponent should collect and analyze current water quality data, from the proposed outfall location, in order for the EA to adequately assess impacts to the water quality from the Project, and to adequately plan for preventing or mitigating those potential impacts.

Issue 3.21: NPNS did not undertake field work to gather relevant data for sediment characterization at the proposed outfall location. NPNS relied, instead, on sediment data that are roughly 30 years old. As well, the EA presents metal concentrations in sediment samples collected in Pictou Harbour in 1993. Without current baseline information to inform the EA, it is not possible to understand the potential impact of the Project on sediment quality. Not having representative and current sediment quality data to inform the EA is considered to be a major data gap in the assessment.

> **Recommendation 3.21:** NPNS must collect current and relevant data on sediment characterization at the proposed outfall location.

Issue 3.22: *Section 8.12 Marine Fish and Fish Habitat:* Herring stocks are currently of concern to DFO, and attempts are being made to manage this fishery to avoid becoming at risk in the area (PEI Standing Committee on Agriculture and Fisheries 2018). Herring spawn between August and October in the southern Gulf of St. Lawrence, and DFO has identified fall spawning grounds for herring in the eastern Northumberland Strait. Currently, the fall spawning stock is in the critical zone and the spring spawning stock is in the cautious zone (DFO, 2018a). The EA states that concern has been raised about the effects of the effluent on herring spawn, however, the main fisheries in the LAA considered in the assessment are scallop and rock crab. There is no mention of what NPNS is doing to mitigate the potential risks to herring spawn due to the project. In addition, field or lab work has not been completed to address this potential risk and concern.

> **Recommendation 3.22:** Proper research needs to be completed to understand possible effects of the effluent on herring spawn, including sub-lethal effects. A rebuilding plan for herring is currently being developed to ensure the regrowth of the stock, and therefore any potential impacts to herring spawn must be fully considered in the EA.

Issue 3.23: *Section 8.12 Marine Fish and Fish Habitat:* The EA reports that mackerel is caught along the coast near the LAA, although most fishing occurs in the central and western portions of the Northumberland Strait. There is only one comment about mackerel in the EA, thereby demonstrating a lack of robust analysis regarding impacts. There is no mention of mackerel life stages or occurrence in the LAA. Data shows that the only key spawning area in Canada is the Southern Gulf of St. Lawrence and that surveys conducted on mackerel eggs are present in the East end of the Northumberland Strait (DFO, 2017) (Figure 6).

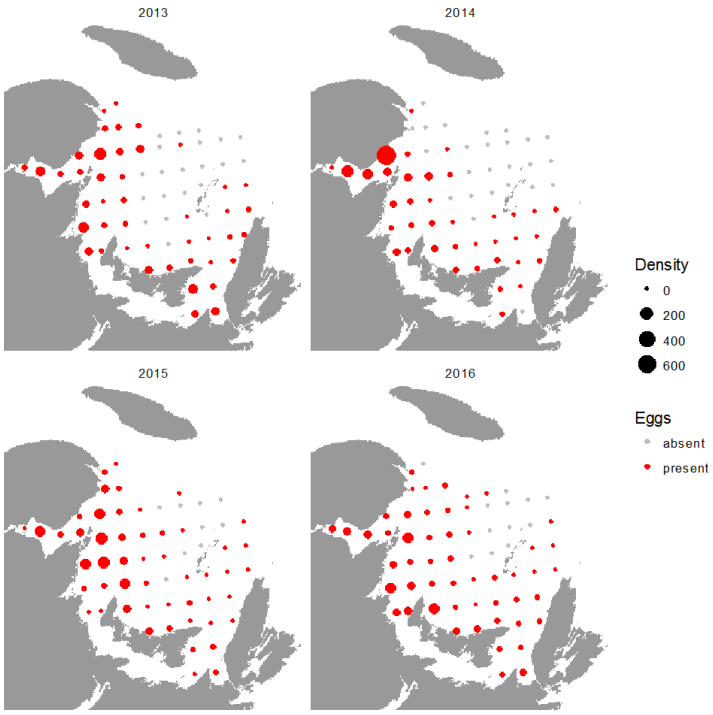

Figure 6. Distribution of Mackerel Egg (Stages 1 and 5) Densities (n/m2) Measured in Surveys in the Southern Gulf of St. Lawrence from 2013 to 2016 (DFO, 2017)

> **Recommendation 3.23:** Research must to be completed to understand possible sub-lethal effects of the effluent on mackerel eggs. Currently, the stock is in the critical zone (DFO, 2017) and a rebuilding plan is being developed to ensure the regrowth of the stock. The EA must clearly assess how potential impacts from the Project could affect stock regrowth.

Issue 3.24: *Section 8.12 Marine Fish and Fish Habitat:* Table 8.12-6 of the EA lists marine fish Species at Risk and Species of Conservation Concern with potential to occur in the LAA. This EA table lists American eel, American plaice, Atlantic bluefin tuna, Atlantic cod, Atlantic salmon, lumpfish, porbeagle, spiny dogfish, striped bass, and white hake, but does not list Atlantic sturgeon. This is another significant data gap in NPNS EA. There are two species of Atlantic sturgeon in Canada and both are listed as threatened by the Committee on the Status of Endangered Wildlife in Canada (COSEWIC) and are known to exist within the Northumberland Strait (COSEWIC, 2011).

> **Recommendation 3.24:** Atlantic sturgeon must be considered in the assessment, and potential impacts to the species identified. Once again, the Minister must consider '*potential and known adverse effects or environmental effects of the proposed undertaking, including identifying any effects on species at risk, species of conservation concern and their habitat'* (Nova Scotia Environment, 2018).

Issue 3.25: The Gulf of St. Lawrence (GSL) American lobster is of high value in the region, with 33,000 mt of lobster worth $445 million landed in 2016, and abundance indices still increasing throughout the Gulf (DFO, 2019a). The value of American lobster is not mentioned in the environmental assessment

submission. Lobster biomass is increasing as efforts have been taken toward voluntary management changes. It should also be noted that conditions like water temperature can impact the distribution of lobster and their catches (DFO, 2013). This is extremely important to the fishers in the area of the outfall considering the temperature being released will be above the average background water temperature when released to the Strait.

At this time, there have been no field trials or lab tests by NPNS to prove that they will not be jeopardizing the lobster fishery. Considering the significant value of lobster in the Gulf (worth $445 million in 2016), proper scientific research needs to be conducted on the potential impacts to the lobster and lobster fishery. The EA relies on desk top research and literature based on dated, 40 year old research.

> **Recommendation 3.25:** As stated in Appendix R of NPNS's EA Registration documents, it is recommended that more research be completed on the effect of the effluent on lobster in each life stage. It is important to highlight that the recommendation given in Appendix R regarding more research on the effect of effluent on lobster must be followed through and completed. It is unclear how the Minister will determine if the following has been addressed in the EA (as outlined in Nova Scotia Environment, 2018), given the lack of a robust consideration of lobster in the assessment:

Issue 3.26: *Section 8.12 Marine Fish and Fish Habitat:* Figure 8.12-5 of the EA presents scallop catch weights from 2010-2014 in the Northumberland Strait, where there is an overlap of the route of the pipeline and at the outfall location. Since 2014, a Scallop Buffer Zone in Scallop Fishing Area (SFA) 24 prevents scallop fishing in this area, except potentially at the location of the outfall. Sea scallops will normally grow in water between 8°C and 18°C; ideal temperature for growth is 13.5°C. Ideal salinity is between 30 to 32 ppt but they can tolerate salinities as low as 25 ppt. Sea scallops are prone to being stressed in environments outside of their normal ranges. They can get stressed at temperatures between 20°C and 23°C and mortality will occur at temperatures of 23.5°C and greater. Water temperatures will be affected by the effluent and will not reach background levels until 100 m from the outfall site. The proposed effluent release will be 26°C in the winter and 37°C in the summer. These temperatures are much higher than mortality-causing temperatures for the sea scallop.

> **Recommendation 3.26:** Detailed field assessment on the sea scallops that inhabit the area near the proposed outfall location must be completed prior to the release of the proposed effluent to ensure there will be no negative effects on the sea scallops. Otherwise, it is unclear how the Minister will be able to determine if adverse effects or significant environmental effects are likely to occur.

Issue 3.27: *Section 8.12.2.5:* NPNS have not completed any scientific field work or a comprehensive assessment of the impacts of the effluent on lobster larvae. NPNS has merely relied on a literature review (Appendix R), in the EA, to make an assumption on the "limited impacts" to lobster and lobster larvae. Further, the review of scientific literature related to the effect of BKME on American lobster (*Homarus americanus*) is mainly related to a small number of lab studies conducted in the 1960's (Sprague and McLees, 1968a 1968b). The limited literature on the subject, coupled with the lack of field

assessments, or detailed analysis of the impacts, indicates that NPNS is unable to conclude what the potential impacts will be to lobster and lobster larvae. A few studies suggest that sublethal effects of chemicals on lobster energetics may occur under laboratory exposure conditions (i.e., concentrations and duration) considered environmentally relevant, that might not be detected through the standard toxicology approaches (alive/dead animal as the only output measured). These physiological changes could result in great impairment under natural conditions (Sprague and McLees, 1968a 1968b). The information provided in the EA is insufficient to conclude whether or not adverse effects will occur to lobster larvae should the Project proceed.

> **Recommendation 3.27:** Detailed field and lab work must be carried out as part of a comprehensive EA that assesses and quantifies sublethal, chronic and cumulative effects on lobster larvae. The level of stakeholder concern regarding lobsters warrants the need for increased scientific understandings and fulsome assessment of impacts, in order for the Minister to make an informed decision regarding potential impacts of the Project to lobster.

Issue 3.28: NPNS has stated that they have attempted to engage commercial and Pictou Landing First Nation (PLFN) fish harvesters to obtain fisheries data in the area of the marine outfall; however they suggest that there was little interest from the fish harvesters to participate or provide any data. This comment is of concern to local harvesters as they did engage in discussions surrounding fishing grounds and it was made clear to NPNS that if there is water, there is fishing. Harvesters maintain their traditional grounds, but they consistently explore other areas outside as well.

> **Recommendation 3.28:** Individual species cannot be pinpointed to specific locations within the Northumberland Strait. Again, they do have traditional habitat and areas they are commonly found, but individuals are not restricted to these areas only. The ability, and likelihood, of each species to move throughout the Northumberland Strait must be considered and accounted for in a robust environmental assessment.

Issue 3.29: *Section 8.12 Marine Fish and Fish Habitat:* Rock crab is another species of extreme importance in the Northumberland Strait, both for its commercial value and its position in the food chain. According to the DFO, American lobster is largely carnivorous and decapods are the principal prey (57% to 84% of prey biomass), with rock crab being the single most important component of the lobster diet (45% to 78%) (DFO, 2019a). As such, a decline in the rock crab biomass could also be detrimental to the lobster biomass. While the majority of the commercial fishery for rock crab occurs in the central and western portions of the Northumberland Strait, there are areas in the eastern portion where rock crab is harvested, including Caribou Harbour where there is overlap with the proposed marine route of the effluent pipeline. The current EA does not consider how a potential decline in a prey species such as rock crab may have a detrimental impact on other commercially important species like lobster.

> **Recommendation 3.29:** The Northumberland Strait must be also assessed as an interwoven and interdependent ecosystem, not only on an individual species by species basis. NPNS must consider these ecosystem impacts in a more comprehensive and robust environmental assessment. Otherwise, it is unclear how the Minister will be provided with sufficient information to make an informed decision about the likelihood of adverse impacts.

Issue 3.30: *Section 8.12.5 Marine fish and fish Habitat Follow-up and Monitoring, Appendix H and G:* As stated in the Environmental Effects Monitoring Program Proposed in Appendix H, completed by Ecometrix and according to the PPER, biological field monitoring studies are recommended to consist of evaluations of benthic invertebrate community condition, fish population health, and dioxins and furans levels in fish tissues. For benthic invertebrates and fish health, the requirements to conduct field studies are only conditional on the spatial extent of the effluent plume in the receiving environment:

A study respecting the benthic invertebrate community, if the concentration of effluent in the exposure area is greater than 1% in the area located within 100 m of a point of deposit of the effluent in water.

A study respecting the fish population, if the concentration of effluent in the exposure area is greater than 1% in the area located within 250 m of a point of deposit of the effluent in water.

In the EA. a statement is made that the mill is only required to implement the field survey programs once it has begun to discharge effluent from the new proposed outfall location and that there is no statutory obligation as defined in the PPER to complete field surveys prior to this time.

> **Recommendation 3.30:** Despite the PPER regulations, given the high level of concern expressed by the public and harvesters, a biological monitoring program should be implemented prior to final commissioning of the proposed treatment plant and effluent outfall. The collection of this baseline information will significantly strengthen the interpretive power of the biological monitoring program as a whole. This baseline information will allow the biological monitoring program data to be analysed in a BACI (Before-After-Control-Impact) framework so that potential effluent related effects can be considered both spatially (i.e., exposure vs. reference) and temporally (i.e., pre-discharge vs post-discharge) .

Issue 3.31: *Section 8.12.5 Marine fish and fish Habitat Follow-up and Monitoring, Appendix H and G:* With respect to the scheduling of monitoring, the Benthic Invertebrate Community Assessment and Fish Population Health Assessment are not required through PPER to be completed in a pre-discharge survey. Further, post-discharge surveys are only being recommended to be performed within 24 months of the initiation of discharge from the new outfall location.

> **Recommendation 3.31:** Again, despite the PPER regulations, in our professional opinion, and due to the high level of concern expressed by the public and harvesters, the biological monitoring program should be implemented and remain continuous as soon as effluent is released to the Strait. Considering the level of concern from stakeholders in the region and coupled with the uncertainty of the effluent composition and the limited collection of existing environmental condition data, it is imperative that NPNS implement a robust continual biological monitoring program prior to effluent discharge and that continues through operations.

Issue 3.32: *Section 8.12.5 Marine fish and fish Habitat Follow-up and Monitoring;* As part of the Pictou Harbour Environmental Effect Monitoring (EEM), sublethal toxicity testing was completed on effluent from the stabilization basin that indicated sea urchin fertilization was affected at stabilization effluent concentrations of greater than 12%. The EA does not mention the results of the EEM or to assess the

potential impacts of the new Caribou Harbour project in the context of what has occurred at Pictou Harbour over the operational period of the mill.

Acknowledging that NPNS has stated that the new effluent will be "different" than the old Pictou Harbour effluent, it is still in the interest of all stakeholders to assess the proposed Caribou Harbour Project using a higher-level scientific scrutiny, due to the legacy impacts of the mill over time, such as the sublethal impacts discussed in the EEM. Currently the EA is lacking in the assessment of sublethal effects. The results of lethal and sublethal effects tests can not be directly correlated between species, because different marine species exhibit different degrees of sensitivity to pulp effluent (Sprague and McLeese, 1968).

> **Recommendation 3.32a:** The EA must consider both lethal and sublethal effects of the Project and must go beyond the provision of "serious harm" to incorporate how effects, other then direct mortality, could negatively impact the fisheries of the Strait.
>
> **Recommendation 3.32b:** In addition, analysis and monitoring of lethal and sublethal effects should be carried out independently of one another on locally important species such as lobster, crab, herring and Atlantic salmon.

3.4 Marine Mammals

3.4.1 Summary of EA Content

The NPNS proposed Replacement Effluent Treatment Facility has the potential to adversely affect marine mammals and because of this, they were scoped into the Project consideration through the Marine Mammals, Sea Turtles, and Marine Birds Valued Ecosystem Component (VEC). The spatial boundaries for this VEC include the Marine Project Footprint Area (PFA), which consists of a corridor of approximately 15m-wide and 4.1km-long that begins at the ordinary high-water mark and extends seaward into the Northumberland Strait until the pipelines terminates at the effluent outfall diffuser, and the Marine Local Assessment Area (LAA), which is an approximately 300m-wide and 4.1km-long corridor. The temporal boundaries for this VEC include the construction (estimated to take approximately 21 months following potential EA approval), operation and maintenance (estimated to occur for several decades), and decommissioning phases of the Project.

The description of the existing environment for this VEC was based on the results of previous research and existing scientific literature and environmental assessments, with a significant emphasis on the Environmental Impact Assessment (EIA) for the Prince Edward Island-New Brunswick Cable Interconnection Upgrade Project. For baseline information on marine mammals, in particular, NPNS relies upon data obtained from the Atlantic Canada Conservation Data Centre (ACCDC), Department of Fisheries and Oceans (DFO) and the Ocean Biogeographic Information System (OBIS).

According to the Project EA, the Gulf of St. Lawrence is known to provide habitat for 13 recorded species of cetaceans (e.g. whales and dolphins) and four species of pinnipeds (e.g. seals), ten of which have

been recorded within the Northumberland Strait and the Project LAA. The species of cetaceans known to occur in the Northumberland Strait include Atlantic white-sided dolphins (Gulf of St. Lawrence population), fin whale (Atlantic population), harbour porpoise (Northwest Atlantic population), long-finned pilot whales, minke whales (Atlantic subspecies), sperm whales; and the species of pinnipeds include grey seal, harbour seal (Atlantic subspecies), harp seal, and hooded seal. These species of pinnipeds are determined to occur in the area either frequently or occasionally, whereas most cetaceans are occasional or rare visitors. At-risk species include fin whale, harbour porpoise, and long-finned pilot whale. According to NPNS's EA, North Atlantic Right Whales are not known to occur in the vicinity of the LAA and there is no record of historical observations in the Northumberland Strait, as shown in Figure 7 below.

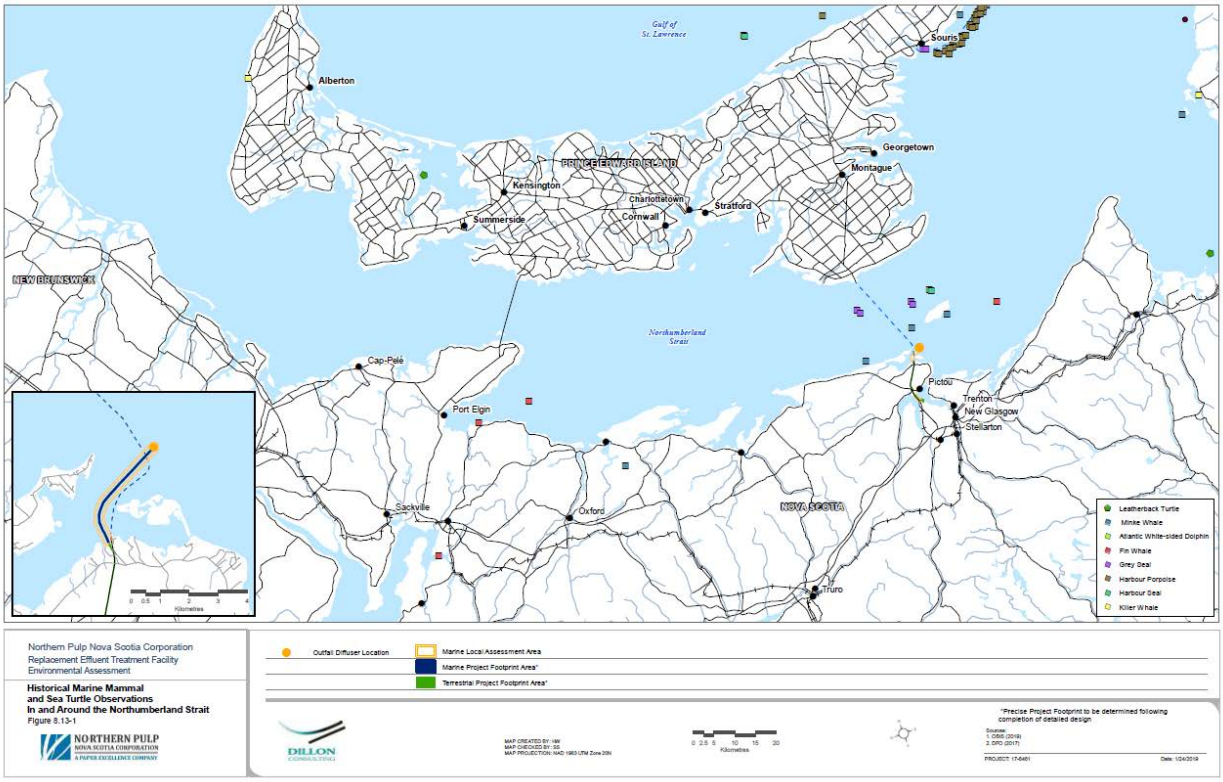

Figure 7. Map of Historical Marine Mammal and Sea Turtle Observations in and around the Northumberland Strait (Source: NPNS Replacement Effluent Treatment Facility EA Figure 8.13-1)

Despite, NPNS's assertion that North Atlantic Right Whales are highly unlikely to be present in the LAA, potential impacts to this species are discussed briefly throughout the effects assessment and considered to a certain extent in mitigation.

NPNS has determined that there is the potential for Project-related activities to result in a change in risk of injury or mortality and a change in habitat quality and use during both the construction and operations and maintenance phases of the Project. Specifically, marine mammals are at risk of injury of mortality due to potential collisions with Project vessels and equipment, potential entanglement in

anchor lines, and potential physical damage due to harmful levels of underwater sound and vibration during marine blasting. Marine mammals could also experience changes in habitat quality and use due to sediment resuspension from seabed disturbance during pipeline trenching and installation, underwater acoustic emissions, and changes in water quality caused by routine effluent discharge from the effluent outfall diffuser.

In order to mitigate these potential adverse effects, NPNS intends to undertake a number of measures including: requiring project vessels to operate a slow maneuvering speeds (e.g. maximum of 10 knots), employing marine mammal observers (MMOs) to monitor and report on marine mammals during marine blasting operations, requiring project vessels to adhere to the general guidelines for vessels operating near marine mammals as outlined in DFO's 2018 Notice to Mariners, minimizing risk of anchor line entanglement by promptly removing them after use and keeping them as taught as possible during use, maintaining buffer distances in the event marine mammals are present near operating Project vessels, and treating effluent in compliance with regulatory guidelines for effluent discharge quality.

Considering the implementation of these mitigation measures, NPNS has determined that significant adverse residual environmental effects on marine mammals are not anticipated.

North Atlantic Right Whale

There was no targeted assessment of the potential adverse effects of the Project on North Atlantic Right Whales, which are listed as endangered by both SARA (Schedule 1) and COSEWIC. They occur in the northwest Atlantic, ranging from Florida to Newfoundland and in the Gulf of St. Lawrence (COSEWIC, 2013). Their wintering and calving grounds are generally located off the coast of Florida and Georgia, however, not all individuals will occupy these areas and the whereabouts of adult males, in particular, is largely unknown (COSEWIC, 2013). Researchers have also recently found a possible breeding ground located in the middle of the Gulf of Maine (COSEWIC, 2013). Female whales will use calving grounds during the early winter then migrate north in the winter and spring to feed in the Great South Channel and Massachusetts Bay areas. During the summer and fall, North Atlantic Right Whales can be found congregating and feeding in the lower Bay of Fundy and in the Roseway Basin on the western Scotian Shelf. However, since 2010 there has been a noticeable shift in the distribution of North Atlantic Right Whales, particularly in their summer foraging range which has led to increasing uncertainty regarding their use of north Atlantic waters (Brillant et al., 2015; Davis et al., 2016; Plourde et al., 2016; Meyer-Gutbrod & Greene, 2018). These changes in distribution are thought to be driven by the changing abundance of North Atlantic Right Whales' primary prey species, *Calanus finmarchius*, which have been shown to be declining in the Bay of Fundy and Roseway Basin, but present in the Gulf of St. Lawrence (Plourde et al., 2016).

The primary threats facing this species are ship strikes and entanglement in fishing gear, both of which have contributed to its endangered status and limited population recovery (COSEWIC, 2013). Most notably, an unusual mortality event was declared in 2017 due to the discovery of 12 North Atlantic Right Whale carcasses in the Gulf of St. Lawrence and 5 near the Gulf of Maine. In most of these cases, causes of death we determined to be blunt force trauma due to ship strikes or entanglement in snow crab

fishing gear (Daoust et al., 2017). Since this time, DFO has worked with industries (e.g. fishing, shipping) to drastically change its management measures to protect North Atlantic Right Whales. Mitigation measures that have been implemented include mandatory vessel speed restrictions, snow crab and lobster fishing closures, and experimentation with new fishing gear technologies (DFO, 2018c; DFO, 2018d).

Underwater noise from increased ship traffic, wind or tidal power projects, and offshore oil and gas exploration also threatens North Atlantic Right Whales by causing acoustic disturbance (COSEWIC, 2013), affecting feeding, migration, care for calves and defense against threats (e.g. vessel traffic). Finally, activities that reduce the quantity or quality of prey (e.g. copepods) are also known threats to the North Atlantic Right Whale habitat.

3.4.2 Evaluation & Recommendations

Issue 3.33: General Comment on EA Scope: An ecological risk assessment (ERA) should be completed to quantify potential risks to the health of marine mammals. This requires detailed information on the chemical characterization of the mill effluent including which chemical parameters are present in the effluent and at what concentrations. If chemicals of potential concern to environmental health are identified as being bioaccumulative, this must be fully considered in the assessment of risks to marine mammals. In particular, we are concerned about North Atlantic Right Whale exposure to contaminants, including but not limited to organochlorines that have the potential to be found in pulp effluent, through vector prey species such as *Calanus finmarchius*. Exposure to bioaccumulating chemicals may influence reproduction and population growth (Weisbrod et al., 2000; Durbin et al., 2002) and exacerbate their current endangered status.

> **Recommendation 3.33:** An ERA is required that considers ecological receptors, including marine mammals such as North Atlantic Right Whales, who may be exposed to chemicals of potential concern from the proposed Project.

Issue 3.34: EA Section Reference: EA Section 8.13.2.1 (p. 400): The description of the existing environment for marine mammals, which forms the basis of the Project effects assessment, is limited in many ways. We are therefore concerned that NPNS's conclusion that the Project is unlikely to cause adverse effects on North Atlantic Right Whales (*Eubalaena glacialis)* is inaccurate. Specifically, there is a lack of transparency and certainty regarding baseline data used, a lack of field studies undertaken, and growing uncertainty regarding the distribution of North Atlantic Right Whales in their summer foraging range.

First, there is a lack of transparency and certainty regarding the baseline data that was considered by NPNS. In Section 8.13.2.1, NPNS states that North Atlantic Right Whales are not known to occur in the vicinity of the LAA and that there have been no historical observations recorded in the Northumberland Strait, citing data obtained from the Atlantic Canada Data Conservation Centre (ACCDC) as of 2018, the Department of Fisheries and Oceans (DFO) as of 2017, and the Ocean Biogeographic Information System (OBIS) as of 2018. However, only the raw data from the ACCDC, and not DFO or OBIS, is provided in EA

Appendices for verification. Further, it is unclear whether these data were obtained from systematic surveys or represent incidental observation records.

Based on our own review of existing marine mammal data from the National Oceanographic and Atmospheric Association's (NOAA) Right Whale Sighting Advisory System, it is clear that NARW have been reported in the Northumberland Strait in the past, most recently in 2015 when a female and her calf were spotted in St. George's Bay (Figure 8).

Second, no field work was conducted as part of this EA registration for the marine mammals, sea turtles, and marine birds VEC. Instead, this section relied substantially on the EIA registration for the PEI-NB Cable interconnection upgrade project.

Third, there is growing uncertainty regarding the distribution of North Atlantic Right Whales in their summer foraging range; it is therefore inappropriate to determine they will not occur in the Northumberland Strait. Since 2010, there has been a noticeable shift in the distribution of North Atlantic Right Whales, particularly in their summer foraging range, which has created uncertainty regarding their use and occupancy of habitat in the north Atlantic (Brillant et al., 2015; Davis et al., 2016; Plourde et al., 2016; Meyer-Gutbrod & Greene, 2017). For example, approximately one third of the North Atlantic Right Whale population is not observed in its traditional or known summering habitats, and in some years, they will abandon these areas altogether (Plourde et al., 2016). Additionally, survey efforts for North Atlantic Right Whales within their summering ranges are concentrated around known critical foraging habitats such as the Bay of Fundy and Roseway Basin (Brillant et al., 2015), despite the fact that in recent years they have been concentrating in the Gulf of St. Lawrence (Plourde et al., 2016; Meyer-Gutbrod & Greene, 2018; Meyer-Gutbrod et al., 2018). This northward shift is distribution is driven in part by the changing relative abundance of their primary prey species *Calanus finmarchius*, and recent studies have shown potential new suitable foraging habitat in areas of the southern Gulf of St. Lawrence (Plourde et al., 2016), which is in close proximity to the Northumberland Strait.

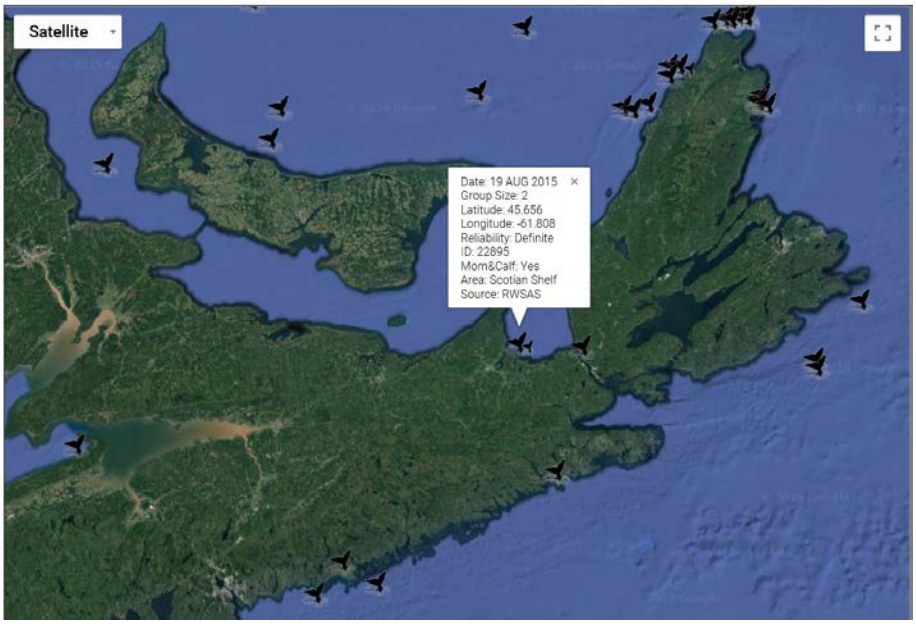

Figure 8. Sighting of North Atlantic Right Whale in the Northumberland Strait in 2015 along with Calf (Source: https://www.nefsc.noaa.gov/psb/surveys/MapperiframeWithText.html)

> **Recommendation 3.34:** The assessment of project effects on marine mammals, sea turtles, and marine birds VEC (Section 8.13) is considered to be incomplete and underscores the need for NPNS to conduct field studies for this Project, especially given growing uncertainty regarding the distribution of North Atlantic Right Whales in their summer foraging range.

Issue 3.35: EA Section Reference: EA Section 8.13.3.2 (p. 417-420): Section 8.13.3.2 does not provide enough information on the methodologies that will be employed by Marine Mammal Observers (MMOs). It is assumed that visual surveying methodologies will be employed based on the specification that MMOs will be equipped with 7x35-power binoculars, but no further details are provided. Visual surveys are known to be limited by a number of factors including daylight, weather conditions, and the availability of suitable monitoring platforms at appropriate times and appropriate locations (Brillant et al., 2015). By contrast, other methods such as passive acoustic monitoring (PAM) can provide continuous coverage of areas that are otherwise difficult to observe visually. Additionally, a rationale was not provided as to why marine mammal monitoring would likely only be undertaken during blasting activities and not all project vessel traffic.

There is also very little information on MMOs reporting requirements and the circumstances under which marine mammal monitoring will be required.

Without these further details on marine mammal monitoring, it is not clear that measures to mitigate the potential adverse effects of the Project on North Atlantic Right Whales will actually be effective.

> **Recommendation 3.35a:** NPNS must provide more detailed information on visual surveying methods and consider completing these in combination with other marine mammal monitoring

methods such as the deployment of passive acoustic monitors or aerial (helicopter or drone) surveys.

Recommendation 3.35b: NPNS must provide more information on MMO monitoring requirements, including information on reporting intervals, accessibility of reports to stakeholders, and whether reporting will trigger any adaptive management measures.

Recommendation 3.35c: NPNS should also consider requiring marine mammal monitoring during all project activities that require vessel travel.

Issue 3.36: EA Section Reference: EA Section 5.3 (p. 49-81); EA Appendix F (p. 1-91); EA Section 8.13.3 (p. 415-424) NPNS acknowledges that marine mammals could be adversely affected by a project-related change in risk of injury or mortality by way of potential collisions with project vessels and equipment (Sect. 8.13.3.1, p. 415). However, there is very little information on the vessel traffic that will be required to complete Project activities (e.g. marine portion of pipeline installation, marine surveying for pipeline route planning, marine outfall construction, pipeline maintenance and inspection, etc.), specifically regarding vessel types, sizes, routes, speeds, and schedules. NPNS does state that "project vessels used for construction and for potential maintenance and repairs during operation will be relatively small in size and draft and will not be present in large numbers" (Sect. 8.13.3.1, p. 417), and that 'Project vessels may operate up to 24 hours a day, 7 days a week during construction" (Sect. 8.13.3.3, p. 420), but this information is not clearly summarized in Section 5.3 or Appendix F in detailed or definitive terms. Subsequently, it is unclear how NPNS came to the conclusion that Project vessels are unlikely to harm North Atlantic Right Whales without providing clear, detailed information on vessel activity.

Additionally, NPNS intends to prevent injury or harm to marine mammals by adhering to general guidelines for vessels operating near marine mammals, as specified in section A2 of the annual edition of Notices to Mariners (DFO, 2018d). This includes measures such as approaching areas of known or suspected wildlife activity with extreme caution, reducing vessel speeds and avoiding approaches within certain distances (e.g. 400m and 100m). However, NPNS has not provided any information on how they intend to detect marine mammal while navigating Project vessels and has stated that they will likely only employ MMOs during blasting activities. This is an information gap that must be addressed.

Recommendation 3.36a: More detailed and definitive information on the vessel traffic (including vessel type, size, route, speed, schedules) that will be required to complete Project activities must be provided and considered in the EA, given potential impacts to marine mammals.

Recommendation 3.36b: NPNS should ensure that observers are present on all Project vessels to identify the presence and location of marine mammals and to ensure appropriate mitigation measures outlined in EA Section 8.13.3.2 are adequately triggered and implemented.

3.5 Cumulative Effects

3.5.1 Summary of EA Content

Cumulative environmental effects are described in the EA as residual environmental effects that are likely to result from a project in combination with the environmental effects of other projects or activities that have been or will be carried out and also referred to as past, present, and reasonably foreseeable future projects or activities (CEA Agency 2014).

The EA claims that the existing environment conditions described in the report reflect the cumulative environmental effects of past and present project activities; however, there is also a need to assess the potential for additional project-related cumulative environmental effects, particularly with respect to potential interactions with other pending projects that are in advanced planning stages, or existing ones that may be subject to modifications or expansion.

The cumulative environmental effects assessment methodology undertaken for the Project is only a high-level approach which is said to have been recommended by the Canadian Environmental Assessment Agency's (CEA Agency) publication titled "Assessing Cumulative Environmental Effects under the *Canadian Environmental Assessment Act, 2012* – Interim Technical Guidance" (CEA Agency 2018).

According to CEAA's guidance document, a cumulative environmental effects assessment should accomplish the following:

- determine if the Project will have a residual environmental effect on a valued component;
- determine if the incremental effect acts cumulatively with the effects of other past, existing, or future actions; and
- determine if, after mitigation, the combined environmental effects may cause a significant change in the VEC.

NPNS acknowledges that there is a high level of existing disturbance in the Northumberland Strait associated with the Northumberland Ferries service, commercial shipping, and commercial fishing in Caribou Harbour and the Northumberland Strait, but that there are few other likely projects or activities in the marine portion of the RAA.

Key cumulative activities that may adversely affect a number of important marine fish and mammal species include increased acoustic emissions, impacts to habitat associated with future dredging activities in Caribou Harbour in support of Transport Canada shipping lane maintenance, potential collisions with other vessels, pollution from bilge water and the accidental release of hydrocarbons.

However, it was determined that most marine fish and mammals are likely to avoid construction activities, and the PFA overall, due to noise and activities. Subsequently, it was predicted that the

residual cumulative effects on marine mammals are not likely to be substantive overall, and that they are not anticipated to extend beyond the PFA.

3.5.2 Evaluation & Recommendations

Issue 3.37: The Gulf of St. Lawrence has been identified as an area of rapid coastal deoxygenation by Claret, M. et. al (2018). Their analysis notes increases in surface water temperature and salinity, as well as decreases in oxygen saturation. This must be accounted for the in the assessment of cumulative effects of the Project, within the EA.

> **Recommendation 3.37:** The EA must assess cumulative effects of the proposed Project on the marine environment, in light of current stressors that have already been identified, including increases in surface water temperature and salinity, as well as decreases in oxygen saturation.

Issue 3.38: In Section 8.14.3.6 (Employment and Economy), within the *Commercial Marine – Harbours, Ferries, and Other Infrastructure* sub-section, the EA describes Northumberland Ferries' operations and traffic and carrying capacity. Yet in the socio-economic section of the EA, there is no analysis or discussion regarding how the potential marine related potential risks may interact as cumulative effects.

> **Recommendation 3.38:** Discussion is required around the interactions between potential impacts from the new ETF discharges from the outfall, and ferry discharges within the harbour and Strait, and in turn the implications for ecological and human health risks, from a cumulative effects assessment standpoint.

3.6 Human Health

3.6.1 Summary of EA Content

A human health risk assessment (HHRA) was not completed as part of the Environmental Assessment Registration Document submission. Rather, NPNS completed a Human Health Evaluation (HHE), intended to prepare for the potential completion of an HHRA, which could be required as part of the conditions of approval for the Project (as stated in the EA). The HHE followed guidance from Health Canada.

The Human Health Evaluation focused on two primary sources of emissions or discharges that have the potential to result in exposure of humans to project-associated chemicals, namely (1) treated effluent released to the marine environment and (2) air emissions from the replacement effluent treatment facility and the existing NPNS mill. As such, the following human health exposure pathways were considered in the HHE for infants, toddlers, children, teens and adults:

- Incidental direct contact with sea water and/or marine sediments;
- Ingestion of marine food items, including those that are part of the commercial fishery and aquaculture;

- Inhalation of air contaminants during construction, operation and maintenance phases of the Project; and

- Ingestion of potentially impacted drinking water.

A quantitative assessment of potential exposures to project-associated chemicals of potential concern (COPC), and any resulting human health risks was not completed in the EA. This is, in part, due to the project-specific effluent chemistry not being fully known (because the chemical process engineering design work has not been completed). As such, the chemical composition of the effluent, including chemical concentrations, has not been fully characterized. Eventually, in the HHRA, it is expected that COPCs will be chosen based on an evaluation of baseline data, chemical toxicity, amount released, chemical fate and behaviour, and the resulting environmental concentrations.

As part of the HHE, NPNS completed a review of published reports (i.e., reports from Toxikos, 2006; Hewitt et al., 2006 as referenced in the EA) to inform the prediction of COPCs. It is stated, within the EA Registration Document, that the list of COPCs for the Project is expected to be relatively small and may include metals/metalloids (including mercury), polycyclic aromatic hydrocarbons (PAH), polychlorinated dibenzo(*p*)dioxins and furans, resin acid compounds, chlorophenolic compounds, non-chlorinated phenolic compounds and chlorinated volatile organic compounds (VOC).

3.6.2 Evaluation & Recommendations

Issue 3.39: A Class 1 Environmental Assessment does not specifically require the completion of an HHRA prior to the registration of the Project EA. However, the "Proponent's Guide to Environmental Assessment, September 2017" issued by Nova Scotia Environment, states that the registration document for a Class 1 undertaking should include any effects on environmental health, such as contaminants that may affect human health that will be released into the atmosphere, water or land. In addition, it is stated that the information included in the registration document needs to be sufficient for the Minister to make a decision on the undertaking. Without a complete HHRA that clearly quantifies potential exposures and risks (if any) to project-associated chemicals of potential concern, it is unclear how this stipulation will have been met through the provision of the HHE. Given the potential for risks to human health to occur as a result of exposure to chemicals of potential concern related to the proposed Project, the Human Health Evaluation, as presented, is not considered to be an adequate assessment of health risks.

> **Recommendation 3.39:** A robust and comprehensive assessment of potential health risks (i.e., through the completion of a Human Health Risk Assessment) is required in order to determine if adverse health effects from the Project are likely.

Issue 3.40: Overall, within the EA Registration Documents, numerous assumptions are made regarding potential impacts to the receiving environment. It is unclear if an adaptive management plan or strategy has been developed should some of these assessment predictions differ from what is observed when the Project commences.

Recommendation 3.40: An adaptive management plan should be provided to address discrepancies between project assumptions and predictions, and what is found to occur in the environment once the Project begins. This plan should include an assessment of changes to predicted risks to human health, should the Project assumptions not hold true.

Issue 3.41: Section 9.2 - It is noted that Pictou Landing First Nation members traditionally harvest various species including lobster, rock crab, herring and American eel; however, the extent and details of their harvesting and consumption patterns are not known. It is also stated that possible local harvesting and consumption of bivalve shellfish may occur along shoreline areas around Caribou and Munroes Island. There appears to be uncertainty regarding fish consumption activities for both Indigenous and non-Indigenous people within the assessment area. This is a significant data gap in understanding the potential human health impacts related to the proposed Project.

Recommendation 3.41: The assessment of potential risks (if any) to human health associated with the Project requires a fulsome understanding of both the exposure concentrations of Contaminants of Potential Concern in the marine environment, and the exposure pathways identified as being of concern to human health (i.e., the consumption of fish and shellfish).

Issue 3.42: Section 9.1 – It is stated that effluent chemistry (i.e., chemicals present and their associated concentrations) is not known and won't be known until the Project is operational. In addition, other areas of uncertainty listed in the Project documents include limited (recent or current) environmental baseline data and food item chemistry data, and limited data on traditional harvesting and consumption patterns. As such, the Human Health Evaluation, as presented in the assessment, is based only on data and study results currently available. Again, the data gaps, as described by NPNS, are significant barriers to properly assessing potential risks to human health. It is unclear when a more robust set of baseline environmental data will be obtained and why this was not completed prior to the Project being registered. Baseline data is of extreme importance to the EA process, and specifically to the identification of Contaminants of Potential Concern in the assessment of health risks. In fact, within the EA, it is stated that consultation with Health Canada in relation to the HHE and potential HHRA resulted in a stated expectation by Health Canada to include both baseline and future conditions exposures scenarios.

Recommendation 3.42: A more robust assessment of baseline conditions (such as water quality, sediment quality, land use patterns, fish consumption rates and other relevant environmental attributes) must be completed prior to project approval, to understand potential risks to human health related to the Project.

Issue 3.43: Section 9.3 - With respect to air emissions, it is anticipated that a pilot study of the combustion of hog fuel and sludge in the power boiler will be conducted. Can NPNS confirm that this will be completed? It should be noted that Health Canada, in consultation with NPNS regarding potential health risks, outlined expectations regarding the need for an evaluation of potential changes in local air quality due to co-burning of sludge in the power boiler.

Recommendation 3.43: NPNS must confirm that the pilot study will be completed to evaluate the potential impacts to air quality due to the combustion of hog fuel and sludge in the power

boiler and must outline adaptive management strategies should the results of the air monitoring and pilot study not align with the assumptions and predictions of the current assessment.

Issue 3.44: Section 9.2.4.1 – Stantec (2019) reported that ambient air monitoring data for 2015, 2016, and 2017 showed no exceedances of the applicable Nova Scotia regulatory Air Quality Criteria for monitored air contaminants. It is unclear if 2018 data are available.

> **Recommendation 3.44:** If 2018 air monitoring data are available from Stantec (2019), they should be included in the assessment.

Issue 3.45: Section 9.2.4.1 – It is stated that based on modeling results, predicted concentrations of the air contaminants of concern—namely CO, NO_2, SO_2, TSP, $PM_{2.5}$ and H_2S—from the operation of the existing and future mill are expected to be in compliance with the reference criteria at the representative off-property discrete receptors. Modelled exceedances of H_2S were estimated to occur less than 0.05% of the time and believed to be an artifact of model inputs. However, it was reported that some odour occurrences were found that were associated with H_2S. A more fulsome discussion of what is meant by an artifact of model inputs is required. The EA does not discuss which adaptive management measures will be put in place to manage non-compliance issues should actual air emissions differ from predicted air emissions.

> **Recommendation 3.45:** Details are required regarding adaptive management measures, to address the potential for actual air emissions to be greater than predicted emissions (based on modelling exercises). In addition, further discussion in the EA is needed regarding what is meant by an artifact of model inputs related to modelled exceedances of H_2S (Section 9.2.4.1).

Issue 3.46: Section 9 and Table 12.1-2 – The Human Health Evaluation did not acknowledge or address the potential for cumulative effects to impact overall human health. Surrounding land uses, including agricultural areas, may contribute to the overall contaminant load in the receiving water, and subsequently marine food items.

> **Recommendation 3.46:** The potential risks to human health associated with cumulative impacts of the Project and current stressors must be considered in the assessment.

3.7 Socio-Economics

3.7.1 Summary of EA Content

Within NPNS's EA for its new effluent treatment facility, the socio-economic environment was considered for its "potential interaction with local communities, how land and water is used in the vicinity of the Project, and the potential interaction between the Project and the economic well-being of these communities" (Section 8.14).

The socio-economic environment's LAA is represented by the communities whose activities

intersect with the PFA and includes: Pictou Landing First Nation, local residents, and local industries located in the Municipality of Pictou County or the towns of New Glasgow, Stellarton, Pictou, Westville, and Trenton.

Within the EA socio-economic section introduction, NPNS describes the interdependencies of other VECs that need to be considered to assess impacts to the social and economic values, including health of communities, accidents and malfunctions, noise, air quality, heritage resources, drinking water, fishing, connection to the water and land (i.e., recreational enjoyment). The mitigations described for addressing the potential socio-economic effects that NPNS has identified within its Project's EA involve:

a) Mitigations and assessment results within other EA sections (i.e., Section 8.11 - Effects on harbour physical environment, water quality, and sediment quality; and Section 8.12 - Marine Fish and Fish Habitat);

b) A communication plan (i.e., notifications to surrounding communities during construction)

c) Ongoing engagement and information exchanges with the Community Liaison Committee;

d) Noise and dust management through the EPP;

e) Scheduling work to avoid or minimize interactions with other VECs (e.g., ferries, fisheries)

f) Possible future mitigations should DFO or TC deem it necessarily as a result of their review.

During construction, the Proponent has identified the following potential effects that could occur on various aspects of the Socio-economic environment:

- Potential localized impact to commercial fisheries in the area due to construction interactions with target species;
- Short-term interruption to Jitney Trail use while construction occurs in that vicinity;
- Potential for periodic, short-term but planned delays to marine traffic including the NS-PEI Ferry and commercial fisheries leaving the marinas east of Northumberland Ferries marine terminal during construction stage where the pipeline route is anticipation to cross the navigational channel;
- Potential short-term traffic delays; and
- Potential for short-term nuisance (e.g., noise, dust) to local residents from construction activities, particularly in the vicinity of Caribou where residences are along Highway 106.

The Proponent states that with mitigation measures applied, the residual environmental effects of the Project on the socio-economic environment during construction will be temporary and not significant in nature.

During operation, NPNS states that "[A]s a result of the design and mitigation measures proposed, residual environmental effects are not expected to the socio-economic environment during operation and maintenance" (Section 8.14.4.3 Characterization of Residual Environmental Effects). The rationale provided is based on the following points or mitigations:

- The measures outlined in the EPP and the mitigation measures identified for other VECs will mitigate interactions with the socio-economic environment;
- Follow up and monitoring will be completed to monitor the environmental effects of the Project and mitigation any (socio-economic) impacts;
- Communications and Compensation Plan for Commercial Fisheries and Aquaculture, in coordination with NSE, DFO, and potentially impacted stakeholders;
- Anyone with concerns about the Project and its interactions with the environment may contact NSE's Area office in Granton; and
- The Community Liaison Committee will continue to facilitate two-way communication and advice to NPNS

Follow up and monitoring related to socio-economic value components will entail the mitigations listed within other VECs and ongoing meetings with the Community Liaison Committee.

3.7.2 Evaluation & Recommendations

Issue 3.47: In Section 8.14.1 (Boundaries), the EA states that "once the ETF or pipeline is nearing the end of a useful service life, a decommissioning plan will be developed and will be submitted for a separate review requiring NSE approval". It is unknown what the pipeline's anticipated lifecycle will be before land disturbance will be required again for its decommissioning, upgrading or replacing.

> **Recommendation 3.47:** Provide information on the pipeline's lifecycle length and anticipated activities for its decommissioning (i.e., expansion, upgrades, replacement etc.)

Issue 3.48: In Section 8.14.2 (Interdependency with Other VECs), NPNS identifies the environmental VECs and impacts that the socio-economic environment relies on to identify impacts including: health of communities, accidents and malfunctions, noise, air quality, heritage resources, drinking water, fishing, connection to the water and land (i.e., recreational enjoyment). Although briefly discussed in the baseline section, missing in the EA are VECs and associated potential effects that reflect the economic and social factors triggered by the Project such as impacts to the local and regional economy, employment, and dynamics during construction phase (e.g., construction activities, workforce and social issues; direct, indirect and induced positive and adverse economic impacts).

NPNS must include VEC, and more importantly, a robust and consistent effects assessment on indicators related on the acknowledged VEC "health of communities" to capture missing elements of health and wellbeing, including the protection of a resilient fishery and associated economies including harvesting

and processing plants; employment, analysis of economic risks and/or benefits at community, regional and provincial level; description for, and management plans for anticipated workforce at both construction and operation phases.

Issue 3.49: In Section 8.14.3.4 (River and Marine Based Uses), NPNS states that "The lobster fishery has for many years been the largest fishery in the area by landing value (DFO 2008 and DFO 2017). However, the assessment of socio-economic effects will not place the importance of this fishery above others. An 'ecosystem approach' for impact assessment that looks at the health and resilience of the Strait as a whole was put forward and confirmed during discussions with all stakeholders, fishermen, and Pictou Landing First Nation." Later in the assessment however, there is no evidence of how stakeholder, fishermen and Pictou First Nation's concerns regarding direct and indirect impacts on the health of the marine eco-system nor fishing economy have been considered into the EA, let alone an ecosystem approach to the effects assessment (e.g., inclusion of eco-systemic interdependencies; species lifecycle differences; food chain dependency ripple effects across species etc.); there is no acknowledgement of industry and conservation efforts to maintain the integrity of commercial fisheries; there is no indication of understanding or indication of interest to understand the direct adverse economic and social impacts any disruption in fishing will have on harvesters – both Indigenous and non-indigenous, in the region; nor indication of how individuals within the lobster fishery or other fisheries (or their children as future participants in the fisheries sector) will be compensated or accommodated for losses as a result of the Project's construction and/or operations activities - missing just a *few days* of the fishing season is a *serious impact to fisheries*. Moreover, an analysis of the risks to a province and region whose economy is primarily dependent on its fisheries sector is absent from the socio-economic section altogether.

> **Recommendation 3.49a:** Apply an actual ecosystem and integrated approach for the effects assessment that considers VEC interdependencies and an economic risk analysis to other economic sectors in the region – fisheries in particular;
>
> **Recommendation 3.49b:** Provide a detailed description of the region's economic reliance on commercial fisheries, including individual harvester economic baselines and dependencies as they relate to fishing.
>
> **Recommendation 3.49c:** Provide analysis of the Project's construction and operation phase effect mechanisms and interactions with harvesters' ability to fish (in terms of access); as well as potential risks to fishing economy due to risks to species' habitat, spawning area integrity and health.
>
> **Recommendation 3.49d:** Describe how individuals within the lobster fishery (and other fisheries) will be compensated or accommodated for losses as a result of the Project's construction and/or operations activities. An explicit acknowledgement of the adverse economic impacts (and in turn social impacts on regional and community wellbeing and health) for fishers when even just a few days of fishing are interrupted is critical for a balanced effects assessment.

Issue 3.50: In Section 8.14.3.6 (Employment and Economy), within the *Manufacturing* sub-section, the EA describes how "…NPNS directly employs over 330 residents of Northern Nova Scotia; provides indirect and induced employment to Pictou County and the province of Nova Scotia in general; and that

NPNS' operations' maintain and create well over 2,000 jobs across the province in the forestry sector". This is appropriate baseline information, however the baseline information for employment and economy has a glaring, inappropriate and unacceptable omission of information to describe the how the region's socio-economic resilience is uniquely and primarily dependent on the health of the Northumberland Straight ecosystem to maintain the Province's primary economic sector: fisheries.

For instance, according to the Nova Scotia Department of Fisheries and Aquaculture, there are over 18,000 people working in the fishing sector within the Province; Lobster is the most valuable seafood export ($947 Million in 2017); followed by crab ($314 Million); scallops ($144 Million); and shrimp ($126 Million) (Nova Scotia Department of Fisheries and Aquaculture, https://novascotia.ca/fish/). In 2012, the lobster fishing industry in the Gulf Region consisted of 2,966 commercial lobster licence holders which included 215 communal commercial licences held by 18 Aboriginal organizations. Each of these commercial enterprises employs numerous people, bringing the total to about 7,100 individuals involved in the harvesting sector in the Gulf Region. In addition, there were nine Indigenous organizations which received communal lobster fishing licences for food, social and ceremonial (FSC) purposes (Fisheries and Oceans Canada, 2014).

The baseline neglects to acknowledge the Province's primary economy altogether: Of Nova Scotia's 5.4 billion export economy, seafood amounted to $2 billion in 2017. Lobster and crab account for $1.26 billion (Nova Scotia Department of Fisheries and Aquaculture; Government of Canada, n.d.). The baseline does not mention Government of Nova Scotia and fishing industry efforts and plans for the region such a legislated mandate to promote, support and develop the fishing, aquaculture, seafood processing and sportfishing industries that contribute to the economic, environmental and social prosperity of Nova Scotia's coastal and rural communities (Government of Nova Scotia, 2018).

Despite a hasty mention of these value components, 'economy' or 'employment' are not actually described in a way that reflects the region's socio-economic reality and are not carried forward at all into the socio-economic impact assessment. No analysis has been conducted of the risks that the Project's short- and long-term activities will pose to the existing, heavily relied upon, commercial fishing sector. This is unacceptable. A more comprehensive baseline is required to demonstrate the unique socio-economic regional context surrounding the proposed Project so that potential effects can be more accurately considered and in turn avoided or mitigated. As referenced in AMEC's *Northumberland Strait Ecosystem Overview Report* (2007), "[L]obster provides the largest share of total landed values for the main species (approximately 85%), and declines in this species alone are cause for concern"…"…the magnitude and longevity of the decline in commercial fisheries for highly dependent communities is more problematic than cyclical patterns experienced elsewhere or in the past (AMEC, 2007. Accessed from: https://docs.wixstatic.com/ugd/b61814_1639a02cebd94db4ba24787ad9a4cac7.pdf.)

Moreover, there has not been any consideration of other facets of the commercial fishing sector such as processing plants in Pictou County, and potential project interactions (e.g., between the plant's water intake pipes and NPNS's effluent discharge areas; such interactions could have devastating human health and economic impacts to the sector and product consumers).

Recommendation 3.50: NPNS must provide a balanced and accurate description of the existing regional socio-economic context, including regional health and wellbeing dependencies on the fish harvesting and fish processing sectors. Using complete baseline information, an economic effects assessment is required that carries forward information referred to within the baseline section including: Project effect mechanisms and interactions with existing fisheries economic sector, at a granular level i.e., net losses anticipated due to forecasted days of interruptions due to construction and operations); human health effect mechanisms and interactions with economic risks related to fish processing plant operation requirements and interactions with effluent discharges; project workforce requirements; wages and salaries, and supply chain procurement needs during both construction and operations.

Issue 3.51: In Section 8.14.3.6 (Employment and Economy), within the *Tourism* sub-section, the EA describes how tourism in the county and region is heavily relied upon for its revenues. Given the level of priority this is for the LAA, the EA would have benefited from more relevant information within its baseline and EA analysis.

Recommendation 3.51: Provide more baseline information describing the specific aspects of the tourism sector within the LAA that have inter-connections with water – either from recreational usage or from drinking and/or other water uses. These details would be relevant within an eco-system approach to the socio-economic impact assessment**.**

Issue 3.52: In Section 8.14.4.1 (Potential Environmental Effects), NPNS identifies the following (8) potential socio-economic related effects that may occur as a result of construction:

1. Temporary delays to Nova Scotia – Prince Edward Island ferry due to marine construction;
2. Temporary delay or access distribution to marine areas (commercial or recreational) due to marine construction;
3. Traffic delays could occur on Highway 106 during construction;
4. Traffic delays (vehicular and ferry) discouraging tourists from entering the area or using the ferry;
5. Local road network could deteriorate from additional vehicular use due to traffic detouring;
6. Temporary nuisance (noise, dust) could be perceived by local residents during construction;
7. Temporary property access disruption to properties adjacent to construction may occur, particularly in vicinity to residents along Highway 106 at Caribou Harbour; and
8. Temporary access disruption to section of Trans Canada Trail or other recreational uses on land during construction of the effluent pipeline

These effects list access and disruption issues to various economic sectors and related activities, which in turn would negatively impact the local economy. However, the potential risk of these adverse effects are minimized if not completely ignored; they are not discussed nor analyzed. Mitigations from other VECs are referred to as the solution and in turn no effects of consequence are predicted. Unfortunately, as this technical review report demonstrates, the EA is riddled with data gaps and generic mitigations that simply do not provide confidence in their ability to address the potential risks as a result of the Project's construction and operations activities.

There is also mention of noise and dust nuisance, which is related to human health. Missing from this list of project effect mechanisms and interactions is the consideration of:

- Adverse social impacts to individuals and families who rely on uninterrupted or disturbed access to the fisheries;
- Cumulative effect of effluent discharge and ferry related discharges in the harbour and straight; which in turn have implications for human and eco-systemic health;
- Increased health and safety risks from an increase in traffic along Hwy 106 (i.e., vehicular/human accidents)
- Socio-economic impacts related to employment and supply chain procurement during construction and operations; and
- Potential social impacts related to the temporary construction workforce.

Recommendation 3.52: NPNS must provide information and analysis of the following:

a) Discussion and analysis of risks and in turn, potential adverse social impacts to individuals and families who rely on uninterrupted or undisturbed access to the fisheries; including mitigations for avoiding this adverse impact.

b) Identification of positive socio-economic effects from employment during the 21-month construction period as well as operations and maintenance. It is acknowledged that the Project description states that no additional jobs would be created during operations as existing personnel would be retrained for the new facility. Both phases of the Project need to be discussed in terms of what economic benefits would occur (even if no change during operations) within the socio-economic effects assessment. This allows the impact evaluation to demonstrate both the potential negative as well as the potential positive socio-economic impacts that would be predicted as a result of the Project's various activities, including employment generation and associated indirect and induced impacts during the 21 months' construction.

c) A description of human and ecological health pathways, project interactions and effect mechanisms within the socio-economic effects assessment including a human health

risk assessment (i.e., drinking water within the LAA's wells; recreational water usage; Indigenous community members' land uses, water and wild foods consumption).

d) A discussion and demonstrated planning for health and safety considerations of the surrounding communities as related to construction, should there be a temporary, non-resident workforce hired for construction. Include whether the construction workforce will be housed in surrounding local communities and/or within temporary workcamps. How many workers are anticipated to be hired for the construction phase?

Issue 3.53: In Section 8.14.4.1. (Potential Environmental Effects), within the *Operations and Maintenance* sub-section, NPNS identifies the following (2) potential socio-economic related effects that may occur as a result of operations:

1. Interference with resources harvested for cultural, commercial, and recreational uses (e.g., if Project introduces odour, or negatively affects fisheries); and

2. The project impacts could negatively affect the local economy by interfering with resources needed for goods production, or transportation of those goods

Similar to the issues identified with the potential effects mentioned for construction, there is little acknowledgement (if not dismissal) of the risks the long term effects the operations will have on the local and regional fisheries. And based on the review of the fisheries, water and other aspects of the Project's design within the EA's registration documents, there are too many gaps in data and modelling to dismiss the potential for long term effects on the health of species; their habitat and/or migration due to effluent discharge and/or temperature change from the outfall.

Also missing from this assessment is consideration of impacts on tourism due to visual impacts and/or human health risks and/or perceived fear of recreational marine use; nor is there consideration of effects from pipeline integrity management activities (e.g., integrity digs and associated land disturbances).

Recommendation 3.53a: NPNS must provide discussion and analysis of potential effects to the health and integrity of the region's commercial fisheries based on results of more comprehensive effluent modelling, data upgrades and effects analysis as per the results of this EA's technical review of these inter-dependent VECs.

Recommendation 3.53b: NPNS must provide discussion and analysis of tourism impacts and human health risks related to Indigenous land and resources, and non-Indigenous lands and resources (i.e., drinking water and marine based recreation)

Recommendation 3.53c: NPNS must provide discussion and analysis of potential impacts of pipeline operations and maintenance (specifically integrity digs) on land and resource use for both Indigenous and non-Indigenous citizens.

Issue 3.54: In Section 18.4.2 (Mitigation), under the *Construction* sub-section, NPNS puts forth the following recommended mitigations to address the identified socio-economic impacts during construction:

"Standard construction best practices" for…

1. Communication;
2. equipment operation;
3. construction staging; and
4. Roads which are travelled regularly by construction vehicles will be repaired.

The suggested mitigations are seemingly abstract plans without details nor commitments. In some cases, they are simply referred to as discussions to occur with various government agencies such as DFO. And all is deferred to mitigations within other VEC sections such as water and fisheries (8.11 and 8.12). The results of the review of these sections, however, point to limited or outdated data from which assumptions have been made in regards to impacts. And mitigations for water and fisheries are relatively general. There is not enough information, nor solid enough mitigations in place to provide assurance for the minimization and dismissal of the socio-economic effects.

> **Recommendation 3.54:** NPNS must provide more fulsome consideration, description and commitment for specific mitigation, management and monitoring measure to address both the ecological and social factors related to the Project's activities at construction and operations as listed in previous comments.

Issue 3.55: In Section 8.14.3.6 (Employment and Economy), within the Manufacturing sub-section, the EA describes how "…NPNS directly employs over 330 residents of Northern Nova Scotia; provides indirect and induced employment to Pictou County and the province of Nova Scotia in general; and that NPNS' operations' maintain and create well over 2,000 jobs across the province in the forestry sector". This is appropriate baseline information, however the baseline information for employment and economy has a glaring, inappropriate and unacceptable omission of information to describe the how the region's socio-economic resilience is uniquely and primarily dependent on the health of the Northumberland Straight ecosystem to maintain the Province's primary economic sector: fisheries.

For instance, according to the Nova Scotia Department of Fisheries and Aquaculture, there are over 18,000 people working in the fishing sector within the Province; Lobster is the most valuable seafood export ($947 Million in 2017); followed by crab ($314 Million); scallops ($144 Million); and shrimp ($126 Million) (Nova Scotia Department of Fisheries and Aquaculture, https://novascotia.ca/fish/). In 2012, the lobster fishing industry in the Gulf Region consisted of 2,966 commercial lobster licence holders which included 215 communal commercial licences held by 18 Aboriginal organizations. Each of these commercial enterprises employs numerous people, bringing the total to about 7,100 individuals involved in the harvesting sector in the Gulf Region. In addition, there were nine Indigenous

organizations which received communal lobster fishing licences for food, social and ceremonial (FSC) purposes (Fisheries and Oceans Canada, 2014).

The baseline neglects to acknowledge the Province's primary economy altogether: Of Nova Scotia's 5.4 billion export economy, seafood amounted to $2 billion in 2017. Lobster and crab account for $1.26 billion (Nova Scotia Department of Fisheries and Aquaculture; Government of Canada, n.d.). The baseline does not mention Government of Nova Scotia and fishing industry efforts and plans for the region such a legislated mandate to promote, support and develop the fishing, aquaculture, seafood processing and sportfishing industries that contribute to the economic, environmental and social prosperity of Nova Scotia's coastal and rural communities (Government of Nova Scotia, 2018)

Despite a hasty mention of these value components, 'economy' or 'employment' are not actually described in a way that reflects the region's socio-economic reality and are not carried forward at all into the socio-economic impact assessment. No analysis has been conducted of the risks that the Project's short- and long-term activities will pose to the existing, heavily relied upon, commercial fishing sector. This is unacceptable. A more comprehensive baseline is required to demonstrate the unique socio-economic regional context surrounding the proposed Project so that potential effects can be more accurately considered and in turn avoided or mitigated. As referenced in AMEC's Northumberland Strait Ecosystem Overview Report (2007), "[L]obster provides the largest share of total landed values for the main species (approximately 85%), and declines in this species alone are cause for concern"…"…the magnitude and longevity of the decline in commercial fisheries for highly dependent communities is more problematic than cyclical patterns experienced elsewhere or in the past (AMEC, 2007).

Moreover, there has not been any consideration of other facets of the commercial fishing sector such as processing plants in Pictou County, and potential project interactions between the plant's water intake pipes and Northern Pulp's effluent discharge areas. Such interactions could have devastating human health and economic impacts to the sector; product consumers; and workforce employed by the plants:

For instance, there is no mention within the baseline section of the North Nova Seafoods Processing Plant in Pictou County, a fish processing plant in very close proximity to the proposed effluent outfall. The plant operates year-round processing a variety of species and employs over 150 people in Pictou County amounting to over $Million in wages. Approximately 60 of the employees are fishermen that operate from NNS's private wharf in Caribou in front of the processing plant. In addition, the plant supports fishermen from 10 other wharfs on the Northumberland Strait and an additional 50 wharfs in Cape Breton to Yarmouth and into PEI and NB (Paul Logan, North Nova Seafoods).

Critical to the processing plant's operations is its use of an intake pipe in the harbour that uses water for the plant's cleaning process. The water is tested regularly to ensure that it is cleared to use. This is a very sensitive issue as the plant is making a ready to eat product and there are strict CFIA guidelines that are followed. The plant's intake pipe will be a few kilometers away from where the proposed effluent pipe is going to be located. With a proposed discharge of 70-90 million litres of treated effluent from a bleached kraft mill every day, it will prevent the plant from using the intake pipe for the necessary water to operation (Paul Logan, North Nova Seafoods). This will have substantial adverse ecological, and in

turn socio-economic impacts by way of possible human health issues from product contamination and may result in the closure of the processing plant which would have devastating economic impacts to the region.

Figure 9. Location of Nova North Seafood Processing Plant in Relation to Northern Pulp's Proposed Outfall Location

Recommendation 3.55: Provide a balanced and accurate description of the existing regional socio-economic context, included regional health and wellbeing dependencies on the fish harvesting and fish processing sectors. Using complete baseline information, an economic effects assessment is required that carries forward information referred to within the baseline section including: project effect mechanisms and interactions with existing fisheries economic sector, at a granular level (i.e., net losses anticipated due to forecasted days of interruptions due to construction and operations); human health effect mechanisms and interactions with economic risks related to fish processing plant operation requirements and interactions with effluent discharges; project workforce requirements; wages and salaries, and supply chain procurement needs during both construction and operations.

4.0 Conclusion

As outlined above, numerous issues and concerns related to ETF design, effluent modelling, impacts to the marine environment, socio-economics, as well as risks to human and ecological health have been identified in the review of the Project EA Registration Documents.

Given the significant information and data gaps outlined in this technical review, it is apparent that the Minister has not been provided with the appropriate data and information required to make an informed decision regarding the Project. A lack of baseline environmental data, effluent chemical composition data, quantified risks to human health and marine life, and a detailed socio-economic assessment, indicates that the potential for 'adverse effects or environmental effects' of the proposed undertaking has not been adequately characterized. The EA does not acknowledge or address the magnitude of potential adverse effects on the region's commercial fisheries and the thousands of (Indigenous and non-Indigenous) citizens who are dependent on a resilient fishery.

As such, in our professional opinion, the Project cannot be approved as currently registered. Given the numerous issues, data gaps and information gaps identified in the EA, we recommend that the Minister, as per Section 13 of the Environmental Assessment Regulations made under Section 49 of the Environment Act, determine either that

- the registration information is insufficient to allow the Minister to make a decision and additional information is required (Section 13(1) (a)), or

- a review of the information indicates that there may be adverse effects or significant environmental effects caused by the undertaking and an environmental-assessment report is required (Section 13(1) (d)).

From:
To: Environment Assessment Web Account
Subject: Proposed project for affluent disposal from Northern Pulp
Date: March 8, 2019 3:10:32 PM

A Federal Assessment is needed.
There is a conflict of interest in having the Nova Scotia Government approve, regulate and manage the treatment facility. I own wood lots in Pictou County.
I live at Waterside on the shore of Northumberland Strait. Our family, all three generations of us, swim in this water from the first of July till the first of October. My cousins and neighbours fish lobsters, herring, scallops and tuna from Toney River and Caribou in this water. This is the richest fishing grounds in the Strait.
Clear cut forestry practices are not sustainable. Northern Pulp can not depend on continuous supply of a diminishing resource. It is not sustainable or desirable. Forestry practices have to be implemented that will enhance a more natural forest flora and fona with a more diverse species mix. Saw mills will continue to have lumber sales and the mill in Port Hawkesberry and others want to purchase chips. Larger logs make more lumber and have more value. The Layhee report makes recommendations on the future of forestry practices.
Tourism and the sales of seafood depend on a clean and un contaminated environment. Health needs to be our top priority for ourselves, our children and grandchildren. There are unknown substances in the water effluent and the air pollution. A Federal Assessment is needed.

Dear Minister Miller;

Attached and below please find our concerns re:

Northern Pulp's Replacement Effluent Treatment Facility Project.

Thanks for your consideration,

on behalf of the North Shore Nova Scotia Chapter, Council of Canadians

---

March 6, 2018

Honourable Margaret Miller
Minister of Environment
Nova Scotia Environment
PO Box 442
Halifax, NS B3J 2P8

Submitted via email ea@novascotia.ca

Dear Minister Miller,

On behalf of the North Shore Council of Canadians, I am writing to you with respect to **Northern Pulp's Replacement Effluent Treatment Facility Project.**

Founded in 1985, the Council of Canadians is Canada's leading social action organization, mobilizing a network of 60 chapters across the country, including the NORTH SHORE NOVA SCOTIA chapter covering the north shore from Pictou to Pugwash.

Through our campaigns we advocate for clean water, fair trade, green energy, public health care, and a vibrant democracy. The Council of Canadians is a registered non-profit organization and does not accept money from corporations or governments.

In making your decision under subsection 34(1) of the *Environment Act* and with respect to Section 12 of the Environment Assessment Regulations, we urge you to consider the following points:

1. **Concerns expressed by aboriginal people**

On January 31, 2018, members of the North Shore Council of Canadians travelled to Pictou Landing First Nation (PLFN) to take part in the community's official one year countdown of the Boat Harbour Treatment Facility.

Member after member of the PLFN, from school children to elected leaders, spoke passionately about the many losses they have suffered since the pulp mill effluent was first piped into the nearby estuary of Boat Harbour in 1967. These losses include a valuable fishery, medicinal plants, recreational use of the water and use of surrounding land for traditional cultural practices. In 2014, a break in the pipe leaked 47 million litres of pulp effluent onto PLFN land damaging much infrastructure.

There is no question that the community of PLFN expects the province to honour the *Boat Harbour Act* and close the current effluent treatment plant on schedule in 2020.

We urge the Minister not to grant Northern Pulp's last minute request to delay the closure and remediation of Boat Harbour. There have been too many broken promises to the PLFN community.

2. **Risk to Pictou watershed**

Northern Pulp's route for their new effluent pipe to the Northumberland Strait crosses the town of Pictou's watershed and the Caribou wellfield, a source of domestic drinking water for the town and some people in the area.

The Council of Canadians is a leader in fights to protect Canada's freshwater sources. Maude Barlow, Honorary Chairperson of the Council of Canadians, served as Senior Advisor on Water to the 63rd President of the United Nations General Assembly and was a leader in the campaign to have water recognized as a human right by the UN.

Communities and governments must not ignore threats to water security such as the threat posed by an effluent pipe leak from Northern Pulp.

There is a documented history of leaks from Northern Pulp's effluent pipe. This suggests that there is a very good probability of leaks from an effluent pipe in the future.

The consequences of an effluent leak into the Pictou watershed could be catastrophic. Such an event would not be easily or cheaply reversed, if indeed mitigation was even possible.

We urge the Minister not to put the drinking water of the town of Pictou at risk.

3. **Inadequate community consultation and time for meaningful response**

The public consultations failed to include all of the communities affected by the Northern Pulp Replacement Effluent Treatment Facility Project.

Communities outside of the immediate geographic areas of the PLFN and town of Pictou were not afforded public consultation opportunities, despite the fact that air emissions travel to these communities. People know the air emissions travel because on some days, there is an obvious smell from the mill.

Furthermore, the proposed treatment system runs the risk of harming sustainable industries all along the North Shore. The tourism industry prides itself on warm, clean water and world class sandy

beaches. The commercial fisheries relies on sustainable wild shellfish that is shipped all across the world. Communities such as Wallace, Tatamagouche and River John, for example, are all identified as sharing in the Northumberland Strait "brand". Even if only one part of the Northumberland Strait suffers environmental damage from Northern Pulp's effluent pipe, it will be impossible for other communities and their tourism and seafood businesses to disassociate themselves from that negative image.

Additionally, the 30-day period for public response to some 2,000 pages of technical documents does not permit meaningful citizen review and input.

We urge the Minister to ensure meaningful public consultations in all Nova Scotian communities along the Northumberland Strait.

To conclude, we urge you to respect the precautionary principle in weighing the information before you. The risks to our health, environment and community well being are high.

Given all that is at stake, we are calling on you to reject the proposed Northern Pulp Replacement Effluent Treatment Facility Project.

Sincerely,

for Shore Nova Scotia Chapter, Council of Canadians

Subject: Proposed Project Comments
Date: March 8, 2019 3:15:16 PM

Project: replacement_effluent_treatment_facility_project Comments: Tourism Industry Association of Nova Scotia TIANS RESPONSE to Environmental Assessment from Northern Pulp Tourism in Everybodyâ?Ts Business and occurs in every community and every corner of Nova Scotia yet the topic of Tourism only warranted one page 483 in the NP Environmental Assessment that the Tourism Industry Association of Nova Scotia TIANS addresses with this communication. The release of Northern Pulpâ?T s Environmental Assessment was extremely disappointing in relation to their analysis of the tourism economy and the potential impact of treated effluent. The Business of Tourism cumulatively is big business in Nova Scotia, constantly growing in contribution to the Nova Scotia economy and generating $2.7 Billion in 2017. This translates to over $300 million in tax revenue for all levels of government revenue which is invested by governments to pay for social services like health care, education and infrastructure. Tourism employs over 40,000 people and generates $3.2 for every $1 invested the largest multiplier effect of all sectors. Along with creating jobs and driving tax revenue, tourism enhances the social condition of our communities and supports a healthy and sustainable natural environment. Nova Scotia is blessed with incredible natural beauty and our enviable location by the sea makes Nova Scotia a much sought-after destination. This strategic location on the Atlantic Coast has provided us with tremendous opportunities, as we utilize our seacoast location to build our brand and develop products and services which provide unique experiences and access to the sea. Recreation/Adventure Tourism and Culinary Tourism are two of the fastest growing segments and all of the new products rely on a healthy and sustainable marine environment. The business drivers are the environment and quality experiences. The perception and demand are pristine areas â?" beaches, water and landscapes. With the warmest waters north of the Carolinas, there is an anticipation of a beach experience and uncontaminated waters. Toxic waste diverted to the Northumberland Strait will affect visitor perception and experience. According to the latest tourism statistics, tourism revenue in the Northumberland Shore Region is 7.8 of the total tourism revenues translating to $210.6 Million . The NP EA states 8.3 and $215 Million. Pictou County estimates are 3 or $81 Million. However, the length of stay in the Town of Pictou has declined from 2010, an average of 3.3 days to 2017 at 2.5 days. Tourism Operators explain the decline in visitor stay is a direct result of the various factors emanating from the effect of the Northern Pulp Mill. The reference to Tourism, on page 438, does a disservice to the importance that tourism plays in the region and the significant economic damage from the environmental risks proposed by Northern Pulpâ?Ts plan. TIANS is extremely concerned about the socio-economic effect on the Tourism Industry. Not only does this threaten the marine environment, it puts at risk other important economic sectors, including fisheries. Culinary Tourism, presently enjoying tremendous growth and recognition, is directly dependant on a healthy fishery. Nova Scotia lobster is widely marketed as a prominent feature of the Nova Scotia experience. The health of their larvae is essential to its sustainability both as a domestic and international product. The Indigenous Tourism product is also a significant growth opportunity. In fact, the Conference Board of Canada just released the latest data and noted Indigenous Tourism growth is outpacing Canadian tourism activity overall. The research shows the direct economic benefits GDP attributed to the Indigenous Tourism sector in Canada rose 23.2 per cent between 2014 and 2017, going from $1.4 billion to $1.7 billion. The Nova Scotia Indigenous product has tremendous potential for growth. Nova Scotia has a history of looking at short term economic vs. long term sustainable growth and pitting one sector against another. The deference to the

Pictou Mill in spite of the strength and importance of Tourism and Fisheries is an example of this. The legacy of Northern Pulp is Boat Harbour, an example of extreme environmental damage that is supported by Health Canada statistics within the Pictou region. With an environmental cleanup worse than the Sydney Tar Ponds, now the responsibly of the Nova Scotia government, it is incredulous that any consideration would be given to research commissioned by this Company that purports no negative impact of other economic sectors. In 2017, Dalhousie released a study on the health of the Gulf of St. Lawrence and noted increasing dead zones as a result of commercial and industrial activity and effluent. The Northumberland Strait connects and empties into to the Gulf of St. Lawrence and the Laurentian Channel within the Gulf. Another study by Brennan, Blanchard and Fennell published in December 2016 discusses the stresses already endured in the Gulf of St. Lawrence and the Scotian Shelf and purports the concept of temperature and oxygen in this area and devastating effect on marine life. The Northumberland Strait therefore is facing threats to the fisheries. The vision for Environmental Goals and Sustainability Act was to have Nova Scotia recognized as one of the cleanest, greenest jurisdictions in the world by 2020 , plans such as this totally contradict this effort. Recently, Destination Canada - Canadaâ?Ts national marketing organization - announced a second consecutive record-breaking year with 21.13 million travellers to Canada in 2018. Tourism generates 745,300 jobs in communities across Canada and contributes an estimated $102.5 billion to the economy. Tourism is transforming the Atlantic Canada economy and continued success will be reliant on a healthy environment. March 8, 2019

The Hon. Margaret Miller
Minister of Environment

Dear Minister Miller:

I am writing in relation to Northern Pulp's Replacement Effluent Treatment Facility Project.

My name and I grew up and live on the Sunrise Trail along the Northumberland Strait. I have lived there for 61 years and have been fishing for 36 years on the beautiful Northumberland Strait.

When the bridge was built from Nova Scotia to P.E.I. in 1997 it had affected the fishing industry where it took years for the lobster to start coming back to that area. It has just been the last few years that the fishermen in that area have seen an increase in lobster catches. During the building of that bridge the fishermen along the Northumberland Strait had seen a huge built up of silt in the traps that caused some concern. It took a few years for that to settle down so if you can try to imagine putting a pipe into the Strait with thousands of liters of effluent spewing into it, is just an environmental disaster.

Every year there are more and more regulations put in place to protect the fisheries carried out on the Strait. The Department of Fisheries is changing mesh sizes, escape mechanics and the number of lobster traps have been reduced from 300 to 280 to protect the lobster fishery. DFO has created a zone in lobster area 26A which includes Eastern PEI and a large portion of Nova Scotia where fishermen are only allowed to fish 1 m from land. The fishermen know how important it is to protect fish habitat and juvenile lobsters. The Federal Government calls this area a marine refuge. The fishermen are not allowed to drag scallops in this closed zone but Northern Pulp would be allowed to dredge, lay a rock mattress, lay a pipe, backfill, and have diffusers releasing a substance into an area the fishermen have been protecting for 30 years. An identical proposal for a pipe into the Northumberland Strait has been rejected twice before by the Federal Government for environmental reasons. The Fisheries is regulated by the Federal Government, fishermen are licensed by the Federal Dept. of Fisheries and fish in Federal waters so how can a foreign company place an effluent pipe in the these waters and only have to pass a Provincial Assessment.

Boat Harbour is being shut down in January, 2020 and Northern Pulp is looking for an extension. They had 5 years to plan what to do with their waste (solid and effluent) so what did they come up with? Let's pump it into the Northumberland Strait right through the marine ecosystem and it is also important to note Northern Pulp has no Plan B. Just the idea of running a pipe out into the Northumberland Strait that is Federal waters is an environmental disaster so it should trigger a Federal Environmental Assessment.

Northern Pulp has said it does not know what is in the effluent except they cannot run it through their boilers and pipes because it will corrode them. This makes a person question what it will do to the ecosystems in the Northumberland Strait. The consultants were asked what solids are coming out of the pipe and they could not answer the question so this is not an acceptable answer. Northern Pulp expects the PLFN, fishermen and

residents to not question the effluent that is being piped into the middle of a marine ecosystem. We do not know what is in the effluent and the amount of warm water that is being piped into salt water where the lobsters lay their eggs is the most absurd idea that I have ever heard. It is hard to imagine that thousands of liters of water is going to be pumped into the Northumberland Strait daily and we are expected to believe this will have no adverse effects on the marine environment. It is very insulting that a foreign company does not have to justify and provide facts that it will not harm the environment. Northern Pulp says it is **highly unlikely** it will be hurt the marine environment. Pulp & Paper regulations are geared for fresh water discharges and will sacrifice a river before it is discharged into the ocean.

The herring spawning beds are only ½ m from the outfall of the proposed pipe and there is also a rock crab nursery in the Strait that is the main food supplier for the lobster. Northern Pulp intends to excavate a trench through this ecosystem which will threaten the lobster industry. Northern Pulp has never assessed the impact on lobsters before the pipe goes into the Strait so if the pipe goes in there will never be any assessment.

The Northumberland Strait has a very shallow channel so there is a concern the water is just not deep enough for a pipe. The Nova Scotia/PEI ferry travels this route so what effect will this pipe and effluent have on this service provided to residents and tourists during the summer months. There are numerous tourists that come to Nova Scotia for our delicious lobster and to experience it firsthand. We have experienced divers that are continually getting calls from fishermen who have problems with their propellers. These divers know the waters in the Northumberland Strait from their firsthand experience over the years. They know the tides and where the water is shallow as well as the problems this creates. Both Caribou and Toney River have to be dredged because of the ice scours changing the course of the sea bottom. The weather plays a big factor in the shifting of the Strait's sea bottom that continually fills in at both wharfs most fishing seasons. Dredging occurs in the spring before the lobster season begins and there are truckloads of this material removed around each wharf.

It wasn't too many years ago that the beef industry suffered drastically because of the mad cow disease. All it took was 1 cow and the entire beef industry suffered so all it will take is 1 lobster to effect the entire country. So why are we putting the fishery at risk for a project that was already denied twice and they cannot provide facts but expect us to accept assumptions that no harm will come to the fishery.

When the fishermen met with Northern Pulp and its consultants the question was asked, "What happens to the effluent when it leaves the pipe, the response, "it goes away". So in other words Northern Pulp and the consultants did not know the answer which makes a person question why they would put any faith in a company that does not have answers to a proposed project that will have a great environmental impact for years to come. I have been fishing for 36 years and know the tides, how strong they are and have seen what destruction they can do. Northern Pulp thinks the solids that come out of the pipe will only affect a small area but they are wrong. The tide rises and falls so each time Northern Pulp's waste will spread a bit further.

In Section 12 of the Environment Assessment Regulations there are 4 considerations that the Minister should consider in making her decision as follows:

1. The location of the proposed undertaking and the nature and sensitivity of the surrounding area.

   The Northumberland Strait is under the jurisdiction of the Federal Government so putting a pipe into the Strait now involves the Federal Department of Fisheries and Ocean.

2. Concerns expressed by the public and aboriginal people about the adverse effects or the environmental effects of the proposed undertaking.

   The Pictou Landing First Nations and the public have many concerns and unanswered questions about this project since it has been proposed. The destruction of a fish habitat and the environment is of the utmost importance and critical. Once the environment and marine ecosystem is damaged it will create a negative ripple effect throughout the area that may never be repaired or take years to restore.

3. Steps by the proponents to address environmental concerns expressed by the public and aboriginal people.

   Northern Pulp has never assessed the impact on lobsters before a pipe goes into the Strait so it may not be addressed for years once the pipe is in the Strait. Northern Pulp does not know the long term effects on Caribou Harbour if a pipe goes into the Strait.

4. Potential and known adverse effects or environmental effects of the proposed undertaking, including identifying any effects on species at risk, species of conservation concern and their habitats.

   There are species at risk where the pipe is proposed to go through a rock crab nursery that provides food for the lobster fishery. There is also a herring spawning bed in close proximity to the proposed pipe.

5. Northern Pulp's proposed project for the pipe to go into the Northumberland Strait will not only affect Nova Scotia but it will also involve P.E.I. and New Brunswick. (Act, n.d.)

It is hard to believe that in this day in age the toxicity test that Northern Pulp performs is a number of fish are put in a bucket of treated effluent and if half of the fish die after 96 hours the test is fine. A 50% mortality rate with a toxicity test is unacceptable and meeting 25 year old PPER is certainly not good enough.

As a fishermen I love my job and all fishermen have worked very hard throughout the years to sustain the fishery because we all know how vital it is for our livelihood and for the future. The fishery and the environment go hand in hand and we know there is a balance that has to be maintained. The fishery can change from year to year as it has done for centuries so when the ecosystem is affected we take appropriate measures to

make it sustainable for future years. If a pipe is put into the Northumberland Strait the marine ecosystem will be negatively affected for years.

It is not always about **'good paying jobs",** it is about doing the right thing for the environment. Our main concern should be about looking after the air we breathe, the marine ecosystems, and the forests. We have strayed so far away from doing the right thing for 50+ years by letting a company destroy what we should value the most.

There is much uncertainty regarding so many environmental issues with Northern Pulp's proposed project that have not been addressed. In conclusion the only appropriate way to move forward is to do a Federal Assessment.

Regards,

Subject: In support of Northern Pulp"s EA application
Date: March 8, 2019 3:28:55 PM

I am writing in support of the Environmental Assessment application submitted by Northern Pulp for its new treatment facility.

A lot has been said about Northern Pulp and its impact on the local community. I stand in agreement with many, including Unifor, that Boat Harbour must close and be cleaned up to respect Pictou Landing First Nations people and their land. I also know there are many positives about having 300 good-paying jobs in Pictou, supporting thousands more across Nova Scotia, particularly in rural communities.

The Nova Scotia Environment Act is an essential piece of legislation designed to protect our shared environment and guide our economic development. The Act rightly spells out its purpose through a set of principles for sustainable development that should guide its application, including:

------> The linkage between economic and environmental issues, recognizing that long-term economic prosperity depends upon sound environmental management and that effective environmental protection depends on a strong economy.

In this situation, science should determine the best path forward. Nova Scotia, along with the rest of Canada, has among the highest global standards for environmental stewardship in the forestry sector.

The job of government and every person we elect to represent us in government is to find the best way forward when there are many competing and sometimes opposing interests. Communities across Canada manage to find a fair balance where good mill jobs coexist with a prosperous fishing industry and thriving communities.

We can and must find this balance for Pictou. There is a lot at stake: jobs, the environment, and respect for First Nations. We can and must find a solution that supports all three.

Thank you.

Project: replacement_effluent_treatment_facility_project Comments: Very supportive of northern pulps replacement effluent treatment system.Nice to see a company investing in not only Pictou County but also the entire province of Nova Scotia to grow our economy and improve their environmental footprint for the region as a whole.The registration documents show how much time and scientific evidence was put in to this project.The proposed project has been proven to work very successfully in many other parts of the world and can be done here as well.Recent upgrades to Northern Pulp such as the new participator to improve their environmental performance and maintain good environmental practices is just one example of their long term committment to Nova Scotia.The replacement effluent treatment facility project is yet another huge example to improve and sustain a future for decades to follow.As mentioned previously,science has proven that this type of replacement effluent treatment facilityETF is used elsewhere with huge success.Very imp ressed with Northern Pulps committment to improve their industry and their desire to do things right for a long future here.So much more can be said,but ultimately science has and will prove that this is a project that will be very successful for all stake holders and everyone else involved.Thank you Name: Email: @hotmail.com Address:

08 March 2019

Dear Minister Miller

I write to you as a lifetime resident of Pictou County, to protect the Northumberland Strait and to end the half century of environmental racism that continues to this day in Boat Harbour.

Please reject the proposed Northern Pulp Replacement Effluent Treatment Facility Project due to the following:

Northern Pulp's Environmental documents use as an example a pulp mill in Tasmania, Australia which does not exist! How can this document be considered, in any way credible, on this fallacy alone? There is no mention of the amount of mercury that will be present in the effluent they propose to dump into the Northumberland Strait. The Northumberland Strait has economically provided for Nova Scotia, Prince Edward Island and New Brunswick, fisheries industries, tourism industry, transportation (Northumberland Ferries Ltd.) along with numerous small business along this beautiful coast. Our license plates states we are: "Canada's Ocean Playground".

Northern Pulp claims that damage will be minimal, how can they make such a claim when the Northumberland Strait is home to a very delicate ecosystem, it is Governments and citizens' responsibility to protect this ecosystem and the sustainable industries that it provides to the Maritime Provinces.

I have lived in Pictou County my entire life, leaving for education and work opportunities for 4 years and then returning to stay. My family summered on Caribou Island, and when I was between 4 and 6 years old my Mother, Aunts, cousins and myself would pick wild heather along the rocky shores of Caribou Island. By the age of 7 there was no more heather to be found along Caribou Island. I realize this may be a coincidence, but as I was born in 1962 and Scott Paper opened in 1967, I have often wondered if the air/water emissions from this industry contributed to the demise of the wild shrub, possibly making the air or the soil to acidic for the plant to continue to thrive. How will the effluent from Northern Pulp effect marshlands, and rivers and brooks? Once these are destroyed can they be remedied? What adverse effects will this have on all wildlife that have already lost their habitat to the clear-cutting, forestry industry here in Nova Scotia?

I respectfully request that this project be subject to a Federal Assessment as the Northumberland Strait is under the jurisdiction of the Federal Government and the *Fisheries Act* is Federal Legislation, not provincial. This proposed project by Northern Pulp, is not worth the risk and the precautionary principle means it is incumbent on the Nova Scotia government to err on the side of caution.

The Northumberland Strait has a delicate ecosystem which must be protected.

There has been no consideration given to the Town of Pictou Watershed, where the pipe will be put through.

The Pictou Landing First Nations, the Northumberland Fisheries Association and the public have raised many concerns which are not being properly addressed by Northern Pulp regarding this project. There has been no public consultations on this newly proposed site.

The potential effects on species at risk has been ignored, the proposed site of the pipe goes through a rock crab nursery which feeds the lobsters; there is a herring spawning bed in close proximity to the site of the pipe; not to mention other protected species such as piping plover, hawks and eagles How will these protected species be affected by not just the effluent, but the construction of this pipe?

I work in by-law enforcement for the County of Pictou, one of the aspects of my position is to remove, seal, whale, shark, porpoise carcasses from the coastline of the county. Has any thought been given to the protection of these incredible sea creatures? How many more species will die from exposure to these chemicals that will spill from this pipe?

As the tax payers have paid for this company for the past 52 years how much more are we going to pay for the pollution we have been subjected to, along with the rape our forestry, and now are we to pay for Northern Pulp to destroy "Canada's Ocean Playground" and the century old industries it has provided? How in 2019 can this be condoned in a leading country of the world?

Please right the wrongs of the past half century, please hold this company to a higher standard and protect our province, our children, and their future by calling for a full Environmental Assessment Report on this proposal; and close the effluent treatment facility in Boat Harbour on January 31, 2020 as scheduled.

Respectfully submitted

We can and must find this balance for Pictou. There is a lot at stake: jobs, the environment, and respect for First Nations. We can and must find a solution that supports all three.

Thank you.

There has been some (truly) wonderful activism in support of our local environment that I encourage to be heard. However, as members of your department will surely know, much of the inner workings of industrial activity is complex and fraught with constant decision-making around finding the right balance. In the case of Northern Pulp, I strongly encourage the Department to adhere to the Act as Unifor has highlighted in its submission and proceed with studies and testing to protect our water, while encouraging the development of our forestry sector - a cornerstone of which is the Northern Pulp mill.

Project: replacement_effluent_treatment_facility_project Comments: I think it is an astonishing step backward to still consider that the solution to pollution is dilution. Some of the most deadly compounds known to man are released in pulp mill effluents Dioxins, PCBs, heavy metals etc.These chemicals are known to preferentially bioaccumulate in the marine food chain fish, lobsters, tuna etc After 50 years of condoning one of the worst mills in N. America, we have the chance to redesign an efficient replacement mill. I personally think this is truly a Canadian issue and that a thorough federal environmental revue is necessary. Name:

Subject: Northern Pulp 's Replacement Effluent Treatment Facility Project
Date: March 8, 2019 3:57:29 PM

Dear Minister

I am writing this note in regards to Northern Pulp's Replacement Effluent Treatment Facility Project.

Our family are proud Nova Scotians with strong connections to Pictou and Pictou Island for many generations. I am one of four children raised in beautiful Nova Scotia. My Parents and my three siblings, are currently raising families in this wonderful province. I am currently living in Alberta were I fear some decisions are not in the environments favour for the future generations of our people.

How can a daily dump of nearly 100 million litres of effluent, of unknown composition, not have a negative impact? How could any additional toxins in our environment and food chain be deemed safe in a globally warming environment? What is the risk assessment associated with constructing and maintaining a 15.5 km pipeline going overland and then through Caribou Harbour? Why do we as a province continue contributing to the all the questionable decisions that have allowed the Northern Pulp Mill to begin and continue operations ?

Coming form a family of Fishers, has any study or monitoring effects on lobster larvae or any other species in the area even though it was strongly recommended internally and by multiple fisherman associations?

The proposed treatment facility on Abercrombie Point is very close to both the de-commissioned Canso Chemical plant site, and the secure landfill both of which have tested positive to high concentrations of Mercury (Baxter, 2019). Mercury, along with other dioxins were not mentioned in the EA even though there is a high risk of them being disturbed by the construction phase

Please give me a reason to continue to be proud Nova Scotians who encourages to sustain our fisher heritage, protect our natural resources and support sustainable industries that protect our future. Please allow us to be proud of the principles and values of this government that become evident in your decision making process.

Please see the attached of my Grandfather who is no longer with us, make him proud PLEASE.

Thank you for your consideration.

Daughter of a fisher
Sister of a fisher
Friend of many fishers and pulp mill workers

Proud Nova Scotian from afar who adores the beautiful shores of the Northumberland Strait every summer.

Subject: Concerns
Date: March 8, 2019 3:59:11 PM

To who it may concern;
I am a 17 year old who is very scared for what could happen if this pipeline is allowed. I believe that putting a pipe in the northumberland straight will be a devastating mistake. It could be destroyed by ice or other factors or if is not monitored daily it will be to late and catastrophic. We will never truly know what it will do to our gorgeous straight and how it would affect the fishing industry. We have a cottage along the straight and I want me, my cousins and eventually my kids to be able to keep swimming, fishing, catching hermit crabs and playing in the ocean without being concerned about contaminated waters. We already have to breathe in all the toxic air and smell the fumes. It turns people away from even being able to tour Pictou. Fifty years of environmental racism is shameful and it is time to resolve this issue. Honour the Boat Harbour act. We need to get a Federal Assessment too not just a Provincial assessment. No more extensions. Please take all the facts from all your emails your receiving and think long and hard about this matter. Enough is enough and more needs to be done to prevent this toxic waste pipeline from going in our ocean.
Thank you,

Subject: Class 1 Environmental Review Northern Pulp
Date: March 8, 2019 4:35:17 PM

The body responsible for caring for the well-being of Nova Scotians is the government. Of greatest importance in exercising these responsibilities is prioritizing them in the best possible order. Pundits on very different sides of an issue will suggest they are bringing a balanced approach and the decider will promote their decision as carefully weighed and well balanced. This is the reality of the debating and deciding game.

This submission is from a retired Math and Physics teacher. One of my sons has a PhD in Land Resource Management with a focus on waste water management and air quality. Although I have some understanding of the issues under consideration, I would speak under the Dunning Kruger effect if I were to get into the weeds on this issue. With all due respect most politicians, and for that matter jurists, operate under the danger of Dunning Kruger and must seek to carefully and objectively weigh the evidence in order to make the best decision. I will rather concentrate here on your willingness to ask some of the relevant questions and honestly seek their answers.

The significant human well-being elements related to the pulp mill include jobs, economic activity, air quality, water quality and the environment. These must be examined looking at impact and sustainability. In your deliberations it would be wise to keep in mind the old adage; “In theory, theory and practice are the same, but in practice, they are not”.

I have a good friend who is a retired lawyer and who has been a back-room boy in politics for many years. He believes that accepting environmental degradation is necessary for human progress. As a good lawyer, he tends to look at the outcome he wants and argue the points that support that decision. He also regularly advocates for a balanced approach, but his balance is very different than mine, and I believe the majority on Nova Scotians.
