Public

Regarding Northern Pulp Nova Scotia Corporation's proposed Replacement Effluent Treatment Facility Project, approximately 913 public comment submissions were received by Nova Scotia Environment – Environmental Assessment Branch during the public consultation period (from February 7 to March 9 of 2019) for this Class I environmental assessment. Where possible, duplicates of the same submission (sent via e-mail, fax and/or other means) were removed. Note that individuals or organizations that provided multiple submissions were not consolidated in one place. The public comments below were organized via a chronological order. In addition to the submissions from individuals, organizations including but not limited to the following also provided comments:

Nova Scotia Environment

Subject: Northern Pulp Replacement Effluent Treatment Facility Project

Thank you for the opportunity to review and comment on the Environmental Assessment (EA) Registration Document for the proposed Northern Pulp Effluent Treatment Facility Project in Pictou, Nova Scotia.

As Transport Canada has previously informed Provincial and Federal departments, as well as the proponent, a Notice of Works (application) for *Navigation Protection Act* (NPA) approval from Transport Canada Navigation Protection Program (NPP) is required. An application for a Lease or License from Transport Canada may also be required, should the effluent pipeline cross at or near Transport Canada lands at the Caribou Ferry Terminal.

To date, neither application above has been received. Only when these applications are received can Transport Canada ascertain more clearly, its involvement in the project.

Specific comments on the EA Registration document as it relates to Transport Canada's Mandate:

- Suggest re-wording the paragraph under *Navigation Protection Act* (Transport Canada Navigation Protection Program Process) on page 21. Applications to the Navigation Protection and Ports programs are separate. The beginning of the paragraph refers to the 'requirement' for a waterlot lease/licence; however, as previously stated, this has not been determined.
- The EA registration document does not consider the potential impacts to navigation. Since a NPA approval is required, this should be added in Sections 7 and 8 of the document under the Socio-Economic Environment VEC. The direct effects on navigation are mitigated as terms and conditions associated with work approved or permitted pursuant to the NPA.

Should you have any questions in regards to this response, please do not hesitate to contact the undersigned.

Subject: Environmental Assessment Registration for Northern Pulp Nova Scotia: Replacement Effluent Treatment Facility

Introduction

The following comments have been developed by technical staff within the Contaminated Sites Unit of NSE based on review of the Environmental Assessment Registration for Northern Pulp Nova Scotia: Replacement Effluent Treatment Facility, January 31, 2019.

Comments

Planning/Design Issues

- A reasonably well-defined characterization of likely effluent chemistry that represents a conservative prediction of the chemicals that may be present in the effluent discharge, as requested by Health Canada prior to the EA Registration submission has not been provided. The proponent has indicated that effluent chemistry characteristics (including the specific substances present in treated effluent and their anticipated concentrations) will not be known with certainty until the project is operational, as the chemical process engineering design work is continuing and there is presently uncertainty regarding the likely chemical composition and characterization of the marine treated effluent discharge. At this time the proponent has only identified candidate contaminants of potential concern (COPCs) that may be evaluated should a human health risk assessment (HHRA) of the project be a regulatory requirement. This lack of information hampers the evaluation of potential risk associated with the project. Northern Pulp Nova Scotia (NPNS) will likely be required to monitor for additional parameters to those listed within the Pulp and Paper Effluent Regulations (PPER). Without having a comprehensive list of chemicals present in the effluent discharge, it is not practical to establish monitoring

parameters or applicable guidelines for monitoring. The proponent has identified that refinement of the candidate COPCs would be anticipated for a potential HHRA study of the project, should one be required. Additional information on the specific substances present in treated effluent (including chemicals and microorganisms introduced in the treatment process), their anticipated concentrations and their risk to the environment should be provided.

- The potential impact to potable water supplies if a release occurs from the pipe line is a significant concern. The proposed pipeline traverses a drinking water supply area. Limited information has been provided on the proposed maintenance and inspection of pipeline during its operation. The proponent has indicated that there is an intention to have a system in place to detect leaks (or a significant drop in pressure) during operation and maintenance; however, details concerning this system have not been provided. It is unclear what impact a "significant drop in pressure" could have on a groundwater supply before being detected. Clarification should be provided to ensure appropriate leak detection, monitoring and action plans are in place to mitigate potential impacts to potable groundwater, particularly within the source water protection area for the well field. The potential HHRA referenced by the proponent should also consider impacts to drinking water, should the effluent pipeline experience a release in the sections that cross drinking water supply areas.

- The proponent has indicated that a component of the contingency plan for the replacement treatment facility is the construction of a spill basin with a capacity of 35,000 m^3. Little information concerning design flow rates have been provided to determine whether the capacity of the spill basin will be sufficient in all scenarios (e.g. successive days with flow rate of 85,000 m^3). The proposed spill basin will be located in close proximity to Pictou Harbour. The proximity of the spill basin to the harbour is concerning, should the spill basin be compromised due to internal or external forces; such as, berm or liner failures, overflows, storm events or potential impacts of climate change. Limited information has been provided at this stage to ensure that operational activities in and around the spill basin will not adversely affect the environment. The proponent has indicated that the existing NPNS groundwater monitoring network will be updated as required once the construction is complete; however, proposed changes have not been identified at this time.

Operational Issues/Other Permitting Processes

- The proponent has indicated that the US EPA under the Resource Conservation and Recovery Act, has made a technical determination that dewatered pulp and paper sludges managed in a manner that preserves the meaningful heating value of the materials, can be considered a standard fuel, with combustion related emissions that are no different than other forest-based solid fuels such as bark. Little information has been provided to indicate whether the sludge material from the Effluent Treatment Facility (ETF) will satisfy these conditions in order to achieve the objective of displacing the use of fossil fuels.

- The proponent has indicated that modelling results have predicted concentrations of the air contaminants of concern (i.e., CO, NO2, SO2, TSP, PM2.5, and H2S) from the operation of the existing mill and the future mill (with replacement ETF) are both expected to be in compliance with the reference criteria at the representative off-property discrete receptors. The composition of the sludge material has not been defined and it is unclear whether any additional contaminants of concern should be assessed and considered in the model calculations.

Other Observations

- The proponent has indicated that dredging will be required for the installation of the pipeline. Appendix F, *Description of Marine Pipeline Construction* briefly discuses the potential for land-based disposal of dredge materials. Further clarification should be provided. If disposal within provincial jurisdiction is being considered, sample results must be compared to applicable criteria (NS Tier I EQS and relevant CCME criteria (Sodium Absorption Ratio & Electrical Conductivity)) for the land use on which the material is proposed to be disposed. If the material if found to be contaminated, the material must be sent to an approved facility.

Memo

To: Helen Yeh

From: Environmental Health, NSE

Date: February 26, 2019

Subject: Northern Pulp Nova Scotia EA

The following comment are provided by Environmental Health following a review of the Northern Pulp Nova Scotia EA in consultation with the medical Officer of Health. The focus of the review was to evaluate project interactions on the environment and their potential to impact human health.

Planning/Design

A. Atmospheric Environment

The assessment of atmospheric impacts related to the proposed undertaking was limited to a handful of substances that are currently regulated under the NS Air Quality Regulations., and PM2.5. Unregulated substances that may be present in air emissions were not assessed with respect to their impact on air quality and human health, which may result in an underestimation of atmospheric impacts related to this project.

No evidence is provided to support the decision to restrict the assessment to regulated substances only. Based on the information provided there's no evidence to support a conclusion that any unregulated substance present in air emission is of no concern to the atmospheric environment and human health.

In Section 8.1.1.2 following a discussion of the Hoffman et. al. (2017) study, the EA states that VOC's may be released in stack and fugitive emissions from the NPNS mill, but based on a literature review VOC are not known to be associated with pulp mill activities and air emissions to any great extent. Conclusions of this nature need to be supported by evidence, which is not provided in the EA.

B. Sludge

A USEPA rule is referenced to support the proposal to co-combust sludge in the mill boilers. No evidence or analysis is provided, however, to demonstrate that the sludge produced as part of this project will comply with existing requirements related to the application of the EPA rule.

C. Treated Wastewater Effluent

Section 8.11.3.1, page 347 of the EA states,

> The treated effluent will contain the following water quality parameters of concern: absorbable organic halides (AOX), total nitrogen (TN), total phosphorus (TP), colour, biochemical oxygen demand (BOD), total suspended solids (TSS), dissolved oxygen (DO), pH, and water temperature.

No evidence is provided to support the above statement. It is unclear as to how the proponent determined the parameters of concern. Also, no information is provided in support of excluding additional contaminants present in effluent. Conclusions of this nature need to be supported by evidence.

Considering the potential for effluent to impact drinking water (related to a pipeline leak and contamination of groundwater) and the receiving environment, a greater understanding of the type, nature and concentration of environmental contaminants present in effluent, and their potential impacts on groundwater and the receiving environment is warranted.

Operational

A. Noise

Section 5.6.4 of the EA states,

> There will also be elevated noise emissions during HDD operation, if this method is selected for pipeline construction at wetlands and/or watercourses. Some activities will involve 24-hour a day operation for a period of up to several days, and will emit near continuous noise emissions during drilling.

The noise impact study that was undertaken, however, did not consider the impacts of the HDD as a noise source as evidenced in Table 8.2-2. Excluding the noise impacts of the HDD is likely to underestimate the impacts of the project on the acoustic environment. If horizontal directional drilling is undertaken during project construction, further consideration will be needed for the

“elevated noise emissions” generated by the HDD for mitigating impacts to the acoustic environment.

B. ETF and Cooling Towers

A on-line search revealed a case study involving two cases of Legionnaire’s disease that were found to be associated with waste water treatment systems used by the forest industry. A link to the case study is provided for review.

https://www.ncbi.nlm.nih.gov/pmc/articles/PMC3014939/

The EA does not consider the impact the ETF and cooling towers might have on human health from exposure to Legionella bacteria found in associated with the ETF. An examination of this risk is warranted.

To: Ms. Helen Yeh, Environmental Assessment Branch, NSE

From: Manager, Climate Change Division

Subject: Class I Environmental Assessment: Northern Pulp's Replacement Effluent Treatment Facility Project FINAL comments

The Climate Change Division has reviewed the Class I Environmental Assessment for Northern Pulp's Replacement Effluent Treatment Facility Project. Please find enclosed below our draft preliminary comments from a greenhouse gas emissions and climate change adaptation perspective.

Planning/Design Issues

Climate Change Adaptation

It is recommended that the proponent consider the combined effects of warmer temperatures as a result of climate change and project activities on water quality of Northumberland Strait and Caribou Harbour.

Greenhouse Gas Emissions

In the construction phase, the proponent states that the primary sources of greenhouse gases for this project are carbon dioxide (CO_2), methane (CH_4), and nitrous oxide (N_2O) from fossil fuel combustion in heavy construction equipment, trucks and other mobile equipment. The proponent further mentions that the total greenhouse emissions during the construction phase are expected to be immaterial. Though the immateriality of these emissions may be justifiable, it is recommended that the proponent provide the estimated direct and indirect greenhouse emissions that are expected during this phase to confirm the immateriality conclusion.

The proponent does not commit to implementing direct greenhouse control technologies in this environmental assessment for mitigation of greenhouse emissions in the construction phase of the Effluent Treatment Facility. There is commitment to employ operational measures to mitigate greenhouse gas emissions during construction in

Table 8.1-7. These measures include instituting and anti-idling policy and to maintain equipment. The opinion of the reviewer is that the indicated measures suffice for emissions that are deemed immaterial at this point.

Operational Issues/Other Permitting Processes

Greenhouse Emissions

Regarding the operation phase of the Effluent Treatment Facility, Appendix K indicates that the mill operations are not expected to vary much with the operation of the new Effluent Treatment Facility. The proponent also indicates that the removal of sludge from the rotary press to be co-combusted with hog fuel in the mill's existing power boiler could have a mitigative impact on GHG emissions from the facility. The removal of sludge from the Effluent Treatment Facility could reduce CH_4 emissions from the water treatment due to the reduction of organic solids in the effluent. Furthermore, the co-combustion of sludge in the boiler could displace natural gas which is the secondary fuel used in the boiler. It is recommended that the proponent should consider estimating the direct and indirect greenhouse emissions that are expected during the operation phase of the project. Where necessary the biogenic carbon content of the proposed sludge fuel should be be estimated using methodology available in the Nova Scotia Greenhouse Gas Quantification, Reporting and Verification Standards.

Concerning the combustion of the sludge, Appendix K assumes the properties of the expected sludge will be similar to sewage sludge for which combustion properties are well known. Appendix K also indicates that further tests with the sludge to deduce its actual performance in the boiler will be conducted once operations begin. It is recommended that the proponent commits to these further tests to re-estimate the expected reductions in CH_4 emissions from the Effluent Treatment Facility, and expected reductions of CO_2 emissions from the boiler.

Other Observations

Climate Change Adaptation

While it is noted that the potential impacts of climate change on the project and mitigation measures have been documented the proponent should consider reviewing the Nova Scotia Environment's *Guide to Considering Climate Change in Environmental Assessment in Nova Scotia* for additional guidance on assessing the combined impacts of climate change and the project activities on relevant valuable environmental components.

Subject: Health Canada's Response to the Environmental Assessment (EA) Registration Document for the Northern Pulp Replacement Effluent Treatment Facility[1]

Dear Helen:

Thank-you for your e-mail dated February 7, 2019, requesting Health Canada's review of the above-mentioned provincial Environmental Assessment Registration (EA) document for issues with respect to human health. Health Canada has reviewed the documentation (with particular emphasis on Section 9 (Human Health Evaluation) and Section 8 (Acoustics and Groundwater)) and is providing the following comments for your consideration with respect to the proposed project (hereinafter referred to as 'the project') which includes the treatment facility (power boiler), pipeline and pipeline diffuser to the Northumberland Strait. In general, Health Canada found that the information contained in the sections reviewed to be insufficient in order to fully evaluate the potential future health impacts of the project.

Human Health Evaluation (HHE)

1) **Section 9.1 (Introduction and Background)** states that "*at this time, effluent chemistry characteristics (including the specific substances present in treated effluent and their anticipated concentrations) will not be known with certainty until the project is operational. Some other current areas of uncertainty include limited recent or current baseline environmental media and marine food item chemistry data, and limited data on traditional marine food item harvesting and consumption patterns within the PLFN community*".

[1]Dillon Consulting. 2019. Northern Pulp Nova Scotia Environmental Assessment Registration Document; Replacement Effluent Treatment Facility. Prepared for Northern Pulp Nova Scotia; submitted to the Nova Scotia Department of Environment, January 31.

Sent by e-mail to Helen.Yeh@novascotia.ca

Given the unknown chemical composition of the future effluent, lack of baseline information on contaminants in the various environmental media (including marine foods), and the lack of understanding of current traditional food harvesting and consumption patterns within the Pictou Landing First Nation (PLFN) community, it is unclear how human health risks from the proposed project can be evaluated with any degree of certainty. In order to reduce these uncertainties, Health Canada advises the following:

- A pilot-scale chemical testing of the effluent be conducted prior to the operational phase of the project (based on the suggested lists of contaminants as presented in Section 9.2.4 and as per Health Canada, 2012);
- adequate baseline sampling of the various environmental media (including marine species) (as per Health Canada, 2010) be conducted prior to any future effluent discharge from the new pipeline to the Northumberland Strait;
- the conduct of either a formal or informal country foods survey with the PLFN prior to the operational discharge of effluent to the Northumberland Strait and prior to the baseline marine food item collection and analysis (Health Canada, 2010; Health Canada, 2017a);
- the conduct of a more formalized human health risk assessment (HHRA) for baseline health risks and also for health risks related to future effluent releases, using the information collected as per the previous three bullets (above).

2) **Section 9.1 (Introduction and Background)** states that "*while such uncertainties would preclude the ability to conduct a HHRA at this time, a qualitative human health evaluation (HHE) was conducted (and presented herein) which serves as an interim approach to address the potential human exposure and risk in relation to project air emissions and treated effluent discharges. The HHE was conducted at the scoping level or screening level of effort and utilizes data and study outcomes that are currently available and/or feasible to address at this time*".

   If there are limited baseline studies and only a qualitative evaluation of health risks based on assumptions that may or may not have been validated with the PLFN or other people who use the area, an understanding of the future health risks associated with the project is limited. Health Canada acknowledges that it has no enforceable regulatory requirements for the project (e.g. permits, authorizations), however, given the lack of information provided in the Human Health Evaluation (HHE), and the unknown chemical composition of the future effluent, any advice provided would be speculative and may not adequately ensure the protection of human health.

   - The information requested in Health Canada's comment 1) above should be used to inform the lack of current data and should be collected prior to the commencement of effluent discharge from the new pipeline to the Northumberland Strait.

3) **Section 9.1 (Introduction and Background)** states that the HHE primarily addresses the following HHRA problem formulation items:

   "• Identifying relevant exposure pathways, routes and scenarios;
   • Identifying relevant human receptors; and
   • Identifying candidate chemicals of potential concern (COPCs) in the project air emissions and treated effluent."

- Given the concerns related to effluent discharges and subsequent uptake by marine species that may be consumed by local people, Health Canada advises that this additional pathway (uptake by marine species and subsequent consumption by people) should be further evaluated in a more quantitative human health risk assessment (HHRA) that should be conducted prior to the commencement of the project (Health Canada, 2010).

4) **Section 9.1 (Introduction and Background)** states that "*with respect to the review and synthesis of historical data and reports, it is noted that a substantial amount of the reviewed historical data were collected from locations outside the current project study boundaries and/or are too old to represent current baseline concentrations of chemicals of interest in air, or in marine environmental media and marine traditional food items*."
   - Given the lack of current and local data, Health Canada advises that this information should be collected prior to the operation of the project in order to give a more fulsome and locally relevant context in which to evaluate human health effects in the local and regional study areas for this project.

5) **Section 9.1 (Introduction and Background)** – states that the "*construction [of the pipeline] is estimated to be approximately 21 months*".
   - Given the deadline of ceasing effluent discharge to Boat Harbour is January 31, 2020 under the provincial *Boat Harbour Act*, and the mill intends to continue operations subsequent to this date, it is unclear where the effluent will be stored or discharged during the project construction phase (estimated to be operational by late 2020). If effluent is expected to be discharged to a temporary location during pipeline construction, Health Canada would suggest that any risk assessment evaluate this temporary discharge location as well for potential human health effects.

6) **Section 9.2.1 (Identification and Potential Exposure Pathways and Routes)** states that "*residual chemicals contained in the treated effluent would.. diffuse within this mixing zone [within 2 m of the diffuser].. thus, this exposure pathway(s) would likely not be carried forward into a HHRA study*".
   - Since the composition of the future effluent is currently unknown, it is unclear how this conclusion (i.e. that chemicals would diffuse within 2 m of the diffuser) could be reached. Health Canada requests additional information be provided to substantiate this statement given the diversity of chemicals likely to be present in the final effluent to be discharged and the lack of characterization as presented in the EA.
   - Given public and Indigenous concerns about marine water quality and contamination of marine foods, it is unclear how this pathway would not be carried forward into an HHRA. Additional explanation is required if this pathway is not considered.

7) **Section 9.2.1 (Identification and Potential Exposure Pathways and Routes)** states that there are four provincially licensed marine shellfish aquaculture operations (all for American Oyster) in the vicinity of Caribou and Monroe's Island near the proposed effluent diffuser location. However, in

Section 9.2.4.2 (Identification of Candidate COPCs in Treated Mill Effluent (page 510), the report states that when determining the potential COPC list, the perspectives that were considered included "*log Kow, bioaccumulation and/or bioconcentration factors, and degree of metabolism/excretion in marine fish*". Given the presence of sedentary 'non-fish' species such as oysters at the aquaculture sites, other bivalves such as blue mussels, and invertebrates such as sea urchins, crabs and lobsters, it is unclear whether this COPC list is sufficient given that these more sedentary species may be more exposed to the effluent that is to be discharged from the diffuser.

- Health Canada requests additional information be provided to support whether or not the proposed chemical list is sufficient in order to evaluate non-fish species and their potential exposure and subsequent consumption by people including the PLFN.

8) **Section 9.2.1 (identification and Potential Exposure Pathways and Routes)** states that "*HHRAs commonly and appropriately exclude exposure pathways and routes …that lack sufficient data to enable their evaluation with a reasonable degree of confidence and/or accuracy*."
   - Health Canada advises that it is not appropriate to exclude any chemicals and/or pathways/routes of exposure that may result in adverse human health effects. See Section 2.4.1 of Health Canada (2012) for more information on appropriate methods to use to screen substances for further evaluation in an HHRA (Health Canada, 2012).

9) **Section 9.2.2 (Identification of Potential Human Receptors and their Characterization)** states that "*general physical/physiological and behavioural characteristics specific to the receptor type (e.g., body weight, breathing rate, food and soil consumption rates, etc.) are used to determine the amount of chemical exposure received by each human receptor*." Based on the information provided, it appears that literature-based sources were used to identify these characteristics for the local study population. Given that the PLFN or other local non-Indigenous people may have different characteristics due to genetics, dietary patterns etc., the use of default assumptions may not represent the characteristics of local people. For example, the PLFN may have an increased reliance on country foods (including marine species), which may not be captured by using default characteristics. As described in Health Canada's comment 1) above, the most accurate means by which to collect community/individual-specific information would be to conduct a targeted survey within the local communities (Health Canada, 2010; 2012; 2017a).
   - Health Canada advises that a community survey (including a dietary survey) be undertaken prior to pipeline construction and operation in order to have more local and up-to-date receptor characteristic information that could then be used in evaluating the potential risk to human health from the proposed project in a more formalized HHRA.

10) **Section 9.2.4 (Identification of Candidate Chemicals of Concern)** states that "*if no health risk are predicted for the chemicals selected for evaluation, then no health risks would be expected for any chemicals not included in the evaluation*". Given that the chemical composition of the future effluent is unknown, additional chemicals that are not part of the evaluation may be unintentionally omitted from any HHRA. In addition, some chemicals may affect the same target organ(s)/have the same adverse impact(s) but may be screened out from further evaluation. As

such, any additive or synergistic effects associated with these chemicals may not be evaluated in an HHRA. The lack of evaluation of certain chemicals (depending on their toxic effect(s) and interactions with other chemicals), may therefore underestimate current and future health risks.

- Health Canada advises that all chemicals which may have an adverse impact on human health be evaluated, including substances with similar toxic endpoints which may have otherwise been screened out. Where similar effects may be possible, the cumulative health risks should be evaluated.

11) **Section 9.2.4.1 (Identification of Candidate COPCs in Project Air Emissions)** states that "*the air dispersion modelling study selected and assessed ten discrete receptor locations that represent the nearest sensitive receptors (residential locations).*" The locations are described as being identified in Stantec (2019). It would be helpful for Health Canada's review if the HHE identified the receptor locations in an appropriately scaled map within the HHE document itself. Nevertheless, given that these locations are considered 'residential locations', the selected locations may not be representative of areas where Indigenous and non-Indigenous peoples may exercise recreational and/or traditional activities, such as country foods harvesting. Given that some of the air contaminants identified have acute and/or chronic thresholds, evaluating concentrations at the nearest residence(s) may not be sufficient to protect human health.
    - Health Canada advises that there should be a discussion about recreational/traditional land use in closer proximity to the proposed project and the possible health implications of shorter-term exposure to the proposed list of air contaminants.

12) **Section 9.2.4.1 (Identification of Candidate COPCs in Project Air Emissions)** - With respect to the air contaminants identified, odour issues may also be of concern, and two groups of substances that were absent from the proposed list were methyl-mercaptans and total reduced sulphurs. Health Canada does not specifically evaluate odours, however, it is important to note that these substances tend to be associated with pulp mill activities and have low olfactory thresholds and therefore can be 'annoying' at levels which may be below any other adverse human-health effects.
    - Although Health Canada does not have specific expertise in the area of odours, if the community is concerned with odours, these substances should also be monitored as part of any air quality monitoring program.

13) **Section 9.2.4.1 (Identification of Candidate COPCs in Project Air Emissions)** of the report cites a recent paper by Hoffman et al. (2017) which evaluated ambient air levels of seven volatile organic compounds (VOCs) near the Northern Pulp Nova Scotia Inc. (NPNS) property, based on ambient monitoring data reported from the Canadian National Air Pollution Surveillance Network (NAPS). The paper reported that results of the temporal and spatial statistical analyses "*indicated that 1,3-butadiene, benzene, and carbon tetrachloride air concentrations routinely exceeded EPA air toxics-associated cancer risk thresholds, and that 1,3-butadiene and perchloroethylene levels in air were significantly higher when the prevailing wind direction blew from the northeast and the NPNS mill towards the Granton NAPS site*." Despite these conclusions, the paper was discounted by the author(s) of the HHE. Health Canada acknowledges that the source(s) of these air pollutants

could not be confirmed (be it the mill and/or other industrial sources in the region), however, in the overall interest of protecting human health, these parameters should be further evaluated in the ambient air once the proposed treatment system (i.e. power boiler) has been installed and commences operation. Given the availability of baseline air quality data related to these COPCs, any changes subsequent to the commencement of the power boiler system could be identified.

- Consider evaluating these seven VOCs as part of the air monitoring program in order to evaluate any future changes and compare the future measured concentrations to applicable guideline values in order to be protective of human health.

14) **Section 9.2.4.1 (Identification of Candidate COPCs in Project Air Emissions)** of the report states that "*should future emission source testing and air dispersion modelling indicate that other air emissions merit evaluation, air quality and human health risk assessment may occur at that time to inform appropriate mitigation strategies (if necessary)*". Given that the report only cites a limited number of air contaminants that may be of interest from a human health perspective, it is unclear how additional air contaminants will be identified and evaluated in order to '*inform appropriate mitigation strategies*'.

- Health Canada requests that additional information be provided to explain how other air contaminant emissions will be identified (and mitigated as necessary) given the limited number of contaminants that will be monitored as part of the air monitoring program.

15) **Section 9.2.4.1 (Identification of Candidate COPCs in Project Air Emissions)** (Page 508) identifies a list of chemicals which may be present in pulp and paper mill effluent. Health Canada (2012) (Table A2) identifies specific chemicals which may be relevant from a contaminated sites perspective for the pulp and paper mill industry.

- The list presented in Health Canada (2012) should be compared to the list of chemicals presented in the HHE to ensure all relevant chemicals related to pulp and paper mills are evaluated in the project.

16) Throughout **Section 9.2.4.2 (Identification of Candidate COPCs in Treated Mill Effluent)** (pages 516-518) there is a discussion about the candidate COPCs for future evaluation with respect to the project (including power boiler, pipeline and pipeline diffuser), which were identified based on a review of current effluent chemical concentrations at Points C and D within the Boat Harbour effluent treatment lagoon. Point C is at the confluence of the aeration/stabilization basin and the Boat Harbour lagoon; and Point D is at the discharge point at the weir between Boat Harbour and the Northumberland Strait. The challenge with using such information is that the new effluent treatment process will be different, and under the current discharge system, effluent released to Boat Harbour undergoes aeration and chemical enrichment, followed by multiple days of retention within Boat Harbour (to allow settling of any suspended particulates) before finally being discharged via the containment weir at Point D, with an approximate residence time in Boat Harbour of 30 or more days. Using the data collected related to water/sediment chemistry in the current process may not be valid considering the new process.

- Health Canada is requesting more information about the appropriateness of comparing the future process to the existing process to determine COPCs given that the current system has a 30 or more day settling process to remove contaminants whereas the new process is expected to result in effluent discharge directly to the Northumberland Strait following treatment in the power boiler.

17) **Section 9.2.4.2 (Identification of Candidate COPCs in Treated Mill Effluent) (page 516)** states that "*it is expected that future treated effluent that will be produced as a result of the NPNS project will be of higher quality than the current effluent and will contain fewer candidate COPC substances. For those substances that are present, it is anticipated that they will occur at lower concentrations in the future effluent relative to current effluent*". However, the HHE also states in **Section 9.1 (Introduction and Background)** that "*at this time, effluent chemistry characteristics (including the specific substances present in treated effluent and their anticipated concentrations) will not be known with certainty until the project is operational*". It is unclear how the conclusion that the future effluent will be of better quality than the current effluent can be assumed based on this lack of understanding of future COPCs and their respective concentrations.
    - Health Canada is requesting additional information about the expected chemical composition and chemical concentrations of the future effluent be provided in order to substantiate the conclusion that the future treated effluent will be of higher quality than the existing effluent that enters the Northumberland Strait, particularly given that the two effluent treatment processes are very different. Without this information, Health Canada cannot provide advice on whether the contaminants in the future effluent may have an impact on human health (either more or less than the current effluent) either through direct exposure pathways or through the consumption of marine species which may uptake these COPCs.

18) **Section 9.2.4.2 (Identification of Candidate COPCs in Treated Mill Effluent)** (page 517) – The report indicates that environmental effects monitoring programs (EEMs) for Boat Harbour have periodically resulted in the collection of chemistry data on effluent parameters in media and biota. For example, in 1996, Jacques Whitford Environment Limited collected (and composited) a total of 10 blue mussels from the outlet area of Boat Harbour. Health Canada advises against compositing individual specimens given the diversity of contaminants that can occur within individual samples (Health Canada, 2010). Health Canada also advocates for a sufficient number of samples to be collected in order to derive a statistically-significant sample size (Health Canada, 2010). In addition, the samples were collected at the outlet of Boat Harbour after the effluent had spent approximately 30 days residing in Boat Harbour before being discharged to the outlet area. As such, this study (and any other bivalve studies conducted in the region) may have limited validity given that the new effluent pipeline is outside of the Boat Harbour outlet, and the effluent will have limited residency time before final discharge to the marine environment. Thus, the impacts of the new effluent pipe on sedentary species (e.g. oysters and mussels, particularly oysters given the presence of oyster aquaculture facilities in the vicinity of the proposed diffuser) may not be fully captured in the current EA.

- Health Canada requests additional information to validate the use of these bivalve studies in evaluating future contaminant concentrations given the different effluent treatment processes and the decreased residency time of the effluent in the proposed project.

Acoustic Environment

1) **Section 8.2.1.2 (Significance Criteria)** states that "*a significant adverse residual environmental effects on the acoustic environment is defined as one where the project-related emissions of noise (as determined through noise modelling) results in a prolonged exceedance of the NSE noise guidelines (prolonged period defined as a continuous 24 hour period) identified in Section 8.2.1 above, or a prolonged increase in ambient noise levels of 10 dBA above existing background levels at a sensitive receptor. For the purpose of this threshold, "prolonged" is defined as a continuous period of 24 hours*."

   Given that the *Nova Scotia Guidelines for Environmental Noise Measurement and Assessment* is separated into daytime (0700-1900 hours), evening (1900-2300 hours) and nighttime (2300-0700 hours) thresholds (with different acceptable levels for each time period), it would appear the test for significance would imply that noise levels would be required to exceed each of the three time periods over a 24 hour period before the effect is considered significant.

   According to Health Canada (2017b), guidelines and recommendations presented in WHO (1999, 2009) regarding sleep disturbance should be considered in an EA. In particular, WHO guideline levels should not be exceeded for quiet rural areas and susceptible populations, such as those in hospitals, or convalescent or senior homes. For estimating the likelihood of sleep disturbance on any given night, the WHO's Guidelines for Community Noise (1999) report a threshold for sleep disturbance as being an indoor sound level of no more than 30 dBA LAeq for continuous noise, during the sleep period. For individual noise events, the WHO has stated: "For a good sleep, it is believed that indoor sound pressure levels should not exceed approximately 45 dBA LAmax more than 10–15 times per night...." Health Canada recognizes that in many cases, people will want to keep windows at least partially open, depending on the season. Unless specified otherwise, it is assumed by Health Canada that an outdoor-to-indoor transmission loss with windows at least partially open is 15 dBA (United States Environmental Protection Agency [US EPA] 1974; WHO 1999).
   - Health Canada suggests that in determining significance a greater emphasis be placed on noise levels during the evening and overnight hours in order to be protective against sleep disturbance.

2) **Section 8.2.2.1 (Baseline Noise Levels)** states that the baseline sound monitoring was completed between December 15 and December 19, 2017 (with paused measurements during the evening of December 16, 2017 until the early morning of December 17, 2017 and again during the evening of December 17, 2017 until the morning of December 18, 2017 because of cold temperatures). No additional information was provided with respect to ground cover (e.g. snow cover or bare ground) or the atmospheric conditions during the monitoring such as wind speed, wind direction, temperature, etc.

- Given that all of these variables have implications with respect to noise propagation, this information should be presented in the EA in order to determine the adequacy of the baseline sound pressure levels.

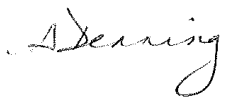
3) **Section 8.2.2.3 (Characterization of Residual Environmental Effects)** states that "*it is acknowledged that for traffic reasons the pipeline construction may occur at night. If this option is chosen, appropriate mitigation measures will be implemented.*" There is no further discussion about what mitigation measures will be implemented in the event of pipeline construction occurring at night to reduce noise levels to meet the provincial guidelines.
   - Health Canada requests additional information related to mitigation measures that would be implemented in the event of night-time construction noise in order to reduce the potential for annoyance and sleep disturbance to nearby human receptors. See Health Canada (2017b) and the WHO (1999; 2009) for more information.

Potable Water Supplies

1) **Section 8.5 (Groundwater)** identifies the number of potable wells within the vicinity of the proposed project (including the effluent treatment facility and the on-land portion of the effluent pipeline). It was noted that the references used in the EA to identify current groundwater chemistry in the area are somewhat dated (e.g. Hennigar, 1968; Gibb and McMullin 1980). If recent groundwater monitoring of these nearby residential wells has not been undertaken (for general chemistry and any other parameters that may be relevant based on the expected new effluent chemical composition), Health Canada advises that baseline sampling be undertaken for any wells that may be impacted in the event of a future pipeline leak.
   - Consider conducting baseline chemistry analyses of any nearby potable groundwater wells in order to have a sufficient understanding of current groundwater quality. In the event of a pipeline break/leak, future samples can then be compared with these baseline concentrations in order to determine whether there has been an impact on local drinking water quality.

If you have any questions, please contact the undersigned at your convenience.

Sincerely,



Allison Denning

Helen Yeh
Environmental Assessment Officer
Environmental Assessment Branch
Nova Scotia Environment

Dear Helen:

Re. Northern Pulp Proposed Replacement Effluent Treatment Facility Project (Highway 106 Abercrombie to Caribou Harbour) - Environmental Assessment Comments from TIR Review

Conceptual drawings *(Northern Pulp Effluent Treatment Plan by KSH Solutions Inc. "Conceptual Marine Effluent Outfall Pipeline Routing Plan Caribou Harbour" Rev. 18 dated Dec. 10, 2018 -10 sheets*) outlining Northern Pulp's proposal to construct a pipeline along the shoulder of Highway 106 to carry effluent from their mill in Abercrombie Point to Caribou Harbour were presented and submitted to Nova Scotia Transportation & Infrastructure Renewal (TIR) by representatives of Northern Pulp for preliminary review and feedback shortly prior to the related Environmental Assessment being registered on February 7, 2019. These drawings, and the Environmental Assessment Registration Document by Dillon Consulting were distributed to TIR stakeholders and the following comments are provided:

1. TIR Policy PO1000 "Construction of Gas/Oil Pipelines within or Adjacent to Highway Right-of-Way" offers guidelines and requirements for TIR to consider permitting pipeline infrastructure within TIR highways. This policy has been provided to and discussed with the proponent. With respect to the proposed project the policy states "no installation of low-pressure pipelines will be permitted on or within 30 metres of 100 Series Highways Right-of-Ways in any form. Any exception requires the approval of the Executive Director of Maintenance and Operations."
2. The concept of **placing the pipeline in the shoulder of the road is not acceptable to TIR** and would not be permitted as it would result in significant operational issues to TIR during construction and any future maintenance of the proposed project, may significantly impact TIR's flexibility to implement future highway improvements, and a significant failure of the pipeline could damage the highway.
3. **Placing the pipeline completely outside of TIR right-of-way is preferred by TIR.** It would be permitted adjacent to highway right-of-way (an approved TIR Work Within Highway Right-of-Way Permit is required for any structure within 60 meters of the boundary of a controlled access highway).
4. If TIR permits the pipeline within highway right-of-way in any location, it would be required to be placed as far as possible from the roadway, including adjacent to the causeway (i.e.

within 3 to 5 meters the right-of-way boundary) to minimize operational impacts to TIR during construction and in the future. Along the causeway, it is preferred to locate the pipeline at or near the toe of the slope of the causeway embankment beneath sea level. In other areas adjacent to Highway 106, the pipeline should be placed to the east of the current roadway to minimize impacts on future highway improvements (locate pipeline to opposite side of highway away from lands reserved for future highway twinning and/or expansion) and designed to be capable of supporting maintenance equipment that may be required to operate on the roadside (e.g. excavators).

5. Development and acceptance of a registered agreement between TIR and the proponent would be required to establish formal terms for location, maintenance/monitoring/inspection, emergency measures, liability, remediation/reclamation, relocation costs if required for future highway improvements, responsibilities for potential environmental impacts and to allow for assignment of responsibilities to future heirs/assigns. The Public Highways Act does not allow for any third-party interest in highway right-of-way such an easement.
6. A significant refundable and non-refundable security deposit would be required prior to permit approval, to cover TIR inspection costs and potential damages to the highway. Amounts would be determined upon review of final design plans acceptable to TIR, based on an assessment of risks and potential impacts to TIR. The refundable deposit would be held for at least one year following completion of construction to allow for monitoring of latent design/construction deficiencies and released following final inspection by TIR staff and once any deficiencies/concerns are addressed to the satisfaction of TIR.
7. Lane closures or stoppage of traffic for construction or future maintenance would not be permitted on Highway 106 for any significant amount of time including the Pictou Causeway. Construction phasing, work plans/schedules and traffic management plans would be required and must minimize impacts to highway traffic.
8. Jacking pits for proposed horizontal drilling shall not adversely impact highway infrastructure or traffic operations and would be required to be identified on design plans. Feasibility for horizontal directional drilling must be confirmed at the design stage (notes on current plans indicate contractor is to confirm feasibility for horizontal drilling).
9. The proposed pipeline would not be permitted at elevations above base material supporting highway culverts as not to impact future highway maintenance needs.
10. Encasement of the pipeline in a sleeve of acceptable design and material (e.g. steel or concrete) would be required at all locations where the proposed pipeline is installed across (beneath) structures and other highways including the Pictou Rotary. Further sleeving details would be required for subsequent design reviews.
11. With respect to proposed venting manholes within highway right-of-way, confirmation would be required that there would be no emissions of noxious or unpleasant/unfavourable vapours, gases or odours, or health/safety/environmental concerns to TIR maintenance staff or the public and that they would only be vented during start-up after am ill shut-down when flow resumes through the pipeline.
12. Comments from TIR Structural Engineering are summarized as follows:
    a. All units on design drawings should be metric

b. Section identifiers and stations on the last (section) sheet of drawings provided appear incorrect and do not match plan drawings in some cases.
c. The proponent should review if insulation and protection of pipe is required where above-ground (i.e. along structures), and if insulation/mitigative measures is required for impacts the higher temperature effluent carrying pipeline may have on surrounding soil conditions during winter conditions e.g. potential for differential settlement, melting snow on ground surface, etc.
d. The proponent should consider if additional manholes are required to facilitate future inspection/repair of pipeline.
e. Maintenance provisions for each TIR structure where pipeline is attached or constructed parallel or below would need to be included in formal agreements.
f. It is difficult to provide detailed comments on impacts to structures at this stage as structural analysis and connection details are not provided. The pipe is relatively large and a structural evaluation of each structure to determine if it could support the weight based on CHBDC Code would be required.
g. Running a pipe along any structure shall not impact the vertical clearance that is available.
h. Typically, pipes are run on the underside of bridges, not on the side of barrier, to minimize exposure to elements and risk of impact from traffic collisions with bridge rail.
i. Complete survey should be completed at each structure to confirm all dimensions. TIR may be able to provide design and/or as-built plans of some or all bridges for reference/information only. Plan, elevation, cross-section, excavation and fill details, and proximity to bridge elements for each structure would be required for subsequent design reviews.
j. Actual slopes and grades of pipe through bridge sites would be required. Section Cl appears to show the pipe travelling through substructure (footings); presumably it would be offset laterally to be away from structural components as required.
k. Dimensions showing distances between pipe, excavations, and bridge footings would be required to ensure there are no concerns with excavation near footings.
l. More detailed design/construction notes and standard references would be required for subsequent design reviews.

13. Additional review by internal TIR stakeholders and opportunity to provide additional comments would be required as design for the project progresses.

Thank you for the opportunity to review this project.

Your truly,

Sylvie Colomb

Helen Yeh
Environmental Assessment Officer
Environmental Assessment Branch
Nova Scotia Environment

Dear Helen:

Re. Northern Pulp Proposed Replacement Effluent Treatment Facility Project (Highway 106 Abercrombie to Caribou Harbour) - Environmental Assessment Comments from TIR Review - Addendum

NSTIR is pleased to offer those additional comments to the above-mentioned project:

1. As per our previous comments, any work within the Right Of Way (ROW) will require a Working Within Highway Right Of Way Permit. But the document references multiple PID's, so in addition to the Department, permission would have to be obtained from any relevant property owners. It also references possible changes to access roads, as well as several public and private roads, as well as trenching and vegetation control. The proponent also references that roads frequently travelled will be "repaired as necessary". The complete scope of any work planned will need to be detailed in the ROW permit application and reviewed by local Department staff for suitability.

2. As indicated previously, NSTIR does not support the use of the ROW to have piping placed in the shoulder of the road. Should any work be completed that is outside the ROW, any work areas created on provincially owned roads as a result will need to be in compliance with the appropriate sections of the Nova Scotia Temporary Workplace Traffic Control Manual. The proponent has referenced this in section 5.7.2.11 Traffic Management and Road Infrastructure. Also, the proponent has referenced several possible mitigation measures on p. 539 as well as p. 577. In any case, any traffic control required as a result, speed limit changes etc. will need to be approved and signed off by appropriate Departmental staff.

3. The proponent has identified a possible need for a Special Move Permit for overweight and overdimension loads. If this is required, the proponent should contact our Departmental contact for Special Moves, Manuel Abreu, to determine any necessary requirements. He can be reached at Manuel.Abreu@novascotia.ca . Also, in conjunction with this, the Transportation Route for any loads needs to be clearly identified, so that Department staff can analyze it to determine suitability of the route, in terms of turning radii for trucks, as well as weights on overpasses and clearances on underpasses.

4. It is indicated p. 523 that the risk of a vehicle accident “would be limited to the construction phase of the project, as limited transportation is required for the project during operation and maintenance”. While the likelihood may be more during the construction phase due to the number of vehicles involved, vehicular accidents can occur at any time and are not eliminated completely for any reason. As a result, stringent mitigation and preventative measures need to be present and active at all phases of the project so that the potential for vehicle accidents is minimized.

Thank you for the opportunity to review this project.

Your truly,

Sylvie Colomb

Environment

Date: March 6, 2019

To: Acting Water Management Unit Manager

From: Senior Surface Water Quality Specialist, Water Management Unit

Subject: Northern Pulp Nova Scotia Replacement Effluent Treatment Facility Environmental Assessment – Review Comments & Recommendations

Scope of Review

As Senior Surface Water Quality Specialist with the Nova Scotia Environment (NSE) Sustainability and Applied Science Division, the following Northern Pulp Nova Scotia Replacement Effluent Treatment Facility (ETF) Environmental Assessment (EA) review focuses on the following subjects:

- Surface water quality & its management
- General surface and groundwater resources & their management

The following review considers whether the environmental concerns associated with the above subjects and the proposed mitigation measures have been adequately addressed in the Environmental Assessment. The recommendations provided below are meant to supplement the actions outlined in the EA submission documents.

While general comments on fish and fish habitat, wetlands, effluent discharge, surface water quantity, and groundwater quality and quantity may be included below, applicable technical specialists should be consulted for specific review and comment.

Reviewed Documents

The following document was the basis for this EA review:

Dillon Consulting. 2019. *Northern Pulp Nova Scotia Environmental Assessment Registration Document Replacement Effluent Treatment Facility*. Northern Pulp Nova Scotia Corporation. 17-64631-1300.

Comments

Surface Water Resources

- Section 8.4.2.1 provides a listing of watercourses, wetlands and other surface water features that will be potentially intersected by the Project footprint or are immediately adjacent.
    - The proposed ETF is within the tertiary watershed 1DP-SD8, which discharges into Pictou Harbour. One mapped unnamed watercourse (WC2) is identified within the footprint and the spill basin construction

area, which will require realignment and/or partial removal. The adjacent WC1 unnamed watercourse may require reconfiguration as well for proposed site activities. Both watercourses receive site drainage from the existing NPNS site and will continue to receive localized surface water runoff following Project construction.

  - The pipeline alignment route crosses three tertiary watersheds, which are 1DP-SD8 (1 unnamed watercourse [WC4]), 1DP-SD3 (seven unnamed watercourses [WC5 – 6; WC12 - 16] and 1DP-SD4 (five unnamed watercourses [WC7 – 11]). All of these are shore direct drainage areas that drain into either Pictou Harbour or the Northumberland Strait directly. The pipeline also directly crosses Pictou Harbour and within the Northumberland Strait to the discharge location near Caribou Point. These watercourses would be potentially impacted during the construction phase by the pipeline installation and in the case of an inadvertent release (leak or spill)

- Baseline surface water quality (Section 8.4.2.2) has been collected on a quarterly basis since 2012 from the watercourses WC1 (upstream and downstream of existing NPNS surface water runoff), WC2 (downstream of existing NPNS surface water runoff) and WC3 (upstream of proposed pipeline crossing). The results for the December 11, 2018 sampling event with analysis for general chemistry, total suspended solids (TSS) and metals was provided with discussion of observed exceedances in comparison to the Canadian Council of Ministers of the Environment (CCME) Canadian Environmental Quality Guidelines for Freshwater Aquatic Life (CEQG-FAL). No reasoning was provided why surface water quality data collected since 2012 was not included in the baseline assessment. General discussion of exceedances was provided.
- Within the pipeline route, surface water quality grab samples were collected on Dec 3, 2018 along with *in-situ* field measurements using a water quality probe (Section 8.4.2.2). The results were compared against the CCME CEQG-FAL as well as CCME CEQG for marine aquatic life for watercourses with a direct marine connection. No additional criteria are provided as to what designates a watercourse a direct marine connection. General discussion of the water quality results in comparison to applicable CCME CEQG criteria is provided.
- Section 8.4.5 indicates that follow-up baseline surface water quality monitoring is not required within the proposed ETF site. Section 8.5.5 indicates additional baseline surface water quality monitoring may occur in areas identified as potential areas where surface water is expected to infiltrate into the local groundwater table along the pipeline footprint area. No other surface water baseline monitoring is proposed prior to Project construction along the pipeline corridor.
- An existing surface water quality monitoring program for the existing NPNS facility is proposed to be continued and expanded for this Project. The minimum surface water quality analysis package proposed is general chemistry, TSS and metals for at least three seasons.

Surface Water Quality

- The quality of the influent from the existing mill to be discharged into the ETF is not fully characterized using field and laboratory quantitative analysis for physical, chemical and biological parameters applicable to the pulp production

process. This characterization is used to identify potential contaminants of concern to be assessed by this EA. Identifying the project contaminants of concern at the influent stage of an ETF supports the following EA activities:

- Treatment system design
- Assessing treatment effectiveness
- Understanding end receiving environments for each contaminant following the treatment process (soil, water, air)
- Assessing potential effects of contaminants of concern to Project valued environmental components (VECs)
- Developing mitigation measures to address potential effects

The following is the level of characterization related to influent to the proposed ETF:

- Concentrations of total suspended solids (TSS) and soluble chemical oxygen demand (COD) of the influent to the ETF are presented and discussed in Sections 5.2.2.4 and 5.2.2.6, respectively.
- Section 9.2.4.2 *Current NPNS Mill Effluent Chemistry* discusses potential contaminants of concern within a single sample collected in 2018 from the plant influent discharge to the Boat Harbour Treatment Lagoon that underwent comprehensive contaminant analysis. No quantitative data, including concentrations or loads, is provided in the section and no reasoning as to why it is not included. No full list of parameters analysed in the sample is provided. No discussion on why one influent sample is enough to characterize the influent is provided. Contaminants of concern are identified as the following: hydrocarbons, toluene, cyanide, metals and metalloids, phenol, o-cresol, a phthalate ester compound, chloroform, total trihalomethanes, phenanthrene and pyrene. The potential contaminants were present at concentrations close to the laboratory reportable detection limits with no inclusion of what those specific quantitative limits were. Mercury, 2,3,7,80-TCDD and 2,3,7,8-TCDF were identified as parameters that were not analysed.

Without quantitative full characterization of the influent quality to identify potential contaminants of concern to be received by the ETF, there is insufficient information to assess the potential Project effects to receiving water systems and their associated VECs, and to support the subsequent selection of appropriate mitigation measures to address those effects.

- The Environmental Effects Assessment (Section 8) and Human Health Effects (Section 9) sections of the Registration Document identify potential contaminants of concern groups associated with the discharge from the proposed ETF. Potential contaminants of concern for the project following treatment are discussed in several sections with varying levels of assessment for each parameter, which are based on *Pulp and Paper Effluent Regulations* (PPER), literature review, characterization of Boat Harbour Treatment Lagoon discharge and review of other relevant historical water quality data:
  - Table 5.6-1 lists the anticipated daily maximum water quality of the treated effluent to be discharged by the Project and its associated concentrations, which are assessed in the discharge receiving water study (Appendices

E1 to E3). The table does not identify whether it is a comprehensive list of potential contaminants of concern.
    - Dioxins and furans are listed within the Registration Document as below laboratory analysis detection limits in the effluent (Table 6.7-1) with no listing of the detection limit value. The metals manganese, cadmium and aluminum are listed in Table 6.7-1 as being potential parameters of concern within the Project effluent during the Operation phase.
    - During the Project construction phase there is the potential for petroleum hydrocarbon spills from stationary and mobile equipment. Petroleum hydrocarbons were also measured above reportable detection limits in the untreated effluent sample in 2018 (Section 9.2.4.2). Reportable detection limit values are not provided.
    - Section 9.2.4.2 *Candidate Contaminants of Potential Concern in Treated Effluent Summary and Path Forward* lists potential contaminants of concern to be evaluated in a Human Health Risk Assessment (HHRA) (if required for the project) which consists of the following:
        - some metals/metalloids (unidentified, except for mercury);
        - some polycyclic aromatic hydrocarbons (PAHs);
        - polychlorinated dibenzo-p-dioxins and dibenzofurans (PCCD/F);
        - some resin compounds;
        - a couple or few chlorophenolic compounds;
        - non-chlorinated phenolic compounds; and
        - chlorinated volatile organic compounds (VOCs)

      The specific number of 'some' compounds is not defined. The list of compounds is expected to be reduced further with the completion of a detailed HHRA. The assessment used to develop this list of potential contaminants discusses concentrations with respect to reportable detection limits and background water quality without quantitative values.

  As with the above influent contaminants of concern characterization comment, the identification of potential contaminants of concern in the treated effluent discharge are discussed using qualitative methods (Section 9). The discussions reference potential sources of quantitative data, but no reasoning is provided as to why this data is not provided in the Registration Document to support the contaminants of concern assessment. A detailed quantitative approach to estimate discharge contaminants of concern concentrations and loads from a treatment system, using a variety of information sources (e.g., literature review, background water quality and similar facility effluent data) would typically be expected as part of an EA Registration Document.

- The effluent water quality listed in Table 5.6-1 and subsequently evaluated with respect to discharge into the marine receiving waters (Appendices E1 to E3) did not include metal compounds, hydrocarbons and several organic compounds listed in Section 9 as potential contaminants of concern. The Registration Document does not discuss why the contaminants of concern listed in Section 9 are not included in Table 5.6-1 and its associated detailed assessments.
- In the Appendix E1 receiving water study, the single port diffusor option at the CH-B site has a simulated discharge plume that does not interact with the seabed for a distance greater than 200 m from the port, while the preferred three

port diffusor is simulated as interacting with the seabed at approximately a 10 m distance from the ports. The receiving water study indicates that dilution rates at this distance are enough to not impact the benthic environment. The effluent water quality is indicated as being primarily diluted to match ambient conditions prior to the 10 m distance for the Table 5.6-1 parameters. There is no detailed assessment of the discharge plume effluent and its interaction with seabed and benthic environment beyond the statement it is unlikely to have adverse effects. The lack of an assessment or further discussion beyond this statement is insufficient information to assess if there are adverse effects to the marine benthic environment.

- The receiving water study (Appendix E1) used the water quality results from the Pictou Road Area (Appendix E3) to represent the ambient water quality at the CH-B discharge point. Discussion was provided to indicate the Pictou Road Area water quality results represented a conservative worst-case estimate than what would be expected at CH-B near Caribou Point, based on existing land uses within the Pictou Harbour watershed. No discussion was provided in the Registration Document about whether follow-up monitoring and assessment at Caribou Point would be used to confirm the input parameter assumption.
- The Appendix E1 receiving water study presents in Figures 3.4 and 3.5 predicted plume dimensions in plan and side views. Two temperature scenarios are discussed prior to these Figures, which are for the winter and summer seasons. No indication is provided as to which seasonal temperature scenario is presented in the Figures. It would be expected that the plume dimensions may be different given the temperature differentiation between the effluent and ambient water for the two seasons. This information would support the effects assessment for the marine environment associated VECs.
- Table 8.4-3 and Appendix M4 present the field and laboratory analysis results from the freshwater surface water quality samples collected during at least one site visit. The samples were analysed for a suite of parameters that included general chemistry including nutrients, select total metals and TSS. The marine baseline water quality is presented in Table 3.1 in Appendix E.3. Table 5.6-1 lists the expected maximum daily effluent water quality of the NPNS effluent, while Section 9 lists several potential contaminants of concern that are not included in the above baseline assessment (e.g., total petroleum hydrocarbons (TPHs), PAHs, resin compounds, phenols (chloro and non-chloro). Having pre-construction analysis results for the full list of potential contaminants of concern in the freshwater and marine systems within the Project footprint provides a comprehensive baseline for evaluating project effects.
- Appendix H, Section 2.5 presents a list of proposed sediment analysis parameters for a baseline follow-up benthic invertebrate community monitoring study. The list of parameters includes some that are listed as project contaminants of concern in Table 5.6-1 and Section 9 (metals, mercury, AOX, dioxins, furans). Three sites are proposed to be sampled along the pipeline route without discussion and/or supporting references as to whether that is a sufficient sampling density for the proposed length of marine pipeline. No sampling is proposed within the discharge plume area. There is no discussion of reportable detection limits for the associated laboratory analysis of the parameters, and applicable federal/provincial criteria for results assessment. Sampling for select parameters (Footnote 3) is proposed to occur as part of another pre-construction

assessment study proposed by Stantec (2017), Registration Document Appendix E3. The following are sediment quality analysis parameters that are listed in Table 5.6-1 and Section 9 as potential contaminants of concern that are not listed in the follow-up study:
    - Nutrients (nitrogen and phosphorus compounds)
    - pH
    - PAHs
    - Specific chlorophenolic compounds
    - Specific non-chlorinated phenolic compounds
    - Specific resin compounds, in addition to resin fatty acids
    - Chlorinated VOCs
    - Total petroleum hydrocarbons, and/or other relevant hydrocarbon parameters
- Appendix H, Section 2.6 presents a list of proposed water quality analysis parameters for the baseline follow-up water quality monitoring study. The list of parameters includes many that are listed as potential contaminants of concern in Table 5.6-1 and Section 9 (pH, colour, TSS, metals, mercury, biochemical oxygen demand [BOD_5], nutrients, dioxins, furans, AOX). There is no discussion of reportable detection limits for the associated laboratory analysis of the parameters, and applicable federal/provincial criteria for results assessment. The following are potential water quality analysis parameters that are listed in Table 5.6-1 and Section 9 as contaminants of concern that are not listed in the follow-up study:
    - Chemical oxygen demand (COD)
    - PAHs
    - Specific chlorophenolic compounds
    - Specific non-chlorinated phenolic compounds
    - Specific resin compounds, in addition to resin fatty acids
    - Chlorinated VOCs
    - Total petroleum hydrocarbons, and/or other relevant hydrocarbon parameters
- Appendix G, Section 3 lists the benthic invertebrate community assessment and fish population assessment pre-discharge surveys as ‘proposed only’ with respect to schedule. The pre-discharge studies are recommended by EcoMetrix to be conducted to improve interpretation of biological monitoring program results.
- Horizontal direction drilling (HDD) is proposed as a pipeline installation method under watercourses/wetlands (Section 5.3.1.8). Drilling muds are listed as predominantly consisting of a mix of water and bentonite clay. Typically HDD mud mixtures also include the addition of polymers and surfactants to stabilize soils and disperse clay particles, respectively (http://factsheets.okstate.edu/documents/pss-2916-can-urban-horizontal-directional-drilling-mud-be-land-applied-2/).
- HDD has the potential to inadvertently release drilling fluid into a wetland or watercourse that is above the borehole, which is sometimes referred to as a frac-out (http://trca.on.ca/dotAsset/105401.pdf). There is no direct discussion of this potential inadvertent release mechanism in the Registration Document and mitigating its impacts to aquatic ecosystems.
- The mixing zone dilution ratio in Appendix E.1 for the CH-B site with a three-port

diffuser is stated as 144 times at 100 m from the discharge point, while the HHE listed the dilution ratio as 168 times at 100 m from the discharge. There is a discrepancy between the two dilution ratios used in the Registration Document.
- Appendix G, Section 2.5 lists proposed sediment analysis parameters for a pre-construction baseline benthic invertebrate community study along the pipeline rout, which includes acid-volatile sulphide and low-level mercury. Both parameters have a Footnote 4 listed next to them with no associated footnote in the document with that number.
- The follow-up monitoring program proposed field verification of fish habitat within watercourses in the vicinity of the Project footprint, which would be conducted prior to the Construction phase.

Surface Water Quantity

- The ETF design includes a spill basin with a design capacity of 35,000 m^3 to handle untreated effluent, which is predicted to handle 10 to 13 hours of full mill effluent diversion assuming an empty condition. The existing plant currently discharges into the Boat Harbour ETF, which would be expected to have substantially more storage capacity volume than the proposed spill basin for handling treatment system upsets. There is no discussion about the change in holding capacity within the proposed ETF compared to the existing process and what impacts to mill operations will be expected, and the robustness of the proposed design capacities in handling ETF system issues without inadvertently discharging into the environment.
- Table 8.4-1 indicates classification of watercourse types (intermittent, small and large permanent) based on site visits with those along the pipeline route only having one site visit in December 2018. Section 8.4.2.1 provides further details on the watercourse observations. One site visit is typically insufficient to assess whether a watercourse has a permanent or intermittent flow regime.
- Flow observations for each watercourse in Appendix M3 are subjective and based on one site visit conducted in December 2018. One site visit is typically insufficient to assess whether a watercourse has intermittent flow, particularly as per the photos in Appendix M2 where several the watercourses have partial ice coverage, which effects flows.
- Flows (Appendix M3) should also have been measured during the site visit for non-ice-covered sites using a velocimeter and calculated using the velocity-area method (or other standard method), instead of general categorization based on visual observations.
- Section 8.6.2.3 refers to watercourse widths and depths for the watercourses within or adjacent to the Project footprint. No table or field notes are provided listing these observed measurements. Having these values in a table or field notes would provide baseline data to support impact assessment and potential future watercourse alteration approval applications.

Groundwater Quantity & Quality

- Section 8.5.3.2 proposes lining the trench within the Town of Pictou source water protection area with an impermeable or low conductivity material/liner. No details are provided as to what type of liner would be considered ‘impermeable’ and where flows from a leak would potentially go and their potential impacts with reduced vertical infiltration. Understanding how leak flows will be managed within

these lined pipeline trench sections would assist with evaluating impacts to various VECs, including surface water resources, and development of appropriate mitigation measures (if required).

- Section 8.5.3.2. indicates that a system will be installed for the pipeline and associated pumping works that will detect leaks or significant drops in pressure during operation and maintenance. No details are provided as to the types of detection systems that are technically feasible for the proposed discharge pipeline and its preliminary design criteria.
- The ETF spill collection system proposes to include a 1.9 mm thick HDPE liner to avoid leakage. No details are provided on whether a monitoring system/program will be instituted around the basin area with respect to detecting leaks. As the spill collection basin will contain untreated effluent, it will be important to confirm the adjacent VECs are being adequately protected or identify if there is an inadvertent release.
- Dewatering activities as part of below grade excavations for the pipeline installation are discussed in general terms within Section 5.3.1.7. There is no mention of whether expected dewatering rates and pumping periods for the project will be assessed with respect to the 'Application Requirements for Water Withdrawal Approvals'. These dewatering activities may trigger the need for the Project to obtain an NSE Water Withdrawal Approval or Approvals.

Recommendations

Planning/ Design Issues

<u>Surface Water Quality</u>

- There is insufficient quantification of the potential contaminants of concern being input into the ETF and subsequently discharged in receiving environments (soil, water and air). A quantitative full characterization of the influent quality to be received by the ETF is required to identify potential contaminants of concern, support treatment system design, evaluate effects on VECs associated with receiving environments for the ETF discharges (e.g., sludge, effluent and air) and develop appropriate mitigation measures to reduce those effects.
- A more detailed quantitative assessment is required to estimate the expected discharge contaminants of concern concentration and/or load ranges to the marine discharge area and other receiving environments. This assessment potentially could use treatment system models or mass balances to support the quantitative estimations. The results of this detailed assessment would then be used to evaluate effects on VECs associated with those ETF discharge receiving environments and develop appropriate mitigation measures to reduce those effects.
    - The effluent receiving water models (Appendix E) should be updated to simulate any potential contaminants of concern that are identified within the discharge effluent that have not been previously modeled. The results of these model runs should be used in the subsequent assessment of their impacts. Additional mitigation measures should be developed to address potential impacts that are identified.
- Further discussion and potentially quantitative assessment of the impacts on ambient marine water quality and the benthic environment with respect to the plume interacting with the seabed at 10 m away from the discharge ports should

be conducted to support the unlikely potential adverse effect statement in Appendix E1. If potential adverse effects are estimated by the additional assessment, then appropriate mitigation measures should be developed.

Groundwater Quantity & Quality

- Although a specific leak or significant pressure drop detection system is expected to be developed during detailed design, examples of relevant leak detection and/or pressure measurement technological options for this type of effluent discharge pipeline and operating flows should be provided to NSE for review. This will indicate to the reviewer whether the leak detection monitoring method types are adequate for the proposed effluent discharge pipeline design. The detailed design and operating parameters of the leak detection and/or pressure drop monitoring system for the pipeline should also be provided to NSE for review, comment and approval prior to the Construction phase.

Operational Issues/Other Permitting Processes

Surface Water Quality

- Additional baseline freshwater surface water quality and marine water sampling within the Project footprint should be conducted, and the field and laboratory analysis should include a suite of parameters that represents the full-list of potential contaminants of concern associated with the ETF influent (e.g., AOX, COD, BOD, mercury, cyanide, PAHs, PCCD/F, resin compounds, chlorophenolic compounds, non-chlorinated phenolic compounds, chlorinated VOCs). This list of parameters would be based on the results of the above requested influent and effluent characterization. A qualified professional should develop the list of additional baseline monitoring parameters to determine which parameters would not be expected to be present in existing water systems, and therefore not require baseline monitoring. This supplemental baseline water quality monitoring will support assessment of potential Project effects.
- Additional baseline marine sediment sampling within the Project footprint should be conducted as part of the EEM program, and the field and laboratory analysis should include a suite of parameters that represents the full-list of potential contaminants of concern associated with the ETF influent. A qualified professional should develop the list of additional baseline monitoring parameters to determine which parameters would not be expected to be present in existing water systems, and therefore not require baseline monitoring.
- Baseline marine water quality sample results within the discharge receiving area near Caribou Point should be compared against the Pictou Road Area water quality results, which were used as inputs in the receiving water study (Appendix E1 & E3). The receiving water study models should be updated, and results re-evaluated if the Caribou Point results represent a more conservative receiving water condition than the Pictou site.
- As part of EMP and/or EPP for the operations phase, the management of the spill containment basin, and associated plant operations, including shutdown, should be discussed with respect to preventing basin overflows.
- Detailed design for the HDD alignments should be conducted, including appropriate geotechnical investigations (including boreholes) and topographic surveys. These designs should be submitted to NSE for review and approval prior to commencement of activities.

- In support of the HDD alignment installations, a Project frac-out monitoring and contingency plan should be developed, particularly focusing on areas immediately adjacent to or within watercourses and wetlands. The monitoring and contingency plan should be submitted to NSE for review and approval prior to commencement of activities. This activity can potentially be done in conjunction with the proposed construction surface water quality monitoring program.
- The Registration Document proposed field verification of fish habitat within watercourses in the vicinity of the Project footprint, prior to the Construction phase, which should be conducted.
- The proposed construction surface water quality monitoring program (Section 8.4.5) should as described in the Registration Document be developed in consultation with NSE and include appropriate upstream and downstream monitoring during storm events. Monitoring should also be conducted when there are in-water activities occurring. Appropriate monitoring compliance criteria (e.g., Canadian Council of Ministers of the Environment Canadian Environmental Quality Guidelines for Freshwater Aquatic Life TSS and/or turbidity criteria [http://st-ts.ccme.ca/en/index.html]) should be part of the program to determine compliance and when to implement additional mitigation measures.

Groundwater Quantity & Quality

- An assessment should be conducted on where flows resulting from a pipeline leak would go with the use of a low permeability liner within certain sections of the pipeline trench during the Operations phase. This assessment should include determining whether flows would be diverted into specific local surface water features. If impacts are determined appropriate mitigation measures should be developed.
- A leak detection system or monitoring program should be developed for the ETF spill collection system. The details of this system/program should be provided to NSE for review, comment and approval prior to the Construction phase.
- The pipeline and ETF excavation dewatering activities should be evaluated with respect to the 'Application Requirements For Water Withdrawal Approvals' and appropriate Approval applications be submitted (if required), including development of mitigation measures to manage discharge flows. This assessment should include an estimation of expected daily dewatering rates and time periods for the Project, and whether they will or will not trigger requirement for an application or applications.

General

- The project specific construction and operations environmental management plan (EMP) and environmental protection plan (EPP) to be developed as part of detailed design within the Registration Document should be provided to NSE for review, comment and approval prior to commencement of applicable Project phases.
- The proposed approval application activities associated with the alteration and/or removal of wetlands and watercourses, and subsequent works within, should be implemented to minimize potential impacts to those aquatic ecosystems, and fish and fish habitat. In support of the approval application process, it is recommended that consultation with appropriate provincial and federal

government departments occur prior to submission of appropriate Approval applications.

Surface Water Quantity

- At least one additional watercourse site visit should be conducted during ice-free conditions to at least the pipeline route intercepted watercourses. The site visits should document qualitative and quantitative channel bed and bank measurements and characteristics (e.g., bed materials, vegetative cover) at an appropriate cross-section and potentially support watercourse and/or wetland applications (if required).

From: Senior Hydrogeologist, Sustainability and Applied Science Division

Subject: Review of Class 1 Environmental Assessment – Northern Pulp Replacement Effluent Treatment Facility (ETF) Project

This EA review from the Sustainability and Applied Science Division Hydrogeologist focuses on the potential for the proposed undertaking/project to adversely affect groundwater resources, including general groundwater quality and local water wells/drinking water supply.

The purpose of the Project is to replace the existing Northern Pulp effluent treatment facility (ETF) with a new one to treat wastewater received from the Northern Pulp pulp mill at Abercrombie Point, Pictou County. The Project includes a new ETF and a new effluent pipeline that will carry treated effluent to be discharged in the Northumberland Strait.

Once treated, effluent would be sent via an approximately 15.5 kilometres-long pipeline. The effluent pipeline would follow the Highway 106 for approximately 11.4 kilometres, then enter the marine environment near the Northumberland Ferries marine terminal, and continue for approximately 4.1 kilometres through Caribou Harbour to the Northumberland Strait where the treated effluent would be discharged via an engineered diffuser.

Comments

1. There are no provincial Protected Water Area (PWA) near the proposed ETF or along the proposed pipeline route. PWA's are not required for drinking water supplies. The nearest PWA is for the New Glasgow Forbes Lake water supply approximately 17 km southeast of the Northern Pulp proposed ETF.

2. The Town of Pictou does have a Source Water Protection Area (SWPA) that extends to the town boundaries and in areas to the north. In particular, the SWPA covers significant sections (>50%) of Highway 106 to Caribou along the proposed

pipeline route. This SWPA is discussed in more detail under comment 4.

3. The nearest Registered Public Drinking Water Supplies (RPDWS from NSE records) to the ETF and pipeline route are as follows:

   ETF –
   - Country Villa Park RPDWS owned by Rivers Trailer Park company has registered a drilled well located approximately 1 km southeast of the proposed ETF

   - Northern Pulp Nova Scotia Corporation has a RPDWS for the Pictou Mill ETF location

   Pipeline Route north of the causeway –
   - Piper's Landing Restaurant approximately 2.9 km west of the proposed pipeline route

   - Several RPDWS located in the Braeshore area north of the Town of Pictou located >3 km east of the proposed pipeline route (Harbour Light Campground, Pictou Lodge Resort/Maritimes Inn and Caribou – Munroe's Island Provincial Park)

4. Municipal wells – Town of Pictou Wellfields and Source Water Protection Area

   The Town of Pictou operates two municipal water supply wellfields containing 13 wells as reported in their 2013 System Assessment Report to Nova Scotia Environment.

   The Caribou Wellfield is located mainly to the north of the existing town boundary (north of Division Road) and contains 5 wells. The Pictou Well Field is located almost entirely within the town boundaries and contains 8 wells.

   These two wellfields have similar sedimentary bedrock geology, although in the Caribou Wellfield area there is an overlying surficial geological unit of gravel and sands that has potential use as a distinct shallow aquifer. To the south, in the Pictou Wellfield area the surficial geology consists of a silty ground moraine till and is likely not suitable for significant aquifer supplies. Data from the Pictou Group bedrock underlying both wellfields however does show both well and aquifer yields that can provide sustainable long-term supply.

   The nearest municipal well to the proposed pipeline route is the "Public Works Well" located at the Pictou Public Works building about 150 m west of Highway 106, near the causeway. The next closest wells are > 1 km away, including the Caribou Wellfield wells to the north of the town boundary (and south of Highway 106).

   It should be noted that many of the Town of Pictou municipal supply wells are located in urbanized municipal areas and have existing risks related to maintaining source water protection, unrelated to the proposed pipeline. The Town of Pictou has

developed a Source Water Protection Plan (latest revision Oct 2017) to address potential risks. Potential risks related to pipeline routing are not specifically addressed. The attached Figure 1 here shows the SWPA delineated boundary. In comparison to Figure 2 (pipeline route also attached) it can be seen the pipeline route along Highway 106 crosses the SWPA delineated boundary in two areas.

5. The registration document from Northern Pulp identifies in Figure 8.5-1 (p. 192) two sets of dashed lines estimating the Pictou and Caribou wellfields extent, and a delineation boundary from the Pictou Source Water Protection Committee (SWPP report). It should be noted that neither of these estimated boundaries represent a strong scientifically valid description of the wellhead protection zones. However they may be useful for planning purposes. Quantitative hydrogeological determination of the well head protection area (WHPA) (numerical computer modelling) showing wellfield zones of contribution and expected times of travel would be beneficial in managing specific risks to the wellfields.

6. The online Nova Scotia Groundwater Atlas (Energy and Mines) was used (by this reviewer) to estimate the number of residential drilled wells within a 500 m radius buffer (on either side) of the proposed pipeline route from the ETF to Caribou. See the attached Figure 2 showing the 500 m buffer zone. The Atlas identified 62 water wells within the 500 m buffer distance. The majority of these are identified as for domestic use, but two are listed as public (non-municipal).

   In the registration document, the proponent reports 121 existing residential water supply drilled wells within a 500 m buffer of the proposed pipeline route. However, it is possible their search zone was different, as this number of wells could not be replicated using the Atlas identification tools with a 500 m radius buffer.

   It has been noted previously that the Well Logs Database Records and any mapping based on these records need to be considered in terms of locational errors/accuracy of the original data. In addition, the Well Logs Database does not contain a complete listing of every water supply well in the province and some areas may contain water supply wells not reported. Field truthing and field surveys for water supply well locations is necessary. This is particularly important given the discrepancies in the registration document concerning the number of water supply wells.

7. The treated effluent will likely contain natural chemicals found in the wood chips, added chemicals from processing and the effects of treatment which can reduce, create or alter chemicals. The chemical characterization is important from a groundwater and drinking water perspective, primarily with regards to the potential for any leaks, spills or other releases that are uncontrolled and enter groundwater or surface waters. Characterization is beneficial in order to plan potential monitoring and mitigation strategies.

   The chemical characterization of the treated effluent that would flow through the proposed pipeline is not determined, mainly because the new treatment processes proposed are not yet operational and no samples can be analysed. However, the

registration document does look at similar treatment plants from around the world. The document presents some lists of “candidate Chemicals of Potential Concern” or COPC that show the potential scope of chemicals in the treated effluent.

The document presents chemicals determined by similar pulp mill process in Tasmania, Australia. The “Toxikos (2006) study is considered to provide a reasonable interim indication of what may be expected in relation to NPNS project effluent chemical composition and characteristics” (p. 508). However, one uncertainty pointed out is that the wood chips used in the Tasmania are largely hardwood eucalyptus whereas at Northern Pulp they are softwood coniferous. The Tasmania project list of candidate COPC’s include:

From page 508:

• “Metals and metalloids.
• Selected plant sterols and steroids (phytosterols and phytosteroids).
• Methylphenols and other alkyl-substituted phenols.
• Nitrophenols.
• Phenol.
• Plant-based hydrocarbons such as pinenes, camphenes, carenes, limonene.
• Petroleum hydrocarbons (primarily long chain aliphatic hydrocarbons).
• BTEX (benzene, toluene, ethylbenzene, xylenes).
• Polycyclic aromatic hydrocarbons (PAHs).
• Alkyl and chloro-substituted PAHs.
• Numerous chlorinated volatile organic compounds (VOCs).
• Chlorinated benzenes and methoxybenzenes.
• Dehydrojuvabione.
• Juvabione.
• Furanones (chlorinated and non-chlorinated).
• Hydroxy and/or methoxy chlorinated diones and pyranonestals and metalloids.
• Thiolignins.
• Thiosulphates.
• Chloroacetic acids.
• Resin acids (chlorinated and non-chlorinated).
• Fatty acids.
• Various aliphatic and aromatic aldehydes and ketones (chlorinated and non-chlorinated).
• Aniline and chloroanilines.
• Chlorinated anisoles.
• Numerous chlorinated phenolic compounds including chlorinated phenols, catechols, cymenes,guaiacols, guaiacones, vanillins, veratroles.
• Vanillones (chlorinated and non-chlorinated).
• p-Cymene.
• Syringol and syringaldehydes.
• Various aliphatic alcohols.
• Polychlorinated dibenzo-p-dioxins and dibenzofurans (PCDD/F).
• Chloromethyl sulfones.
• Chlorohydroxypyron.
• Thiophenes and chlorinated thiophenes.
• Hexachlorocyclopentadiene.
• Various ions such as ammonia, nitrate/nitrite, chloride, sulphate, hydrogen sulphide, carbon disulphide, chlorate, chlorite.”

Candidate COPCs for Northern Pulp Effluent

The proponent has gone further by considering other studies from the present Northern Pulp/Boat Harbour effluent and other Canadian studies that may be more relevant. They have reported another similar list, that is more specific regarding candidate COPC's expected for the Northern Pulp effluent. However, the focus here does seem to be on the ocean as the receiving environment.

From page 514:

"The chemicals that merit consideration as candidate COPCs from the review of previous studies and sediment or sea water data include the following:

• Metals (including mercury) and metalloids
• PAHs.
• PCDD/F.
• Phytosterols.
• Resin and fatty acids (non-chlorinated).
• Petroleum hydrocarbons, oils and greases.
• Chlorinated VOCs.
• Chlorinated phenols, catechols, guaiacols, vanillins and veratroles – [only detected in the ASB and other effluent-treatment process lagoons and basins, and primarily during the early 1990s; these compounds have not been detected in the marine receiving environment influenced by the current mill effluent discharge point].
• H2S and other sulphides.
• Chlorate/chlorite.
• Cyanide.
• Syringaldehydes."

On page 516 of the document, the proponent presents a description of sampling results from the untreated mill effluent. Actual sample results were not provided.

> A recent (2018) sample of untreated mill effluent (collected from Point A) underwent a very similar suite of chemical analyses as the 2018 Point C and D samples. This sample represents worst case effluent chemistry as it was collected at a point prior to the current effluent treatment process. Comprehensive chemical analysis of this sample shows that most candidate COPCs are below detection limits even in untreated mill effluent. The only candidate COPCs that were measurable (above RDLs) in this Point A untreated effluent sample (also generally at low concentrations near RDL values or within typical natural ranges in water) were: hydrocarbons, toluene, cyanide, metals and metalloids, phenol, o-cresol, a phthalate ester compound (likely from pipe materials rather than due to mill processes), chloroform, total trihalomethanes, and trace PAHs (phenanthrene and pyrene only). Mercury was not tested for in this sample, nor was 2,3,7,8-TCDD; 2,3,7,8,-TCDF (as testing of untreated effluent for these dioxin and furan parameters is not required under the PPER).

The above lists of potential COPCs include a variety of metal and chemical parameters that are of potential concern if accidentally released into groundwater or surface water. The potential COPCs from a groundwater, surface water and drinking water quality perspective need to be considered separately from those determined important for the receiving ocean environment.

8. Groundwater is identified as a Valued Environmental Component (VEC) by the

proponent in Section 8.5 of the registration document. The document states:

> "Groundwater was selected as a VEC because it contributes to drinking water aquifers in potable areas and may discharge to surface water and aquatic habitat." (page 185)

Section 8.5 also documents a number of groundwater conditions including numbers of municipal and residential wells along the proposed pipeline route and ETF, as well as in the Town of Pictou wellfield. Statistics based on well construction details are also provided such as well yield and depth. Most wells in the area are very capable of providing adequate yields for domestic water supplies and as demonstrated by the Town of Pictou wellfield, for municipal drinking water supplies. Groundwater quality is also generally good, with some well-specific issues potentially related to chemicals such as chlorides, manganese and other generally natural contaminants (or effects of road salting/salt water intrusion in the case of chlorides).

9. ETF Groundwater Monitoring

The project proponent describes existing groundwater sampling networks at the Northern Pulp Nova Scotia (NPNS) site. One of these networks is the Industrial Landfill Monitoring Network (27 shallow monitoring wells). The other is the operational NPNS Monitoring Network, near the ETF (6 shallow monitoring wells). These networks are being monitored following Approval Conditions specified for the existing plant operation.

Groundwater in the ETF area is relatively isolated in that it is surrounded on three sides by water (Pictou Harbour). To the south of the ETF, there are isolated private well water supply systems, but the nearest of these is about 650 m to the southeast.

Details of the ETF groundwater monitoring program are not fully provided in the registration document (Figure 8.4-1 page 173 does show the existing monitoring well locations and page 194 summarizes some of the results). However, as new facilities are to be constructed on the Northern Pulp site (including clarifiers, aeration basin and effluent spill basin) the monitoring network plan needs to be revised to include these new activities and locations. Groundwater monitoring needs to provide adequate testing to ensure any operational issues are identified and addressed before they become a significant risk to the environment.

10. Pipeline Route Groundwater Monitoring

The project proponent recognizes the critical nature of the groundwater VEC, particularly in relation to drinking water supply. Although the actual proposed monitoring is not specific, the proponent does state (page 202):

> "NPNS will develop a surface water monitoring program to monitor runoff within the pipeline footprint both during and subsequent to construction in areas where surface water can infiltrate to groundwater. As part of this program the frequency of monitoring and parameters to be assessed will be identified in consultation with NSE, particularly with respect to surface waters that could infiltrate

to groundwater within the municipal groundwater watershed areas identified within the SWPP and more populated residential neighbourhoods along the un-serviced portion of the pipeline footprint."

Groundwater monitoring along the proposed pipeline route is also an important function for protection regarding potential post-construction accidental spills from leaks, ruptures or other damage to the pipeline. Groundwater monitoring would need to include two components:

- Baseline monitoring of water wells (residential well survey)
- Monitoring of the pipeline itself for potential leaks, with particular focus on sensitive groundwater use areas and important surface water features (e.g. watercourse crossings and installations of the pipeline below the water table).

11. Pipeline Installation Below the Water Table

The proposed pipeline route may need to include installation below the water table in some areas such as wetlands and watercourse crossings. Some pipeline installation by Horizontal Directional Drilling (HDD) under watercourses is being proposed (page 65). The registration document provides a general description of methodologies to be used, however, if employed, each site using HDD, or with pipe installed below the water table, would need detailed assessment by the proponent and probable NSE approvals.

12. Pipeline Monitoring and Mitigation Measures

Pipeline monitoring for potential leaks resulting from accidental damage is perhaps one of the most important measures for protection groundwater and surface water supplies. Monitoring as close to the potential contaminant source is critical. For a long pipeline, as proposed, this does represent some challenges. The proponent provides some of their potential monitoring/mitigation measures on page 197-198.

"In light of the pipeline route crossing over the Town of Pictou's source water area, additional mitigative measures during construction of the pipeline will include:

- Lining the trench with an impermeable (or low conductivity) material so that, if a leak occurred, it would be contained and prevent vertical infiltration;
- The pipe will be constructed of >2 inch thick HDPE which combines strength and flexibility to withstand stresses as well as being resistant to corrosion;
- The pipeline will be constructed with fusion technology to eliminate most, if not all, jointed sections.
- Having a system in place to detect leaks (or a significant drop in pressure) during operation and maintenance; and
- Inclusion of the Pictou watershed area in the mill ERCP, including contacting the Pictou Water Utility, property owners with potable water wells along the pipeline route, and other stakeholders."

The measures proposed seem preliminary and would need to be expanded upon to provide sufficient risk mitigation. For example, leak detection using only pressure monitoring detection may not be sufficient given the chemical quality expected of the treated effluent, the large volumes of treated effluent passing through the pipe daily and the likelihood that even small accidental release volumes could adversely affect a water supply based on drinking water criteria.

13. Acidic rock drainage (ARD) due to surface water contact with disturbed soils or bedrock geology is a potential concern for both groundwater and surface water where construction excavation projects occur. Acidic rock drainage is not expected by the proponent, based on their review of geological conditions (page 164, 166). They state that the “Underlying Pictou Group bedrock is not known to produce ARD.” However, ARD testing of any bedrock encountered during excavation may be a reasonable expectation in order to confirm this.

14. Although the project does not anticipate involving blasting during construction (page 201), should any blasting be necessary, water wells in the vicinity of blast locations should be included in pre-blast surveys for the ability to determine potential effects to groundwater quantity and quality (see document page 95).

Recommendations

The following recommendations relevant to the groundwater evaluation are made regarding the Northern Pulp proposed ETF industrial activity.

Planning/Design Issues

1. Monitoring design plans for detecting potential spills/leaks resulting from accidental damage to, or malfunctions of the pipeline should be prepared with methodologies for further evaluation.

   Plans should include more details on methods to be used for monitoring for pressure drops/leaks. In addition, plans should address monitoring immediately adjacent to the pipeline where the pipeline is installed in areas of significant risk including: below the water table, in significant wetlands, in areas of watercourse crossings and in the two areas where the pipeline route crosses the Source Water Protection Delineated Boundary for the Town of Pictou Wellfields. The proponent should evaluate and present the use of pressure monitoring systems and shallow groundwater monitoring wells among other potential options.

2. Risk mitigation measures need to be more completely described for further evaluation regarding design to prevent/contain spills/leaks from pipeline accidental damage or malfunction, particularly in areas of significant risk. Description should be made of the practical operational efficacy of measures such as the trench lining proposed, as well as the potential need/benefits of secondary containment of the pipeline in areas of significant risk.

Operational Issues/Other Permitting Processes

1. Field-truthing and locational mapping of water wells within 500 metres radius of the proposed activities (ie. 500 m from each side of the centreline of the pipeline route, or from the ETF site boundaries) should be conducted prior to construction.

2. Pre-Construction Water Well Surveys should be conducted within 500 metres radius of the proposed activities (ie. 500 m from each side of the centreline of the pipeline route, or from the ETF site boundaries). These surveys should include both monitoring for drinking water quality parameters and well water levels and be conducted prior to any construction activities. Methodologies and monitoring proposed for the water well survey should be submitted to NSE for approval prior to implementation.

3. Groundwater monitoring plans in the ETF area will need to be enhanced to include the new activities proposed. This includes additional monitoring to include the area with the proposed new clarifiers, aeration basin and effluent spill basin. The effluent spill basin is proposed to be HDPE lined and this should incorporate leak detection monitoring. The ETF area monitoring plans should be reviewed and approved by NSE.

4. More details on the potential Chemicals of Potential Concern (COPCs) from a groundwater, surface water and drinking water quality perspective need to be provided and evaluated by the proponent in order that their contingency plans for monitoring and mitigation can appropriately include these parameters. Details should include a final list of COPCs and their range of concentrations expected both in untreated influent and treated effluent that could be released accidentally into the environment at the ETF site, or along the pipeline route.

5. Consideration should also be made for including specific measures in Northern Pulp's Environmental Response and Contingency Plan (page 97) that relate to contingencies that potentially involve the Town of Pictou Source Water Protection Plan, SWPA (Source Water Protection Area) and the Town of Pictou water supply wellfields.

6. If the project proceeds to the next stage, it is recommended that standard conditions be provided to the effect that the Proponent is responsible to replace or repair any water supply well found to be adversely affected by the project activities and operations to the satisfaction of the well owner.

Other Observations

1. The current Source Water Protection Plan for the Town of Pictou includes a conceptual indication of the groundwater zones contributing to the two wellfields and a larger Source Water Protection Area. As a greater protection measure, the Well Head Protection Area (WHPA) zones would be updated by better definition and quantitative (numerical) computer modelling to demonstrate the 0-2 year

(Zone A), 2-5 year (Zone B) and 5-25 year (Zone C) time of travel zones for the wells/wellfield. This would be useful in many ways for the beneficial management of the town's wellfield.

This would allow:

a) greater definition of the capture zones of the wellfields,
b) estimated times of travel for various contaminants to the wells which will be useful in providing greater definition and management of source water protection risks for the Town's SWPP
c) greater confidence in a hydrogeological model and wellhead zone protection

It is noted that the Source Water Protection Plan (SWPP) for the town water supply is the responsibility of the Town of Pictou and additional work to better define WHPA zones in the SWPP would require their cooperation and involvement.

Date: March 6, 2019.

To: Helen Yeh, Nova Scotia Environment

From: Beth Lewis, Consultation Advisor, Office of Aboriginal Affairs

Subject: **Replacement Effluent Treatment Facility Project**

The Nova Scotia Office of Aboriginal Affairs (OAA) reviewed the "Replacement Effluent Treatment Facility Project" and provides the following comments:

- Crown consultation is referenced on page 108 in a paragraph summarizing Northern Pulp's (NPNS) participation in consultation meetings with Pictou Landing First Nation (PLFN). It also mentions that Dillon attended a consultation meeting in November 2017 where the EA was introduced in advance of the public sessions. The EA process was introduced at this meeting but, to clarify, a draft EA was not provided at this time.
- On page 109, Dillon references the April 26 technical meeting but refers to it was "crown-led consultation". We wish to clarify that this was not an on-the-record consultation meeting, but a technical briefing provided by NPNS's consultant (KSH) for PLFN.
- Dillon's engagement summary does not include the meetings between OAA and NPNS/Dillon in which aboriginal engagement was reviewed and discussed (January 24 and February 26, 2018).

Sustainability and Applied Science

MEMORANDUM

To: **Helen Yeh, EA Officer, EA Branch**

From: **Manager, IMU**

Date: **March 6, 2019**

Subject: **Northern Pulp Effluent Treatment Facility EA Review Comments**

Hi Helen, below are comments provided by hydrologist engineering staff in my unit. Thanks

Scope of review:

The scope of this Environmental Assessment review from the NSE Sustainability and Applied Science Division Hydrologist is to assess the potential environmental impacts and proposed mitigations of the proposed undertaking on surface water quantity and management. While comments may also include considerations for impacts on general surface water quality, groundwater, freshwater fish habitat, and wetlands, appropriate technical specialists for these areas should be consulted for specific review and comment. This review is specifically focused on freshwater resources, and not on any potential marine impacts.

Documents reviewed:

The documents outlined below formed the basis for this EA review, and is referred to as the 'EA submission' through the rest of this memorandum:

- Northern Pulp Nova Scotia Environmental Assessment Registration Document – Replacement Effluent Treatment Facility. Including Appendices related to surface water. Report Prepared by Dillon Consulting. Dated January 31, 2019, and accessed from https://novascotia.ca/nse/ea/Replacement_Effluent_Treatment_Facility_Project/

Comments re: Northern Pulp Effluent Treatment Facility EA document:

General:

- Appendix C outlines that the "current mill average effluent flow varies between 70,000 and 75,000 m^3/day". This does not align with the 62,000 m^3/day average reported in the submission.

- The values used in the receiving water study and for the design of the ETF are a maximum flow rate of 85,000 m3/day. A clear rationale for this design flow has not been provided in the submission.

Water quantity: Watercourses and Site Drainage

- Two watercourses (WC1 and WC2) will be impacted as a result of the construction of the ETF, and are documented to be small or intermittent watercourses that are previously influenced by the existing plant footprint and operations. WC2 is outlined as having potential for fish habitat, and it is reported that "Direct loss of fish habitat may occur at watercourse WC2 due to the spill basin and potential infrastructure footprint" (pg 218). An estimation of an affected area of 45 m^2 of fish habitat is provided in the submission.
- The proposed project "…does not intend to include in-watercourse or in-wetland crossings", with plans to avoid in-stream work "where technically feasible" (p. 65). It is further outlined in the submission that "Instream work will not be considered unless additional assessment is made during appropriate seasons of potential habitat effects and approvable mitigation designed" (pg 65). As part of this approach, Horizontal Directional Drilling (HDD) has been proposed as a potential method to be used.
- It is outlined in the submission that "If open cut crossing or isolation methods are considered, a seasonally appropriate field habitat assessment will be undertaken, appropriate mitigation proposed to meet NSE/DFO requirements, and work would be conducted under applicable NSE and DFO approvals." (pg. 73)
- As the effluent pipeline aligns with previously installed infrastructure, permanent alterations to watercourses and drainages associated with the pipeline are reported to be non-significant, with land clearing adjacent to the highway reported to "…not exceed a 10 m width, and in most areas will be considerably less" (p. 51). However, it is not clear in the submission whether the necessary permissions to use the existing infrastructure right of way in this way have been received.
- It is reported that "An Environmental Inspector will monitor the implementation of the EPP during all critical phases (i.e., clearing/mowing, topsoil salvage, replacement, grading drainage and watercourse crossings and clean-up) of construction;" (pg. 91).
- Monitoring for construction and post-construction near watercourses is outlined in Section 8.4.5. It is reported that "Watercourse monitoring will be conducted as part of the visual inspection of the construction of the project by a specialist" (pg 184), and the submission outlines that watercourses will be monitored and revisited after construction to ensure that they are stabilized (pg 184).
- It is reported that the timing of pipeline route selection only allowed for a preliminary reconnaissance visit to be completed prior to EA submission, and as a result, a "a conservative assessment was made on the potential for freshwater fish and their habitat and it was assumed that such species may be present where potential habitat is present in the pipeline local assessment area" (pg. 205). Additional assessment is reported to be planned for summer of 2019.
- The water availability report provided in Appendix M5 has been previously assessed as part of the Middle River water withdrawal application.

Water Quality

- Section 5.3.2.5 provides general details surrounding proposed approach to pipe leak detection and includes a reliance on regular inspection of the pipeline. Specific details surrounding the frequency and extent of these inspections are not provided in the submission.
- Section 5.7.2.3 outlines planned erosion and sedimentation control mitigations associated with project activities.
- Section 8.4.5. outlines that "The Construction Monitoring Program will be developed in consultation with NSE and will include monitoring of surface water (pH and TSS) during storm events" (pg. 184).
- It is outlined that a spill basin with 35,000 m^3 capacity is proposed, which will have the capacity to store 10 – 13 hours of discharge at full production. It is noted that "The spill basin should never be kept full, since it would then have no capacity to absorb any system upsets" (pg 43). It is not clear in the submission what criteria were used in determining the volume of the spill basin, and whether the volume is appropriate in mitigating cases of system upsets. The plan for operation and maintenance of the spill basin is not clear, and a result it is difficult to understand how the spill basin will be operated to ensure it is an effective mitigation.

<u>Conclusions and Recommendations:</u>

Planning/Design Issues:

- As it drives the design of the EFT and receiving water study, it is critical to have confidence in the 85,000 m^3/day maximum water use. At current, it is unclear how this number was determined and whether it is appropriate. Clarification surrounding the rationale for this number is required.
- The rationale for the adequacy of the proposed Spill Basin size is not clear in the current submission. It is recommended that details regarding the rationale and adequacy of the proposed Spill Basin size be provided to confirm the effectiveness of this proposed mitigation measure.

Operational Issues/Other Permitting Processes:

- Considerations for risks to the environment from using the HDD method have not been provided in the submission. It is recommended that detailed plans for any Horizontal Directional Drilling be provided to the Department for review prior to use of this methodology, with considerations for any potential risk and mitigation to nearby watercourses associated with using this method.
- It is also recommended that alternatives to HDD are presented as part of the application process so that any watercourse alteration activities can proceed effectively if HDD is not deemed feasible in the field.
- A detailed sediment and erosion control plan for the various activities proposed is to be developed by a qualified professional and is required to be submitted for NSE review and approval prior to construction activities, including clearing, grubbing, and stripping, take place.
- Watercourse alteration applications for watercourse crossings shall be accompanied with enough detail to illustrate how impacts to upstream and downstream watercourses and any existing water users will be mitigated as part of construction activities, supported by results of

fish and fish habitat assessments that the submission outlines are to be conducted prior to these activities taking place.

- Additional details for the spill basin are required prior to construction, including details of operation and maintenance that outline the measures that will be taken to mitigate the risk of overflow, failure, and/or accidental release of substances from the basin.
- Additional details surrounding the approach to pipe leak detection, with considerations for addressing the areas with highest downstream risk, is recommended.

NOVA SCOTIA

Date: 2019-03-07

To: Helen Yeh, Environmental Assessment Officer

From: Executive Director, Policy and Corporate Services
Nova Scotia Department of Agriculture

Subject: Replacement Effluent Treatment Facility Project Environmental Assessment

Thank you for the opportunity to review the Replacement Effluent Treatment Facility Project Registration Document.

The Nova Scotia Department of Agriculture (NSDA) has the following comments:

There are agricultural lands within 1 km of the proposed pipeline, however, the proposed pipeline route may not impact agricultural land bordering the Highway 106 directly.

NOVA SCOTIA

Fisheries and Aquaculture

60 Research Drive
Suite A
Bible Hill, Nova Scotia
B6L 2R2

Date: 2019-03-07

To: Helen Yeh, Environmental Assessment Officer

From: Executive Director, Policy and Corporate Services
Nova Scotia Department of Fisheries and Aquaculture

Subject: Replacement Effluent Treatment Facility Project Environmental Assessment

Thank you for the opportunity to review the Replacement Effluent Treatment Facility Project Registration Document.

The Nova Scotia Department of Fisheries and Aquaculture has the following comments:

- The seafood industry in areas adjacent to the project are important commercial fishing waters for many species including lobster. There are three active processing facilities and four active fish buyers operating or located within 25 km of the proposed project.

- The abundance and safety of seafood is important to the Nova Scotia economy and the harvesters, processors and exporters in the area that rely on the fishery. Although the responsibility for the marine environment, commercial fish stocks and safety of seafood rests with the Federal government through agencies including Department of Fisheries and Oceans and the Canadian Food Inspection Agency, any adverse effects on fish stocks would negatively impact the industry and economic growth of Nova Scotia.

- The Province of Nova Scotia issues licenses and leases for commercial aquaculture operations in the province. There are currently 25 licensed aquaculture sites within 25 kilometers of the proposed project, with the potential to grow that number. There are 23 marine shellfish sites and two land-based sites, with the closest marine shellfish site is 2.47 kilometers away from the proposed outlet. Water quality is important to shellfish aquaculture and must be considered in evaluating the nature and dispersion of the effluent and in any mitigation strategies and emergency shutdown planning.

- The proposal outlines watercourses along the proposed pipeline footprint where freshwater habitat and recreational fishing could be impacted. Specific comments

include:

- Under Section 8.6, Table 8.6.1: The proponent describes brook trout as *S3, Uncommon in the province,* however this species is very common in the province, including in area assessed in this document, and the primary species targeted for freshwater sportfishing.
- Clarity on whether there are contingencies in place to mitigate potential large and rapid fluctuations in water temperature at the diffuser location during low production or maintenance shut down periods would be helpful.

NOVA SCOTIA

MEMORANDUM

DATE: March 7, 2019

TO: Helen Yeh, Environmental Assessment Branch

FROM: Director of Protected Areas and Ecosystems

SUBJECT: Northern Pulp Nova Scotia Corporation (Northern Pulp) Replacement Effluent Treatment Facility Project

Following are comments from Protected Areas and Ecosystems Branch with respect to the Environmental Assessment application for Northern Pulp Nova Scotia Corporation (Northern Pulp) Replacement Effluent Treatment Facility Project

Wetland Comments:

Components of the project that have a direct impact on wetlands identified within the study area include the Effluent Treatment Facility (ETF) and the proposed effluent pipeline.

Summary ETF footprint:
Two wetlands were identified on the NPNS property within the footprint of the new ETF. These wetlands have been delineated and assessed in relation to the proposed work associated with construction, maintenance, operation of the facility. Both wetlands (WL1 and WL2) will be impacted by a direct loss of habitat as a result of construction of various components of the facility including the AST building and the effluent spill basin. Both wetlands receive stormwater runoff or have been historically altered/impacted by activities associated with development of the industrial site.

WL-1 (0.036 ha) – total loss of small wet meadow, likely result of site development.
WL-2 (0.75 ha)- removal of approx. 0.12 ha of habitat and associated functions relating to water retention and habitat services.

Wetlands on the landscape of the existing NSNP property represent approximately 4% of the total area, therefore it is unlikely that wetland loss will result in a significant loss of habitat. No species at risk (SAR) where identified to be specifically dependent on these features. As site development will likely require stormwater management, it is not anticipated that WL-2 would provide a significant role in this capacity as there is no defined inlet/outlet. Potential for impacts to wetlands as a result of operation of the facility are addressed through design of the effluent spillway and EPP document relating to spills/accidental releases.

Planning/Design
No specific concerns relating to design of the ETF.

Operational Issues/Other Permitting Processes
It is our understanding that specific design of the effluent spillway will be evaluated in conjunction with review of the treatment processes. This should be designed to ensure sufficient capacity in the event of a major malfunction/release from the mill facility and suitability of proposed system monitoring and environmental contingency plans.

Wetland approvals will be required for WL1 and WL2. Under the approval process, compensation for wetland loss will be required and additional monitoring of WL2 will be required to determine indirect impacts associated with construction/operation of the ETF. This could include vegetation, hydrology, soil/water quality monitoring.

Other Observations
Noted that both wetlands within the ETF have historically been impacted/influenced by site development history.

Summary of Pipeline:

While no formal delineation or assessment of wetlands that occur along the proposed pipeline route, preliminary identification of wetland habitats adjacent to the route have been identified using available datasets and sire reconnaissance.

In total, 20 wetlands were observed in vicinity to the proposed pipeline route. No direct disturbance of wetlands associated with construction of the pipeline are anticipated based on the use of the existing Highway 106 shoulder and proposed trenchless methodologies for construction to avoid sensitive habitats (including wetland associated with watercourse crossings).

Indirect impacts associated with construction of the pipeline are addressed through the EPP relating to spills/releases of treated effluent. Ongoing maintenance (routine vegetation maintenance) of the route is also expected to minimally impact wetlands along the route by following NS TIR standard maintenance procedures used along roadways throughout the province. Indirect impacts, relating to hydrology changes and water quality inputs associated with the pipeline construction can be mitigated based on the construction procedures proposed and through post construction monitoring. Based on the proposed route, it is unlikely that construction and maintenance of the pipeline will result in significant impacts to the adjacent wetlands.

One saltmarsh (WS3) was identified adjacent to the proposed pipeline route. All saltmarshes (tidal/estuarine marshes) are designated as Wetlands of Special Significance by the NS Wetland Conservation Policy. Again, no direct impact is anticipated associated with construction activities as the route will be confined to the existing causeway and road infrastructure.

The pipeline route reportedly crosses lands included in the source water area for drinking water for the Town of Pictou. As the source water area has not been designated under legislation, these wetlands are not necessarily afforded status as Wetlands of Special Significance.

It was noted that vernal pools may be present along the pipeline route. These tend to be small wetlands and may not exceed 100 m^2 in which case they would be exempt from the NS Wetland Conservation Policy and approval process. The location and size of these features should be provided. Field delineation and assessment of all the wetlands, including presence or absence of priority species, will be required to support wetland alteration applications.

Planning/Design Issues
It is our understanding that the pipeline route as identified in the registration document is dependent on approval from NS TIR to construct the pipeline within the developed Right-of-way of Highway #106. Additional work would be required to determine wetlands that may be impacted as a result of a change to the proposed route (i.e. a new route is determined to be required).

Operational Issues/Other Permitting Processes
Where applicable, formal delineation and assessment of wetlands along the pipeline route will be required prior to construction activities. Dependent on method chosen to cross wetlands, post construction monitoring will also be a requirement under wetland approval process and can include vegetation, hydrology, water/soil quality monitoring.

Permissions from property owners is also be a requirement of the wetland approval process, which should be considered with respect to the proposed pipeline route.

Risks associated with pipeline construction and effluent monitoring should be evaluated in conjunction with treatment objectives, relevant environmental criteria, and environmental protection and emergency response plans.

Other Observations
Proposed route is along an existing developed corridor and methods proposed for wetland and watercourse crossings include methods that would limit or mitigate the potential for alterations to wetland area and function.

Summary of Marine Effluent Discharge:

The marine effluent discharge does not directly impact on wetlands through construction activities. Potential indirect impacts, as discussed below, relate primarily to characteristics of the effluent itself, ability to achieve treatment objectives, and identification of environmental criteria that are protective of aquatic environments as well as characteristics of the receiving waters.

The potential indirect risks to coastal wetlands associated with a marine effluent discharge is possible in the event of a major malfunction of treatment facility. While evaluation of treatment objectives and receiving water body characteristics (i.e. currents, tides, fate of contaminants in marine environments) are beyond current staff expertise, it is the understanding that modelling of the discharge plume has been completed. Evaluation of the modelling and proposed treatment objectives should be conducted to ensure sufficient protection is afforded and treatment objectives are achievable based on the proposed treatment processes and any other requirements for discharges of pulp mill effluents into marine waters.

Planning/Design Issues
Identification and evaluation of coastal wetlands habitats that may be impacted as a result of effluent

discharge has not been provided in the registration document and were not included within the study area presumably based on the results of the discharge plume modelling conducted. Identification of these features, and other coastal habitat (beaches, estuaries, etc.), could be required if deficiencies within the modelling and treatment capabilities are identified in subsequent review of these components of the registration document.

Operational Issues/Other Permitting Processes
It is our understanding that environmental effects monitoring, which could include water and sediment quality monitoring programs, would be required under various approvals required to be obtain should the proposed project be approved.

Other observations:
None at this time.

Summary

- Prior to any wetland alterations, the proponent must obtain Wetland Alteration Approval for any wetland directly or indirectly altered by the proposed development and assess wetland function and resulting changes to wetland area/function in association with the approval application.

- Prior to work within 30 metres of a wetland, the proponent should develop, in consultation with Lands and Forestry and other regulatory bodies, a wildlife management plan that includes priority species associated with the wetlands and be referenced in any wetland alteration applications.

- Prior to altering any wetlands, the proponent must develop a wetland monitoring plan, which should include the following:
    - How baseline conditions will be documented before construction (and grubbing) begins. This should include indicators of hydrology, water quality parameters and vegetation community.
    - How changes in hydrology of the partially impacted wetlands will be monitored and proposed performance indicators.
    - How changes in the vegetation community of the partially in filled wetlands will be monitored, especially regarding the proportions of wetland specific plants, and invasive species and proposed performance indicators.
    - How changes in water quality of the impacted wetlands will be monitored and proposed performance indicators.

- Prior to any wetland alterations, the proponent must develop a Wetland Compensation Plan. The Wetland Compensation Plan and associated reporting requirements must be developed to establish specific objectives intended to prevent the net loss of wetlands and functions in accordance with the Nova Scotia Wetland Conservation Policy.

Protected Areas Comments:

- Due to the distance from any Nova Scotia's protected areas there are no comments or concerns.

NOVA SCOTIA

Environment

Barrington Place
1903 Barrington Street
Suite 2085
Halifax, Nova Scotia
Canada B3J 2P8

File No: 40100-30-273

Date: March 8th, 2019

To: Helen Yeh, Environmental Assessment Officer

From: Air Quality Unit

Subject: Northern Pulp Replacement Effluent Treatment Facility Environmental Assessment

Further to your request, the Air Quality Unit provides the following comments with respect to the Air Quality sections of the Class I Environmental Assessment Registration Document, dated January 31st, 2019, for the above-mentioned project:

Planning/Design Issues

1) The Air Dispersion Modeling Study limited the evaluation to air contaminants identified in Schedule A of the Air Quality Regulations and the current Operating Approval for the mill. The proponent should have identified the full air emissions inventory for the facility and modeled all potential air contaminants of concern, as a result of the proposed project.
2) An updated ambient air monitoring plan based on the air dispersion modeling results should be provided. This plan should include the identification and proposed location of additional monitor(s).

Operational Issues/Other Permitting Processes

1) Technical details associated with the method of sludge dewatering and proposed operational or physical modifications to the power boiler to manage sludge, should be provided with the Application for Approval under Division V of the Activities Designation Regulations.
2) Section 4 of the Air Dispersion Modeling Study indicates that the mill will conduct a pilot study on the co-combustion of hog fuel and wastewater sludge in the power boiler. Details of the proposed pilot study should be included as part of the Division V Application for Approval. The study plan should include, but not be limited to:
    a. Proposed volume of fuels to be burned, fuel mixtures, fuel feed rates;
    b. Proposed fuel feed method;
    c. Analytical characterization of the wastewater sludge to identify the contaminants of concern;

d. Comparison of the wastewater sludge with existing fuel characterization;
e. Proposed contaminants of concern for testing;
f. Proposed test methodologies;
g. Identification of air quality standards proposed for comparison during testing;
h. Proposed operating conditions of the power boiler during testing;
i. Proposed testing scenarios to demonstrate that testing will be conducted for the cases when the highest concentration of air contaminants would occur.

Depending on the results of the study, further modeling and testing may be required.

3) The Division V Application for Approval should include an alternate method for sludge disposal in case the pilot study for co-combustion proves unsuccessful.
4) The Division V Application for Approval should include an environmental response plan to address any malfunctions or upset conditions at the power boiler resulting from the co-combustion of wastewater sludge with primary fuels.
5) The Division V Application should include odor mitigation strategies for operations as a result of the proposed activity.

Other Observations

1) The following issues should be addressed in an updated Air Dispersion Modeling Study:
    a. The mill is authorized to operate at an annual production rate of 330 000 air dried metric tonnes/year. The air dispersion modeling study indicates that the mill currently produces between 280 000 to 300 000 air dried metric tonnes per year. The air dispersion modelling should represent results for the mill under its authorized production rate.
    b. The Tables of Emissions included in the Emissions Inventory Section provides the emission rates of air contaminants for the mill sources. The “Other Mill Point Sources” category should be broken down to individual mill point sources and include the specific modeled emission rate for each source.
    c. Sections 6.1 and 6.2 of the Air Dispersion Modeling Study should identify the maximum predicted concentrations of the modeling and the specific UTM Coordinates for the maximum concentration location.

Nova Scotia Environment
Environmental Assessment Branch, Attn: Helen Yeh
Barrington Place
1903 Barrington Street, Suite 2085
Halifax, Nova Scotia B3J 2P8

Dear Helen Yeh:

Subject: Class I Environmental Assessment on the Northern Pulp Replacement Effluent Treatment Project

The Fisheries Protection Program (the Program) of Fisheries and Oceans Canada (DFO) received the Class I Environmental Assessment (EA) on the proposed Northern Pulp Replacement Effluent Treatment Project on January 31, 2019. For future reference, please refer to the below DFO file number and title:

DFO File No.: 19-HMAR-00032 / 19-EA-032
Title: Northern Pulp Replacement Effluent Treatment Project

At this time, the Program is pleased to offer general comments on the proposal for the Minister's consideration. A further evaluation of some aspects of the EA, such as fish species assemblages and fish population levels and distributions may follow, after the submission of additional information by Northern Pulp Nova Scotia (NPNS), through DFO's regulatory review process.

To begin, DFO would like to address the EA references to DFO's responsibilities for regulating effluent under the *Fisheries Act* (FA). The Pollution Prevention Provisions of the FA are intended to control the deposition of deleterious substances affecting fish, fish habitat or the use of fish, and are therefore of interest of DFO, Environment and Climate Change Canada (ECCC) and Health Canada (HC) in fulfilling their respective mandates. The administration and enforcement of Subsections 36(3) to 36(6) of the FA is led by ECCC, with support, cooperation and communication with DFO and HC, as appropriate.

With respect to the scope of the below comments, DFO's review of the EA was conducted pursuant to Section 35 of the FA; specifically related to the physical impacts from the proposed projects or activities, and the potential for them to cause serious harm to fish or fish habitat, which are part of, or support a commercial, recreational or

Aboriginal fishery. DFO's review also considered potential impacts to species at risk, as defined in subsection 2(1) of the *Species at Risk Act* (SARA).

At this time, the Project description is not sufficient to completely characterize the potential effects related to Section 35 of the FA. Additional information is required to sufficiently address the following information gaps: the disposal at sea location; the underwater marine benthic habitat survey; the detailed wetland and watercourse crossing information; and, the final pipeline construction methodology.

The Project description also identified and provided a thorough preliminary assessment of nine freshwater watercourses, and 11 wetlands that provide fish habitat. It should be noted that any watercourse or wetland alteration from pipeline installation works would be subject to regulatory review by DFO, under Section 35 of the FA. Therefore, DFO would require, for each watercourse or wetland alteration application, site specific information, including but not limited to, pipeline methodologies and timelines for any pipe installation. Additionally, a detailed fish habitat assessment, conducted by a certified habitat assessment specialist, would be required.

The Project also identifies that there will be approximately 4 kilometers of marine pipeline work, including the following: dredging, side casting, rock mattress placement, pipe placement, potential pipe armoring, construction of temporary access roads, and disposal at sea activities. Despite Appendix F of the EA document being detailed in terms of the potential installation methods for the marine section of the pipeline, additional information is required for the completion of DFO's full assessment of the proposed activities. This information includes the following:

a) Detailed benthic habitat information in the pipeline route;
b) Mitigation measures associated with each potential installation method;
c) Information at the pre-construction (baseline) and post construction monitoring phases of the Project, as well as during construction (e.g., information on turbidity monitoring, and how it will be conducted (divers, ROV, sampling program, etc.);
d) Construction timelines; and
e) Blasting details, if likely.

Once the above information has been provided by NPNS, the potential effects can be reviewed and evaluated through DFO's request for review process, which will determine if there is a need for a Section 35 FA Authorization. At this time, DFO's regulatory review of the marine pipeline construction is underway, and additional information has been requested from NPNS.

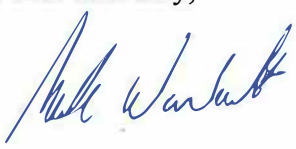
With respect to the Marine Refuge Scallop Buffer Zone (SBZ) within Scallop Fishing Area 24, it forms part of DFO's Other Effective Area Based Conservation Measures that contribute toward Canada's 2020 Marine Conservation Targets (MCTs). The conservation objective is to protect juvenile lobster and its habitat by restricting the activity of scallop dragging in this area. If a new activity such as the effluent discharge is permitted in or around this area and later deemed incompatible with the stated

conservation objectives, loss of Marine Refuge status may occur, in whole or in part. DFO has noted that the boundary of the marine refuge is not accurately represented in the EA document. As such, DFO is developing a more accurate image of the boundaries to clearly define the current Marine Refuge. It should be noted that, it is probable that the marine portion of the effluent pipe construction will travel through, and discharge inside the Marine Refuge. DFO recommends that the EA document also reflect that other species such as Sea Scallop and Winter Flounder are protected as part of the Marine Refuge. DFO will carefully assess the potential impacts to this physical habitat as part of the regulatory review process.

In closing, DFO looks forward to continued involvement in the review of the Project, and all associated works, such that fish and fish habitat is protected and conserved, and residual adverse impacts are reduced and mitigated to acceptable levels.

Thank you for the opportunity to review and provide comment. Should you wish to discuss the above, please do not hesitate to contact me at Michael.Wambolt@dfo-mpo.gc.ca or 902-402-5851.

Yours sincerely,



Mike Wambolt,
Section Head, Marine Developments
Regulatory Review, Ecosystem Management

NOVA SCOTIA

Lands and Forestry

M E M O R A N D U M

TO: Helen Yeh, NS Department of Environment

FROM: Department of Lands and Forestry

DATE: March 8, 2019

RE: Northern Pulp's Replacement Effluent Treatment Facility Project

---

The Department of Lands and Forestry provides the following comments on the above project:

Crown Land

The proponent will require permissions from Land Administration (permit/easement/lease) for any pipelines, outfalls/intakes and other associated infrastructure beneath the Ordinary High-Water mark of both the large crossing at the junction of the three rivers before federal Pictou Harbour and in the Northumberland Strait.

The project description notes portions of the pipeline will be constructed within the limits of the public highway, should this design change, there are Crown lands that abut that public highway, and would require permissions from Land Administration (easement).

Coast Line Area:

The Department's mandate includes operating provincial parks in the immediate coast line area of the outfall. The cumulative effects monitoring program should be expanded to include monitoring for impacts to recreation activities, specifically swimming and beach use, as part of the socioeconomic impacts in the outfall area. Provincial park coast line areas of interest include: Caribou-Munroes Islands, Waterside Beach, MacKenzie Beach and Melmerby Beach.

Wildlife, Wildlife Habitat and Surveys:

The Department recommends that the following mitigation measures be included:

- *Section 8.9.3.1 and 8.10.3.1.* Construction activities should be mitigated to address any impacts to wildlife and wildlife habitat with respect to light, noise, and dust.

- *Section 8.10.3.1.* Options be developed to discourage waterfowl and other wildlife from using spill basin and clarifiers.

- *Section 8.10.3.2.*
    - The majority of anticipated work for the pipeline appears to occur within the highway Right of Way (ROW). If this project receives approval, a condition of approval should be that development of mitigations for non-migratory bird species, and nests or habitat for reptile and amphibian species that may be encountered during the course of work, must be done in consultation with, and approved by the Department of Lands and Forestry.

    - A mitigation plan specific to raptor species be developed, given the high number of raptors encountered within the Local Area of Assessment (LAA) through desktop analysis and encountered during field work (Appendix Q).

- An explanation is required on how the interpretation of the bird survey results may have been affected as a result of discrepancies in the survey methods. Section 8.10.2.3 indicated that surveys were conducted for 10 min and all birds seen and heard during this timing window recorded from a stationary location, with additional time given to ensure all birds were recorded. However, Appendix Q shows time spent at each survey site, with a range from 1 min-33 min spent on site. Although there is sufficient explanation for the time extension beyond 10 min, no explanation is given for when a survey took less than 10 min to complete.

- Develop a mitigation plan for *priority species (as defined in Section 8.0 under Valued Environmental Components (VECs))* that are encountered during field surveys to be undertaken in 2019 along the proposed pipeline route. The proponent is also advised to consult with the Department of Lands and Forestry and to seek approval for the plan.

- Section 8.13.3.2: The Department requires additional mitigation measures be taken to prevent disturbance of the colony of Double Crested Cormorants nesting on the banks of the causeway. A colony survey by the Department in 2009 recorded 413 Double Crested Cormorants nests on the banks of the causeway and 83 nests of the causeway pilings. This bird is a provincial responsibility; therefore, appropriate mitigation measures must be approved by the Department of Lands and Forestry.

It is recommended that the following surveys be added to the 2019 field season survey for birds and plants:

- Dedicated owl surveys and raptor nest searches at all project locations prior to the commencement of any work.
- Previous survey efforts were not sufficient to assess Common Nighthawk (*Chordeiles minor*) as they are most active at dawn and dusk. Surveys for Common Nighthawks be conducted within the project area prior to

commencement of work.

- Surveys for the colony of Double Crested Cormorants nesting on the banks of the causeway and adjacent wharf pilings. This survey was not identified in the Environment Assessment under: *Nesting Calendar for Breeding Birds within the Northumberland Lowlands Ecodistrict* (section 8.10.1.2).
- *Section 8.9.2.* Herptile surveys were conducted once in June 2018. Herptiles typically have peak activity periods twice in the year (spring and fall). Additional herptile surveys be conducted during the fall activity period.

Other information:

- *Section 8.10.2.4.* Great Cormorants are known to have bred on Amet Island in the Northumberland Strait and may still occur. This is a corrective note that the proponents may want to consider in future work on potential impacts to marine birds.

NOVA SCOTIA
Municipal Affairs

Maritime Centre, Floor 14 North
1505 Barrington Street
PO Box 216
Halifax, NS B3J 2M4

Date: March 8, 2019

To: Helen Yeh, Environmental Assessment Officer

From: Gordon Smith, Provincial Director of Planning

Subject: Northern Pulp's Replacement Effluent Treatment Facility Project

As requested, the Department of Municipal Affairs has reviewed the Environmental Assessment Registration Documents for the proposed Northern Pulp's Replacement Effluent Treatment Facility Project.

Departmental staff in their review have found nothing of particular concern within our Department's area of mandate. Still, we highlight the Statement of Provincial Interest Regarding Drinking Water, and assume that adequate consideration is being given to the Town of Pictou's water supply, since the proposed effluent pipeline crosses the source water area for that supply.

Thank you for the opportunity to review the Registration Document for the above-noted project. Should you require additional information, please feel free to contact either Andrew Paton, Senior Planner (902-424-7492) or me (902-424-7918).

Yours truly,

Gordon Smith
Provincial Director of Planning

Subject: FW: NPNS EA

Hello Helen. By way of introduction, I am the Operations Manager for PSPC Environmental Services group for Nova Scotia. I have attached our comments on the NPNS Replacement Effluent Treatment Facility registration material, originally provided to the Canadian Environmental Assessment Agency (Agency) on February 27th. The document summarizes our Department's interest and mandated responsibilities in relation to the Project. While the comments were originally developed to assist the Agency in making a decision concerning the most appropriate EA track, they may also provide some useful context to your current exercise related to Class l process elements. Please contact me at any time should wish to discuss. Have a great weekend.

PSPC Atlantic Response to the Canadian Environmental Assessment Agency: NPNS Designation Request. February 27, 2019.

1). Indicate if the project description of the Project presented in the project website is sufficient in characterizing project effects to the components of the environment as defined under section 5 of CEAA 2012 that related to your mandate including whether these effects may be adverse.

Public Service and Procurement Canada (PSPC) has provided a brief description of its mandated authority in respect of the Project in response to question 3 (below). As the custodian of the seabed for the affected portion of the internal waters and territorial sea of Canada lying outside a province, PSPC would need to be asked to provide a licence allowing the use of the ocean floor for the construction and operation of the effluent pipe and outfall.

PSPC has determined the Departments' scope of participation as a Federal Authority in relation to the Project according to CEAA 2012 (Act). In this regard, Section 2 of the Act provides a broad definition of the environment including specified "components of the Earth", and defines federal lands to include the relevant portions of the sea floor. Section 5(1)(a) of the Act requires several environmental effects to be taken into account by a federal authority, and Section 5 (1)(b) specifies that related effects need to be assessed for federal lands. Section 5(1) (c) of the Act provides specific requirements related to Aboriginal peoples that must be met over the course of any Federal environmental assessment of a Project, and Section 5(2) provides further requirements for involved Federal Authorities which include effects relating to health, socioeconomics, and physical and cultural heritage.

The majority of concern expressed in relation to the potential effects of the Project on the environment are focused on the potential adverse impacts from sustained effluent introduction into the marine environment, either during normal operations or due to upset conditions. While PSPC regards the environmental assessment registration document produced by Dillon Consulting Ltd. as being of professional quality, the Department also notes informational deficiencies related to the marine environment. Specifically, Dillon has indicated in the registration submission that for situational reasons"... it was not possible to conduct field work in the new pipeline corridor or marine environment in order to inform this EA Registration". It is understood that the additional work will be carried out during the spring and summer of 2019.

Under CEAA section 5, PSPC will need to satisfy itself as to the potential significance of environmental effects related to the Project, and in particular with those respecting the ocean floor and receiving waters, prior to making any final decision concerning the licencing of the seabed to enable the Project to proceed. Part of the related decision making will be dependent upon addressing these informational deficiencies.

PSPC is mindful of the duty to consult First Nations on the Project, and in this regard will consult with, or will participate in broader federal consultations with, First Nations communities and organizations to meet these obligations.

PSPC also notes that the Province of Prince Edward Island has officially expressed concern over the potential environmental effects of the Project on the Northumberland Strait lobster fishery, and has asked that a federal environmental assessment be carried out prior to approving the Project.

Subject to receiving a request for a license, PSPC is of the opinion that additional environmental assessment work will need to be carried out in order to satisfy CEAA 2012 Section 5 requirements and that additional consultations, particularly with First Nations, will be required.

2).Identify potential environmental effects not described on the project website and their linkage to components of the environment under federal jurisdiction (as defined under section 5 of CEAA 2012.

a).Identify whether any potential adverse effects are likely to be significant in nature; and,

b). Comment on whether any potential adverse effects identified could be managed by existing regulatory processes.

The registration material indicates that no residual impacts are likely to be significant in nature. As indicated above, the document has been crafted to a high standard. That being said, it is reasonable to assume that the additional information required regarding potential marine environmental effects will inform an evaluation of potential significance. Pursuant to CEAA 2012, Section 5(1) and 5(2), PSPC expects that additional consultations and assessment efforts pertaining to social, economic and cultural factors will also require additional assessment.
Once the environmental effects and mitigation strategies are understood, it is expected that existing regulatory processes (outside of PSPC) will figure prominently in ensuring that predicted effects are verified through follow up and monitoring and in evaluating mitigation efficacy. Regulatory compliance monitoring and associated enforcement activity lying within the purview of our federal counterparts is anticipated to comprise an essential part of this.
3).List the potential powers, duties or functions that your department may issue to enable the project to proceed, why they might be issued, and which project components and activities are related to the power, duties or function.

PSPC is the custodian of the seabed for the affected portion of the internal waters and territorial sea of Canada lying outside a province. PSPC would need to be asked to provide a licence allowing the construction and operation of the pipeline and outfall components proposed for that portion of the seabed that is subject to the Department's jurisdiction.

4). Potential environmental effects associated with power, duty or functions identified above., as described in subsection 5(2) of CEAA 2012. Please include in your response a description of the scope or extent (i.e. project activities addressed and components of the environment included) under this power, duty or function).

As previously noted, PSPC may be asked by the proponent to licence the use of the seabed. Should this occur, PSPC will need to be satisfied with regard to the significance of impacts on the marine environment as well as socioeconomic and cultural issues in relation to these environmental effects. PSPC will engage with other directly mandated federal counterparts for advice as we proceed.

5).Has your department or agency already exercised the above-noted power or performed a duty or function to enable the proposed project to proceed in whole or in part? If yes, please describe.

No.

Response to

Northern Pulp Nova Scotia
Environmental Assessment Registration Document
Replacement Effluent Treatment Facility

Table of Contents

1. Statement of the Town of Pictou Position

2. List of Concerns to be Addressed in this Response

3. Context for Responding

4. Environmental Assessment Concerns:

   A: Potential for Accidental Ground Water Contamination

   B: Changes in Air Emissions and Odours Associated with the AST (Activated Sludge Treatment), Burning of Sludge and Transmission of Treated Effluent

   C: Economic Effects for the Town During the Construction Phase of the Project

5. Appendices

1. Town of Pictou Statement of Position:

The Town of Pictou hereby informs the Nova Scotia Department of Environment that it can not support the Northern Pulp Nova Scotia plan for the Replacement Effluent Treatment Facility. Additional risk, however small, to the domestic water supply is unacceptable.

2. List of Concerns to be Addressed:

A. The plan creates additional risk to the Town water supply by the on-land portion of the proposed transmission pipe carrying treated effluent to Caribou Harbour.
B. The limited information in the Environmental Assessment Registration Document regarding the potential for increased (new) toxins and/or odours produced as a result of the re-location of the Activated Sludge Treatment (AST) facility to Abercrombie Point, the burning of sludge in the power boiler, and the venting of air as part of the transmission of warm effluent through the Town of Pictou.
C. Economic effects of potential disruption(s) to tourism traffic to and from the (Caribou, NS – Wood Island, PEI) ferry terminal during the construction phase of both the on-land and under water portions of the effluent pipe.

3. Context for Responding:

The Town of Pictou is a community of approximately 3200 residents located on the north shore of Pictou Harbour approximately three kilometers from the Northern Pulp Nova Scotia facility. The Trans-Canada Highway (TCH) 106 runs through the west end of the Town and proceeds to the Northumberland Ferry Terminal at Caribou Harbour. The Harvey A. Veniot Causeway connects the Town of Pictou to Abercrombie Point where Northern Pulp is located.

For 52 years Northern Pulp and its previous owners have provided a reliable and, depending with whom you speak, a greatly appreciated source of income for many members of the community through direct employment at the processing facility and the integrated forestry and trucking industries. The mill and its air emissions are visible from most (all) locations in the Town of Pictou. In November 2017, Pictou Town Council passed a Resolution to request

consideration for Federal oversight of the Northern Pulp project and that there be 'no harm to the Northumberland Strait fishery' (Appendix F, Pg. 1)

In the 1990s The Town of Pictou created the Pictou Waterfront Development Corporation with the goal of improving the waterfront/downtown district while promoting the tourism sector. The signature attraction for the development was the construction of a full-size replica of the *Ship Hector*. The $10M project was completed with financial support from the Atlantic Canada Opportunities Agency (ACOA), the Province of Nova Scotia and the Town of Pictou. The Pictou Waterfront has since been and is expected to continue to be significant focus of economic interest within the Town.

Pictou is the home of Advocate Printing and Publishing, AECON Fabco (Shipyard), CMS Steel Pro Mechanical. Council continues to embark on projects promoting the Town as the service and entertainment centre for Pictou West and a tourist destination.

Within the past 15-20 years the Town of Pictou, with financial support from Provincial and Federal governments, has completed several significant additions and upgrades to important infrastructure ensuring the comfort and security of residents and visitors. This work is aimed at ensuring long term sustainability and compliance with health and safety standards.

Construction and commissioning of a municipal Wastewater Treatment Facility for the Town of Pictou and surrounding area took place in 2011. The facility processes one hundred percent (100%) of the Town's sewage and, unfortunately, a large portion of the storm water. Our tests reveal one hundred percent (100%) compliance in achieving standards for effluent and the development of a storm water plan for the Town is now underway so future wastewater needs can be met. We are extremely proud of our advances in service to the community and the protection of our environment.

The Town of Pictou has, in the past, consistently experienced issues associated with water discolouration and mineral build-up in the distribution pipes. A new 'state of the art' Water Treatment Plant was commissioned in October 2019 to centralize water treatment and distribution while removing high levels of manganese and iron from the supply. We are very pleased that initial scientific testing and a positive public response indicate great success as we continue to upgrade our infrastructure to ensure safe and reliable water for home and commercial use.

4. Environmental Assessment Concerns (In Order of Significance):

A. Risk of Ground Water Contamination

The proposed on-land portion of the pipe carrying treated effluent to Caribou Harbour will cross both the Pictou wellfield which is completely within the Town of Pictou boundaries, and, the Caribou wellfield which is situated completely within the boundaries of the Municipality of Pictou County. Both wellfields are located within the delineated boundary of the Caribou/Pictou Watershed protected area identified of in Figure 1 of Appendix D (Pg 6).

The Town has been granted Permits from the Province of Nova Scotia to draw approximately half of the Town's potable water from wells within the Caribou wellfield and the rest from the Pictou wellfield. A total of approximately 600K cubic meters are pumped annually from eight active wells. Limits for water extraction from the various wells can be found in Table 2 of the Permit (Appendix B, Pg. 8). As part of the permitting process, the Caribou/Pictou Source Water Protection Committee was formed, and the Pictou/Caribou Source Water Protection Plan was completed (Appendix D). This plan identifies risk and best management practices for mitigating risk should accidents occur.

Residents of the Town of Pictou depend on the groundwater drawn from the Pictou/Caribou watershed for their drinking water. The Caribou and Pictou wellfields are the only viable sources of potable water and it would be safe to conclude that without this dependable source of water there could be no town. It is the Town's position that we can not be supportive of any activity that would add additional risk to our water supply regardless of the many references to 'insignificant' risk in the Environmental Registration Document. More specifically, we cannot support the planned construction of a pipe carrying the treated effluent containing 'residual contaminants' (Registration Document, Pg. 32) along TCH 106. In the original Source Water Protection Program from 2005 the hydrologist representing *ADI Limited* identified a 'Zone of Influence' which shows the extent of the sand and gravel aquifer where surface water could affect the Town water supply (Appendix A, Pg. 4). A large stretch of TCH 106 is situated well within the aquifer and, therefore, we should assume that any accidental spills in the area could be harmful to our citizens.

It should also be noted that, as a 'General Term' within the Town's Permit To Withdraw Water, the Town has indemnified the Province against our (the Town) actions in causing 'damage resulting from the activities performed pursuant to this Approval' (Appendix B, Sec. 3(v)).

B. Additional Air Emissions and Odours Associated with the AST (Activated Sludge Treatment) and Transmission of Effluent

The Pictou West area, including the Town of Pictou is the recipient of a significant portion of the air emissions from the mill operations as shown in (Appendix E, Figures 1 and 2, Pages 3 and 5). As a result of this, residents and visitors alike have complained about the emissions including concerns for the long term effects on their health. Numerous studies suggest that higher levels of certain illnesses are evident in the area. For many years, dining and accommodation operators have also expressed concern about lost revenue as the result of odours associated with the air emissions from the mill.

Despite significant improvements to overall emissions with the recent construction of the Precipitator Unit, emissions and associated odours continue to affect the Town on a regular basis.

With the relocation of the Activated Sludge Treatment (AST) Facility to Abercrombie Point we are concerned that new odours, similar to those that have been a problem around Boat Harbour since the mill was made operational, might have a tendency to 'drift' in the Town's direction. Additional contaminants in the emissions from the Power Boiler when the sludge from the new treatment facility is incinerated will also be of concern. The Environmental Assessment fails to provide comfort that particulate emission and odours will be handled to the Town's satisfaction.

An additional concern exists regarding the proposed venting along the on-land portion of the effluent pipe. It is our understanding the vent must be placed at a high point in the transmission line which could be between the Harvey A. Veniot Causeway and the Pictou Rotary. If this is to be the case, we expect that there could be additional odours from the warm treated effluent at that location. Also, should any unintended blockages of the pipe occur beyond that point, it could be concluded that the vent would provide a release point for effluent until the flow is stopped. It is important to note that his point is within the Town limits and is above the Pictou Wellfield.

C. Potential Economic Effects of the Pipe Construction Phase on the Economy

The Town of Pictou is located approximately eight kilometers from the ferry linking Nova Scotia to Prince Edward Island. This is a major entry and exit point to Nova Scotia where approximately 20 000 vehicles use the ferry each year between April and December.

Our community is, not only, a service centre for the Pictou West area but also a stopping place for travellers and a tourist destination. Many of the Town's businesses and tourist attractions are seasonal operations and depend on the high traffic volumes from May to October.

The timeline for construction outlined in Table 5.4-1 (Registration Document, Pg. 82) indicates that land clearing, construction and watercourse construction for the land portion of the pipe will take place from November 2019 until possibly September 2020 and the Marine portion from April 2020 to October 2020.

Should travellers choose to avoid the Northumberland or TCH 106 due to construction, financial impacts would be felt by the businesses and seasonal operators in the Town and the surrounding area.

1.0 INTRODUCTION

1.1 Location

The Town of Pictou is located along the Northumberland shore of Nova Scotia within the Municipality of the County of Pictou (Figure 1-1A). The Town encompasses some 8.14 km^2 within its political jurisdiction along the north shore of Pictou Harbour.

Pictou was first settled in 1767 with the Hector arriving in 1773. It was subsequently "founded" (1788), and given its name as the Shiretown of Pictou County in 1792. It became incorporated in 1873. Since that time, the Town's population has grown gradually to its present level of approximately 4000 people.

1.2 Goals of This Report

This report has been prepared for the Town of Pictou by ADI Limited (ADI) to meet the requirements of the Nova Scotia Department of Environment and Labour's (NSDEL) Source Water Protection Planning. This is now a condition of approval for all water works in the Province. Given historical work (Section 1.3) and ongoing studies (Section 1.4) this Protection Plan should be considered a continual "work in progress".

1.3 Background

The Town of Pictou was authorized to develop its water supply in 1888 and has been extracting groundwater for municipal services since 1901. Up until 1901, water was supplied from privately owned wells in the Town, which were not maintained in a sanitary condition. To overcome the danger of disease, the first council (1874) appointed a Superintendent of Wells and Pumps and requested aid from the provincial government. Subsequently, Chapter 120 of the Nova Scotia Acts in 1888 provided for supplying the Town with water. This authorized and empowered the Town Council to provide a sufficient supply of water for domestic, fire and other purposes. These early actions started what is now over 125 years of Development, Management and Protection of its water supply. *This foresight and list of accomplishments form a remarkable achievement for such a small community, and only a 1250 domestic user rate base.*

The first well field outside the Town, referred to as the Caribou Well Field, was constructed in the early 1900's. The first seven wells were drilled in 1901, followed by additional ones in 1907 (Smith-Grant) and 1943 (Footes Lane), all drawing from the bedrock aquifer. Although outside of urban activities, and easier to protect, it was within a different political

jurisdiction, a source of future problems. By the late 1960's the well field supplying the Town encompassed 14 active pumping wells, nine of which were on the vacuum system within the Caribou Well Field (Figure 1-1B).

The 1970's and 1980's saw a period of *Resource Evaluation and Well Field Expansion.* These technical studies culminated in two new production wells in the Caribou Well Field and delineation of additional target areas for future expansion.

The 1990's focused on *Well Field Protection*, long before it became the "thing-to-do" after the Walkerton tragedy in 2000. During this decade, the Town brought on a hydrogeologist for technical guidance. Numerous studies focused on delineating the extent and source of recharge supplying the Caribou Well Field aquifer, as well as assessing and mitigating potential risks; before NSDEL requested it in 2002. A three zone Well Head Protection Area (WHPA) was outlined with a listing of "permitted uses" and suggested "constraints".

This work culminated in a formal request to the Minister of NSDEL to designate lands surrounding the Caribou Well Field as a protected area in 2002. Unfortunately, this request was turned down.

The last five to eight years have been characterized as *Adaptive Management.* This approach is "learn by doing", which manages multiple issues with action based on incomplete knowledge using the Pre-Cautionary Principle, supported by feedback through monitoring. requirements.

1.4 On-Going Studies

At the time of submission of the Surface Water Protection Program (SWP) a number of relevant studies and activities are ongoing, specifically:

1.4.1 Activities

The Town is maintaining their hydrogeological technical advisor, purchasing land around the Caribou Well Field, developing protection plans for the Urban Well Field, hiring summer staff, upgrading the distribution system, searching for additional supplies within the Town boundaries, expanding their digital database, working with the Pictou County District Planning Commission on land use constraints, addressing demand side management by installing water meters and requesting rate increases, as well as continuing to educate the public on water.

1.4.2 Studies

Groundwater under Direct Influence (GUDI): The Town is presently eight months into the one year assessment of NSDEL's Phase II level GUDI of surface water effort on 12 wells.

Distribution System: The Town is presently assessing and upgrading the distribution system, parts of which are over 100 years old. It has instituted an assessment of chlorine demands, potential for trihalomethanes (THMs) and haloacetic acids.

Additional Production Wells: Foresight necessitated assuming replacement wells would be a more efficient response to any GUDI problems which arise, if they can be positioned within Town boundaries and direct flow to the central reservoir for treatment. A test drilling/pump exploration program is underway to locate such supplies.

Water Sampling of Wells: As part of "due diligence" associated with the Adaptive Management Approach, the monitoring program supplying feedback on the Town's actions encompasses more than that required by the NSDEL permit. Along with "Source" and "Distribution" system monitoring, the Town has incorporated a "Source Protection" program, which monitors the "health" of the aquifers and allows us to reflect impacts of climate change into our strategies.

1.5 Report Outline

Building upon the background outlined above, the main body of the report initially summarizes the characteristics of the existing water system supplying the Town of Pictou (Section 2.0). The remaining sections follow NSDEL's five steps to Source Water Protection Planning namely:

Section 3.0 Delineate Source Areas
Section 4.0 Identify Potential Risks
Section 5.0 Develop SWP Strategies to Manage Risks
Section 6.0 Develop a Monitoring Plan
Section 7.0 Develop SWP Advisory Committee

The text for each section summarizes salient points. Support documentation can be provided upon request.

2.0 EXISTING SYSTEM

The groundwater supply for the Town presently comprises 13 wells encompassed with two well fields identified as the "Caribou" and "Town" Well Fields (Figure 1-1B). Presently, the demand ranges from 950 to 1040 Lpm for a population of about 4,400.

The Pictou Water Utility was issued an operating permit for the Town of Pictou's Water Supply by the NSDEL on 19 March 2003: Approval No. 2001-024443.

The Caribou Well Field is located north of the Town Boundaries, within the basin-shaped, central part of the Pictou Peninsula. It is presently comprised of five active pumping wells (No's 8, 9 and 10, as well as Smith-Grant and Division Road wells). This comprises approximately 45% of the present total Town demand.

The Town Well Field is located within the Town of Pictou's political boundaries. It is presently comprised of eight active pumping wells. They include Footes Lane, Public Works, Exhibition, Vance, M and M, Beeches Road, No. 11 and No. 12. All were constructed between 1942 and 1969, except for No.'s 11 and 12, which were brought on line in 1989 and 1996 respectively.

3.0 DELINEATION OF SOURCE AREAS

This section initially summarizes the present state of knowledge of the physical and chemical characteristics of the hydrological cycle within which the extractions are occurring; support documentation can be provided if so required. This forms the technical base upon which the delineation of Source Water Protection areas is based, as outlined in Section 3.2.

3.1 Conceptual Model for Ground and Surface Water Flow Fields

Climatologically, the area experiences a humid continental climate. A water balance analysis indicates slight water deficits in June, July and August, with moisture surplus creating Spring and Fall groundwater recharge periods. Longer term trends note gradual declining precipitation and elevated air temperature since the early 1990's, suggesting less water available for recharge.

Physiographically, the Town and its well fields are located within the Pictou peninsula (Figure 1-1A), bounded to the northeast and south by salt water of the Northumberland Straits and Pictou Harbour.

ADI Limited © 2005

Hydrogeologically, the Peninsula is positioned with a "Lowland Setting" consisting generally of a glacial till over bedded sedimentary rock. The Caribou Well Field extracts water from the Upland Aquifer Complex, combining both a surficial sand/gravel, as well as a bedrock aquifer. The Town Well Field draws water from the bedrock aquifer.

There are three Hydrostratigraphic Units (HUs), which control water flow to the well fields, including the Pictou (bedrock) HU, Sand and Gravel (S/G) HU and the Till HU. The Pictou and S/G HUs can be defined as a Class 1 Aquifers, utilizing NSDEL's classification (Shawinigan Eng. Ltd., 1980). The Till HU is an aquitard, which semi confines the Pictou HU.

Hydrological analysis has keyed to the Caribou Well Field, given the surficial nature of the S/G aquifer, and its susceptibility to the introduction of contaminants from streamflow. A tributary of Mill Brook, identified as Beaton's Brook, extends through the middle of the well field, draining from south to north. Of the four inflow streams, only one is perennial, primarily since it over lies the S/G aquifer, which provides base flow during the summer. All channels disappear upon entering the central core of the S/G aquifer in the lowland area surrounding the production wells, and continuing through almost to Priest Road. This is expected to be a function of recharge into the S/G aquifer.

3.2 Source Water Protection Areas

3.2.1 Approach

Delineation of SWP's for a groundwater source requires detailed hydrogeological analysis of the aquifers transmissivity (T) and storage coefficient (S) in order to delineate drawdown cones and travel times. However, most of the production wells became operational prior to requirements for pump testing and cannot be turned off to allow for testing, due to demand on the system. Therefore, T and S values for every well are not available and delineation of Well Head Protection Zones based upon travel times is not possible. At this stage the conceptual/analytical model summarized in Section 3.1 has been used to aid in delineating protection area coupled with the Pre-Cautionary approach; numerical modelling has not been incorporated to date.

3.2.2 Caribou Well Field

For the Caribou Well Field, a three zone WHPA was tentatively outlined utilizing existing information (Figure 3-1). Zone 1 (Well Head) was based upon existing roads, and the historical approach by the Town in acquiring land. Zone 2 (Zone of Influence) was based

upon the known limits of the S/G aquifer. Zone 3 (Zone of Contribution) was delineated using surface watershed boundaries.

3.2.3 Town Well Field

Three wells have been pump tested to date. Pump testing of No. 12 production well provided a T of 15 to 22 m^2/d with a storage coefficient of 1 x 10^{-4} to 1 x 10^{-5}, representing a semi-confined aquifer with leakage. Assuming these values are representative of the Pictou HU, an average continuous pumping rate over 30 days of 250 to 295 Lpm creates a 1 metre drawdown some 3 km radius from the pumping well, assuming equivalent porous media approach applies. At the 100 metre radius, drawdown is in the order of 1.5 to 5 metres. The 100 metre radius has been applied to each well to delineate Zone 1 of a WHPA, the extents of which is shown on Figure 3-1. Zone 2 and 3 would be encompassed by the 3 km radius. It was this zone that an intensive study was undertaken to assess land use and potential sources of contamination.

4.0 RISK IDENTIFICATION

4.1 Caribou Well Field

Review of aerial photographs and field assessment of WHPA Zone 1 identified a number of potential risks as summarized below and on Figure 4-1.

4.1.1 Sand and Gravel Pits

Extraction of sand and gravel for aggregate from the S/G HU in the southeast corner and north boundary occurred historically from the early 1900's until the late 1970's. Although operations have ceased, indiscriminate disposal of various municipal wastes and auto bodies has sporadically continued to present. In 1985, the Town barricaded all access roads into Zone 1. Debris was gradually removed from 1987 to present and continues as necessary.

4.1.2 Waste Disposal

In approximately 1959, burnt creosote timbers from a fire on the Pictou Wharf were disposed of in the core of the Well Field, adjacent to Production Wells No.s 9 and 10. Concern expressed with leaching of PAHs into the S/G HU prompted NSDEL to undertake an investigation; sampling indicated no problems were being created. Monitoring wells were installed within the S/G HU between the disposal area and the wells by the Town in 2000.

Design Chkd. By: FEB	Last Modified By: NEB	Rev. 0

ADI Limited © 2005

There was no visual or analytical evidence of PAHs. Some of the surficial materials were removed by the Town in 1998.

4.1.3 Septic System

One septic field is present for the Fraser household in proximity to the No. 8 Production Well. The Town removed the old tank/field bed system and installed a new approved system at its expense during the summer of 2001. One septic bed is in use just north of the gated roadway along Central Caribou Road. This private residence has its own well and the Town has no access to validate the condition of either.

4.1.4 Abandoned Wells

The Town located and securely capped all of the known test holes and monitoring wells from previous hydrogeological investigations. This was to prevent contamination from entering the aquifer by transmission through open abandoned wells and deteriorated casing

4.1.5 Domestic Dwellings

A total of 38 private lots are present in Zone 2, but immediately adjacent to Zone 1. Each home is supported by its own drilled well water supply utilizing primarily the Pictou HU and on-site septic systems. Of these, 22 have been identified as of primary or secondary priority for Environmental Site Assessments (ESAs) to document past and present activities.

4.1.6 Agricultural Activities

Land use is present in the southwest corner of Zone 1, adjacent to Division Road and No. 8 Production Wells. The land is utilized for crop production utilizing standard acceptable agricultural practices. Manure spreading is not undertaken within 150 metres from each well head.

4.1.7 Forestry Activities

The forest within Zone 1 has been extensively harvested in the past. While little harvesting work has been conducted within the past 30 years, a significant amount of wood was harvested by clear cutting 20 to 40 years ago, for forestry as well as sand and gravel extraction. The abandonment of the latter since the 1970's has resulted in the regeneration of stands of pioneering species such as white birch, grey birch, poplar, white spruce, eastern larch (tamarack) and alder, generally with a high hardwood component. The abandonment

of agricultural land has also contributed to development of similar stands of pioneering species, usually with a greater softwood component.

4.2 Town Well Field

Since the wells are spread far apart, an investigation was undertaken within the 100 metre radius of each site to identify risk factors. To date, four well sites have been assessed as summarized below. Investigations are on-going for the remaining four sites.

4.2.1 No 12 Production Well

The pump house is on land owned by J.R. MacDonald of Far East Construction with the well parcel under easement to the Town.

There are four residential lots within the 100 metre radius of the well. There are no records of homes or subsurface facilities dating back at least to 1970. A quarry is present 300 metres north of the well used in the past to extract building stone, it is presently abandoned. The base of the quarry drains to the southeast corner, where a pond remains during dry periods some 320 metres from the well.

It would appear that most of the properties were wooded prior to construction of the homes, therefore, historical land use issues do not appear to present an issue of concern.

Garbage was noted scattered throughout all properties including car parts, beer bottles, cans, scrap metal and miscellaneous items. There is a small amount of household garbage in the northeast corner of the quarry; garbage has been removed in the past. Two power poles exist at 60 and 120 metres south from the well that have been treated with tar.

Two homes apply manure to their gardens some 110 to 130 metres from the well but do not use pesticides/insecticides/herbicides. Annual use of "roundup" as a lawn application was confirmed on one property, as well as use of a compost pile 125 metres from the well.

All homes are on individual septic tanks/fields at distances of 90, 125, 130 and 140 metres from the production well, primarily down-ground-surface gradient. The systems are older than 30 years; maintenance is unknown. Two of the homes are heated with oil and have on-site storage tanks. No chemicals are stored at any of the sites. Each dwelling has at least one abandoned water well, not in use since central water was brought in; one house has three wells. None have been abandoned according to well construction regulations. Negotiations are on-going with homeowners to ensure compliance.

A major transportation corridor, Beeches Road, is present 160 metres downgradient, which is salted.

4.2.2 No. 11 Production Well

This well is located in a rural residential area, just west of Wellington Street. There are no homes within the 100 metre radius of the well. The Town owns the building lot around the pump house encompassing approximately 0.39 hectares.

There are five nearby lots, two of which are empty. The land directly north and south of the well is vacant residential property. No historical land use was documented for the last 20 years, although 1971 aerial photos indicate land was used to grow hay. There are no surface or subsurface facilities (i.e., storm/sanitary sewers, power/communication lines) adjacent the site.

All lots within a 100 metre radius are in the R2 Zone, rural residential. There are few restrictions on land use activity, i.e., permitted to keep agricultural animals if this is subordinate to residential use. However, the land to the east across Wellington Street is the H_20 Zone which has more restrictions.

One house nearby is heated with oil; pesticides/insecticides/herbicide or fertilizers are not used. The house is on a septic system installed in 1979 less than 100 metres from the well; maintenance of the system appears to be poor. At least two abandoned wells are in the vicinity. One rusted vehicle full of garbage is within 70 metres of the pump house.

The site lies between Patterson and Wellington Streets some 280 and 110 metres respectively from the well head; both are paved and salted with no curb/gutter. They are not used for transporting goods, the only transport truck traffic would be for local oil supply.

Surface facilities include two power poles 17 and 90 metres from the well.

4.2.3 Beeches Road Production Well

The Town owns a rectangular area around the pump house of approximately 0.25 hectares, positioned adjacent Beeches Road. The next closest street is Sea Birch Drive, a residential road 160 metres directly north and upgradient.

Most of the lots within a 100 metre radius of Beeches Road well are in the R1 Zone, residential. There are more restrictions on land use activity in the R1 zone versus R2, i.e.,

not permitted to keep agricultural animals even if this is subordinate to residential use. Other zones in the proposed protected area are W-waterfront and R2. Currently, there are no by-laws protecting the wells in town. There are no restrictions in the entire town on pesticide/herbicide/insecticide use.

The well is located in a residential area. There are nine residential homes and a golf course within the 100 metre radius. Previous land use noted farming in the area. The homes are located between 50 and 160 metres from the well head. All are on Town water and sewer but some are expected to still have remnants of old well and septic systems. With the exception of one, all are heated with oil. There is no recorded residential use of pesticides/herbicides/ insecticides; some use compost piles. There is no known chemical storage.

The club house for a golf course is 375 metres from the well head, with the course used since 1922. It operates off its own 63 metre deep well and on-site septic system; with oil used for heating. Herbicides/pesticides and fungicides are applied twice per year on greens and fairways. Runoff from the course comes within 100 metres of the well, and considering surface gradients, will run to Pictou Harbour.

The pump house is 3.8 metres off Beeches Road, which is paved with no curb/gutter and large ditches on each side of the road. It is a main road with relatively a large amount of traffic, but is not used for transporting goods.

A small first order stream runs within metres of the well head draining south into Pictou Harbour.

Garbage was noted scattered throughout the woods, including car parts, beer bottles, cans, scrap metal, etc.

4.2.4 M and M Production Well

The pump house is located in a residential area off Beeches Road along Union Street. The Town owns a small rectangular area around the pump house.

There are 23 residential homes within the 100 metre radius of the well. Most of the lots within the 100 metre radius are in the R1 Zone, residential. Other zones are I - Institutional and C2 - neighborhood commercial. Most lots have small wartime houses built in the early 1940's, all have been connected to town water and sewer. Most are heated with oil. No pesticides/herbicides/insecticides are used; there is no known chemical storage.

Beeches Road (some 30 metres upgradient of the well) has moderate traffic, but not used for transporting goods. Union Street may be a route for shipping supplies to the shipyard and servicing oil tanks. Both are salted.

The pump house is surrounded by a parcel of land owned by East End Grocery Store, which has been in operation since the 1940's. The building is 10 metres upgradient from the well with a rental unit upstairs and a hairdressing shop next door. The building is heated with oil, pesticides, etc., are not used, no chemicals are stored.

An existing storm drain and sewer line are positioned 90 and 60 metres from the well head respectively.

The new DND facility just south of the well head was constructed in 1992. An environmental site assessment prior to construction noted no contamination. Surface run off from the parking lot is controlled by curb and gutter and discharges to the existing Town storm drain system. The facility is heated by oil with a state-of-the-art, outside tank facility.

5.0 SOURCE WATER PROTECTION STRATEGIES

A total of 14 strategies have been developed to manage the risks outlined above, including:

- Land Use Planning
- Emergency Response
- Land Acquisition
- Forestry Management
- Inspection/Enforcement
- Building/Maintaining a Database
- Ecosystem Approach
- Public Education
- Counter Terrorism
- Road Maintenance
- Planning for Impact of Climate Change
- Personnel and Training
- Demand Side Management
- Best Management Practices

A summary of each is provided below, details can be provided for regulatory perusal only, if so required.

5.1 Land Use and Planning

The goal of land use planning was taken as the development of a practical, cost-effective means of managing land use activities within the Town of Pictou's well fields, to ensure the long-term viability of the water supply.

In so doing, it is recognized that since some of the land is privately owned, this will require balancing the rights and responsibilities of private citizens and Municipal Governments with the long-term costs and benefits of an uncontaminated water supply. As more data become available in the future, it may be possible to reduce any constraints while maintaining the same risk. In essence, science will never know all there is to know. Rather than allowing the unknown or uncertainty to paralyse us, we must apply the best of what we know today and at the same time be flexible enough to allow for change and for what we do not yet know.

5.1.1 Caribou Well Field

A three zone WHPA was tentatively outlined (Figure 3-1), including Zone 1 (Well Head), Zone 2 (Zone of Influence) and Zone 3 (Zone of Contribution). This was based upon protecting the Caribou aquifer, rather than a residence timing around a well head. A listing of "permitted uses" and "constraints" was developed for 10 land use activities within Zone 1 including: Residential/Industrial/ Commercial and Institutional, Waste Disposal, Agriculture, Forestry, Transportation/Power/Communication Corridors, Mining/Pits/ Quarries, Pest Control Products and Biocide Restrictions, Soil Erosion and Sedimentation Control, Cemeteries and Recreational. Uses and constraints within Zones 2 and 3 were to be governed by existing County, Provincial and Federal Regulations.

Aquifer monitoring suggests no noticeable impact of operational pumping of the Caribou Well Field in either the bedrock or S/G aquifers along the outer ring roads, where the domestic wells are located (Figure 5-1B). Therefore, the well field extraction is not mining the resource.

5.1.2 Town Well Field

A portion of the Town is still predominately under rural land use. An H_20 Protection Zone (Figure 5-1) was established in this area by the Town Council, then approved by the Minister in June 1994. Zoning By-laws were developed to protect the groundwater resources by placing constraints on land use within this zone. As noted in Figure 5-1, the H_20 zone also protects that portion of Zones 2 and 3 for the Caribou Well Field, which are positioned within the Towns' political boundaries.

ADI Limited © 2005

Over the last decade, work has gradually been undertaken to provide additional land use protection. Starting in the summer of 2001, production well sites had begun to be inspected to develop short and long-term protection strategies.

5.2 Best Management Practices

On privately owned land, the Town will suggest, demonstrate and, where necessary, financially support the use of Best Management Practices, as exemplified by activities in the Caribou Well Field.

1. For homeowners who agreed to support the request for designation, the Town Council agreed to share the costs of required upgrades in fuel storage, on-site septic disposal and other matters on a 50% basis to a total of $2,500.00 per home.

2. Upgrades to the on-site septic system on the Fraser property were paid for by the Town. In addition, a new fuel containment structure was installed at the Town's expense.

3. An ESA was carried out on the former North Shore Ballast property in proximity to Production Well No. 8.

4. A total of 13 domestic wells surrounding Zone 1 have been sampled for inorganic water chemistry at least once, at the Town's expense.

5. Agricultural land use is present in the southwest corner of Zone 1 WHPA for the Caribou Well Field adjacent to Division Road and No. 8 Production Wells. The land is utilized for crop production. Discussions with the farmer in 2001 resulted in his acceptance not to spread manure within 150 metres of the two wells.

To demonstrate the Town's willingness to meet its own targets imposed on private citizens it has undertaken upgrades in areas it has responsibility for, as exemplified by work undertaken to date in both well fields:

Exhibition Well: A nearby sewer line was upgraded to ensure no leaks could occur in close proximity to the well head. An open ditch was collected with piping to divert road wash runoff to a location 65 metres northwest of the well head.

Public Works Well: Underground oil storage tanks were removed and changed to aboveground systems. A french drain system was installed to divert chlorides and/or oil away from the well head. The salt storage was placed on an asphalt pad.

Vance Well: A new service line was installed in 1991, just north of the well head. An abandoned septic field bed at the former Odd Fellows building was abandoned and connections made to a new sewer in 1995.

The Caribou Well Field: The Town located and securely capped/abandoned a number of test holes and monitoring wells installed during previous hydrogeological investigations to prevent aquifer contamination.

5.3 Emergency Response Plan

As a part of the Town's Emergency Response Plan, a number of procedures and equipment have been put in place to enable Town staff to quickly respond to accidental spills that could potentially affect the production wells.

In summary, these activities include storage of "soak-up" products and disposal bags at selected well sites, as well as information on well sites and contact numbers distributed to local petroleum delivery vehicles. The Town's Public Works Department is equipped with a vacuum operated sucker truck to lift and remove any floating products. Water Utility staff are trained in Transportation of Dangerous Goods to ensure their ability to react in the appropriate manner in event of a spill. The Watershed Emergency Response Plan will become part of the Emergency Measures Organization Response Plan for the Town of Pictou and the Municipality of the County of Pictou.

5.4 Counter Terrorism Plan

Given the results of September 11, 2001 counter terrorism plans have been formulated to assess the risks to all three attributes crucial to water supply, namely: quantity of water on demand, delivered at sufficient pressure and safe for any use. Presently, the utility is assessing its vulnerabilities and prioritizing them for necessary security improvements.

Overall, a groundwater supply is more difficult to contaminate, given its slow transport rate and natural attenuation. All well heads are enclosed in locked structures and checked daily by Town personnel. Additional activities have been put in place, or are under development, but are not for discussion in a public environment.

5.5 Land Acquisition

5.5.1 Caribou Well Field

The Town purchased the land on which the former well-vacuum system was situated between 1907 and 1916. Arrangements were made with the major land owner within Zone 1 of the WHPA for this Well Field to purchase their land when it became available.

In 2001, the Town purchased one 1.34 hectare property within Zone 1 and in 2002, acquired 19.87 hectares. Figure 5-1A outlines the 68% of Zone 1 presently owned by the Town. The additional land is under right of first refusal for the Town.

Production Wells No. 9, 10 and Division Road are located on land purchased by the Town in 2002. Production Well No. 8 is on land for which rights for water were purchased from the Fraser Estate on September 12, 1907.

5.5.2 Town Well Field

A H_20 Protection Zone was established within a portion of the Town limits in June 1994. It encompasses a portion of the Town boundaries still under predominately natural land use, effectively covering the topographic high, or groundwater recharge area for the Bedrock aquifer underlying the Town itself.

In 2001, the Town purchased an additional 18.5 hectare piece of property within this zone to provide additional protection. Figure 5-1 outlines the 47.5 hectare or 52% of the H_20 area now owned by the Town. In the summer of 2005, the Town acquired an additional 2.17 hectacres, not shown on Figure 5-1.

The Zone encompasses, however, only one of the production wells, Footes Lane. A very small portion of land around each of the other Town well heads is owned by the Town, the rest is privately owned. There is no intention at this stage of purchasing additional land around each until the results of the GUDI testing and assessment of the new production well are known.

5.6 Road Maintenance

Consultation between the Pictou Water Utility and Nova Scotia Department of Transportation and Public Works has lead to cessation of the use of highway salt on Division Road for one kilometre east and west of the Caribou Well Field. This also included Central Caribou Road

along the west boundary. The other two boundary roads are gravelled surface and not normally salted. Dust suppression products are discouraged on secondary gravel roads within the Caribou Well Field

The Town has agreed to maintain the access road (private lane) into the Caribou Well Field to ensure that non-contaminated products are used for road maintenance work.

Illegal dumping and quarrying sites along woods roads within the Caribou Well Field have been curtailed by preventing access. Off-road motorized recreational vehicles will be prohibited on Town owned lands and discouraged within the Caribou Well Field's WHPA Zone 1.

Risk identification (Section 4.0) noted numerous paved roads surrounding most of the Town wells. Discussions are presently on-going to determine how best to address road salting and road wash runoff to storm sewer issues.

5.7 Forestry Management Plan

Century Forestry Consultants Ltd. was contracted by the Town to develop a Forestry Management Plan for Zone 1 of the WHPA area of the Caribou Well Field and the H_20 Zone within the Town boundaries (Figure 5-2). The following forms a summary of the reports. Details are available for the regulators upon request.

5.7.1 Caribou Well Field

The block contains approximately 126 hectares in total. The area is occupied by 104 hectares (82%) forested land and 22 hectares (18%) non-forested. The most dominant cover types within the block are mixed wood and softwood, which each comprise 29 hectares. Hardwood cover types make up the next most significant portion of productive forest at 23 hectares or 18% of the landmass. There is a significant proportion of non-productive forest land within the block at 23.5 hectares or 19% of the landmass. Agricultural land covers 19 hectares (15%) and residential lands occupy 3 hectares (2%).

Very little in the way of serious insect and disease problems or blow down were found throughout the block.

5.7.2 Town H_20 Zone

The plan includes approximately 73 hectares containing the Town's H_2O Zone along with a small portion outside of the zone. The area is split in ownership between the Town (41 hectares) and a private woodlot owner (32 hectares). The land base of this block is occupied by 57.5 hectares of forested land (78%) and 11 hectares of abandoned farm land (22%).

Forest cover types are divided into softwood, mixed wood and hardwood. Hardwood occupies the largest portion of the forest at 29.5 hectares (51%), followed by mixed wood cover types at 19 hectares (33%) and softwood at 9 hectares (16%). Immature stands make up the largest portion (40%) and occur on Town owned land. Regenerating stands cover 30% as a result of a recent harvest on privately owned land. There are no over mature stands. Very few serious insect or disease problems were encountered throughout the block.

5.7.3 Management Plans

The basis of the Forestry Management Plan is the understanding that the forest is a dynamic entity, continually changing as trees grow and die with the overall structure of the forest evolving through a number of stages. Because the forest is dynamic, it must be continually monitored for changes which have occurred as a result of significant influences, often unpredictable in nature.

The operators of the plan must be committed to acting decisively when the need arises, while staying the course on the overall plan, its long-term principles and goals, and its short-term objectives. If the management principles, management recommendations and the operating recommendations are followed, it is possible to conduct forestry activities while protecting the Town's most valuable natural resource - its water supply.

Put in the context of strategic planning, long-term management principles and goals must support the mission of maintaining water quality and quantity. A total of four Management Principles and 26 Management Recommendations and six Operating Recommendations based upon Best Management Practices of the day were outlined to guide decisions that affect the future structure of the forest by guiding (limiting and encouraging) activities conducted on the ground. The Principles are summarized below.

> *MANAGEMENT PRINCIPLE 1.0 - Forest related activities should encourage the establishment and growth of long-lived species such as red spruce, white pine, eastern hemlock and red oak.*

MANAGEMENT PRINCIPLE 2.0 - Forested areas should maintain a tree cover of not less than ten (10) feet in height and not less than fifty (50) percent stocking.

MANAGEMENT PRINCIPLE 3.0 - The forest should be maintained in a healthy, actively growing state.

MANAGEMENT PRINCIPLE 4.0 - Forestry activities should be conducted so as to minimize disturbance or pollution to the forest floor and the underlying soil.

5.8 Adaptation for Climate Change

At present, the operational concept in how the utility is adapting to climate change is to assume the climate is warming, whether due to man-made and/or natural factors. The results will be seen more in terms of extremes, i.e., floods, droughts.

The actual impact of this change in climate on groundwater resources is less clear. Baechler (2003) noted that deep groundwater supplies were less susceptible to on-going changes in climate over the last 15 years than surface waters.

The nearest Environment Canada Climate Stations most representative of the well field were selected in consultation with personnel of the Atlantic Climate Centre. These were determined to be Lyons Brook and Caribou.

Since 1998, the Town received the data on a monthly basis to assess monthly and seasonal trends in precipitation and temperature. Longer term trends have been established by updating a moving decadal analysis (Figures 5-3). To date the "warm" years experienced over the last portion of the 1990's have resulted in declining precipitation and rising air temperature.

The Atlantic Climate Centre was also requested to undertake a water balance analysis to better define Fall and Spring Groundwater recharge periods (Figure 5-3).

To quantify the impact of climate change on groundwater resources within the two main aquifers, two automated groundwater level recorders have been installed to monitor changes in head levels (Figure 5-4). No large scale long-term trends are apparent in the data to date.

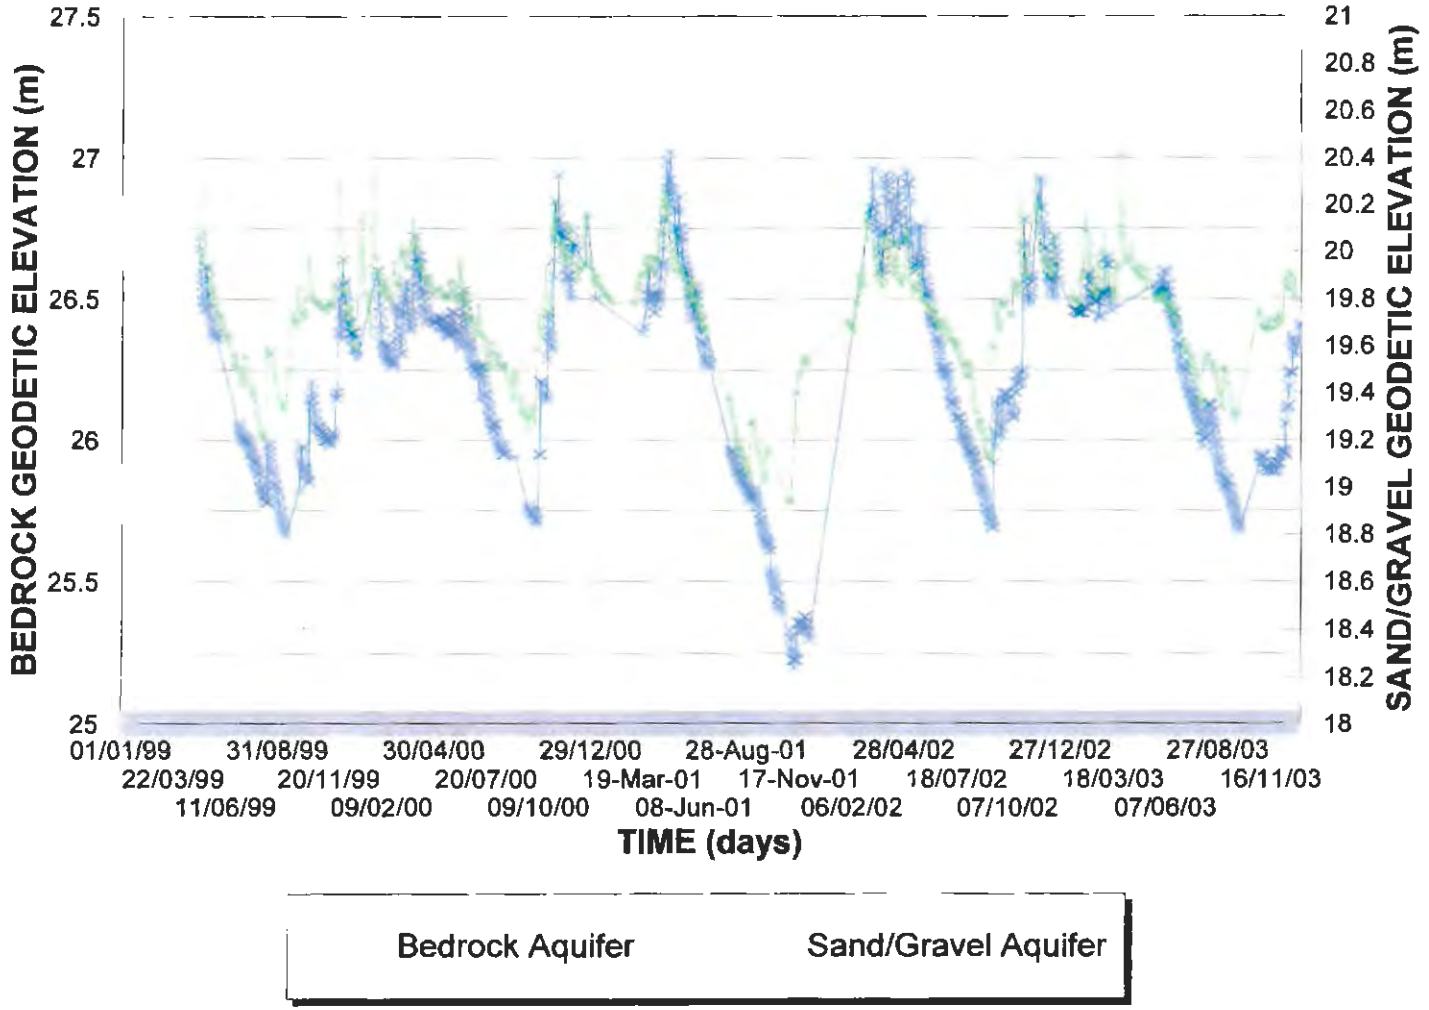
FIG.5-4: 5 YEAR HYDROGRAPH
BEDROCK and SAND/GRAVEL AQUIFERS



5.9 Public Education Program

Given the critical nature of the groundwater resources and the importance of public education and consultation, a range of activities have been on-going since 1991.

In 1996, ADI and Town staff held a public open house to provide the residents with detailed information about groundwater in general, and about the development of the aquifer in the immediate Caribou Well Field area. Prior to this Public Open House, the Town notified all affected landowners again by letter and advertised in the Pictou Advocate newspaper of this "Open House" information session. Seventeen interested persons attended. A second, well publicized open house was held on March 13, 2000, less than five people attended.

Meetings were held twice with the owners of the Fraser property, located in the middle of the well field during 1999 and 2000 to discuss the proposed land use guidelines and their impact on them. Modifications were made to the plan to accommodate some of their concerns. Town representatives presented information on preliminary land use constraints to a public open house on December 6, 2000. Town representatives met with the core of the Caribou Well Field Community Ad Hoc Committee on Land Use in February 2001.

A continuous display of educational information on the Town's water supply and water related issues was established, and made available to the public. The Director of Public Works continues to discuss the well field and the groundwater aquifer in this area with any interested persons

5.10 Inspection/Enforcement

Staff visit each production well site daily to record production and inspect for security violations. A weekly inspection of the perimeter of the watershed is undertaken to note any unauthorized use of Town lands.

For those private lands, especially in the County, the Town strongly believes it is the responsibility of the NSDEL to undertake a weekly to bi-weekly inspection visit of lands within WHPA Zones 2 and 3 for the Caribou Well Field and enforce existing environmental legislation as required.

5.11 Development of a Hydrogeological Model for the Well Fields

The Town has committed to acquire and fund the collection of additional technical information on the ground and surface water resources forming the Well Fields and

Protection Zones. These data have been used to continually update the database and refine the hydrogeological model. This allows for a more comprehensive understanding of the occurrence, quantity and quality of the water resources. When sufficient data has been collected to form a satisfactory conceptual model, consideration will then be given to development of a computer numerical model for the groundwater flow field, the impact of the pumping wells and groundwater stream interaction.

The intention is to undertake affordable, practical program each year over the long-term to obtain information pertinent to answering specific operation/protection issues as they arise. The overriding concept is "It is difficult to protect what you don't understand".

This commitment includes the hiring of a summer student each year to aid in these investigations, while providing practical experience to upcoming qualified students.

5.12 Building and Maintaining a Database

A computerized map of the well field and environs has been established by ADI using MICROSTATION. The base was developed with existing LRIS digital mapping at a scale of 1:10,000. This base allows for development of the technical figures presented in this report, as well as large scale colour overlays for public presentation.

Information being collected on wells, GUDI, chemistry, etc., is entered into EXCEL spreadsheets, which are being maintained at two sites to prevent loss of data. This database includes information such as water levels, water chemistry, pumping rates and volumes, streamflow, subsurface lithographic logs, etc. This forms the basis for presenting updated information in the annual reports to NSDEL.

5.13 Demand Side Management

The Town recognizes that Demand Side Management (controlling demand) is as important as Supply Side Management (finding new water sources) in managing its water supply. This not only reduces the demand on the system, but also supplies additional revenues to undertake additional monitoring and investigations as so required.

A recent investigation on usage in the Town by ADI noted that the average residential water consumption in Pictou is high, with a residential usage of approximately 380 litres/person/day. This is compared with average Canadian residential water demands in 1996-1997 of 72 to 76 litres/person/day. The Atlas of Canada reported in 1999 that average per capita water demand in Nova Scotia ranged from 160 to 320 litres/person/day.

Domestic users are presently unmetered. There are 1251 such users currently being charged a quarterly rate of $41.25. Schools pay $291.50 per quarter. A total of 116 commercial services are metered based upon service size. A total of 16 sprinkler systems are billed at $110/yr. The above rates were set out and agreed to by the Board of Public Utilities as of January 1, 1986. Recently the Town has made a submission to the Board for a new rate structure based upon domestic metering.

5.14 Ecosystem Approach

A relatively new system is being employed in source water protection in specific Ontario communities identified as the Ecosystem approach. This approach is grounded in ecological science and a belief that human decisions should be made with due regard for essential ecological process, biodiversity and sustainable uses. It acknowledges the importance of human needs while at the same time confronting the reality that the capacity of our world to meet these needs in perpetuity has limits and depends on the functions of ecosystems.

In essence, it combines what was already covered with the above strategies for land use management, forestry management, adaptation for climate change and Public Education Program. The Town is considering other ways to incorporate this strategy into Source Water Protection Planning and is watching its implementation in Ontario with interest.

6.0 SOURCE WATER PROTECTION ADVISORY COMMITTEE

The Pictou Watershed Management Committee was established in 1993 to guide future initiatives designed to protect the Town's water resource and to pursue the designation for the Caribou Well Field. Participation included a member of the Pictou County Council, since the designated land in question was positioned within the County. The Committee also included a hydrogeological technical advisor from ADI. In 1993, the Town contacted each identified landowner within the boundaries of the survey and advised them of the Town's proposal to protect the groundwater resources within the well field. Out of the 74 separate landowners, only 14 responded by mail or telephone.

The Town pro-actively commenced a public consultation program. Two newsletters were sent out to property owners within the proposed protection area identifying the watershed management committee and its long-term goals. In 1996, they invited the residents to a public open house and requested their input and ideas.

The Management Committee has held ongoing meetings with NSDEL, a representative from the Pictou Planning Advisory Committee and the Warden of Pictou County since 1994.

On going participation from the Pictou County District Planning Commission has included the preparation of the Caribou Well Field Protection Project Status Report and a draft Joint Land Use By-Law between the Town of Pictou and the Municipality of the County of Pictou.

As part of the requirement for designation, the Town developed a Terms of Reference in 2002 for a Town of Pictou Watershed Advisory Committee for the Caribou Well Field. Given that designation is not possible at this time, it is the Town's intent to build upon those guidelines to develop a Source Water Protection Committee that would be responsible for "advising" on both well fields. The key components of the mandate for the committee are expected to include:

1. It exists by the authority of the Council of the Town of Pictou and will act as an advisory body to Council. However, individuals still retain the ability to address Town Council directly on issues relating to the well fields.
2. On-going contact with the Committee shall be provided for by the Town of Pictou's Administrative offices.

3. The committee has an advisory mandate only, and is not responsible for managing the day-to-day operations of the Pictou Water Utility.

4. Its mandate is to provide assistance and suggestions with regard to:
   - Land use activities that have an impact on the water supply;
   - Providing for public comment and education on specific matters;
   - Making recommendations regarding remedial measures aimed at correcting, or minimizing harmful effects on the water supply; and
   - Maintaining an appropriate emergency response protocol to respond to any crisis, which might affect the water supply.

5. All meetings shall be open to the public and press, or as allowed under the municipal Government Act

6. Membership shall be comprised of at least
   - The mayor for the Town of Pictou
   - The Warden for the Municipality of Pictou County
   - The Chair of the Planning Advisory Committee
   - A member of Municipal Council for Pictou County

- A member at large representing the Town of Pictou
- A member of the Ad Hoc Committee representing the Municipality of Pictou County. This member shall be a land owner who occupies a dwelling year round within Zones 1, 2 or 3 of the WHPA for the Caribou Well field; and
- Technical and support staff may be present when requested and agreed to by the Committee.

7.0 MONITORING PLAN

As part of "due diligence", the water supply monitoring program established by the Utility encompasses more than that required by the NSDEL permit. It involves both "Source" and "Distribution" System monitoring. The key components are located on Figure 7-1.

The Town draws groundwater from the Pictou (bedrock) aquifer and the Caribou (S/G) aquifer. The monitoring program entails head levels and chemistry from background wells within the aquifer. This includes two automated head level recorders, as well as monthly head levels on up to 35 observation wells, with periodic chemical analysis.

Environment Canada's Lyons Brook and Caribou weather stations provide real time weather data on temperature and precipitation. NSDEL's Durham groundwater level recorder provides historical head level data on the Pictou Aquifer.

Staff visit each production well daily to record production and chlorine levels at each injection site. Tri-monthly chemical analyses are conducted on raw and treated samples for iron and manganese, where treatment is provided. Weekly sampling is undertaken for bacteria at various locations. The water level is continuously monitored in the reservoir.

Annual monitoring reports are submitted to NSDEL as a requirement of the approval to operate.

External monitoring wells to Caribou aquifer are in place and monitored, designed around aquifer protection, not necessarily well head protection. To date, there are no monitoring wells positioned around any of the Town's production wells to forewarn of contaminant incursion.

The costs/benefits of utilizing a SCADA system to aid in data collection is presently being assessed.

TOWN OF PICTOU - TOWN WELL FIELD
WELL HEAD PROTECTION - URBAN WELLS
CHECK LIST FOR EVALUATION OF EACH WELL

DRAFT 1 JUNE 18/02 - for review and comment

NOTES ON METHOD OF APPROACH

√ includes wells, but not storage tank or distribution system
√ assesses principally Zone 1 - assumes between 150 - 300 m radius around each well head - until refined by analysis of drawdown cone(incorporates all properties within that zone therefore extent of zone not circular but determined by property boundaries).
√ historical perspective goes back 100 years
√ Will result in a report on each well, with appendices including interview forms, photos, maps etc.

← for an example

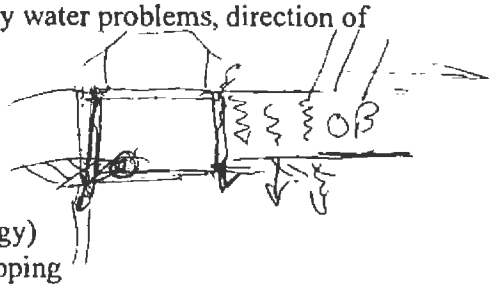
A - FACILITY EVALUATION (pumphouse and property)

√ Extent, shape, size of Town owned land around well head
√ Pump House Construction (size, structure, building materials)
√ facilities contained within Pump House (treatment, chemicals etc)
√ Signage ←
√ access restriction :\1)personnel, rodents, 2) vehicles,\3) back flow preventers, 4) well cap, 5) link with distribution system(seepage collars), and 6) airborne.
√ Well Construction details(casing, annular seal, drive shoe, age, total depth)
√ Wastes (type, nature of disposal)
√ Level and type of surveillance, inspection frequency, alarms ←
√ History of land use on site - prior to well installation
√ Presence of groundwater monitoring program at perimeter of drawdown cone
√ Groundwater chemical/quality monitoring of Production Well
√ Direction which on-site drainage is transported to
√ Remoteness (distance to existing structure, access to site, distance to nearest road and sidewalk/trail)
√ Distance to and height above sea level
√ Distance and direction to nearest watercourse

B- LAND USE IN PROPOSED PROTECTION AREA

√ present land use - all types (domestic, commercial, industrial, parks etc) with description and photos
√ past land use (historical research, air photos, interviews)
√ Subsurface facilities - storm/sanitary sewers, power/communication lines, wet wells, drains from homes (need age and construction details if possible)
√ Surface facilities(power, communication poles, transformers, grounding etc)
√ vegetation (trees, lawns, gardens etc.)
√ surface drainage patterns (natural and man-made)

√ present property ownership, names, contact numbers, address
√ road network - location ,construction , curb and gutter, age, direction of roadwash runoff, culverts, AADT's if available, truck/tanker traffic (and type of chemicals), accident rates, de-icing materials and volume
√ land use policies/restrictions
√ any previous history of blasting
√ buildings (description, presence of basements and any water problems, direction of roof gutter drainage etc.)



C - HYDROGEOLOGIC SETTING

√ Overburden (type, thickness, presence of fill, pedology)
√ bedrock (lithology, structure - from well log and mapping
√ hydrostratigraphic units
√ pumping rates and water levels
√ water chemistry from pumping well (looking for signs of contamination or trends)
√ surface watersheds (upstream of well site)
√ groundwater water watershed (upstream of well site)
√ Sewersheds (for storm and sanitary sewers passing well head)
√ location and description of any other wells (i.e. drilled wells, geotechnical boreholes, sumps, wet wells etc)

D - CONTAMINANT SOURCE INVENTORY

√ Nature of contaminant(chemical, biological, physical, radiological etc)
√ Nature of release (point or non-point, surface or subsurface release, continuous or time related, volume)
√ i.e. - fuel handling and storage(LUSTs)
- road wash runoff
- storm/sanitary sewers
- fertilizer/pesticides/herbicides/insecticide application
- material handled by tanker trucks
- roof wash runoff

√ Identify toxicity of contaminant to man(acute, chronic, carcinogenicity, mutagenicity etc)
√ Characterize pertinent Properties(solubility, density viscosity vapour pressure etc)
√ Characterize Relationship to Water(dissolved, colloidal, LNAPL, DNAPL)
√ Identify what concentrations necessitate "Action"(Drinking Water Guideline)
√ Identify whether contaminant is presently analyzed for in Pumping well and what concentrations are found

E - HAZARD ASSESSMENT

Natural and human disasters that can create major emergencies specific to each well - doesn't include general ones that would in all likelihood impact all wells (i.e. earthquakes, hurricanes etc.

Appendix B

NSE Approval to Withdraw Groundwater from Pictou and Caribou Wellfields

June 20, 2013

Mr. James Chisholm
Town of Pictou
40 Water St
PO Box 640
Pictou, NS
B0K 1H0

Dear Mr. Chisholm:

RE: Approval to Withdraw Groundwater - Town of Pictou; Approval No. 2002-026956-R01; Authorization No. 3889

Enclosed please find Approval # 2002-026956-R01 issued to the Town of Pictou to withdraw groundwater from wells within the Town Wellfield and the Caribou Wellfield, located at or near Pictou and Central Caribou, Pictou County, Nova Scotia.

You will be invoiced an annual user fee based on the approved withdrawal volumes. You will also be invoiced for an annual approval administration fee. These fees are subject to review and adjustment by the Minister and you will be invoiced annually.

This Approval or a copy is to be kept on-site at all times. All personnel involved in the project must be made fully aware of the terms and conditions of this Approval. The terms and conditions are shown as attached and it is the Approval Holder's responsibility to ensure that they are followed. Failure to comply with the terms and conditions is an offence under the *Environment Act*.

It is the Approval Holder's duty to advise the Department of any new and relevant information respecting any adverse effect that results or may result from the approved activity, which comes to the Approval Holder's attention after the issuance of the Approval. This is required under Section 60 of *the Environment Act*.

If the activity is altered, extended or modified beyond the description given in this Approval, please reapply as a new Approval may be required.

Despite the issuance of this Approval, the Approval Holder is still responsible for obtaining any other authorization which may be required to carry out the activity, including those which may be necessary under provincial, federal or municipal law.

Should you have any questions, please contact Bonnie MacDonald, Northern Region, Pictou Office at (902) 396-2426.

Yours truly,

Jennifer D McDonald, M.Sc., P.Geo.
Regional Hydrogeologist

1.0 Definitions:

a) "Act" means the *Environment Act* S.N.S. 1994-1995, c.1 and includes all regulations made pursuant to the Act.

b) "Activity" means the withdrawal of groundwater from multiple wells within the Town and Caribou Wellfields, and associated works.

c) "Administrator" means the Manager of the Northern Region, Pictou Office of Nova Scotia Environment or the Manager's designate.

d) "Department" means the Northern Region, Pictou Office, of Nova Scotia Environment located at the following address:

Nova Scotia Environment
Environmental Monitoring and Compliance Division
Northern Region, Pictou Office (Granton)
20 Pumphouse Road
RR #3
New Glasgow
Pictou County, NS B2H 5C6

Phone: (902) 396-4194
Fax: (902) 396-4765

e) "Groundwater" means all water naturally occurring under the surface of the Province of Nova Scotia.

f) "Minister" means the Minister of Nova Scotia Environment.

g) "NSE" means Nova Scotia Environment.

h) "Watercourse" means
   i) the bed banks and shore of every river, stream, lake, creek, pond, spring, lagoon or other natural body of water, and the water therein, within the jurisdiction of the Province, whether it contains water or not, and
   ii) all groundwater;

2.0 Scope of Approval

a) This Approval (the "Approval") relates to the Approval Holder and their application and supporting documentation, as listed in the reference documents above, to withdraw groundwater from multiple wells within the Town and Caribou Wellfields, situated at or near Pictou and Central Caribou, Pictou County.

b) This Approval supercedes previous Approval number(s) which is/are now null and void.

3.0 General Terms and Conditions

a) The Approval Holder shall construct the watercourse alterations in accordance with provisions of the:

i) *Environment Act* S.N.S. 1994-1995, c.1;
ii) Regulations, as amended from time to time, pursuant to the above Act;
iii) Standards, Policies, or Guidelines issued by Nova Scotia Environment, as amended from time to time.

b) The Activity shall be conducted in accordance with the details and specifications in the Application and attached appendices and the reference documents. **If there is a discrepancy between the reference documents and these terms and conditions, the terms and conditions of this Approval shall apply.**

c) Any request for renewal or extension of this Approval is to be made in writing, to the Department, at least ninety (90) days prior to the Approval expiry.

d) The Minister or Administrator may modify, amend or add conditions to this Approval at anytime pursuant to Section 58 of the Act.

e) This Approval is not transferable without the consent of the Minister or Administrator.

f) i) If the Minister or Administrator determines that there has been non-compliance with any or all of the terms and conditions contained in this Approval, the Minister or Administrator may cancel or suspend the Approval pursuant to subsections 58(2)(b) and 58(4) of the Act, until such time as the Minister or Administrator is satisfied that all terms and conditions have been met.

ii) Despite a cancellation or suspension of this Approval, the Approval Holder remains subject to the penalty provisions of the Act and regulations.

g) The Approval Holder shall notify the Department prior to any proposed extensions or modifications of the Activity, including, but not limited to, an increase in withdrawal rates or the addition of production wells. The Approval holder shall obtain written authorization or amendment from the Administrator before implementing any change that would not comply with the Terms and Conditions of this Approval.

h) The Approval Holder shall immediately notify the Department of any incidents of non-compliance with this Approval.

i) Pursuant to Section 60 of the *Act*, the Approval Holder shall submit to the Administrator any new and relevant information respecting any adverse effect that actually results, or may potentially result, from any activity to which the Approval relates and that comes to the attention of the Approval Holder after the issuance of the Approval.

j) The Approval Holder shall bear all expenses incurred in carrying out the environmental monitoring required under the terms and conditions of this Approval.

k) Unless specified otherwise in this Approval, all samples required to be collected by this Approval shall be collected, preserved and analysed, by qualified personnel, in accordance with recognized industry standards and procedures.

l) The Approval Holder shall submit any monitoring results or reports required by this Approval to the Department. Unless specified otherwise in this Approval, All monitoring results shall be submitted within 30 days following the month of monitoring.

m) The Approval Holder shall ensure that this Approval, or a copy, is kept on Site at all times and that personnel directly involved in the watercourse alterations are made fully aware of the terms and conditions which pertain to this Approval.

n) Within one month of the issuance of this Approval, the Approval Holder shall designate in writing, to the Department, a contact for this Approval. If the contact should change, the Approval Holder shall immediately notify the Department in writing.

o) The Approval Holder shall, upon receipt of an invoice from the Minister of Nova Scotia Environment stating the amount owing, pay to the Minister of Finance the amount stipulated in said invoice. Said amount shall be, in accordance with the schedule of fees established by the Minister of Nova Scotia Environment, as may be revised from time to time.

p) The failure of the Minister to insist upon a strict performance of a Term and Condition contained in this Approval shall not be deemed a waiver of any rights or remedies that the Minister may have and shall not be deemed a waiver of any subsequent breach of the Terms and Conditions of this Approval.

q) This Approval does not give sole or exclusive rights to any watercourse or water resource, and the Minister reserves the right to use and to allow others to use the watercourse or water resource and the water therein.

r) The Approval Holder may not alter or use the watercourse or water resource so as to:

   i) prejudice any riparian or other rights, should any such rights exist, of a person lawfully in possession lands abutting the watercourse or water resource;
   ii) cause damage or nuisance to adjacent or abutting lands.

s) The Approval Holder shall not place a pecuniary value on or claim any pecuniary value for the rights granted by this Approval, over and above the amounts, if any, paid to the Minister by the Approval Holder for the rights.

t) The Approval Holder shall maintain a culvert, bridge, dam, sluice, flume, conduit, well or other structure built or used in or on the watercourse or water resources so that it does not cause an adverse effect. This conditions survives the expiry or cancellation of this Approval.

u) The Approval Holder shall conform to a direction of the Minister or an Administrator concerning the maintenance or rehabilitation of a watercourse or water resource or the maintenance, rehabilitation or removal of a culvert, bridge, dam, sluice, flume, conduit, or structure used or maintained in and on the watercourse or water resource. The Approval Holder shall, pursuant to an Approval where required, remove a culvert, bridge, dam, sluice, flume, conduit or other structure and any equipment or personal property built, used or maintained in and on the watercourse or water resource at the end of the useful life of the culvert, bridge, dam, sluice, flume, conduit or structure. In the event the Approval Holder fails to remove a culvert, bridge, dam, sluice, flume, conduit or other structure or equipment or personal property, the Minister may, without any liability, remove or demolish the same in whatever manner the Minister deems necessary and the Approval Holder shall reimburse the Minister for all expenses and costs of such removal or demolition. This condition survives the expiry or cancellation of this Approval.

v) The Approval Holder shall indemnify and save harmless the Minister and an employee, servant or agent of the Department against any loss, cost or damage resulting from the activities performed pursuant to this Approval. Such indemnity shall include, but not be restricted to, all losses, costs or damages occasioned by the improper or faulty relocation of a watercourse or water resource or the improper or faulty construction of, repair, alteration or addition to any culvert, bridge, dam, sluice, flume, conduit or other structure in or on the watercourse or water resource, or by any trespass, negligence or wilful act of the Approval Holder or any employees, agents, contractors or guests of the Approval Holder.

w) This Approval shall enure to the benefit of and be binding upon the Minister, the Minister's successors, assigns and authorized representatives and upon the Approval Holder, and the heirs, administrators, executors and assigns of the Approval Holder.

x) The Minister and all persons designated as Inspectors pursuant to the *Environment Act* shall have free access at all times to the Activity and to land under control of the Approval Holder to ensure these Terms and Conditions are being fulfilled.

y) Nothing in this Approval relieves the Approval Holder of the responsibility for obtaining and paying for all licences, permits, approvals or authorizations necessary for carrying out the work authorized to be performed by this Approval which may be required by municipal by-laws or provincial or federal legislation. The Minister does not warrant that such licences, permits, approvals or other authorizations will be issued.

4.0 Approved Withdrawal

a) The location and construction of the production wells covered by this Approval is restricted to those shown in Table 1.

b) The maximum pumping rate, average pumping rate, 30 day withdrawal volume and annual withdrawal volume for each individual well and the total wellfield shall not exceed the values shown in Table 2.

c) The Department may amend the approved withdrawal limits specified in Table 2. The Approval Holder will be notified in writing of any changes to the approved withdrawal limits.

Table 1 - Well Construction Information

Production Well	Date Completed	NSE Well Log Number	Well UTM Coordinates		Well Total Depth (m)	Casing Depth (m)	Diameter (mm)	Screen Description
			Easting	Northing				
Beaches Road	1945	-	-	-	156	-	203	none
Division Road	1974	740136	523052	5060347	152	13	203	none
Exhibition	1972	-	-	-	117	10	203	none

Table 2 - Approved Withdrawal				
Production Well	Pumping Rate (litres/day)		Withdrawal Volume (litres)	
	Maximum [1] (over 3 days)	Average [2] (Over 30 days)	30 day [3]	Annual [4]
Beaches Road	393,120	230,400	6,912,000	84,096,000
Division Road	264,880	164,160	4,924,800	59,918,400
Exhibition	164,160	79,200	2,376,000	28,908,000
Footes Lane 2	328,880	230,400	6,912,000	84,096,000
M&M	228,960	144,000	4,320,000	52,560,000
Public Works	228,960	164,160	4,924,800	59,918,400
Smith Grant	228,960	129,600	3,888,000	47,304,000
No. 8	131,040	93,600	2,808,000	34,164,000
No. 10	817,920	194,400	5,832,000	70,956,000
No. 11	228,960	129,600	3,888,000	47,304,000
No. 12	681,120	331,200	9,936,000	120,888,000
No. 14	524,160	367,200	11,016,000	134,028,000
No. 16	326,880	326,880	9,806,400	119,311,200
Total Wellfield [5]	**4,280,000**	**2,260,000**	**67,800,000**	**824,900,000**

Notes:

1 Pumping rate shall at no time exceed the maximum based on actual rate averaged after 3 days.

2 Average allowable pumping rate is based on the demonstrated water needs of the applicant and sustainable yield.

3 30 day withdrawal volume = Average pumping rate multiplied by 30 days.

4 Annual withdrawal volume = Average pumping rate multiplied by the number days pumped per year (i.e. 365).

5 Total well field is based on the previous approved withdrawal limits and current demand; it is not a sum of the approved limits for all production wells.

5.0 Flow Monitoring

a) Well production flow meters shall be installed, maintained and monitored separately for all production well(s).

b) The Approval Holder shall keep daily well production records for each well to include water usage volumes. Data shall be tabulated within a spreadsheet program.

6.0 Groundwater Withdrawal Records

a) The Approval Holder shall maintain monitoring records for:
   i) pumping flow rates;
   ii) duration of pumping;
   iii) total withdrawal volumes;
   iv) water quality;
   v) changes in use; and
   vi) reported effects of the withdrawal on other groundwater users.

b) These records shall be maintained on Site for a period of ten years and are to be available for review immediately upon request by the Department.

7.0 Well Interference Remedy

a) If production causes interference problems with any existing well supplies, the withdrawal rates shall be reduced and/or the problem rectified by the Approval Holder in accordance with an action plan acceptable to the Department.

8.0 Well Decommissioning

a) Any new or existing well located at the Site that is required to be decommissioned by the Minister or is not used or maintained for present or future use shall be decommissioned in accordance with the *Well Construction Regulations* and Water Well Decommissioning Guidelines. This condition survives the expiry or cancellation of this Approval.

9.0 Water Level Monitoring

a) The Approval Holder shall collect manually, or with electronic data loggers, water levels in all production wells on at least a weekly basis. Data shall be tabulated within a spreadsheet program.

b) The Approval Holder shall collect manually, or with electronic data loggers, water levels in dedicated observation wells on at least a semi-annual basis. Data shall be tabulated within a spreadsheet program.

c) The water level monitoring data is to be maintained on Site for a period of ten years and is to be available for review immediately upon request by the Department.

10.0 Groundwater Withdrawal Reporting

a) The Approval Holder shall submit the following records to the Department on an annual basis:
   i) production records for each well (i.e. groundwater withdrawal volumes), in comparison with approved withdrawal limits;
   ii) a summary of any occurrences during the year that may have resulted in potential hazards or changes to the water supply (nearby land development, new wells or pumps installed, wells abandoned, contaminant spills etc.);
   iii) a description of any water conservation measures implemented;
   iv) a summary of any effects reported by other groundwater users in the area;

b) The records shall be incorporated as part of the annual report for the Municipal Water Works Approval and submitted to the Department on or before April 1 following completion of the calendar year being reported upon.

c) Data submissions completed for the requirements of this Approval does not remove the Approval Holder from meeting any other registration, reporting, data maintenance and compliance requirements such as those specified in the Guidelines for Monitoring Public Drinking Water Supplies or other regulatory guidelines.

11.0 Site Specific

a) If salt water intrusion problems occur as evidenced by changes to water level or water quality effects, the Approval Holder shall notify the Department immediately and the withdrawal rate shall be reduced and/or the problem rectified to the satisfaction of the Department.

b) i) The Approval Holder shall review the safe yield estimates for the following production wells: No. 12, No. 14, No. 15, and Footes Lane 2 after the collection of one year of operational data with No. 15 and Footes Lane 2 added to the system.

ii) A report outlining the results of this review shall be submitted to the Department within 18 months of Well No. 15 and Footes Lane 2 being connected to the system. The report shall included recommended updates to the safe yields and withdrawal rates specified in Table 2, as applicable. Approved withdrawal limits specified in this Approval may be amended by the Department pending the results of this review.

ii) The items referenced in 11 b) i) and 11 b) ii) shall be completed by a qualified Hydrogeologist, licensed to practice by the Association of Professional Geoscientists of Nova Scotia (APGNS) or the Association of Professional Engineers of Nova Scotia (APENS).

Appendix C

NSE Permit to Operate a Water Supply System

(Approval No: 2012-080096-R02, March 4, 2016)

NOVA SCOTIA
Environment

APPROVAL

Province of Nova Scotia
***Environment Act*, S.N.S. 1994-95, c.1, s.1**

APPROVAL HOLDER: Town of Pictou

APPROVAL NO: 2012-080096-R02

EXPIRY DATE: February 16, 2026

Pursuant to Part V of the *Environment Act*, S.N.S. 1994-95, c.1, s.1 as amended from time to time, approval is granted to the Approval Holder subject to the Terms and Conditions attached to and forming part of this Approval, for the following activity:

Operation of non-GUDI and medium risk GUDI wells with natural filtration credit, greensand filters, and UV and chlorine for primary and secondary disinfection, water distribution system and associated works, located at or near 40 Water St, Pictou, Pictou County in the Province of Nova Scotia.

Administrator Penny McLeod
Penny McLeod

Effective Date March 4, 2016

TERMS AND CONDITIONS OF APPROVAL

Nova Scotia Environment

Approval Holder: Town of Pictou
Project: Water Supply System Serviced by non-GUDI and Medium Risk GUDI wells with Natural Filtration Credit, Greensand Filters, and UV and Chlorine for Primary and Secondary Disinfection

40 Water St
Pictou, Pictou County

Approval No: 2012-080096-R02

File No: 94600-30

1. **Definitions:**

a. "Act" means the Environment Act S.N.S. 1994-1995, c.1, s.1 and includes all regulations made pursuant to the Act.

b. "Administrator" means a person appointed pursuant to Section 21 of the Act.

c. "Associated Works" means all the piping, valves, instrumentation, controls, electrical works, etc., required for the operation of the Facility and Water Supply System.

d. "CT" means disinfectant residual in mg/L multiplied by the contact time in minutes.

e. "Contact Time" denoted as T_{10} is an effective contact time for disinfection in minutes and represents the time when 10% of the water passes the contact unit; that is 90% of the water remains in the unit and will be exposed to longer disinfection within the unit. T_{10} can be established by tracer studies or calculated using theoretical hydraulic detention times multiplied by an appropriate baffling factor listed in the "Treatment Standard for Municipal Surface Source Water Treatment Facilities" or "Treatment Standards for Municipal Groundwater Source Water Treatment Facilities".

f. "Continuous monitoring" is sampling or flow through analysis equipment that creates an output signal a minimum of once every five minutes.

g. "Department" means the Northern Region, Pictou Office, of Nova Scotia Environment located at the following address:

Nova Scotia Environment
Environmental Health and Food Safety Division
Northern Region, Pictou Office (Granton)
20 Pumphouse Road
RR #3
New Glasgow
Pictou County, NS B2H 5C6

Phone: (902) 396-4194
Fax: (902) 396-4765

h. "Facility" means the medium risk GUDI wells, greensand filters, Chlorine for primary disinfection, Chlorine for secondary disinfection and associated works.

i. "GCDWQ" means the latest edition of "Guidelines for Canadian Drinking Water Quality".

j. "Grab sample" means an individual sample collected in less than 30 minutes and which is representative of the substance sampled.

k. "Groundwater under the direct influence of surface water " or "GUDI" means any water beneath the surface of the ground with:

   i. significant occurrence of insects or other macro-organisms, algae, organic debris, or large-diameter pathogens such as *Giardia lamblia* or *Cryptosporidium*; or

   ii. significant and relatively rapid shifts in water characteristics such as turbidity, temperature, conductivity, or pH which closely correlate to climatological or surface water conditions.

l. "GUDI well" means a well that has been classified as GUDI based on the "Protocol for Determining Groundwater Under the Direct Influence of Surface Water" and has been accepted as such in writing by the Regional Hydrogeologist.

m. "Inadequately disinfected" means water that does not meet the required contact time.

n. "Log reduction" means a negative of the base 10 logarithm of the fraction of pathogens remaining after the treatment process.

   log reduction = log removal by physical treatment + log inactivation by disinfection

   where log removal by physical treatment is equal to the credit assigned to the filtration technology indicated in the Department's "Treatment Standard for Municipal Surface Source Water Treatment Facilities", as amended from time to time; and

   log inactivation by disinfection is equal to the inactivation which shall be calculated as defined by the Department's "Treatment Standard for Municipal Surface Source Water Treatment Facilities" or "Treatment Standard for Municipal Groundwater Source Water Treatment Facilities", as amended from time to time.

o. "Maximum day demand" means the highest daily use rate during the year.

p. "Minister" means the Minister of Nova Scotia Environment.

q. "MPA testing" means Microscopic Particulate Analysis which analyses for significant numbers of large macro-organisms, algae, and surrogate indicators of surface water.

r. "Non-GUDI well" means a well that has been classified as non-GUDI based on the "Protocol for Determining Groundwater Under the Direct Influence of Surface Water" and has been accepted as such in writing by the Regional Hydrogeologist.

s. "NSE" means Nova Scotia Environment.

t. "QA/QC" means quality assurance and quality control.

u. "Quarterly sampling" means samples taken once per quarter with no less than 45 days interval between sampling events.

v. "Site" means the structure used by the operator in overall direct responsible charge to maintain and store documents and records required by this approval.

w. "Total trihalomethanes" means the level of total trihalomethanes as defined by the latest edition of the GCDWQ.

x. "Water Supply System" means the Facility and all auxiliaries/associated works for the collection, treatment, storage and distribution of water from the source of supply to the service connection of the ultimate consumer.

y. "Water Withdrawal Approval" means an approval from Nova Scotia Environment for the withdrawal of water from a surface or groundwater source. For clarity, this approval was also formerly known as a "water rights", "water licence", "water permit" or "water authorization".

2. Scope of Approval

a. This Approval (the "Approval") relates to the Approval Holder and their application and supporting documentation, as listed in the reference documents above, to operate the Water Supply System.

b. This approval relates to aspects of the application and reference documents necessary to meet the operational, environmental, and public health requirements of the Water Supply System.

c. This Approval supercedes previous approval number 2012-080096-R01, which is now null and void.

3. General

a. The Approval Holder shall operate the Water Supply System in accordance with provisions of the:

   i. *Environment Act* S.N.S. 1994-1995, c.1, s.1 as amended from time to time;
   ii. Regulations, as amended from time to time, pursuant to the above Act.

b. The Water Supply System shall be operated in accordance with the details and specifications in the Application and attached appendices and the reference documents. **If there is a discrepancy between the reference documents and these terms and conditions, the terms and conditions of this approval shall apply.**

c. Any request for renewal or extension of this Approval is to be made in writing, to the Department, at least ninety (90) days prior to the Approval expiry.

d. The Minister or Administrator may modify, amend or add conditions to this Approval at anytime pursuant to Section 58 of the Act.

e. This Approval is not transferable without the consent of the Minister or Administrator.

f. i. If the Minister or Administrator determines that there has been non-compliance with any or all of the terms and conditions contained in this Approval, the Minister or Administrator may cancel or suspend the Approval pursuant to subsections 58(A)(1) and 58(A)(2) of the Act, until such time as the Minister or Administrator is satisfied that all terms and conditions have been met.

   ii. Despite a cancellation or suspension of this Approval, the Approval Holder is at all times subject to the penalty provisions of the Act and regulations.

g. The Approval Holder shall notify the Department prior to any proposed extensions or modifications of the Water Supply System, including process changes or waste disposal practices which are not granted under this Approval. Written approval from the Administrator may be required before implementing any change.

h. Pursuant to Section 60 of the Act, the Approval Holder shall submit to the Administrator any information respecting any adverse effect that actually results, or may potentially result, from any activity to which the Approval relates and that comes to the attention of the Approval Holder after the issuance of the Approval.

i. The Approval Holder shall immediately notify the Department of any incidents of non-compliance with this Approval.

j. The Approval Holder shall bear all expenses incurred in carrying out the environmental monitoring required under the terms and conditions of this Approval.

k. Unless specified otherwise in this Approval, all samples required to be collected by this Approval shall be collected, preserved and analysed, by qualified personnel, in accordance with recognized industry standards and procedures.

l. Unless written approval is received otherwise from the Administrator, all samples required by this Approval shall be analysed by a laboratory that meets the requirements of the Department's "Policy on Acceptable Certification of Laboratories" as amended from time to time.

m. Notwithstanding the above item, the following parameters may be analysed at the Facility or a laboratory that is not certified.

Alkalinity*, Aluminium Residual*, Chloramines, Chlorine Dioxide Residual, Chlorine Residual, Colour, Conductivity*, Fluoride Residual*, Hardness*, Iron*, Manganese*, Methane*, Free Ammonia (as N)*, Ozone Residual, pH, Temperature, Total Organic Carbon, Turbidity and UV Absorbance.

* These parameters must have a QA/QC component that includes quarterly confirmation by an accredited laboratory.

n. The Approval Holder shall ensure that this Approval, or a copy, is kept on Site at all times and that personnel involved in the Water Supply System operation are made fully aware of the terms and conditions which pertain to this Approval.

4. Spills or Releases

a. All spills or releases shall be reported in accordance with the Act (Part VI) and the *Environmental Emergency Regulations*.

b. Spills or releases shall be cleaned up in accordance with the Act.

5. Operations - General

a. The Water Supply System has been classified as a **Class II Water Treatment Facility** and a **Class II Water Distribution Facility**.

b. In accordance with the *Water and Wastewater Facilities and Public Drinking Water Supplies Regulations*, the Approval Holder shall place the responsibility for the operation, repair and maintenance of the Water Supply System under the overall direct responsible charge of an operator who holds a valid Operator Certification Certificate of a classification rating that is equivalent to or greater than the classification rating applied to the Water Supply System.

c. Notwithstanding Clause 5(b) above, if the Approval Holder cannot meet the requirement of Clause 5(b), the Approval Holder shall work towards satisfying Clause 5(b) in accordance with a transition plan approved by the Administrator. The transition plan shall be submitted to the Administrator within 90 days of being unable to satisfy Clause 5(b). This plan shall be subject to review and acceptance by the Department.

d. The Approval Holder shall ensure the contingency plan for the Water Supply System:
   i. meets the minimum requirements of the Department's "Water Utility Standard Operating Procedures and Contingency Plan Guidance", as amended from time to time.
   ii. is reviewed and updated on a yearly basis, if required. The Approval Holder shall document in the annual report what modifications were made to the plan, if any, and how the plan was communicated to their staff.
   iii. A copy is maintained on Site at all times and is available to the Department upon request.
   iv. All employees are apprised of the contingency plan.

e. When it is necessary to use a by-pass, the Approval Holder shall immediately notify NSE, identify the anticipated period of time that the by-pass system will be in service and initiate a Boil Water Advisory as stated in the "Guidelines for Monitoring Public Drinking Water Supplies". The Approval Holder shall maintain the boil advisory until otherwise advised by Nova Scotia Environment.

f. The Approval Holder shall take immediate preventive or corrective action, using methods that are acceptable to the Department, when results of an inspection or sampling results identify conditions which are currently or may result in an adverse effect to the environment or public health.

g. The Approval Holder shall protect the Water Supply System from

contamination due to cross-connections. If repairs, construction or maintenance are required, the Approval Holder shall ensure that the necessary work meets the requirements of the latest revision of CSA B64.10/B64.10.1.

h. The Approval Holder shall demonstrate that any Water Supply System component in contact with treated water has been disinfected after construction, repair or maintenance in accordance with ANSI(American National Standards Institute)/AWWA (American Water Works Association) C651 - Disinfection of Water Mains, ANSI/AWWA-C653 - Disinfection of Water Treatment Plant, and ANSI/AWWA C652 - Disinfection of Water Storage Facilities or the latest revisions.

i. The Approval Holder shall ensure that all chemicals used in the treatment process and all materials contacting the water are of "food grade" quality and meet both the AWWA quality criteria as set out in AWWA standards and the ANSI safety criteria as set out in ANSI standard NSF/60 (for chemical additives) or NSF/61 (for materials). A copy of the appropriate NSF certification is to be kept on Site and is to be available for review immediately upon request by the Department.

j. The Approval Holder shall discontinue use of any chemical found to have adverse effects on finished water quality limits as prescribed in the GCDWQ or this Approval.

k. i. The Approval Holder shall ensure that the emergency notification procedures are reviewed and updated on a yearly basis. The Approval Holder shall document in the annual report what modifications were made to the emergency notification procedures and how the procedures were communicated to their staff.

ii. A copy of the emergency notification procedures are to be maintained on Site at all times and are to be available to the Department upon request.

iii. All employees shall be apprised of the emergency notification procedures.

l. i. The Approval Holder shall ensure a comprehensive operations manual is kept up to date.

ii. A copy of the operations manual is to be kept on Site at all times and is to be available for review immediately upon request by the Department.

iii. All employees shall be apprised of the operations manual.

m. A set of current engineering drawings, shall be retained on Site by the Approval Holder for as long as the Water Supply System is in operation. These drawings shall be made available to the Department upon request.

n. The Approval Holder shall establish procedures for receiving and responding to complaints including a reporting system which records and documents what steps were taken to determine the cause of complaint and the corrective measures taken to alleviate the cause and prevent its recurrence.

o. The Approval Holder shall establish security measures to assure the safety of the Water Supply System.

p. The Approval Holder shall maintain a written list of the name of each laboratory utilized, and the parameters analysed by each laboratory, and shall submit this list to the Department upon request.

6. **Source Water Protection**

a. On or before May 2, 2016, the Approval Holder shall submit the updated Source Water Protection Plan to the Department for review and acceptance.

b. On or before June 30, 2016, the Approval Holder shall submit an updated implementation schedule for the Source Water Protection Plan to the Department for review and acceptance.

c. The Approval Holder shall implement the accepted Source Water Protection Plan, required under Condition 6 (b), in accordance with the accepted schedule.

d. The Approval Holder shall review and update the Source Water Protection Plan and implementation schedule on a yearly basis, if required. The Approval Holder shall document in the annual report the status and activities of the Source Water Protection Plan and modifications made to the Source Water Protection Plan or implementation schedule, if any.

e. If directed by NSE, the Approval Holder shall modify the updated Source Water Protection Plan or implementation schedule to the satisfaction of the Department.

7. Water Quality Requirements - Performance and Limits

a. General Requirements

i. The treated water shall meet the health-related concentration limits for the substances listed in the "Guidelines for Canadian Drinking Water Quality" (GCDWQ), latest edition unless stated otherwise in this Approval. These are described in the guidelines as Maximum Acceptable Concentration (MAC).

ii. For the medium risk GUDI wells (No. 8, No. 10, Smith Grant, Public Works, Beeches Road, and M&M), through a combination of natural filtration, UV, and chlorination, the treatment facility shall meet the following treatment efficiencies:

(1) Treatment shall be sufficient to ensure 99.9% reduction of *Giardia* cysts and *Cryptosporidium* oocysts (3-Log Reduction);

(2) Treatment shall be sufficient to ensure 99.99% reduction of viruses (4-Log Reduction); and

(3) Natural filtration is assigned a 1-log reduction credit for *Giardia* and *Cryptosporidium*.

(4) Primary disinfection shall address a minimum of 2-log inactivation for *Giardia* and *Cryptosporidium* and 4-log inactivation for viruses. CT/IT values shall be calculated in accordance with the Nova Scotia Treatment Standards for Municipal Drinking Water Systems, 2012.

iii. For the non-GUDI wells (No. 11, No. 12, No. 14, No. 15, Division Road, Exhibition, and Footes Lane 2), using both the natural filtration and disinfection processes, the treatment facility shall meet the following treatment efficiencies:

(1) Treatment shall be sufficient to ensure 99.99% reduction of viruses (4-Log Reduction); and

(2) Primary disinfection shall address a minimum of 4-log reduction for viruses. CT values shall be calculated in accordance with the "Nova Scotia Treatment Standards for Municipal Drinking Water Systems" (2012).

iv. The treated water shall be treated to minimize corrosion of the water distribution and/or plumbing systems.

b. **Primary Disinfection Requirements**

i. Primary disinfection through the use of chlorine, ultraviolet light or an alternate disinfection method which is acceptable to the Department, shall contribute a minimum of 2-log reduction for *Giardia* and *Cryptosporidium* and 4-log inactivation for viruses for each GUDI well or if water from individual GUDI wells is combined, for the combined flow. The disinfection log inactivation shall be based on CT values which shall be calculated as defined by the Department's "Treatment Standard for Municipal Surface Source Water Treatment Facilities".

ii. Primary disinfection through the use of chlorine shall contribute a minimum of 4-log inactivation for viruses for each non-GUDI well or if water from individual non-GUDI wells is combined, for the combined flow. The disinfection log inactivation shall be based on CT values which shall be calculated as defined by the Department's "Treatment Standard for Municipal Drinking Water Systems" (2012).

iii. System-wide redundancy shall apply - individual disinfection units shall be configured to apply primary disinfection at all times to ensure that inadequately disinfected water does not enter the distribution system. A well shall shut down automatically when the monitoring system detects inadequate disinfection.

iv. Each disinfection unit shall be designed to meet the rated design flow capacity of the wells or combined wells.

v. Disinfection equipment shall be operated in such a manner as to prevent inadequately disinfected water from being distributed.

vi. Continuous monitoring of the primary disinfection process is required with measurements taken at no more than five minute intervals.

vii. The Facility shall be equipped with instrumentation capabilities to notify operations staff if the disinfection process fails to operate properly.

viii. In the event of an emergency situation where inadequately disinfected water enters the water distribution system, the Approval Holder shall issue a boil water advisory and immediately notify the Department as required by the "Guidelines for Monitoring Public Drinking Water Supplies".

ix. UV Light Requirements

(1) UV systems shall provide a minimum dosage of 40 mJ/cm^2 at all points within the reactor at all times when water is passing through the treatment process provided that the water quality characteristics indicate that this is a sufficient dosage.

(2) Water flow shall be stopped or directed to waste, or another method of disinfection shall be used, during the minimum design warm-up period for the UV unit.

(3) UV disinfection unit shall be equipped with UV sensors reading calibrated UV intensity.

(4) The system shall be equipped with an alarm notification and shutdown procedures in the event of:
- high temperature in the reactor, lamp, ballast or transformer;
- high flow rate that causes dose to fall below design specifications;
- low UV dose;
- low UV intensity;
- UV has shutdown;
- or any other emergency situation.

(5) UV lamp operation shall be monitored in a manner that ensures bulb replacement can be accomplished prior to reaching the maximum lamp life expectancy.

(6) The Approval Holder shall receive written verification from an independent third party that the manufacturer's system will continually meet the 40 mJ/cm^2 requirement and provide this information to NSE immediately upon request.

x. On or before May 2, 2016 the Approval Holder shall submit standard operating procedures (SOPs) for the disinfection process to the Department. The SOP's shall be implemented and communicated to all operations staff and documented in the operations manual required by Clause 5(l) above. The procedures and a log indicating the date and method of communication to staff shall be made available to NSE upon request.

xi. The SOPs shall indicate the design ranges for achieving the required log inactivation by disinfection, for example:
- CT: lowest temperature, highest pH, lowest chlorine, minimum contact time.

- IT: UV intensity, UV transmittance, flow rate.

xii. The Approval Holder shall maintain a log of events when operational conditions are outside the design ranges for achieving the CT/IT. These records shall be made available to NSE immediately upon request. Log inactivation shall be calculated during every such event.

xiii. When operational conditions are outside the design ranges, the Approval Holder shall immediately notify NSE, investigate the cause and take necessary corrective action. CT/IT shall be calculated during every such event.

c. **Secondary Disinfection and Residual Monitoring Requirements**

i. Secondary disinfection through the use of chlorination shall be used to maintain a chlorine residual in the water distribution system.

ii. The disinfection process shall be operated in such a manner as to ensure that the following minimum chlorine residual value is achieved throughout the water distribution system at all times:

- 0.20 mg/L free chlorine residual.

The disinfection process shall be operated in such a manner as to ensure that the maximum chlorine residual delivered to consumers does not exceed the following values:

- 4.0 mg/L free chlorine residual.

iii. Continuous online monitoring of the chlorine residual is required for finished water at each location where water enters the water distribution system from an individual well or combined wells, with measurements taken at no more than five minute intervals.

iv. Continuous on-line monitoring of the chlorine residual is required for the water entering the distribution system and leaving any water storage structure within the water distribution system, with measurements taken at no more than five minute intervals.

v. Monitoring of the water distribution system for chlorine residual is required. Unless specified otherwise in this approval, sampling and testing frequency is the same as for bacteriological sampling requirements as stated in the "Guidelines for Monitoring Public Drinking Water Supplies".

d. **Turbidity Requirements:**

i. Continuous raw water turbidity monitoring (with measurements taken at no more than five minute intervals) is required at the wellhead prior to disinfection for the medium risk GUDI wells (i.e., Public Works, M&M, Beeches Road, No. 8, No. 10, and Smith Grant).

ii. Continuous (with measurements taken at no more than five minute intervals) or daily grab raw water turbidity monitoring is required from each non-GUDI well or combined flow from non-GUDI wells entering the distribution system (i.e., No. 11, No. 12, No. 14, No. 15, Division Road, Exhibition, and Footes Lane 2).

iii. Turbidity levels entering the distribution system from individual wells or combination of wells shall not exceed 1.0 NTU:

- in at least 95% of the measurements taken by grab sample for each calendar month; or

- in at least 95% of the time each calendar month if continuous monitoring is the method of turbidity measurement.

iv. Notwithstanding clause 7(d)(iii), if the Approval Holder cannot meet the requirement of clause 7(d)(iii), the Approval Holder may request that a less stringent value apply provided the Approval Holder can demonstrate to NSE that the turbidity is not health-related and that the disinfection process is not compromised by the use of a less stringent value.

v. A turbidity value of 5.0 NTU or less shall be achieved on water distribution system sampling. Unless specified otherwise in this approval, sampling and testing frequency is the same as for bacteriological sampling requirements as stated in the "Guidelines for Monitoring Public Drinking Water Supplies".

vi. i. Where turbidity values of greater than 1.0 NTU are observed entering the water distribution system, from individual GUDI or non-GUDI wells or combined flow from non-GUDI wells, the Approval Holder shall investigate the cause and take corrective action as necessary and notify the Department.

ii. Where turbidity values of greater than 5.0 NTU are observed in the water distribution system, the Approval Holder shall investigate the cause and take corrective action as necessary and notify the Department.

e. **Greensand Filtration Requirements:**

i. The greensand filtration process shall be monitored and equipped with alarms and instrumentation to notify the Approval Holder of any problems that may compromise the disinfection process or result in a health-related drinking water guideline exceedence.

ii. Standard operational procedures for the greensand filtration process shall be developed, implemented and communicated to all operations staff and documented in the operations manual required by Clause 5(l) above. The procedures and a log indicating the date and method of communication to staff shall be made available to the Department immediately upon request.

iii. The standard operational procedures referenced in 7 e) ii) shall be submitted to NSE by May 2, 2016.

8. **Filter Backwash Water System - Performance and Limits**

a. Filter backwash water from the Facility shall be discharged to an approved location.

b. The Approval Holder shall submit an updated filter backwash plan to NSE for approval on or before June 30, 2016, for the independent wells and an interim plan for the wells that will be connected to the treatment plant. The filter backwash plan shall address the concerns identified in the 2013 System Assessment Report and shall include discharge locations and limits.

9. **Sludge Disposal**

a. The Approval Holder shall submit a plan for the ultimate disposal of solids from the waste treatment process to the Department for review and approval on or before June 30, 2016.

b. All solids from the waste treatment process shall be disposed in accordance with the approved sludge disposal plan.

c. Written approval is required from the Department to modify the sludge disposal plan.

10. **Upgrade Approvals**

a. The Approval Holder shall obtain from NSE a separate Approval for the construction of any proposed facilities required to meet the drinking water treatment standards and waste discharge requirements.

b. The Approval Holder shall submit an application for an amendment to this Approval if any new wells are to be connected to the existing Water Supply System. No additional wells shall be connected to the existing Water Supply System without prior written approval from the Minister.

11. **Production**

a. The Approval Holder shall comply with the Terms and Conditions of the water withdrawal approval for the Facility.

b. The Approval Holder shall report water withdrawal data in the annual report.

12. **Backup Water Systems**

a. When a backup water system is used for supplying water for human consumption, the Approval Holder shall immediately notify the Department and identify the anticipated period of time that the backup system will be in service.

b. For backup systems that do not meet the Nova Scotia Treatment Standards, the Approval Holder shall immediately initiate a Boil Water Advisory as stated in the "Guidelines for Monitoring Public Water Supplies". The Approval Holder shall maintain the boil advisory until otherwise advised by Nova Scotia Environment.

c. For backup systems that meet the Nova Scotia Treatment Standards, the backup water system may continue to operate as under normal conditions until the main water system is ready to be put back into service.

13. **Monitoring and Recording**

a. All monitoring shall be carried out as per the requirements of the *Water and Wastewater Facilities and Public Drinking Water Supplies Regulations* and the "Guidelines for Monitoring Public Drinking Water Supplies" as amended from time to time.

b. The Approval Holder shall monitor and sample the Water Supply System in accordance with a monitoring program approved by the Department and which meets the minimum requirements of Schedule A attached. In the case of a discrepancy between Schedule A and the approved monitoring program, the approved monitoring program shall apply.

c. Sampling shall be representative of the water distribution system.

d. i. On or before October 1, 2016, the Approval Holder shall undertake a review of sampling sites (post water upgrades) and submit to the Department for approval a recommended monitoring program for the Water Supply System for the current year. The proposed sampling plan shall address the items identified in the 2013 System Assessment Report and associated Corrective Action Plan.

ii. On or before October 1 of each year, the Approval Holder shall recommend to the Department the monitoring program for the Water Supply System for the following year highlighting any changes and the reason for the change. Any existing monitoring program shall remain in place until the recommended monitoring program is approved by the Department.

ii. The monitoring program shall include compliance monitoring, as required by this Approval, and process monitoring, response monitoring, special process characterization and optimization monitoring and source water characterization monitoring.

iii. The monitoring program shall meet the minimum requirements of the Department's "A Guide to Assist Nova Scotia Municipal Water Works Prepare Annual Sampling Plans", as amended from time to time.

Iv. The monitoring program shall be acceptable to the Department.

v. The Approval Holder is responsible for implementing, on an annual basis, the monitoring program and subsequent revisions as approved by the Department.

vi. The Approval Holder shall not move, relocate or otherwise alter the location of the sampling locations indicated in the approved monitoring program without written permission from the Department.

vii. Following a review of any of the analytical results required by this Approval, NSE may alter the frequencies, location, and parameters for analyses required for this Approval or require other remedial action.

e. Any flow measuring devices and continuous water quality analysers and indicators with alarm systems shall be installed, maintained and calibrated as specified by the instrument manufacturer's instructions. Calibration logs for each instrument shall be maintained on Site and be available for inspection immediately upon request by the Department.

f. The Approval Holder shall establish a QA/QC program to validate the measurements obtained from continuous monitoring equipment and for all analysis conducted at the Facility or a non-certified laboratory.

g. The Approval Holder shall establish and conduct process control testing and sampling and record the results. Results are to be made available for inspection or review by departmental staff immediately upon request.

h. The Approval Holder shall establish and conduct source water protection testing and sampling and record the results. Results are to be made available for inspection or review by departmental staff immediately upon request.

14. Laboratory Reports and Water Quality Results

a. The Approval Holder shall submit copies of the laboratory certificate of analysis to the Department immediately upon request.

b. The Approval Holder will authorize and work with laboratories to electronically report water quality results to the Department upon implementation of an on-line drinking water quality surveillance program.

c. Electronic reporting shall not replace the Approval Holder's responsibility to immediately notify the Department when bacteria is present or an exceedance of a maximum acceptable concentration or interim maximum acceptable concentration for a health-related parameter listed in the "Guidelines for Canadian Drinking Water Quality" is detected.

15. Reporting

a. Reporting Upon Request

i. The Approval Holder shall keep records continually updated in such a way that weekly and/or monthly reporting of monitoring and sampling results can be immediately sent to the Department upon request.

b. **Annual Reporting**

ii. The Approval Holder shall prepare and submit to the Department, an annual performance report for the Water Supply System.

iii. The annual report shall be submitted on or before April 1 following the completion of the calendar year being reported upon.

iv. The annual report shall contain but not be limited to the following information on the form provided by the Department.

(1) a summary and discussion of the quantity of water supplied during the reporting period on a per month basis showing design values, maximum daily flow and average daily flow for each month and any other parameters or conditions specified in the Water Withdrawal Approval.

(2) a summary and interpretation of analytical results obtained in accordance with the monitoring and recording section of this Approval, including an explanation for any exceedance of the maximum acceptable concentration (MAC) or interim maximum acceptable concentration (IMAC) of health-related parameters listed in the "Guidelines for Canadian Water Quality", latest edition and the actions taken to address the exceedance.

(3) annual trend graphs for parameters that are continuously monitored.

(4) date and description of any emergency or upset conditions which occurred during the period being reported upon and action taken to correct them.

(5) any modifications to the contingency plan or emergency notification procedures including a description of how the information was communicated to staff.

(6) a list of the names of each laboratory utilized by the Approval Holder and the parameters analysed by each laboratory.

(7) an update on the status of the source water protection plan, including any modifications to the plan or implementation schedule, and a summary of activities taken to achieve the goals and objectives of the plan.

(8) all incidents of free chlorine residual below 0.20 mg/L in the water

distribution system shall be detailed with a description of any actions taken.

(9) verification that the operational conditions remained within the design range for achieving CT/IT; if operational conditions went outside the design ranges, provide CT/IT calculations and a summary of corrective actions taken.

(10) records of any violations of the conditions of this Approval and actions taken by the Approval Holder to correct those violations.

(11) any complaints received and the steps taken to determine the cause of the complaint and the corrective measures taken to alleviate the cause and prevent its recurrence.

(12) a review of the QA/QC program to validate the measurements obtained from continuous monitoring equipment and for all analysis conducted at the Facility or a non-certified laboratory.

(13) a list of each certified operator and their level of certification.

c. Immediate Reporting on Operation

i. The Approval Holder shall notify NSE immediately in the event of an incident that may adversely affect the quality of the water within the Water Supply System. Notification shall be made to a live person followed by fax or email. These incidents shall include but not be limited to: the presence of bacteria; inadequately disinfected water being directed to the water distribution system; sewage or other spills in the source water supply area; line breakage that may result in cross contamination; etc.

ii. The Approval Holder shall notify NSE immediately if any analytical results of any specific parameter exceed the maximum acceptable concentration (MAC) or interim maximum acceptable concentration (IMAC) of health-related parameters listed in the "Guidelines for Canadian Drinking Water Quality", latest edition.

iii. When bacteria are detected at the Facility or in the water distribution system the Approval Holder shall notify NSE immediately and undertake corrective action as outlined in the latest edition of the "Guidelines for Monitoring Public Drinking Water Supplies", as amended from time to time or other Policies or directives issued by NSE.

iv. If the chlorine residual in the water distribution system is less than 0.20 mg/L free chlorine, the Approval Holder shall notify NSE immediately and take immediate action to obtain the required residual.

16. **MPA Testing and Reporting**

a. MPA testing (of the raw water from each individual GUDI well) is required every two years in spring following a rainfall.

b. The Approval Holder shall immediately notify the Department if the GUDI status of a well changes and take any necessary corrective action.

c. MPA testing shall be conducted in accordance with Appendix A of the Nova Scotia Treatment Standard for Municipal Drinking Water Systems, Protocol for Determining Groundwater Under the Direct Influence of Surface Water.

17. **Records**

a. The Approval Holder shall keep the following records and water quality analyses:

i. All incidents of suspected and/or confirmed disease outbreaks attributed to the water system shall be documented and kept for a minimum of ten years.

ii. Bacteriological, chlorine residual and turbidity analyses shall be kept for two years.

iii. Chemical analysis shall be kept for 10 years.

iv. Annual water withdrawal records shall be kept for 10 years.

b. The Approval Holder shall also retain the following information for a period of three years:

i. calibration and maintenance records;

ii. continuous monitoring data.

c. A copy of project reports, construction documents and drawings, inspection

reports, shall be kept for the life of the Water Supply System.

18. **Site Specific Conditions**

a. i. The Approval Holders shall sample the following wells on a quarterly basis, to be analyzed for polycyclic aromatic hydrocarbons (PAHs): Well No. 10 and observation well No. GWMW 99-5.

ii. Any amendment(s) to the sampling program referenced in 19(a)(i) must be approved in writing by NSE.

b. The Approval Holder shall inspect all observation wells within the Town of Pictou Wellfield and Caribou Wellfield on an annual basis to evaluate the structural integrity of the wells and make repairs as necessary. All observation wells shall be properly capped with security measures in place.

SCHEDULE A

SAMPLING REQUIREMENTS

Non-GUDI and Medium Risk GUDI Wells, with Natural Filtration, Greensand Filtration, Disinfection and Water Distribution System

PARAMETER	MINIMUM FREQUENCY	LOCATION
parameters as per the source water protection monitoring plan	In accordance with Step 5 of the Source Water Protection Plan and approved annual monitoring program	In accordance with Step 5 of the Source Water Protection Plan and approved annual monitoring program
water volume	continuous*	each individual well and combined flow; as per the Water Withdrawal Approval
temperature	daily grab or continuous*	CT control point
pH	daily grab or continuous*	water entering the distribution system; and as required by process monitoring if pH control is practised

SCHEDULE A		
SAMPLING REQUIREMENTS		
Non-GUDI and Medium Risk GUDI Wells, with Natural Filtration, Greensand Filtration, Disinfection and Water Distribution System		
PARAMETER	**MINIMUM FREQUENCY**	**LOCATION**
turbidity	<u>For GUDI Wells</u> continuous*	<u>For GUDI Wells</u> raw water at each individual GUDI well before pre-treatment and/or disinfection; and as requested by NSE.
	<u>For Non-GUDI Wells</u> Daily Grab or continuous*	<u>For Non-GUDI Wells</u> from individual wells or the combined flow entering the distribution system; and as requested by NSE
turbidity within distribution system	weekly grab	distribution system sample points
backwash waste water	in accordance with the approved annual monitoring program to comply with discharge criteria	in accordance with the approved annual monitoring program to comply with discharge criteria
chlorine residual	continuous*	all locations where water enters the distribution system from individual wells or combined wells; storage tank outlet
	twice weekly grab, spread evenly throughout the week	distribution system sample points

SCHEDULE A		
SAMPLING REQUIREMENTS		
Non-GUDI and Medium Risk GUDI Wells, with Natural Filtration, Greensand Filtration, Disinfection and Water Distribution System		
PARAMETER	**MINIMUM FREQUENCY**	**LOCATION**
total coliform and E.coli (present/absent) **	twice weekly (spread evenly throughout the week)	all locations where water enters the distribution system from individual wells or combined wells; and distribution system sample points
parameters as per the corrosion control program	quarterly grab sample	select distribution sample points
lead	annual grab sample - during warmest month	select distribution system sample point(s)
total trihalomethanes	quarterly grab sample	select water distribution system sample point(s) representative of the longest retention time - generally furthest from the source
haloacetic acids	quarterly grab sample	select distribution system sample point(s)
parameters as per the process monitoring program	in accordance with the approved annual monitoring program	in accordance with the approved annual monitoring program
	UV monitoring	see 7(b), UV light requirements

SCHEDULE A		
SAMPLING REQUIREMENTS		
Non-GUDI and Medium Risk GUDI Wells, with Natural Filtration, Greensand Filtration, Disinfection and Water Distribution System		
PARAMETER	**MINIMUM FREQUENCY**	**LOCATION**
parameters as per the Guidelines for Monitoring Public Drinking Water Supplies (GMPDWS)	annually for GUDI wells; every two years for non-GUDI wells (Note - fluoride is a required parameter regardless of whether fluoridation is occurring or not because natural fluoride may be present)	raw water from each individual well; and treated water entering the distribution system
MPA testing	every 2 years, in spring following a rainfall	raw water from each individual GUDI well; in accordance with the Protocol for Determining Groundwater Under the Direct Influence of Surface Water.
unless specifled otherwise in the approved monitoring program, all health-related parameters in the Guidelines for Canadian Drinking Water Quality, latest edition, having maximum acceptable concentrations (MACs)	every 5 years - timing for individual parameters may fluctuate (e.g. pesticides during application periods, etc.) (Note - algal toxins does not apply to groundwater supplies.)	raw water from each individual well; and treated water entering the distribution system except bacteria, THMs, HAAs, and lead which are to be taken in the distribution system
Viruses	as requested by NSE	raw water from each individual well; and water distribution system

SCHEDULE A		
SAMPLING REQUIREMENTS		
Non-GUDI and Medium Risk GUDI Wells, with Natural Filtration, Greensand Filtration, Disinfection and Water Distribution System		
PARAMETER	**MINIMUM FREQUENCY**	**LOCATION**
Giardia & *Cryptosporidium*	as requested by NSE	raw water from each individual well; and water distribution system

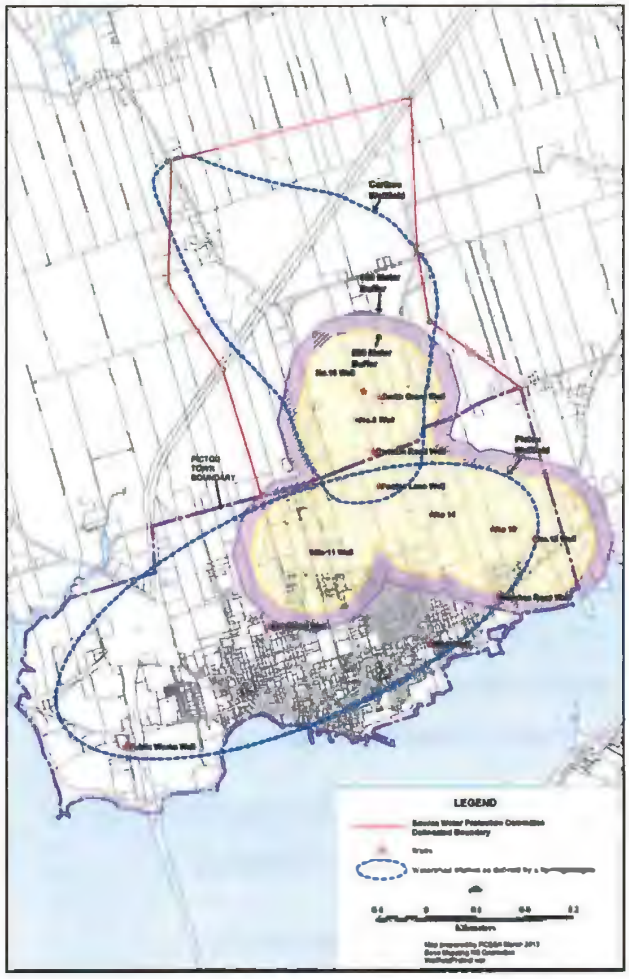
* Continuous monitoring - readings shall be taken a minimum of once every five minutes. Any report submitted to NSE shall include the maximum value for turbidity and the minimum value for residual chlorine recorded on the continuous monitoring equipment.

** The presence of coliform will require an immediate notification to NSE and resampling of the water.

Appendix D

Pictou Caribou Source Water Protection Plan

(2013, Revised in 2014 and 2017)



Pictou / Caribou Source Water Protection Plan

Approved: October 16, 2017

Revised: October 10, 2017

Prepared For

NOVA SCOTIA

Environment

Prepared By

Town of Pictou

Birthplace of New Scotland

Caribou Source Water Protection Committee

Members

REVISIONS

October 2017

REMO officer updated

January 2017

Minor Grammar Changes

Deleted Preamble – this section did not add value to the report and was captured in the Introduction.

Added Sections 3.7 and 4.7 to include "environmental risk" and how the source water protection committee can identify and respond. This changed the numbering the proceeding subsection headers.

3.7	To include reference to the sampling and monitoring standards the town has applied since the 2014 wellhead upgrades.
4.7	Added this section on Climate Change monitoring and mitigation strategies. Updated the status of current town related best practices to reflect recent upgrades. This describes current actions taken to monitor impact of climate change and suggested action plans in events of major droughts.
4.10	Include action plan to eliminate all chemical and minimize travel requirements to wells located in the connected wellfield (Caribou and Pictou Wellfields)
5.2	Added new program to address water conservation in drought events Included newly programmed alarms to notify if well parameter or water chemistry exceeds guidelines set by NSE or internally. Describe the impact and monitoring of centralized treatment on source water safety.

December 2014

Updated Figures and Table numbers to reflect new map

Section 4.4	Included graphic of Town sewer and water systems
Section 5.8	Created a risk management ranking system
Section 5.9	Renumbered Implementation Plan and included references to Utility EP and CP as well as REMO involvement

July 2013

General	Updated names of all provincial and federal government departments. Changed NSEL to NSE.
Table of Contents	Update Table to reflect changes in plan
Section 1.	Updated Introduction.
Section 1.1	Changed to Section 2.
Section 2.	Changed to Section 3.
Section 3.	Changed to Section 4.
Section 4	Changed to Section 5.
Section 5.	Changed to Section 6.
Section 3.	Updated map of delineated source water area.
Section 4.	Modified Table 1 to include type/category of potential risk.
Section 4.6	Changed Forestry to Forestry Operations
Section 5.4	Referenced all NSE pesticide regulations in second bullet.
Section 5.8	Included Tables 2. Modified table to identify status of activity, completion date, and the activities intended audience. Activities organized by risk management strategy (i.e. Education and Stewardship Initiatives, Best Management Practices, Emergency and Contingency Planning, Monitoring).
Section 6.2	Added Table 3. Table provides a status of monitoring activities, and recommended next steps.
APPENDICES	All Appendices updated include websites, names of provincial departments, and contact information.
APPENDIX II	Appendix II has been replaced with Wellfield Management Policy adopted by the Town of Pictou. Text from previous Appendix II has been incorporated into sections 1 and 2 of the document.

INTRODUCTION

Water is a provincial resource and regulated by Nova Scotia Environment (NSE) under the Environment Act. All Municipalities are required to obtain an approval from NSE to withdraw from water sources (i.e. groundwater and surface water) in Nova Scotia. The Town of Pictou (Town) holds water withdrawal approvals for both the Caribou and Pictou wellfields and an Approval to Operate (Approval) for their water treatment and water distribution system from NSE under the Activities Designation Regulation. The Approval details the operational conditions for the Town to ensure compliance with the Environment Act. Included are provisions for the Town to develop a source water protection plan (SWPP).

In 2002, NSE introduced its Drinking Water Strategy to ensure clean drinking water for all Nova Scotians. The main goal of a Water Utility is to provide safe, clean drinking water to its customers. Protecting the quality and quantity of the source water is a top priority for utilities as one-step in the multiple barrier strategy developed for the protection of drinking water quality in Nova Scotia.

The Town is located along the Northumberland shore of Nova Scotia. The Town's source of drinking water comes from two wellfields - one directly underlying the Town itself (Town Wellfield) and one to the north of the Town, referred to as the Caribou Wellfield. The Town Wellfield is bounded to the south by Pictou Harbour while the Caribou Wellfield extends from the Town boundary north into central Pictou Peninsula.

The Town's two wellfields utilize 13 wells. The Caribou Wellfield contains five wells (#8, #10, Division Road, Smith Grant and Footes Lane) while the Town Wellfield contains the remaining eight (#11, #12, #14, #15, Public Works, Exhibition, M&M and Beeches Road). All 13 wells are housed in structures constructed and maintained by the Town's water utility on lands owned by the Town and supply water to a population of 4,400.

The fundamental goal of the SWPP is to ensure the continued safety and quality of the Town's drinking water supply through protection of its source waters in the Town and Caribou watersheds. The procedures for development of the Plan are:

1) Form a Source Water Protection Advisory Committee (Committee);

2) Delineate a Source Water Protection Area Boundary;

3) Identify Potential Contaminants and Assess Risk;

4) Develop a Source Water Protection Management Plan; and

5) Develop a Monitoring Program to Evaluate the Effectiveness of a Plan.

This document provides details for source water protection through education and monitoring processes, and is not intended to form a basis for any regulation or watershed designation brought forth at a future time.

STEP 1: WATERSHED ADVISORY COMMITTEE

A Watershed Advisory Committee was appointed to develop a Source Water Management Plan and provide advice to Town and Municipality of the County of Pictou Councils, as well as the residents living in the area. The Watershed Advisory Committee consists of members representing a cross section of the various interested stakeholders such as the Water Utility, council members (Town and Municipality of the County of Pictou Councils), landowners, and land users. The Terms of Reference (Appendix I: Pictou / Caribou Source Water Protection: Advisory Committee - Terms of Reference) explains the details of operations and make-up of the Committee. The Wellfield Management Policy (Appendix II: Wellfield Management Policy) provides a framework for ensuring a co-ordinated effort by the Town and the Municipality of the County of Pictou representatives for protecting water quality and quantity for all residents served by the Town and Caribou Wellfields.

The goals of this committee are to:

1) Protect water quality and quantity for both Town and Municipality of the County of Pictou Residences;
2) Establish an effective SWPP; and
3) Develop a SWPP that enhances information sharing, promotes mutual respect and fosters open communications;

STEP 2: Delineating the Source Water Area

The source water area is determined as any lands inside the Town boundaries and those lands north of town included in the area shown in Figure 1: Source Water Area for the Town's water supply. The following geographical coordinates bind the source water area:

"From the intersection of Patterson St. and Division Rd. 343 degrees to Highway 106 at:

N4S 42.101 W62 43.275

Then 327 degrees to N 45 42.470 W 62 43.618

Then 02 degrees to the Central Caribou Rd. at N 45 43.016 W 62 43.596

Then 76 degrees to Highway 106 at N45 43.289 W 62 42.078

Then 178 degrees to Glenn East Rd. at N 45 42.631 W 62 42.046

Then 171 degrees to N 45 42.305 W 62 41.969

Then to the Division Rd. at the eastern town boundary"

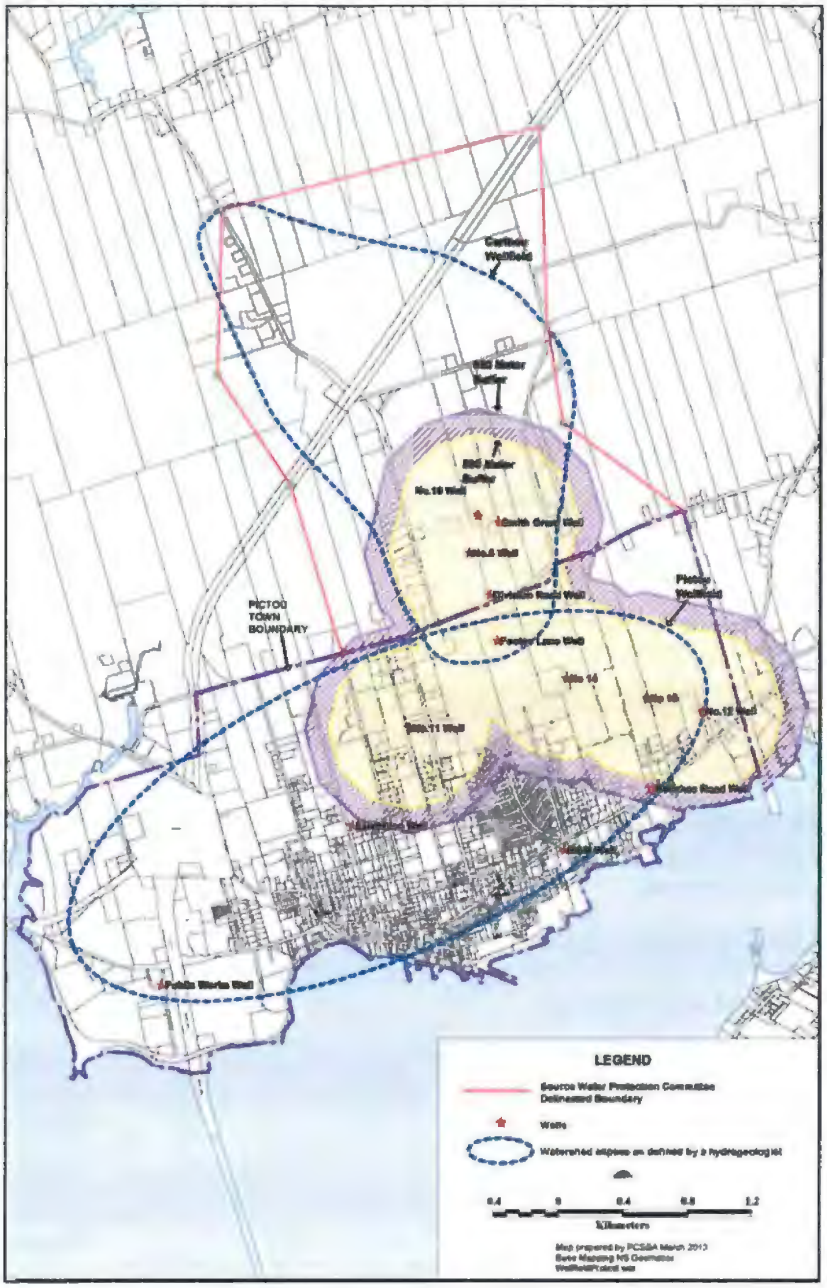

Figure 1: Source Water Area for the Town's water supply

The Pink shaded area is where privately owned domestic wells located within 650 m of a planned installation of a Town production well, with consent, will have an Hydrogeologist pre-assessment (Appendix II: Wellfield Management Policy). This boundary roughly represents the geological "bowl" of the source water area and is not a legal or surveyed description.

STEP 3: SOURCE WATER RISK IDENTIFICATION

The risks to water quality have been identified and are discussed with respect to the activity or land use. These activities include transportation, residential development, waste disposal, agriculture, industrial development, recreation and environmental. Potential risks associated with these activities are listed in Table 1: Potential Risks for Source Water Quality. These include pathogens, salt, petroleum products, pesticides, sediment and climate change.

These risks are grouped into activities or land uses in the following section to more easily apply selected management strategies. For example, residential risks might utilize educational initiatives. The implementation of an education program would cover several of the individual risks identified such as oil tanks, septic tanks and storage of pesticides.

Table 1: Potential Risks for Source Water Quality

Risk	Category
Changing Conditions of Wellfield including test well security	All
Well Drilling Activities	Utility / Residential
Creosote Timbers in Wellfield, above and below ground	Industrial
Increase in Water Demand	Utility
Salvage Yard impact on water quality	Industrial
Use of round-up and liquid manure	Agricultural
Forest clear cutting	Forestry Operations
Speed Zones	Transportation
Garbage Dumping	Other
Road Conditions	Transportation
Abandoned Sand and Gravel Pits	Industrial
Abandoned Wells	Utility / Residential
Septic Tank System malfunctions	Residential
Oil Tank leaks	Residential / Industrial / Commercial

Risk	Category
Transportation, fuel trucks, etc.	Transportation
Urban run-off and contaminants generated by Commercial, Residential & Recreational activities	Commercial / Residential / Recreational
Existing Commercial Activities	Commercial
Cemeteries	Other
Use of Pesticides	Agricultural / Residential
Forest or building fires	Forestry Operations
Climate Change	Environmental

3.1 AGRICULTURE

Agriculture risks are considered low because of the limited activity in the watershed. Potential risks can exist and should be addressed to protect drinking water quality. Risks are primarily associated with pesticide/herbicide use and manure storage and spreading, i.e. biological and organic contaminates. Continued due diligence on the part of the farming community will ensure that any risks associated with agricultural operations will be managed appropriately.

3.2 INDUSTRIAL AND COMMERCIAL ACTIVITIES

Industrial and commercial risks are mainly related to shops and services in the watershed area. Risks include chemical spills/leaks, septic system malfunctions, petroleum contamination, and contaminants generated from salvage yards.

The following commercial sites are potential sources of contaminants in the Town or Caribou Wellfields:

- Salvage Yard (petroleum products, chemicals, antifreeze)
- Abandoned Sand and Gravel Pit (direct pathway to groundwater)
- Gas Stations (petroleum products, antifreeze)
- Ship Yard (petroleum products, various chemicals)
- Print Shop (chemicals associated with inks and solvents)
- Metal Fabrication (petroleum products, various chemicals used in fabrication)
- Landscaping (pesticides/herbicides, organic materials)
- Concrete Plant (chemicals)
- Power Substations (herbicides, petroleum products)

3.3 Recreation

Recreation risks are mainly chemical and biological in nature. These include pesticide use on sports fields, the exhibition grounds, and chemicals used at various sports venues such as the arena and the pool.

Marinas also have potential risks as various potential contaminants are transported to and from the sites.

Garbage disposal and campfires are also additional recreation risks.

Finally, risks are sometimes associated with pet wastes. Pet owners should be encouraged to pick-up waste and dispose of it appropriately.

3.4 Residential Activities

The main risks identified in the Caribou and Town wellfields included those from septic systems, oil tanks, runoff, yard maintenance and household waste.

Septic systems are potential sources of microbial, inorganic, organic contaminants, pesticides and herbicides as well as pharmaceutical products. Septic systems are considered an elevated risk to water quality in some situations.

Oil tanks are a potential source of organic contaminants. Oil entering a watercourse or groundwater is both difficult and extremely expensive to remove. Accidental spills can occur in several ways. Fuel storage tanks can rust over time and develop holes in the tank. Fuel lines can leak or break if something falls on the line, such as snow or ice. Spills can also occur during fueling. Only certified fuel storage tanks should be used for fuel storage and the owner is responsible to inspect their tank for signs of deterioration or damage.

Residential runoff could contain pesticides, herbicides, as well as other chemicals used for household and landscaping maintenance.

Fire suppression could also create runoff contamination. Runoff should be contained if possible or remediated as soon as possible after the fire is extinguished.

The Town of Pictou also understands that residential sewage collection and water distribution could impact groundwater. To fully understand the area of influence, the map on the next page displays all water and sewer lines.

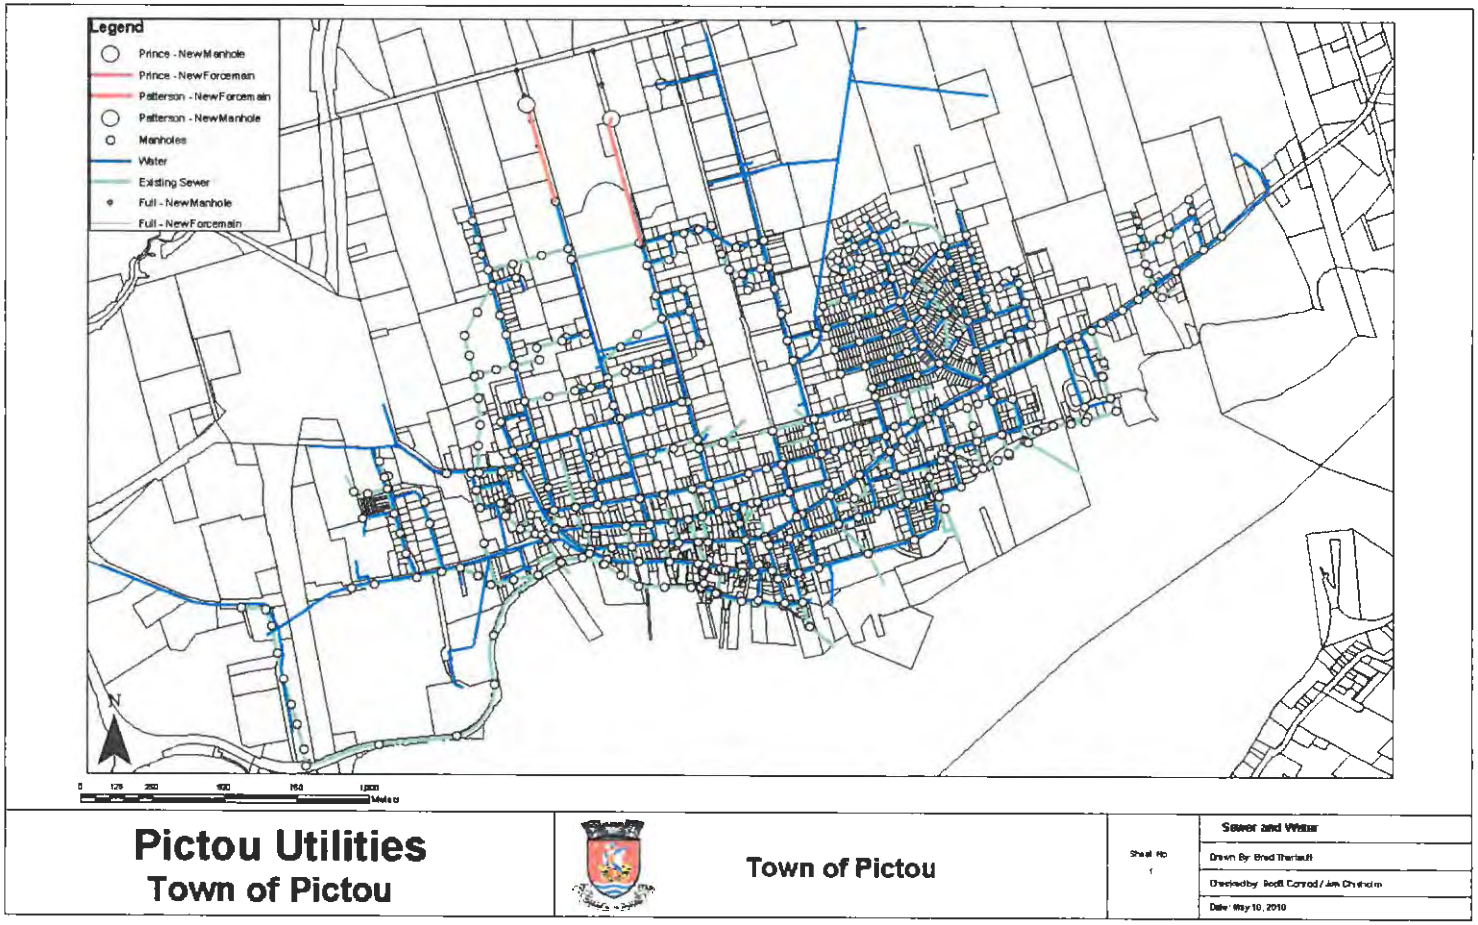

Figure 2: Town sewer and water mains

3.5 Transportation / Road Maintenance

Accidental spills resulting from transport of various materials (ex. petroleum products, chemicals used in commercial businesses or industrial processes in the area) are potential threats. The use of oil for residential heating and its transportation pose the greatest risk. Petroleum products (oil, gasoline and diesel) may enter watercourses and subsequently groundwater, because of automobile or transport accidents.

Contaminants could also be biological in nature. This could occur as in the case of a spill during the transport of septic sludge. Since accidents are always a possibility, these risks must be managed appropriately.

Road salt is a contaminant associated with winter road maintenance. Salt contamination can find its way into groundwater via ditches or direct infiltration and affect water quality.

Another risk associated with transportation is the high occurrence of excessive vehicular speeding on various roads through the watershed. Speeding is the leading cause of accidents and in a sensitive area like the Central Caribou Watershed, any increased potential for accidents should be addressed.

3.6 Forestry Operations

Risks associated with forestry operations include:

- wood harvesting and extraction;
- road construction and maintenance;
- pest and weed control; and
- fuel use, transfer and storage.

These are potential sources of pesticides and organic contaminants. A significant concern exists with respect to the long-term impact of clear cutting and the impact on changes in water table levels due to the loss of vegetative cover.

Forestry operations have been mainly mechanized clear cutting of various stands. Unfortunately, several properties were clear cut as a response to the uncertainty of regulations being proposed that were perceived to affect a landowner's ability to carry out forestry activities.

The selective harvesting of mature stands is a common practice in several watersheds in Nova Scotia. A forest management plan designed to protect water quality is the best way to minimize the impacts in the watershed.

Forestry operations utilize petroleum products for fuel and lubrication. Accidental spills can occur because of the use of these products and pose an elevated risk if the operation is within the recharge area for town or other individual wells. Accidental spills can occur during refueling or when hydraulic hoses break. Containers used for temporary storage of petroleum products can pose a risk to water quality if the containers are not properly constructed.

Other risks associated with forestry include fire and the suppressants utilized to control forest fires. Since the watershed is mainly covered by forest and that there are active forestry operations, there is a potential for fire and degraded water quality from the loss of forest cover and possibly from the use of chemical suppressants. In the case of large forest fires, the use of appropriate additives to water, or even the use of salt water is preferable to loss of cover.

The term "pesticide" is a generic term used to describe a variety of poisons used to kill plants (herbicides), insects (insecticides) and even fungus (fungicides). The use of pesticides in the watershed can potentially contaminate drinking water. Runoff from areas where these chemicals have been applied can enter groundwater and pose a human health risk.

3.7 Environmental

Global warming is inevitable, therefore and it is essential to consider this risk of it. Specifically, naturally occurring events, such as drought, will increase in frequency. The committee and Pictou Water Utility should consider these events as probable and should determine best practices for creating indicators and mitigating impact.

3.8 Other

The watershed committee has identified several other concerns that may affect water quality. A frequent problem in rural Nova Scotia is the uncontrolled and illegal dumping of garbage. Road networks through watershed lands provide the perfect access to remote locations where unconcerned individuals will simply

dump garbage regardless of the potential impacts. It is often the case that those that dump the garbage do not usually live in the watershed area. Illegal dumping can introduce various contaminants into the groundwater system depending on the nature of the garbage.

A legacy of past practices, i.e. creosote timbers that once were the structural framework of wharfs along the waterfront, are now buried in the middle of the Central Caribou Wellfield. While, in cooler temperatures, creosote is immobile, contamination of drinking water from the creosote remains a concern for Town and Municipality of the County of Pictou residents and should continue to be monitored over time.

The location of cemeteries is another concern for residents although they are considered a minor concern at this point. There are two cemeteries - one located on the fringes of the Caribou Wellfield and one is in the Town Wellfield. The main contaminant associated with cemeteries is formaldehyde in embalming fluid that leaches out during decomposition. Other contaminants can be associated with cemeteries as well, such as ammonia, nitrate, bacteria, viruses, etc. Continued monitoring is required to identify any changes in groundwater quality.

Although bio-solids are not in use at this time, the development of application methods in other areas suggests that they should be considered a potential risk, and their use in the source water area must be discouraged.

Refer to Table 4: Status of Effectiveness of Monitoring Land-use Activities.

Finally, the Town of Pictou water withdrawal is also considered a risk. To mitigate risks, the Town has installed state-of-the-art monitoring and controlling devices as well follow a rigorous sampling protocol defined by NSE. In 2016, the Town of Pictou did not have any Health Parameter exceedances.

STEP 4: RISK MANAGEMENT RECOMMENDATIONS

A SWPP contains a variety of management options that work together to effectively manage risks to water quality in a watershed. Management options fall into a variety of categories referred to as the ABC's of source water protection as outlined by the NSE guides to source water protection planning. They include Acquisition of land, By-laws, Best management practices (BMP's), Contingency plans, Designation and Education and stewardship.

Acquisition of Land: The acquisition of land by the Town gives direct ownership and control of portions of the source water area to the Town. This allows for a high level of protection of a source area due to direct control over the activities that can take place there. Targeted acquisition of specific parcels of land, as the need and opportunity arises are common practices in water supply areas throughout Nova Scotia. For more information please see Figure 3: Map of Town owned Land (brown).

Best Management Practices (BMP's): These standardized and widely accepted practices for activities and products are the most practical and effective means of preventing or reducing contaminants from reaching source water. BMP's have been developed for most activities, which occur in a wellfield. They can be applied to various aspects of residential development, including septic system and oil tank installation and maintenance, and construction activities. Most aspects of agriculture have operating BMP's in place through a variety of regulatory and market driven processes. Many of these practices are specifically designed to manage specific activities, which may affect water quality. BMP's are also in place for many industrial products, services, and activities related to motorized recreation and transportation.

Land Use By-laws – Municipal Planning Strategy: Development and implementation of a Municipal Planning Strategy (MPS) allows a municipality to develop land-use bylaws to manage development and control activities near sensitive areas. The Town has developed a MPS that covers the Town Wellfield, which outlines policies aimed at protecting water quality. There are no Municipality of the County of Pictou By-laws for the Caribou area.

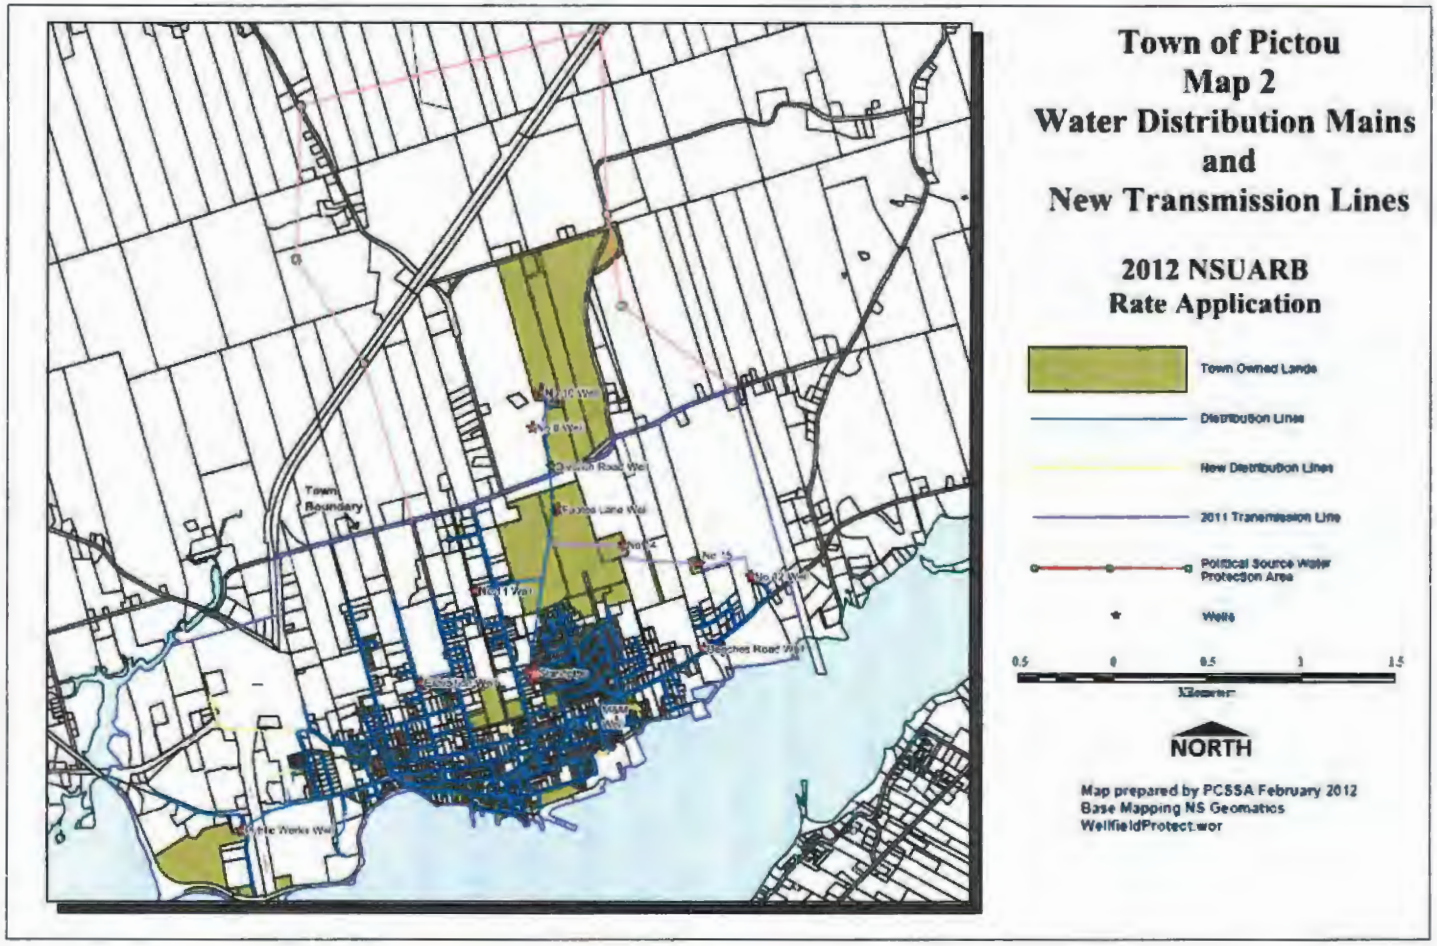

Figure 3: Map of Town owned Land (brown)

Contingency Planning: Contingency planning provides protocols to use in case of a contamination emergency in the source water area. The goal of the plan is to protect residents against contamination and ensure the immediate and long-term viability of the source area for water supply. The Town currently has an emergency response plan in place that includes boil water directives, mapping, resource lists, work plans and communications protocols to deal with emergency situations. These plans are reviewed and updated annually.

Designation as Source Water Protection Area: Designation is not being considered as a management option.

Education and Stewardship Initiatives: The development and promotion of an education and stewardship program can be an effective management option for protecting source water quality.

Education of stakeholders can reduce the uncertainty of the objectives of the Town and can help introduce a change in behavior if necessary. Education also creates a sense of ownership and responsibility among residents in a water supply area, which can significantly increase the success of other con-current management practices adopted. Specific opportunities for education and stewardship initiatives have been identified in the residential development, recreation, and forestry sectors.

The following sections describe the management options selected to address and reduce the risks identified in STEP 3: Source Water . The Watershed Advisory Committee selected these management options based on the type of water supply, the physical nature of the watershed and the specific activities that take place within the watershed. Refer to Table 3: Activities to Manage Identified Risks in Pictou/Caribou Wellfields in Implementation Plan for all the activities identified below.

4.1 AGRICULTURE

Agriculture activities are limited within the Central Caribou Watershed. The following management options are proposed to manage risks associated with, bacterial contamination of source water due to manure spreading and storage, and the use of chemical fertilizers.

- Make available the Recommended Agriculture Practices within Municipal Watersheds that has been developed by NSE, and Nova Scotia Department of Agriculture (Appendix III: A Guide to Recommended Agricultural Practices within Municipal Drinking Water Supply Areas in Nova Scotia) and general information on the Source Water Protection initiative.

4.2 Industrial/Commercial Activities

Industrial and commercial development is found throughout the watershed area, especially in the Town. It is important to emphasize contaminants that runoff from these activities can enter the groundwater system either directly through infiltration or through leaking storm sewers. It is important to educate proprietors that prevention and due diligence is the key to preventing accidental release of substances into the environment that can adversely affect water quality. The following recommendation was developed to address industrial and commercial contamination/pollution concerns.

- Develop an information/education package targeted at commercial and industrial users in the watershed area that introduces the Source Water Area Planning initiative and discusses potential contaminants associated with industrial/commercial activities such as petroleum storage, fuel spills, chemical storage, the use of pesticides, etc. The package should highlight the various best management practices for fuel storage, spill clean up, chemical storage, etc. Proper disposal of substances that could potentially affect groundwater quality should be explained. The information package should also include existing publications that discuss issues such as spraying. (See Appendix IV: Industrial/Commercial Best Management Practice References and Appendix V: Emergency Response Planning)

4.3 Recreation

Recreation is generally considered a desirable aspect associated with living in a rural setting. Passive recreation needs to be promoted. Passive recreation fosters an appreciation for the environment and aids in the informal policing of sensitive areas. Recommended management options include:

- Establish signage at trail heads in the Caribou Wellfield and at Town boundaries educating users on the sensitive nature of the area (i.e. as a source water protection zone) and to keep it clean by not littering and being diligent with respect to forest fires etc.
- Develop bylaws regarding pet waste pickup near streams, and other sensitive areas.

Activities or concerns associated with "active recreation" include golfing, ice making and maintenance at the arena, the swimming pool and activities at the marinas. As illustrated in STEP 3: Source Water , the main concerns are associated with transfer of petroleum products, various chemicals used in cleaning and disinfecting and the use of pesticides. The recommended management options to address concerns associated with these activities include:

- Develop an information package for managers of the various recreational venues in the source water area. This package should include BMP's for golf courses, BMP's for the handling/disposal of chemicals or liquids, petroleum products and other substances that may impact water quality and general information on the Source Water Protection Planning initiative.
- Signage discussed in the above section is also an important management option that can be used.

4.4 Residential Activities

The main risk activities associated with existing residential development in the watershed were identified as on-site septic systems, sewage lines, exterior oil tanks and household hazardous waste management. The management options selected to manage risks in the residential sector are as follows:

- Develop a Homeowner Education Program to help residents understand the importance of maintaining septic systems and oil tanks and the potential impacts to water quality from malfunctioning systems. The education program will include BMP's that have been developed by NSE with respect to septic systems, oil tanks, the use/storage and disposal of various household hazardous wastes and general information on other practices that contributes to watershed protection and the Source Water Protection initiative. (See Appendix VI: Residential Best Management Practice References).
- Develop a general SWP Newsletter to educate the public about impact on water quality, because of specific activities. For example, stress the importance of eliminating or restricting the use of pesticides, and when necessary use only those that degrade quickly and are recommended for use in such areas. Pesticide application must be done in accordance to the Non-Essential Pesticides Control Act, List of Allowable Pesticides Regulations, and Exceptions to Prohibitions on Non-Essential Pesticides Regulations from NSE.
- Encourage landowner responsibility for clean-up of derelict vehicles, old tanks, drums, tires, etc. for proper disposal through the SWP Newsletter.

4.5 Transportation

In Transportation / Road Maintenance, the main risks identified with the transportation sector were associated with road construction/maintenance and accidental spills of petroleum products or other contaminants and the management of road salt contamination. The critical areas were identified as the intersections between roads and watercourses, roadside ditches and proximity to wellheads. The recommended options to manage these risks are as follows:

- Establish high profile signage along public access routes indicating the presence of the Water Supply Area and to use caution.
- Develop an awareness program (BMP's i.e. reduced speeds) for transport companies focusing on watershed protection. Include contact numbers for Emergency Response.

- Employ Contingency/Emergency Response Plan for spill response and containment (Appendix V: Emergency Response Planning).
- Continue to monitor salt levels and evaluate alternatives (i.e. sanding, de-icing chemicals) if required.

4.6 Forestry Operations

Forests are the dominate vegetation in the watershed. Healthy and properly managed forests support quality water protection, generate economic activity for public and private owners, and support wildlife, recreation, and other forest-based values. Potential risks to water quality identified in STEP 3: Source Water include biological, chemical and petroleum contamination and potential impacts to water quantity/availability. The following management options have been identified to manage risks associated with harvesting, pest and weed control, and fuel use, transfer and storage.

- Stress the benefit of maintaining forest cover in watershed areas. Landowners should be encouraged to minimize forestry harvesting, and to follow best management practices regarding harvest/extraction, silviculture, and fuel use and storage, developed by the Departments of Natural Resources and Environment (Appendix III: A Guide to Recommended Agricultural Practices within Municipal Drinking Water Supply Areas in Nova Scotia). In addition, any forestry activities on Town owned lands must follow the Forestry Management Plan (Appendix VII: Forest Management Plan).
- Discourage the use of pesticides for silviculture and forest protection through education (newsletter, etc.).

4.7 Environmental

Drought is the immediate concern for conservation of water. Steps have already been conducted to ensure early indication of adverse effects. The Town has several monitoring sites as well as real time water level monitoring in all well houses. The Town currently has all wells alarm to notify operators when the water level in wells drop below 100 feet above the sensor. This value was chosen as it provides the operator early noticed of well drawdown and time to respond. In the event of alarms, operators will adjust the pumping rate down to help reduce the impact on drawdown. It is noticed that an immediate pumping rate change creates instantaneous relief in circumstances observed to date.

If decreases in pumping rates do not create the desired affects, a policy should be created for water conservation. This policy will be triggered by a series of events such as XX number of days without rain, XX consecutive attempts at decreasing pumping rates or some other consideration. Several communities currently

have similar policies in place which limits grass watering or car washes on certain days of the week or just provides a request to the public to conserve water.

The Source Water Protection Committee should with Pictou's Water Utility to develop a communications plan before these events occur or happen on a regular basis. For example, water conservation plans will need to be developed and proper communication channels considered. These could include alternating days of the week for watering lawns/gardens or public awareness campaigns.

4.8 OTHER

The Watershed Advisory Committee identified three additional concerns were through the development of this plan; illegal dumping, the creosote timbers buried in the watershed area and the two cemeteries - one inside Town and one in the Central Caribou Watershed area. The following management strategies are proposed to address these concerns.

- Develop a general education package or newsletter on the value of protecting source water for all residents. Groundwater is a shared resource and all residents play a part in protecting it.
- Develop a school education program focusing on the groundwater resources in the area. Education programs of this nature are generally successful in helping to educate an entire family with respect to the various challenges in protecting water quality and the important roles the various stakeholders play.
- Continue to monitor groundwater quality in monitoring wells and residential wells adjacent to the buried creosote timbers.
- Continue to monitor water quality in wells adjacent to the cemeteries.

4.9 RISK RANKING

Each risk has a varying level of probability and potential impact on the source water. To assess each risk, a rating system must be developed to rank the risk based on threat to the water system. A rating system should be based on possibility of occurrence and the severity of the impact on the water system.

As a single contamination of the water source, which makes the water unsafe could have a greater impact than several minor inconveniences. It is proposed to weigh impact as 8/10 and the probability of occurrence at 2/10. These two factors will provide a risk rating out of 10 for each activity. The table below ranks each activity based on risk:

TABLE 2: RISK ASSESSMENT

Section	Activity	Frequency (2)	Severity (8)	Total Score (10)
5.1	Agriculture			
5.2	Industrial/Commercial			
5.3	Recreation			
5.4	Residential			
5.5	Transportation			
5.6	Forestry			
5.7	Other (creasote piles, illegal dumping, two cemeteries)			

4.10 Implementation Plan

Following the adoption of the SWPP the management options or strategies that have been identified to manage the risks in the Town and Central Caribou Watersheds. Several general management strategies could be implemented immediately after the SWP Plan has been approved and these are outlined below:

- Develop a broad education and stewardship program outlining the purpose and status of the management plan and opportunities for participation. This could be done internally (with help from NSE) and take the form of a watershed newsletter and include information on sewer lines, septic systems, oil tanks, passive recreation and other general stewardship initiatives. Encourage feedback and questions from homeowners and other interested parties.
- Establish signage at access roads indicating the nature of the area as a source water protection zone and provide contact information in case of an emergency.
- Contingency Plans (CP) and Emergency Procedures (EP) are annually updated within the Town of Pictou's operating manual in Chapter 5. Any suggestions for new plans or procedures can be suggested through email or directly to the Utility. These procedures identify the plan of action in the event of emergencies and a contact list depending on the type of issue (news, high-risk customers, emergency services, etc.). The Utility's EP and CP focus on well site-specific contamination or failures and how to mitigate them.
- The Regional Emergency Measures Organization (REMO) has a countywide response plan on dealing with emergencies or disasters. All major emergencies should involve this committee. The Chief Administrative Officer (CAO), Scott Conrod, of the Town of Pictou is the local contact, while John Davison is the regional contact. To contact Scott, call the Town Office at 902-485-4372 and to reach John call 902- 759-1797.

The remaining strategies identified in Step 4: Risk Management Recommendations are listed in the Table 3: Activities to Manage Identified Risks in Pictou/Caribou Wellfields to illustrate when the strategy may be implemented.

Table 3: Activities to Manage Identified Risks in Pictou/Caribou Wellfields

Management Activity	Target Area	Status	Date of Completion	Comments
Education and Stewardship Initiatives				
Develop and distribute SWPP Newsletter	All	Ongoing		Distributed in 2007, 2008, and 2011.
Establish Signage at Access Roads	Transportation / Recreation	Complete	September 2007	
Assemble and Distribute Homeowner Information Package (Appendix VI: Residential Best Management Practice References)	Residents	Complete	September 2007	Available on the Town's website.
Develop & Distribute Forestry Education Package (Appendix VII: Forest Management Plan)	Forestry Operations	Complete	September 2007	Available on the Town's website.
Develop an information package: Managers of recreational venues	Recreation	Complete	September 2007	
Develop an information package: Industrial / Commercial sector (Appendix IV: Industrial/Commercial Best Management Practice References)	Industrial / Commercial	Complete	December 2008	Available on the Town's website.
Develop and deliver a school education program	Residents	Incomplete	TBD	
Develop conservation plans	Residents	Incomplete	TBD	
Best Management Practices				
Distribute Agricultural BMP's (Appendix III: A Guide to Recommended Agricultural Practices within Municipal Drinking Water Supply Areas in Nova Scotia)	Agricultural	Complete	September 2007	Contact NS Department of Agriculture annually to determine if any changes have been made. Available on NS Department of Agriculture website.
Develop & Distribute Transportation BMP's	Transportation	Complete	December 2007	Contact NS Department of TIR annually to determine

Management Activity	Target Area	Status	Date of Completion	Comments
				if any changes have been made.
Develop Forestry Management Plan	Forestry Operations	Complete	December 2008	Contact NSDNR annually to determine if any changes have been made.
Wellhead Upgrade Project	Utility	Complete	November 2014	Phase 1: November 2013 Phase 2: November 2014
Water Meter Installation	All	Complete	Spring 2014	Conservation
Wellfield Management Policy (Appendix II: Wellfield Management Policy)[1]	Utility	Complete	August 2011	
Eliminate Chemical Use at multiple sites and reduce traffic near water sources	Utility	In Progress	April 2019	When the Town builds a Water Treatment Plant it will centralize chemical and monitor requirements
Emergency and Contingency Planning				
Review Existing Contingency / EMO Plans	All	Complete	March 2008	
Develop Contingency Plan for Accidental Spills (residential) (Appendix V: Emergency Response Planning)	Residents	Complete	September 2007	Available on the Town's website.
Develop Contingency Plan for Accidental Spills / Accidents	All	Complete	September 2007	
Monitoring				
Monitor salt levels		Ongoing		Sampled annually
Monitor wells adjacent to buried creosote timbers		Ongoing		Sampled quarterly
Monitor water quality in wells adjacent to the cemeteries		Ongoing		Sampling frequency to be determined.
Review and Evaluation				
Review and update SWPP		Ongoing		Latest Update January 2017

[1]Activity added since previous version of SWPP.

STEP 5: EVALUATION AND MONITORING

An evaluation and monitoring program has been developed in conjunction with the management plan described above. Monitoring is the basis for Step 5 of the Five Step Guide under the Drinking Water Strategy for Nova Scotia. The purpose of the program will be to carry out on-going monitoring of water quality within the watershed to assess the effectiveness of management controls, warn of potential problem areas and contaminants in the watershed and track the overall health of the supply area.

The evaluation and monitoring program will provide an on-going snapshot of conditions in the watershed and help to provide early warning of potential risks to water quality and target areas where attention is required. Monitoring will also help to determine whether the management plan is working effectively and if any changes to the plan need to be made.

The monitoring program is comprised of two main components – a water quality-monitoring component, to directly measure the quality of source water; and a general component, to monitor land use changes and other activities in the watershed.

The SWPP should be reviewed regularly to assess effectiveness and reflect any major changes in activities or land uses in the watershed or changes in source water quality. Management options should be reviewed individually to assess their effectiveness, usefulness and cost/benefit. It is recommended that the watershed committee meet at least once a year to review the plan and source water quality, or as additional information, concerning the source area, becomes available.

5.1 WATER QUALITY MONITORING

The main component of the monitoring plan is the regular sampling of the source waters within the watershed for quality analysis. Water analyses will provide an indication of the overall source water quality within the watershed and any changes in quality that occur over time because of changing land use practices or other activities in the watershed.

At present, the Utility has in place a comprehensive raw water-monitoring program for each of the wells, as part of its operating permit for drinking water supply. The program includes continual, weekly, quarterly, annual, and five-year sampling. Water quality parameters related to the SWPP are sampled on

a quarterly basis. District 3 residents, under the guidance of the Pictou County Council should develop plans to test private wells adjacent to the creosote timbers, the cemetery, and the salvage yard, at four to six well locations on a semi-annual basis, or as deemed necessary.

5.2 SWPP Evaluation and Review

Monitoring of the activities and issues identified during the risk analysis (Step 3) of the source water protection planning process should be carried out as a general provision of the overall monitoring activities. This can be accomplished by the Watershed Advisory Committee meeting regularly to exchange information regarding changes in land use, water quality or proposed activities throughout the watershed. The Committee may also choose to review and change portions of the SWPP to reflect changes in the watershed.

The following specific monitoring and evaluation activities may be conducted, either formally or informally, and reviewed by the Source Water Protection Committee. The monitoring activities are grouped by major land-use activities:

TABLE 4: STATUS OF EFFECTIVENESS OF MONITORING LAND-USE ACTIVITIES

Monitoring Activities	Status	Next Steps
Agriculture		
Monitor changes in agricultural operations and monitor water quality with respect to changes in water quality from contamination that is associated with agriculture such as nutrient levels or coliform counts.	No major change in activity identified. The Utility monitors for coliform counts weekly at each well operated by the utility. Nutrient levels are monitored annually at each well operated by the utility. Results are found in the Utility's Annual Report submitted to NSE.	Continue monitoring. Evaluate Committee's ability to monitor agricultural operations.
Industrial / Commercial		
Monitor changes in water quality with respect to industrial and commercial operations throughout the watershed	No major changes in industrial or commercial activity in the watershed.	Evaluate Committee's ability to monitor this activity.
Recreation		
Continue monitoring recreation activities with respect to potential fuel spills and littering. Encourage recreational users of the watershed to report any irregularities or problems they encounter.	No significant issues identified with respect to recreational activities.	Evaluate Committee's ability to monitor this activity.
Residential Development		
Monitor the development activities within the watershed, especially new commercial or industrial developments.	No major activities identified.	Continue monitoring.
Monitor any serious issues that arise with septic systems/sewers, such as major malfunctions or changes in policy with respect to waste	No key issues identified with respect to septic	Work closer with NSE to discuss whether septic

Monitoring Activities	Status	Next Steps
disposal.	systems / sewers.	systems malfunctions occur in watershed, and discuss methods for notification.
Develop plans for monitoring private wells adjacent to the creosote timbers, the cemetery, and the salvage yard, at four to six well locations on a semi-annual basis, or as deemed necessary.	No monitoring plan developed.	TBD
Transportation		
Monitor water quality results for any signs of potential contamination of source waters from road salting (i.e. high chloride levels).	Salt levels are continually monitored at each well operated by the Utility. Wells with increasing levels have been identified. These wells do not have surface water influences. Road salt not suspected to be source of increasing levels. Results are found in the Utility's Annual Report.	Continue monitoring.
Monitor transportation patterns in the watershed, to ensure that dangerous goods that are transported through the watershed follow BMP's.	No monitoring of this activity.	Evaluate Committee's ability to monitor this activity. Invite Nova Scotia Department of Transportation and Infrastructural Renewal and / or Transportation Canada to committee meeting to discuss approaches and feasibility.
Forestry Operations		

Monitoring Activities	Status	Next Steps
Monitor changes the forest cover due to the frequency, size, and extent of harvesting or natural disasters such as from wind, fire, insects/diseases, or other agents.	No monitoring of this activity.	Evaluate Committee's ability to monitor this activity. Invite Nova Scotia Department of Natural Resource to committee meeting to discuss approaches and feasibility.
Monitor water quality results for any signs of potential contamination of source waters due to construction, development or other activities (i.e. nutrient levels, coliform counts, TSS).	No major change in activity identified. The Utility monitors for coliform counts weekly at each well operated by the utility. Nutrient levels are monitored annually at each well operated by the utility. Results are found in the Utility's Annual Report submitted to NSE.	Continue monitoring.
Environmental		
The Town will monitor groundwater level and set alarms to provide early notice adverse effects.	These alarms are programmed through the Utilities SCADA system and send automatic alarms to the operators	Continual Monitoring. This should be supplemented by a communication plan during time when conservation protocols are in place.
Other		
Monitor changes in PAH's due to creosote timber burial.	PAHs are sampled quarter annually since 2009 and included in the Utility's	Continue monitoring. Developed policy / procedure for enhanced sampling and

Monitoring Activities	Status	Next Steps
	Annual Report submitted to NSE. Benzo(a)pyrene detected in June 2009. No detection since June 2009.	notification. Develop plan for including private well owners in sampling.
Monitor changes in water chemistry due to contaminants associated with cemeteries.	No sampling frequency established.	Establish sampling frequency. Developed policy / procedure for enhanced sampling and notification. Develop plan for including private well owners in sampling.
Monitor solid waste practices.	No major change in activity identified.	Evaluate Committee's ability to monitor solids waste practices of individuals.
Groundwater Level	Continually through SCADA system	The system is designed to alarm if the water level drops below 100 feet above the sensor's head.
System turbidity, pH, temperature	Continually through SCADA	Alarms will sound if parameters exceed NSE recommended parameters
Centralize Treatment and Disinfection Operations	Build and use a centralized treatment plant	This will eliminate untreated backwash, multiple chemical injection sites and several vehicle trips to the wellfield.

Appendix I: Pictou / Caribou Source Water Protection:

Advisory Committee - Terms of Reference

Advisory Committee - Terms of Reference

The following are the Terms of Reference for the Source Water Protection Advisory Committee for the Town and Central Caribou Wellfields, the source area for Town, Central Caribou & surrounding area, Pictou County, Nova Scotia. The Pictou / Caribou Source Water Advisory Committee will be recognized by the Pictou Town Council (the Town), the Municipality of the County of Pictou, and the Water Utility.

Mandate:

The Pictou /Caribou Source Water Protection Advisory Committee (the Committee) shall:

1. Elect a Chair to provide leadership to the Committee;

2. Review and make recommendations to the Pictou Town Council and Municipality of the County of Pictou Council on all activities that may adversely affect the water quality in the Town and Central Caribou Source Water Area (source area) as requested by the Utility, Council, the Central Caribou Watershed Advisory Committee, landowners or other stakeholders in the source area;

3. Provide a forum for landowner and stakeholder involvement and for reporting to landowners and stakeholders on matters regarding water resources and water quality/quantity protection;

4. Review and make recommendations regarding monitoring of water quality and quantity programs and other studies related to the source area. All water quality/quantity information shall be available to the Committee;

5. The Committee will develop information for educational programs regarding water quality/quantity and source water protection for landowners and other stakeholders in the source area;

6. Develop a SWPP and Implementation Schedule to protect the Town and Central Caribou Wellfields.

Membership of the Committee:

To develop and implement a comprehensive SWPP, the following will be included as members of the Committee:

- members of the Pictou County Council;
- members of Town Council;
- members of Municipality of the County of Pictou Council;
- the water utility operator;
- landowners from the area;
- other interested stakeholders;

The following may be invited to assist the Committee in an advisory capacity:

- Nova Scotia Department of Environment;
- Other government or technical advisors if necessary.

Operation of the Committee:

1 The Committee will be chaired by a member selected by the Committee;

2 Members will serve for a term that is to be determined by the Committee;

3 Secretarial services will be provided by the Committee;

4 These terms of reference may be amended by the Committee;

5 The Committee will endeavour to conduct business by consensus, but should voting be necessary, all motions require support from a quorum (two-thirds) of the Committee members;

6 Disputes that cannot be resolved through consensus will be addressed at a special session mediated by a third-party;

7 The Committee will meet as necessary, but no less than once in each calendar year.

8 The Committee may from time to time request or admit individuals or groups to make representation to the Committee regarding matters or issues affecting the source area.

9 The Committee will liaise with government agencies not represented on the Committee, particularly Nova Scotia Environment;

10 The Committee will prepare an annual report at the end of each calendar year and circulate it to all members of the committee

APPENDIX II: WELLFIELD MANAGEMENT POLICY

Wellfield Management Policy

Policy Objective

The policy objective is to efficiently and effectively address management of existing Town wells and the activities related to the planning of new well installations.

Policy Presentation

1. Exploration and Installation of New Production Wells

The Town's statement of general policy is to:

1.1 Employ the services of a licensed Hydrogeologist to recommend future Town well sites, assess valid complaints, and to prepare an aquifer testing report (ATR). Such an ATR will include, with the permission of private well owners, the completion of pre-assessment reports as described in provision 1.3 of this policy.

1.2 To reduce impacts on private wells, the Town will first focus its exploration for new wells, when and if new Town wells are required, to sites located within the northeastern portion of the Town as shown on the attached map.

1.3 For privately owned domestic well(s) located within 650 meters of a planned installation of a Town production well, and upon consent of the private well owner(s), the Town shall have a Hydrogeologist conduct a pre-assessment.[a] The purpose of the pre-assessment is to collect baseline information specific to the private well(s), e.g., the collection of pre-pumping data, which can be used for comparison purposes should private well interference effects be suspected in the future. Private well owners who do not wish to participate in a pre-assessment process are not necessarily excluded from opportunity to make future complaint, but are advised that a determination of future impact without a pre-assessment is less probable.

[a] The Guide to Groundwater Withdrawal Approvals issued by the Province of Nova Scotia references 500m for the identification of potential interference effects of new installations on nearby groundwater users, The Town increased this distance to 650m due to the number of homes that are just beyond the 500m distance from Town owned lands.

1.4 To advise the owners of private wells within 650 meters of a new Town production well of the expected date of well testing and the date on which the new Town production well is expected to be operational; and

1.5 To maintain observation (background) wells located outside of Town pumping areas (outside of Town pumping influence) for the purposes of collecting data related to natural fluctuations in the water table.[b]

2. Operation of Existing Production Well

The Town's statement of general policy is to:

2.1 Apply steps 2.2 through 2.4 below for the operation of existing production wells following the commissioning of Well #15, currently underway, and including any other new wells after commissioning.

2.2 Employ the services of a licensed Hydrogeologist to prepare an aquifer testing report (ATR) and act upon written complaints from private land owners. Such an ATR will include an assessment of valid complaints from private land owners within 650 meters of a Town production well in a manner consistent with provisions 3.1 through 3.6 of this policy (excluding 3.2))c

2.3 Maintain a series of observation wells, which are both within the Zone of Influence of existing production wells, and located outside the Zone of Influence between the production wells and adjacent private wells. These wells will be used for the purposes of establishing background aquifer water levels and variations due to pumping of Town wells.

2.4 For the purposes of establishing baseline conditions for existing production wells installed prior to the implementation of this policy, the aquifer data to be considered shall be that available under the present wellfield conditions, and is limited to data collected on or after the installation of a production well.

[b] The Town maintains two backgrounds wells, each is equipped with a hydrograph. One well is located within an aquifer comprising sand and gravels, while the second is located within an aquifer comprising bedrock.

[c] This aspect will be part of a standardized application to NSE for Groundwater Withdrawal Approval by the Town. Other requisites of the NSE application typically include the drilling and monitoring of an observation well within the adjacent influence area of a proposed production well. The observation well is to be used by the Hydrogeologist to gauge the pumping effects of the production well (drawdown cone) relative to groundwater levels within the related area.

3. Administration of Valid Complaints

Specific to the processing of valid written complaints received from private owner(s) of well(s) wherein the owner(s) of said well(s) alleges unacceptable interference (diminished water levels) caused by Town activities, the Town shall:

3.1 A written complaint received by the Town shall be deemed valid based on records of aquifer water levels in existing production and observation wells in addition to pumping rates from existing wells Water levels in observation wells must be shown to have varied outside normal seasonal fluctuations and/or production rates must have exceeded normal 3-day maximum withdrawal volumes for a written complaint to be deemed valid. Such an assessment will be made by a licensed Hydrogeologist engaged by the Town.

3.2 Engage a licensed Hydrogeologist to undertake an independent review of the complaint. The independent review shall include:

a) a comparison of the conditions encountered by the private well owner(s) to those benchmarked during the pre-assessment (if completed) as referenced above;

b) a comparison of the conditions encountered by the private well owner(s) to those benchmarked within the observation (background) wells as referenced above; and

c) a determination by the reviewing Hydrogeologist of whether there is a relationship between Town pumping activity and water shortage encountered by the complainant.

3.3 In response to valid written complaint(s) received by the Town from owner(s) of private well(s), where the subject well(s) are located within 500 meters of a Town well currently in production, and upon the owner of such well executing a release of liability to the Town in respect of responsibility for loss of water prior to the completion of the Hydrogeologist independent review, the Town shall furnish the owner of said private domestic well with a temporary supply of water, at Town expense, until such time as the independent review referenced in provision 3.2 of this policy is complete.

3.4 In response to a written complaint(s) received by the Town from the owner(s) of a private well(s), where the subject well(s), is located between 500 and 650 meters of a Town well currently in production, the Town shall engage an independent licensed Hydrogeologist as soon as possible to

undertake an independent review and file a report pursuant to provision 3.2 of this policy. The Town will not provide temporary water supply in this instance.

3.5 If it is determined in the independent review that Town pumping activities create unacceptable interference (diminished water levels) within private wells, the Town shall:

a) Notify the owner of the well and NSE in the form of a copy of the report upon its receipt;

b) Attempt at the earliest reasonable date to negotiate a resolution with the private well owner, wherein the deficiencies being experienced are satisfactorily addressed to an objectively reasonable standard. The negotiation/resolution may require the engagement of professional and independent Hydrogeologists and/or professional design engineers; and

c) To keep NSE apprised of independent review work and negotiations in a timely manner.

3.6 This policy shall not relate to new or replacement domestic wells drilled after the date on which Town production wells are operational.

4. Water Conservation Planning

Over the eighteen (18) months succeeding the adoption of this policy, the Town agrees to develop a water conservation program that may include without limitation:

4.1 Determining the feasibility of installing residential water meters and a central water monitoring system for Town wells (known as ***SCADA) that in part could be used to conserve usage and to quantify and locate unoccounted water production.***

4.2 Have the Nova Scotia Utility and Review Board modify the Town's regulations to include a conservation provision empowering the Town to control (restriction or denial) of water usage by its customers during dry periods.

4.3 Analyze historic data relative to precipitation and well operating parameters (e.g., rates of drawdown and recharge) for benchmarking normal operating parameters and quantifying points under which the Town would invoke conservation regulations described above.

Appendix III: A Guide to Recommended Agricultural Practices within Municipal Drinking Water Supply Areas in Nova Scotia

Prepared by

Nova Scotia Department of Agriculture and Fisheries

Nova Scotia Department of Environment and Labour

2005

INTRODUCTION

Some types of agricultural practices can impair water quality. If not carefully managed, common pollutants of water originating from farming activities may include: sediment, nutrients (especially nitrogen and phosphorous), bacteria, and pesticides. The challenge to farmers is to balance agricultural production with the protection and conservation of water quality.

This document is designed as a guide to farmers and to operators of municipal drinking water supplies, providing recommended management practices that can be incorporated into daily farming activities to help protect water quality in areas, which drain into public drinking water supply areas. It was developed in conjunction with the Nova Scotia Department of Agriculture and Fisheries and the Nova Scotia Department of Environment and Labour. It is aimed at minimizing the risk of an impact on water supply areas, while recognizing that there is no practical method of ensuring an absolute zero risk approach, particularly regarding surface water supplies (rivers and lakes).

Farmers operating within drainage areas contributing to municipal drinking water supplies are expected to demonstrate due diligence. This means taking every reasonable precaution to prevent or minimize impacts from activities that can impair water quality. The best approach to ensuring due diligence is achieved is by using Beneficial Management Practices, or BMPs. The BMPs outlined in this guidance document have a proven record of success in reducing impacts to water from farming activities. Some of the management practices in this document may be superseded by regulations in some water supply areas. For certainty, contact the water utility operator responsible for the water supply in question, or the Nova Scotia Department of the Environment and Labour.

BENEFICIAL MANAGEMENT PRACTICES

ENVIRONMENTAL FARMS PLANS AND NUTRIENT MANAGEMENT

The Nova Scotia Federation of Agriculture and Department of Agriculture and Fisheries have developed programs to assist farmers in reducing impact to the environment from farming activities.

The **Environmental Farm Plan (EFP)** is a voluntary program that helps farmers identify and assess environmental risks on their property. Farmers work with an EFP coordinator and engineer to develop a confidential environmental farm plan for their operation.

The objective of the EFP Initiative is to help farm families develop a practical plan for operating the farm in an environmentally responsible manner. The Environmental Farm Plan acts as a guide which enables farm families to incorporate sound environmental practices into their operations. The EFP Initiative is industry-led and industry-driven.

The **Nutrient Management Program (NMP)** is a farm-specific tool that determines the amount, timing and application of nutrients from manures and fertilizer. Livestock and poultry producers operating in areas which drain into municipal drinking water supplies are strongly encouraged to develop a nutrient management plan for their farming operations. The major elements of such a plan should include:

1.1 Periodic analysis of the manure produced in the animal operation

1.2 Routine soil testing program

1.3 Realistic yield goals for rate calculation

1.4 Accurate records of fields manured and the application rates used

1.5 Sufficient storage capacity

1 6 Field maps where wetland and other freshwater ecosystems are identified

1.7 Proper timing of manure application

1.8 Calibration of manure spreaders so application rates can be determined

For more information about these programs please contact:

MANAGEMENT OF LIVESTOCK MANURES

The land application of livestock manure is recognized as an acceptable farming practice. When properly managed, the risk of an impact on a water supply area is minimized to a level that can be managed by other components of a water supply protection plan.

Between the time manure is excreted and the time it is incorporated into the soil, the loss of nutrients and the resulting potential for pollution can be quite high depending on how manure is handled. The following methods should be employed when managing manure in drinking water supply areas:

1.1 Ensure that all manure hauling and spreading equipment is suited to the type and consistency of the manure produced on the farm.

1.2 Ensure storage structures have the capacity to hold the total volume of manure, wastewater, and bedding produced between periods of land application.

1.3 Time the loading and field application of manure to reduce the potential for environmental contamination and to provide the greatest benefit for soils and crops.

1.4 Make storage facilities manure tight to contain and protect manure from the weather thereby

providing the greatest conservation of nutrients and the best protection against water contamination.

1.5 Keep manure handling to a minimum, agitating manure, particularly in liquid form, causes the gaseous loss of nitrogen, which causes odours. Manage manure to minimize the number of times that manure is mixed and spread.

1.6 Plan the location of animal production and manure storage facilities so that they are adequately separated from water sources.

1.7 Always apply manure following minimum separation distances for water resources.

1.8 Avoid applying manure on wet soils to minimize compaction, runoff and leaching.

1.9 Unless immediately incorporated into the soil, surface apply manure at reasonable distances from residences and public buildings to reduce odor problems.

1.10 Rotate fields receiving manure to avoid nutrient buildup and maximize nutrient utilization, as dictated in the nutrient management plan.

1.11 Only spread manure on slopes greater than 5% between the months of June and August.

1.12 Supplement commercial fertilizers only when manure nutrients do not meet crop yield goals.

1.13 Apply manures as close as possible to the time crop utilization of the nutrients in the manure. Utilize fall cover crops to minimize soil erosion and runoff and to maximize nutrient utilization from manure application.

1.14 Avoid surface application of manure on steep slopes, frozen soil or near surface waters.

SEPARATION DISTANCES FROM WATERCOURSES AND WELLS

The Department of Agriculture and Fisheries has developed Manure Management Guidelines that recommend minimum setback distances for spreading manure on agricultural land. The following tables summarize minimum setback distances recommended for use within the manure management

guidelines.

TABLE 5: MINIMUM SEPARATION DISTANCES FOR MANURE APPLICATION

Water Source	Separation Distance (meters)	
	clay loam & loam soils	sand & gravel soils
Dug or Drilled Wells	30	60
Primary Watercourse	10	10
Tributaries to Primary	5	5
Ditches	3	3

TABLE 6: RECOMMENDED SEPARATION DISTANCES FOR SPREADING MANURE ON SLOPED LAND

Slope gradient to watercourse (located within 2 km of water treatment plant intake)	Separation Distance (meters)
< 2 %	20
2 - 5 %	50
5 - 10 %	100
> 10 %	Not Recommended

Farmers operating within a water supply area that has been designated as a Protected Water Area (PWA) under the Environment Act, may have to comply to other specified setback distances outlined within the PWA designation regulations.

Farmers should also be familiar with the Department of Agriculture and Fisheries Guidelines for the Siting and Management of Hog Farms in Nova Scotia, as well as any guidelines or regulations associated

with separation distances required for the storage of animal manures.

Nova Scotia Department of Agriculture and Fisheries, Factsheets on Manure Nutrients, Manure Spreader Calibration, Earthen Manure Storages, and Integrated Fly Management for Livestock Farms.

PASTURING LIVESTOCK

As a measure of due diligence, pasture land must be fenced to prohibit the entry of livestock into adjacent watercourses.

The minimum recommended setback for fencing pastured cattle from a well or watercourse is 5 meters. If livestock are pastured on both sides of the water supply, an approved crossing must be constructed so the livestock can cross without entering and disturbing the watercourse.

MANAGEMENT OF CHEMICAL FERTILIZERS

Farmers operating in areas which drain into municipal drinking water supplies that use surface water should use the following setback distances when applying fertilizer to crops:

< 10 meters from the primary watercourse

< 5 meters (minimum) from a natural watercourse other than the primary watercourse

< 3 meters from a ditch

BUFFER STRIPS

Buffers are strips of land in permanent vegetation, designed to intercept pollutants and manage other environmental concerns. Buffers include: filter strips, grassed waterways, shelterbelts, windbreaks, living snow fences, contour grass strips, cross-wind trap strips, shallow water areas for wildlife, field borders, alley cropping, herbaceous wind barriers, and vegetative barriers. Riparian buffers refer to a buffer strip along a stream.

Strategically placed buffer strips in the agricultural landscape can effectively mitigate the movement of sediment, nutrients, and pesticides within farm fields and from farm fields. When combined with appropriate beneficial management practices, buffer strips should allow farmers to achieve a measure of economic and environmental sustainability in their operations. Buffer strips can also enhance wildlife habitat and protect biodiversity. Buffers slow water runoff, trap sediment, and enhance infiltration within the buffer. Buffers also trap fertilizers, pesticides, pathogens, and heavy metals, and they help trap snow and cut down on blowing soil in areas with strong winds. Buffers help stabilize a stream, create shade and reduce its water temperature. Buffer strips also offer a setback distance for agricultural activities from water sources. If properly installed and maintained, they have the capacity to:

1.1 remove up to 50 percent or more of nutrients and pesticides.

1.2 remove up to 60 percent or more of certain pathogens.

1.3 remove up to 75 percent or more of sediment.

1.4 reduce noise and odor.

MANAGEMENT AND USE OF PEST CONTROL PRODUCTS

All users of pest control products within a municipal drinking water supply area shall hold a valid certificate of qualification as defined in the Pesticide Regulations of the Nova Scotia Environment Act (1995). Farms operating within a Designated Protected Water Area must comply with Section 21 of the Pesticide Regulations of the Nova Scotia Environment Act (1995), which states.

> "No person shall apply a pesticide within a protected water area designated under Section 106 of the Act unless the person complies with any regulations regarding the use of pesticides within the protected water area."

In other words, farmers are responsible for finding out if they are conducting their agricultural activities within a Protected Water Area, in addition to, complying with any associated regulations which may apply to their farm activities.

SOIL CONSERVATION AND MANAGEMENT

The following recommended practices for soil conservation and management apply only within those Municipal Drinking Water Supply Areas in which the water supply is derived from surface waters (lake, river, stream, etc.). Farmers are encouraged to use erosion control methods if the following circumstances apply to their operation:

1.1 In any year that annual crops (i.e. corn, small grains, vegetables, etc.) are grown on slopes exceeding 3%.

1.2 Tillage operations or harvesting are conducted that will expose bare soil during mid-October through mid-April.

1.3 Perennial crops which are subject to erosion (i.e. small fruits and tree fruits) are grown.

1.1 Reduce soil compaction by tilling or harvesting when soil is not wet. Studies have shown fields with soil compacted by farm equipment results in greater runoff of nutrients and pesticides.

1.2 Avoid exposing large areas of bare soil during the winter period

1.3 In Nova Scotia, it is recommended that fields with bare soil or less than 50% cover, be mulched with hay or straw if it is too late to provide adequate field cover with cover crop

Appendix V: Emergency Response Planning

Emergency Response Plan

In general, initial response to emergency situations will be provided by the fire departments, police and ambulance services. The provincial emergency system is set up to facilitate quick response from these agencies. The responding group will be able to assess the nature of the situation and call for additional resources, ranging from the town and local contractors with equipment and materials to construct containment areas, regional EMO managers, environment department personnel, to hazardous materials response units, and environmental consulting firms with knowledge of the proper procedures. These first response groups have been informed of the sensitive nature of the area, and have been given contact information to the resources available.

The Town has provided emergency response procedures related to source water protection in the regional emergency response plan. For additional information related to the protection of the source water during the emergency responses refer to the Regional Emergency Response Plan and the Water Utility Operations Manual. The Operations Manual can be found at the Town Office or the Public Works building.

APPENDIX VII: FOREST MANAGEMENT PLAN

FOREST MANAGEMENT PLAN

INTRODUCTION

The committee recommends that landowners follow a management plan which would provide a mature forest cover on lands in the source water area, providing the benefits of such wooded areas to water protection and conservation. While acknowledging the owner's rights to the property it is suggested that a long term sustainable harvesting plan be used to insure the regeneration of new growth while thinning over mature trees and keeping a healthy land cover.

MANAGEMENT PRINCIPLES

1 Forest related activities should encourage the establishment and growth of long-lived species such as red spruce, white pine, eastern hemlock and red oak.

2 Forested areas should maintain a tree cover of not less than 10' in height and not less than 50% stocking.

3 The forest should be maintained in a healthy, actively growing state.

4 Forestry activities should be conducted to minimize disturbance or pollution to the forest floor and the underlying soil.

SHORT-TERM OPERATING PLAN (5 YEAR5)

Operating recommendations are as follows:

Shelterwood Harvesting

The primary objective is to establish the natural regeneration of shade-tolerant species under the existing canopy of mature or over mature stands through a series of partial cuttings.

Selection Harvesting

Selection harvesting will include partial cutting in which the salvaging of over-mature components of stands is the primary objective, whereas the establishment of natural regeneration is the secondary objective.

It must be remembered that the forest is a dynamic entity, continually changing as trees grow and die with the overall structure of the forest evolving through several seral stages. Because the forest is dynamic, it must be continually monitored for changes which have occurred because of significant influences, often unpredictable in nature. The operators of the plan must be committed to acting decisively when the need arises, while staying the course on the plan, its long-term principles and goals, and its short-term objectives.

GUIDELINES FOR FORESTRY ACTIVITIES AND OPERATIONS

NOTE: All guidelines as presented are subject to amendment from time to time by the Source Water Protection Committee.

1. White pine and red oak should only be cut when individual trees are diseased or pose a health threat.
2. Where possible, tolerant tree species such as red spruce, hemlock, white pine and red oak should be selected as crop trees (leave trees) over all other species in harvesting or thinning treatments.
3. Maximum basil area removal should not exceed 50% at any given time.
4. Any equipment proposed for use should be free of leaks.
5. Fuel barrel and jugs, oil containers or other similar containers should not be stored on site other than enough to complete a day's work and then on PVC lined areas.
6. It is recommended that absorbent materials such as peat moss, saw dust, or other material be on hand in case of spillage of fuel, oil, lubricants, antifreeze, or other liquids. All contaminated materials, including contaminated soil, should be immediately removed from the area and properly disposed.
7. Carpet or other absorbent mats will be used at the point of chainsaw refueling to absorb spillage from fuel and oil jugs. The mats should be removed from the site daily and properly disposed of when they become saturated.
8. Adequate fire fighting equipment must be kept on site during fire season. Only fresh water may be used for fire suppression. Flame retardant chemicals may not be used other than as approved commercial fire extinguishers, which must be kept with each piece of equipment

Appendix E

Pilot study investigating ambient air toxics emissions near a Canadian kraft pulp and paper facility in Pictou County, Nova Scotia

(Hoffman, Guernsey, Walker, Kim Sherren, Andreou, 2017)

Environ Sci Pollut Res (2017) 24:20685–20698

Abstract Air toxics are airborne pollutants known or suspected to cause cancer or other serious health effects, including certain volatile organic compounds (VOCs), prioritized by the US Environmental Protection Agency (EPA). While several EPA-designated air toxics are monitored at a subset of Canadian National Air Pollution Surveillance (NAPS) sites, Canada has no specific "air toxics" control priorities. Although pulp and paper (P&P) mills are major industrial emitters of air pollutants, few studies quantified the spectrum of air quality exposures. Moreover, most NAPS monitoring sites are in urban centers; in contrast, rural NAPS sites are sparse with few exposure risk records. The objective of this pilot study was to investigate prioritized air toxic ambient VOC concentrations using NAPS hourly emissions data from a rural Pictou, Nova Scotia Kraft P&P town to document concentration levels, and to determine whether these concentrations correlated with wind direction at the NAPS site (located southwest of the mill). Publicly accessible Environment and Climate Change Canada data (VOC concentrations [Granton NAPS ID: 31201] and local meteorological conditions [Caribou Point]) were examined using temporal (2006–2013) and spatial analytic methods. Results revealed several VOCs (1,3-butadiene, benzene, and carbon tetrachloride) routinely exceeded EPA air toxics-associated cancer risk thresholds. 1,3-Butadiene and tetrachloroethylene were significantly higher ($p < 0.05$) when prevailing wind direction blew from the northeast and the mill towards the NAPS site. Conversely, when prevailing winds originated from the southwest towards the mill, higher median VOC air toxics concentrations at the NAPS site, except carbon tetrachloride, were not observed. Despite study limitations, this is one of few investigations documenting elevated concentrations of certain VOCs air toxics to be associated with P&P emissions in a community. Findings support the need for more research on the extent to which air toxics emissions exist in P&P towns and contribute to poor health in nearby communities.

Keywords Air toxics · Air quality · Volatile organic compounds (VOCs) · Community health · Pulp and paper · Cancer risk

Introduction

Poor ambient air quality is an increasing global concern with recent revelations that 92% of the world's population is exposed to air pollution levels above the World Health Organization (WHO) air quality guidelines (WHO 2006, 2016; Kelly and Fussell 2015). Ambient air pollution is widely recognized and increasingly associated with a wide range of acute and chronic adverse health effects, including cancer, cardiovascular, respiratory, and mortality outcomes (IOM 2011; Villeneuve et al. 2013; ECCC 2015a). The pathological mechanisms by which these toxic exposures exert their effects are not well understood. WHO highlights the need for research in order to better inform exposure-response relationships (WHO 2016).

Most air pollution surveillance activities are limited to measurement of respirable fine particulate matter ≤2.5 μm ($PM_{2.5}$), without regard to their specific chemical composition and criterion air contaminant (CAC) gases (i.e., nitrogen oxides [NO_x] and ground-level ozone [O_3]). There is growing concern about the toxicity of volatile organic compounds (VOCs) (Cicolella 2008) and the consequences of long-term, low-dose exposure to these agents. VOCs are varied and widespread air pollutants (e.g., hydrocarbons, aromatics, and some chlorinated compounds) that are increasingly recognized as important precursors to $PM_{2.5}$ and ground-level O_3 formation through photochemical reactions (Ryerson et al. 2001). Atmospheric deposition of VOCs may contaminate other environmental media (e.g., soils, sediments, and biota) (ATSDR 2014a; MacAskill et al. 2016). Many VOCs are included in the US Environmental Protection Agency (EPA) "air toxics" list. "Air toxics" are defined as "those pollutants that cause or may cause cancer or other serious health effects [...] or adverse environmental and ecological effects" (EPA 2015a).

According to the Canadian Environmental Protection Act 1999 (CEPA), VOC releases are acknowledged as a health concern, but, due to their highly volatile properties, are challenging to monitor and manage (CCME 2011). Although no specific Canadian legislative or regulatory tools address ambient VOC levels, emissions are indirectly controlled through regulatory mitigation of $PM_{2.5}$ and ground-level O_3 under the Canadian Ambient Air Quality Standards (CAAQS). Under CEPA, it is mandatory for owners or facility operators, who meet reporting requirements, to self-report pollutant releases to air, water, and land to Environment and Climate Change Canada (ECCC)'s National Pollutant Release Inventory (NPRI) (ECCC 2014). While this provides a disincentive to those industries releasing these agents, there is less regulatory control or routine monitoring of these agents in Canada which, in turn, limits scientific understanding of sources, exposures, and the effectiveness of current control measures across the country.

Ambient air monitoring in the US is conducted in accordance with the *Clean Air Act* (CAA) (Clean Air Act 1970). CAA amendments identify 187 air toxics, which form the basis for EPA's approach to regulating emissions (EPA 2015a). Of these, EPA identified 30 air toxics that pose the greatest potential health threat in urban areas (EPA 2015b). Although many CEPA-toxic or equivalent agents are monitored by the National Air Pollution Surveillance (NAPS) network, it includes a selection (not all) of EPA's list of prioritized air toxics, and the main criteria for air toxics monitoring in Canada has been their potential contribution to ambient PM and ground-level O_3 (Galarneau et al. 2016). Consequently, there are gaps in understanding of air toxics concentrations across the NAPS network. Using the risk-based principles outlined in CAA, EPA developed the National Air Toxics Assessment (NATA), a comprehensive evaluation tool that prioritizes efforts to regulate emissions of air toxics (EPA 2015c). Such a rigorous initiative has yet to be implemented in Canada, where no federal guidelines exist for ambient air toxics.

Despite economic benefits of the P&P industry, it generates large quantities of atmospheric and effluent emissions, resulting in environmental degradation (Hewitt et al. 2006; Hoffman et al. 2015; Hoffman et al. 2017). P&P mill emissions vary depending on the pulping method, wood species, and by the age and technology used (Soskolne and Sieswerda 2010). P&P mills are industrial emitters of air toxics, although few investigations (e.g., the Nez Perce National Air Toxics Program, funded by EPA [STI 2009]) have characterized ambient concentrations in nearby communities.

Potential adverse health effects associated with exposure to air pollutants in the vicinity and downwind from P&P facilities include respiratory disease, neurophysical symptoms, and higher risks of contracting lung cancer (Soto et al. 1991; Toren et al. 1996; Mirabelli and Wing 2006). Yet, few investigations reported adverse health effects from chronic community-level ambient exposures to P&P mills emissions in Canada (Mirabelli and Wing 2006; Soskolne and Sieswerda 2010). While there have been a number of occupational epidemiological studies of P&P workers, these investigations have not been extended to examine community exposures, due to research design challenges including ecological fallacy (i.e., inferences made about individuals deduced from the population) in community studies (Soskolne and Sieswerda 2010). Additionally, most of these studies focused on respiratory disease outcomes; there is a dearth of epidemiological studies of cardiovascular effects or cancer effects in these communities.

Decades-long concerns for perceived higher incidence and mortality rates for all-cause cancer, cardiovascular disease, chronic respiratory disease, and diabetes (Reid 1989; PCHA 2008; Statistics Canada 2013) in PC, Nova Scotia, have generated considerable community antipathy among residents towards a local P&P mill (Hoffman et al. 2015). This bleached kraft P&P mill ("the mill") is located approximately 3 km south of the town of Pictou (population 3500) and produces approximately 280,000 t of bleached kraft pulp annually from softwood and hardwood chips (NP 2016b) (Fig. 1) and has been in production since 1967 (Ogden 1972). Public backlash gained momentum during 2014 due to the failure of the recovery boiler electrostatic precipitator (i.e., particulate filtration device).

Environmental reporting by the mill, when compared against provincial and federal regulatory compliance standards, contrasted to local perceptions of impacts. Most environmental monitoring reports indicated some

level of compliance in atmospheric emissions, but when compliance targets were exceeded, there were inconsistent regulatory enforcement (Hoffman et al. 2015). The mill is required to report emissions to NPRI: conduct third-party stack testing, continuous emission monitoring of total reduced sulfur (TRS), and ambient air monitoring for pollutants found in the Nova Scotia Air Quality Regulations pursuant to the *Environment Act* (NSE 2015). The mill's air emission monitoring data are reviewed by provincial and federal regulators to ensure compliance with applicable environmental permits and air quality objectives (ECCC 2014). Hoffman et al. (2015) provided detailed information on new and existing environmental policies that impose pollution abatement in the P&P industry in Canada, particularly the PC mill (e.g., 2015 Industrial Approval).

These are critical research gaps both in relation to community exposures to VOCs in P&P communities and in regard to adverse health effects resulting from chronic exposure to P&P emissions which are a concern given the potential adverse health outcomes that VOCs and other P&P air emissions pose. This further justifies the need for more research to characterize air quality in this particular subset of industrial communities, which have often been neglected because of their remote locations.

An intensive study of specific ambient air toxic emissions in PC has not been undertaken. The aim of this pilot study was to assess levels of PC community exposures to VOC air toxics emissions from 2006 to 2013, and to evaluate these data in relation to potential risks suggested by EPA air toxic guidelines. The main objective of this study was to determine whether wind direction correlated with prioritized air toxic ambient VOC concentrations at a nearby NAPS site (Granton). As the Granton NAPS site is positioned southwest of the mill, it was hypothesized that prevailing winds (PW) from northerly and northeasterly directions would

positively correlate with an increase in ambient VOC concentrations, as capturing potential VOCs from the mill's plume would be optimized (Fig. 1).

Materials and methods

Spatial and temporal sampling

Historical meteorological and NAPS data from the Granton NAPS site discrete receptor (ID: 31201) were collected from publically assessable ECCC databases (http://climate.weather.gc.ca/climateData/; http://maps-cartes.ec.gc.ca/rnspa-naps/). Hourly surface wind observations (i.e., speed and direction to the nearest 10°) were obtained from the closest EC meteorological station, Caribou Point (45.767° N; 62.683° W), located ~10 km north of the mill (45.652° N; 62.718° W). Temporal data for ambient VOCs monitored at the Granton NAPS station were limited to 2006 to 2013.

Nova Scotia Environment (NSE) operates both NAPS monitoring stations in PC: (i) downtown Pictou (ID: 30901) located 3.5 km northeast of the mill and (ii) Granton (ID: 31201) located 2.5 km southwest of the mill (Fig. 1). The Pictou NAPS site routinely monitors NO, NO_2, NO_x, O_3, $PM_{2.5}$, TRS (not VOCs), and wind characteristics, whereas the Granton site monitors 36 VOC species. Multi-component VOC monitoring at NAPS sites are conducted using canister sampling and gas chromatography/mass spectrometry (GC/MS) (CCME 2011). Sampling of 24 h (midnight to midnight) cumulative ambient air samples ($\mu g/m^3$) are taken on a 1-in-6-day schedule by pumping ambient air into pressurized stainless steel SUMMA® canisters and analyzed by an EC accredited Laboratory (CCME 2011; Galarneau et al. 2016).

Statistical analyses

Variation of meteorological conditions and VOC concentrations were assessed by conducting a spatiotemporal analysis to characterize ambient air toxics emissions in PC from 2006 to 2013. Various analytical methods can be applied to concentration data to estimate source apportionments of air pollutants to provide additional insights into the source/receptor relationships to guide development of more effective air quality management strategies (Hopke 2016). However, given the limitations of having complete VOC data from only one NAPS monitoring station in the region, a full chemical mass balance analysis to identify and apportion sources of atmospheric contaminants were not conducted in this study.

Wind rose plots were generated with WRPlot View™ (©Lakes Environmental Software) to simulate seasonal and spatial variation of wind direction (°) frequency and wind speed (m/s) with the mill as the focal point. Although simplified, wind rose models have proven utility for estimating spatial gradients for fate and transport of pollutants from emission sources (Gibson et al. 2013). Summer, when local people spend more time outdoors (and more vulnerable to outdoor pollution exposure), was a focus of this study (Figs. 1 and 2).

This pilot study was conducted to determine whether ambient concentrations of VOCs exceeded their EPA-associated cancer and/or noncancer risk thresholds, to help identify potential human health concerns in PC. VOCs selected for analysis were based on EPA's list of 30 urban air toxics (EPA 2015b) and *National Air Toxics Trends Station Work Plan Template* (EPA 2015d). Health Canada and the province of Nova Scotia currently do not have specific guidelines for air toxics exposures. Therefore, EPA thresholds were considered a more acceptable standard for carcinogenic exposures in this study. Cancer risk threshold refers to the probability of contracting cancer if exposed to a substance every day over the course of a lifetime (assumed to be 70 years for the purposes of NATA risk characterization). Lower threshold values correspond with higher toxicity. Noncancer risk threshold is associated with effects other than cancer, based on reference concentrations via the "hazard quotient" ratio (HQ; exposure divided by appropriate chronic or acute value) (EPA 2015c). The HQ should not be interpreted as a probability of adverse effects. Noncancer risk thresholds are typically higher compared to cancer risk thresholds, as lower concentrations can elicit a carcinogenic response, whereas other diseases are not triggered until higher exposure thresholds are reached. US and Canadian method detection limits (MDL) are provided (Health Canada 2010; EPA 2015d) (Table 1).

The mill is located approximately 40° northeast of the Granton NAPS site. The selected PW range expected to result in increased VOC concentrations at the NAPS site (±40° either side of the mill [80° total]). A narrower range may be more accurate; however, due to the sample size of VOC samples, the selected range captured more data. All other wind directions (AOWD) represent ranges outside PW (i.e., >80°, <360°). AOWD represent sampling days when no time PW blew from the selected range (i.e., 0 h). VOC concentrations for AOWD were compared to when PW were present for at least 1 h.

Hourly meteorological data were compiled to correspond with ambient VOC sampling. Hourly wind direction within defined PW range (i.e., 360°–80°) was assigned a value of 1; AOWD were assigned a value of 0. Daily totals represented the proportion of time with PW (i.e., 1–24 h) compared to AOWD. Daily

4

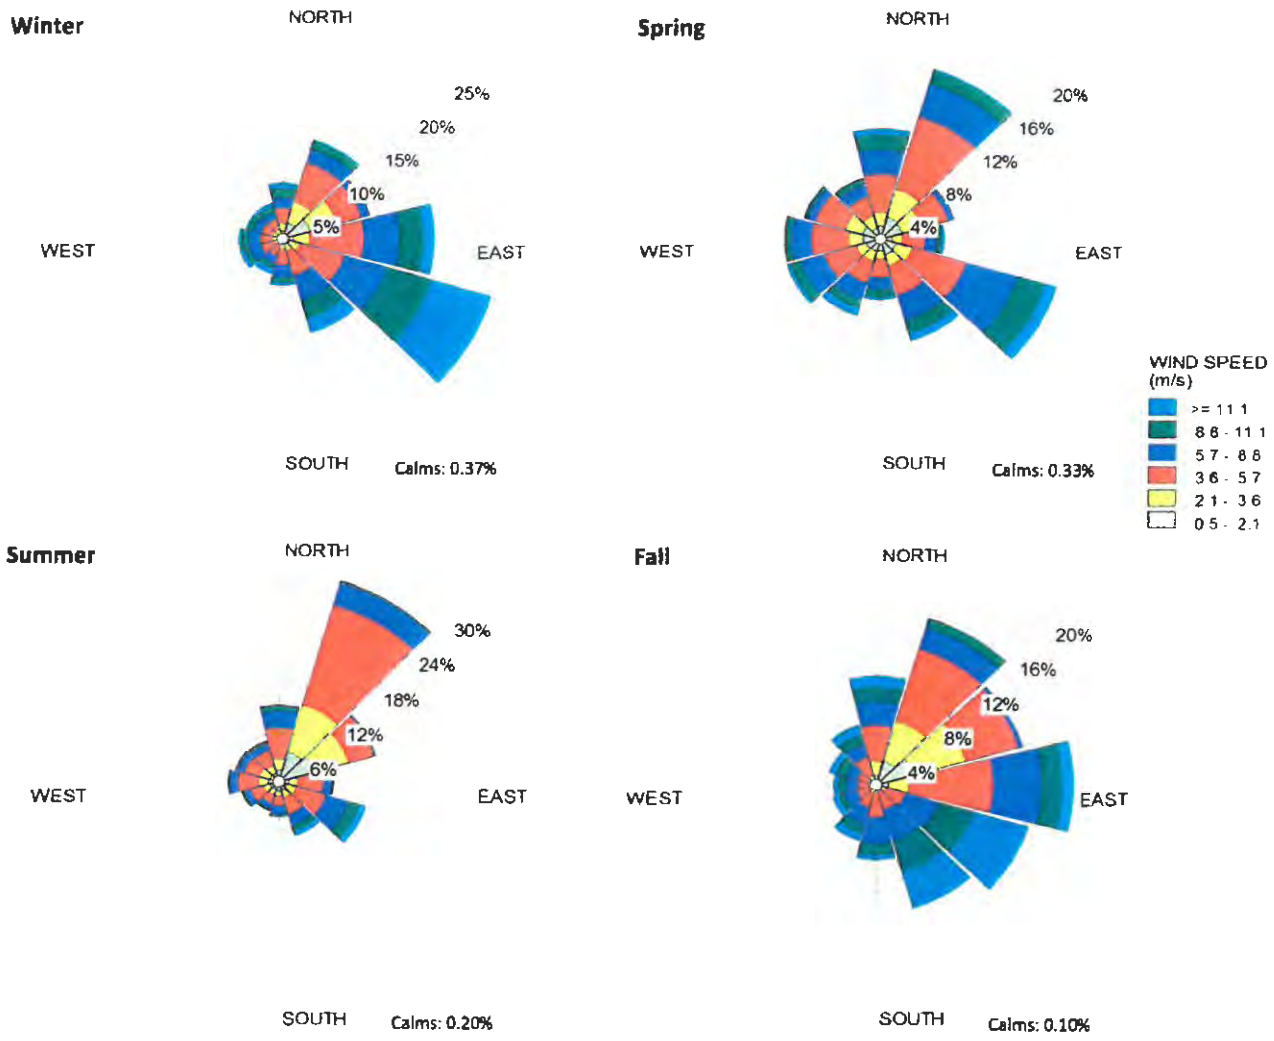

Fig. 2 Seasonal (2006–2013) wind rose simulations using WRPlot View™ (blowing to direction). Percentages represent frequency of wind direction

totals corresponding to VOC sampling were paired. Increasing proportions of PW (AOWD [0 h], ≥1 h, ≥4 h, ≥8 h, ≥12 h) categorized VOC concentrations, which were predicted to correlate with higher VOC concentrations. To test the effect of wind direction and season on ambient VOC concentrations, multivariate analysis of variance (MANOVA) and univariate analysis of variance (ANOVA) were applied in ©R. Due to right-skewed distributions for all VOCs, except for carbon tetrachloride, statistical procedures were performed on both raw and log-transformation of VOC concentrations (Supplementary material Table S1).

Box plots and histograms were used to compare VOC concentrations with PW ≥ 1 h to AOWD on an annual and seasonal basis in relation to their respective cancer and noncancer risk thresholds. See Supplementary material for histograms, and additional box-and-whisker plots illustrating VOC concentrations with increasing time categories with PW (AOWD [0 h], ≥1 h, ≥4 h, ≥8 h, ≥12 h) (Figs. S2 and S4). Box plots display the distribution of data based on a five-number summary: minimum, first quartile, median, third quartile, and maximum. The central rectangle ("box") spans the first to the third quartile (i.e., interquartile range [IQR]). The horizontal line segment within the box represents the median, and "whiskers" above and below the box represent the minimum and maximum. Radar plots consist of a sequence of angular spokes, whose length extending from the center along a separate axis is proportional to the magnitude of the variable relative to the magnitude of the variable across all data points. Lines connect the data values for each spoke. Radar plots were used to display seasonal variation of median VOC concentrations for PW ≥ 1 h and AOWD. One-tailed *t* tests, assuming unequal variance, were performed to determine whether seasonal variation associated with increasing proportions of time

Table 1 List of priority air toxics (i.e., VOCs), associated cancer/noncancer risk thresholds (μg/m^3), and method detection limits (MDL) (μg/m^3) (Health Canada 2010; EPA 2015d)

VOC	Cancer risk[a] (μg/m^3)	Noncancer risk at HQ = 0.1[b] (μg/m^3)	MDL[c] (NATS) (μg/m^3)	MDL (Health Canada) (μg/m^3)
Chloroform	–	9.8	0.50	0.089
1,3-Butadiene	0.0300	0.2	0.10	0.055
Vinyl chloride	0.1100	10.0	0.11	0.046
Benzene	0.1300	3.0	0.13	0.038
Carbon tetrachloride	0.1700	19.0	0.17	0.123
Trichloroethylene	0.2083	0.2	0.20	0.190
Tetrachloroethylene	3.8462	4.0	0.17	0.120

[a] Cancer risk threshold: the probability of contracting cancer over the course of a lifetime (assumed to be 70 years for the purposes of NATA risk characterization). Lower threshold values correspond with higher toxicity (EPA 2015c)

[b] Noncancer risk threshold: the risk associated with effects other than cancer, based on the reference concentration via a ratio known as the "hazard quotient" (HQ; the exposure divided by the appropriate chronic or acute value)

[c] MDL: the lowest concentration that can be detected with confidence. NATA and Health Canada's MDLs are listed for comparison (Health Canada 2010; EPA 2015d)

with PW (i.e., ≥1 h, ≥4 h, ≥8 h, ≥12 h) resulted in a significant increase ($p < 0.05$) in VOC concentrations compared to AOWD (see Supplementary material, Table S3).

Quality control

Standard procedures of the Meteorological Service of Canada have been developed in accordance with internationally recommended procedures established by the World Meteorological Organization (ECCC 2013a). As part of the quality assurance and quality control (QA/QC) program, observational meteorological data are subjected to a computer analysis or review to reveal possible errors. EC and the operating agency are jointly responsible for the NAPS network QA/QC program. Elements of the program include site selection, sampling system requirements, instrument calibration and reference standard requirements, and inter-laboratory testing and performance audits. With few exceptions, analyzers are accorded with EPA designation as either a reference or equivalent method for ambient air monitoring (ECCC 2004). ECCC's air quality laboratories use International Organization for Standardization requirements (i.e., ISO 9001:2008 or ISO/IEC 17025:2005) (ECCC 2013b).

Results and discussion

Meteorological observations

Wind rose simulations illustrate seasonal variability with respect to wind direction, with the mill as the focal point (Fig. 2). During summer, wind blew NNE (25.47%) and ENE (11.80%) directions (aggregate range 15°–75°) towards Pictou and Pictou Landing First Nation (PLFN) (Figs. 1 and 2). Wind blew less frequently towards S-NNW (aggregate range 165°–345°) towards the Graton NAPS site. During winter, wind typically prevailed from the north; the highest frequency (21.99%) blowing ESE, followed by E (15.37%) directions (aggregate range 75°–135°) (Fig. 1). Spring and fall have meteorological characteristics that are similar to summer and winter and were considered transitional periods. Pictou, PLFN, Chance Harbour, Trenton and New Glasgow are communities close to the mill that are downwind of annual PW (range 15°–165°). The Granton NAPS site correlates poorly with seasonal or annual wind directions (Fig. 2).

VOC concentrations

Carbon tetrachloride had the highest median concentration (0.5452 μg/m^3) and vinyl chloride had the lowest (0.0014 μg/m^3) (Fig. 3). Carbon tetrachloride concentrations exceeded its EPA cancer risk threshold (0.1700 μg/m^3) for all samples, with maximum and minimum concentrations of 0.7047 and 0.2892 μg/m^3, respectively. Benzene concentrations exceeded its cancer risk threshold (0.1300 μg/m^3) for most samples, with maximum and minimum concentrations of 1.889 and 0.0266 μg/m^3, respectively. Concentrations of 1,3-butadiene concentrations occasionally exceeded its cancer risk threshold (0.0300 μg/m^3), with maximum and minimum concentrations of 0.1062 and 0 μg/m^3, respectively (Fig. 3). Consequently, 1,3-butadiene, benzene, and carbon tetrachloride were air toxics of primary concern in terms of local

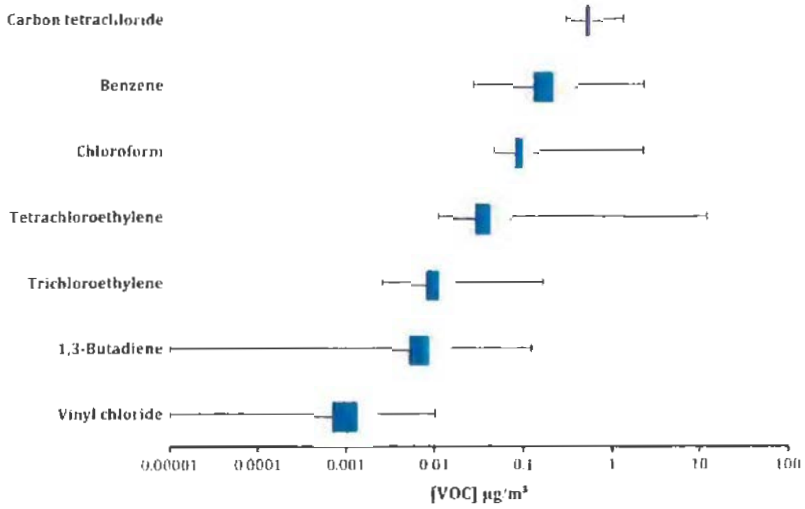

Fig. 3 Relative VOC concentrations (µg/m^3) (2006–2013). Should not be interpreted as orders of magnitude of toxicity. Minimum concentration for 1,3-butadiene and vinyl chloride is 0 µg/m^3 or undetectable

population risk. Other VOCs are presented in Supplementary material (Fig. S5).

ANOVA and MANOVA results revealed that 1,3-butadiene was significantly bigher with the presence of PW ≥ 1 h (p = 0.001and p = 0.01 for raw and log-transformed data, respectively). Tetrachloroethylene was also statistically bigher with the presence of PW ≥ 1 h (p < 0.01) for log-transformed data. Benzene approached significance with the presence of PW ≥ 1 h (p = 0.07) for log-transformed data. Although not statistically significant, median concentrations of other VOCs, except carbon tetrachloride, were equal or marginally higher with presence of PW ≥ 1 h compared to AOWD. Season had a consistent significant effect on VOC concentrations, except chloroform and tetrachloroethylene (Supplementary material Fig. S2 and Table S1).

Box plots combined with radar graphs illustrate seasonal variation of VOC concentrations of primary concern (i.e., 1,3-butadiene, benzene, carbon tetrachloride) under PW ≥ 1 h and AOWD conditions (Figs. 4, 5, and 6). Median VOC concentrations associated with PW ≥ 1 h and AOWD display parallel

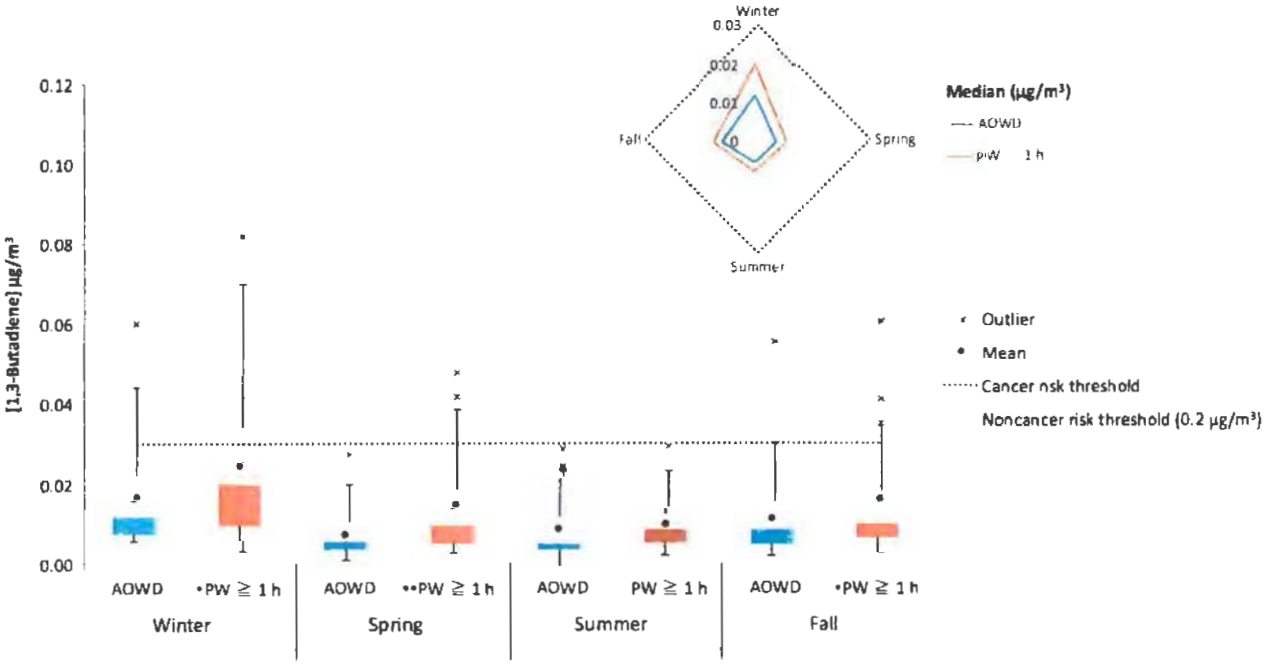

Fig. 4 Seasonal variation (2006–2013) of [1,3-butadiene] (µg/m^3) comparing AOWD to PW for at least 1 h on sampling days (i.e., 360° – 80°), relative to associated cancer and noncancer risk thresholds. Minimum concentration is 0 µg/m^3 or undetectable. Significant differences indicated as *<0.05; **<0.01

seasonal trends. Concentrations of 1,3-butadiene (Fig. 4) and benzene (Fig. 5) exhibit seasonal variation. Both have evidently higher concentrations during winter, with summer having overall lowest concentrations. In addition to exceeding cancer risk thresholds, *t* test results revealed that 1,3-butadiene and benzene concentrations were significantly higher with the presence of PW ≥ 1 h compared to AOWD during at least two seasons, including spring and fall. Conversely, median carbon tetrachloride concentrations showed little variation (Fig. 6). Regardless of season or wind direction, all carbon tetrachloride samples exceeded its associated cancer risk.

This pilot study presents findings of a secondary analysis of 8 years of air toxic VOC exposure data associated with ambient air quality in a Canadian P&P town. Concentrations of three ambient outdoor air toxics routinely exceeded EPA air toxics-associated cancer risk thresholds and are consequently of primary health concern in relation to population health risk in PC: 1,3-butadiene, benzene, and carbon tetrachloride. Exceedance in cancer risk thresholds for these air toxics is consistent in the literature (e.g., Morello-Frosch et al. 2000). The extent to which threshold exceedances of 1,3-butadiene adversely affect human health is poorly understood, with little toxicity information available to compare with cancer risk estimates (Morello-Frosch et al. 2000). With respect to benzene exposure, most monitoring data are associated with occupational studies (ATSDR 2007a), where long-term exposure can cause leukemia (ATSDR 2007b). High exposure to carbon tetrachloride can cause liver, kidney, and central nervous system damage (ATSDR 2005). Combinations of air toxics may have additive or synergistic adverse health effects (Morello-Frosch et al. 2000). Therefore, exposure to mixed VOCs might pose health risks to facility employees and neighboring residents (An et al. 2014; He et al. 2015).

Emission sources within the defined PW range, N to ENE of the Granton NAPS site, may be a causal factor for the increase in VOC concentrations, except carbon tetrachloride. The largest point source emitter within this range is likely the mill; however, the origin(s) of VOCs are inconclusive. According to the mill's most recent substance report submitted to NPRI in 2012, 143.18 t of VOCs were atmospherically emitted on-site (ECCC 2012). An estimated 3.195 t of benzene were released to the air from a stack higher than 50 m and 0.022 t were released within 50 m of the ground. Additionally, benzo(a)anthracene and of benzo(a)phenanthrene were emitted to the air (9.7 and 6.7 kg, respectively) and deposited on-site (0.753 and 0.142 kg, respectively) (ECCC 2012). Although trichloroethylene, tetrachloroethylene, and carbon tetrachloride were not reported to have been released, they may become airborne through evaporation from P&P wastewater (Soskolne and Sieswerda 2010). Boat Harbour (the mill's effluent treatment facility) may therefore contribute to ambient concentrations of VOCs. Collectively, these emissions may have contributed to the ambient atmospheric levels of VOCs measured at the Granton NAPS site. While

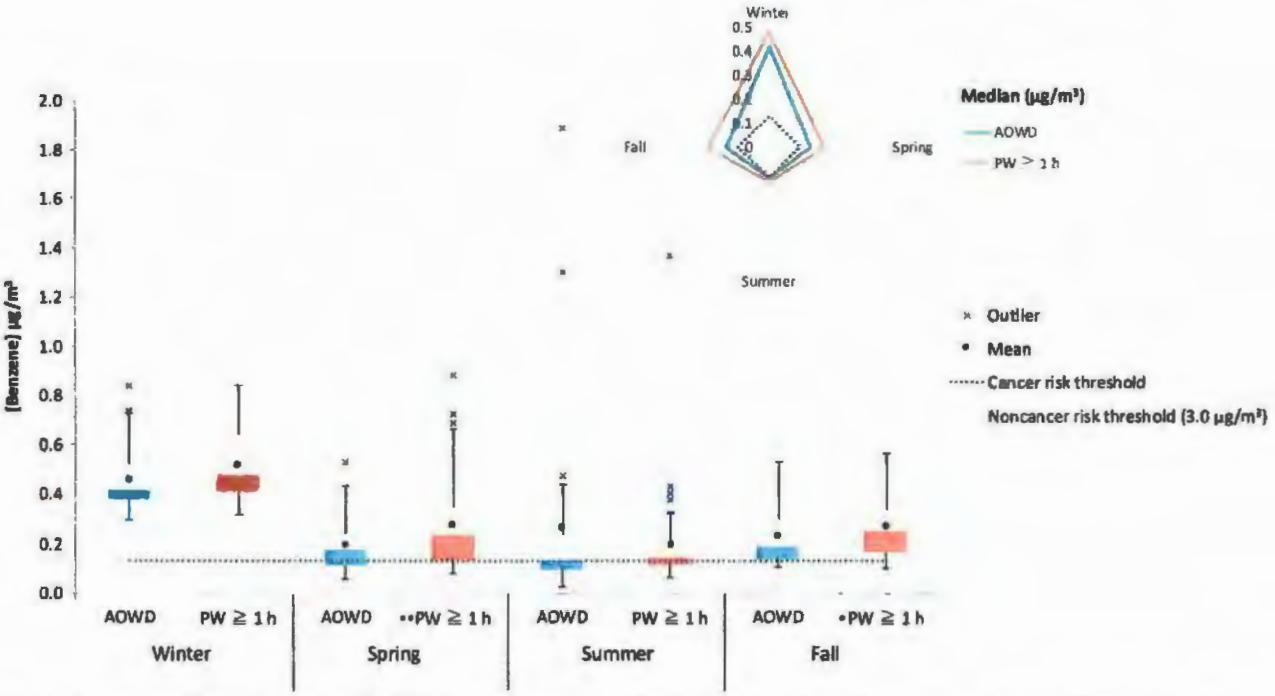

Fig. 5 Seasonal variation (2006–2013) of [benzene] (µg/m^3) comparing AOWD to PW for at least 1 h on sampling days (i.e., 360° – 80°), relative to associated cancer and noncancer risk thresholds. Significant differences indicated as *<0.05; **<0.01

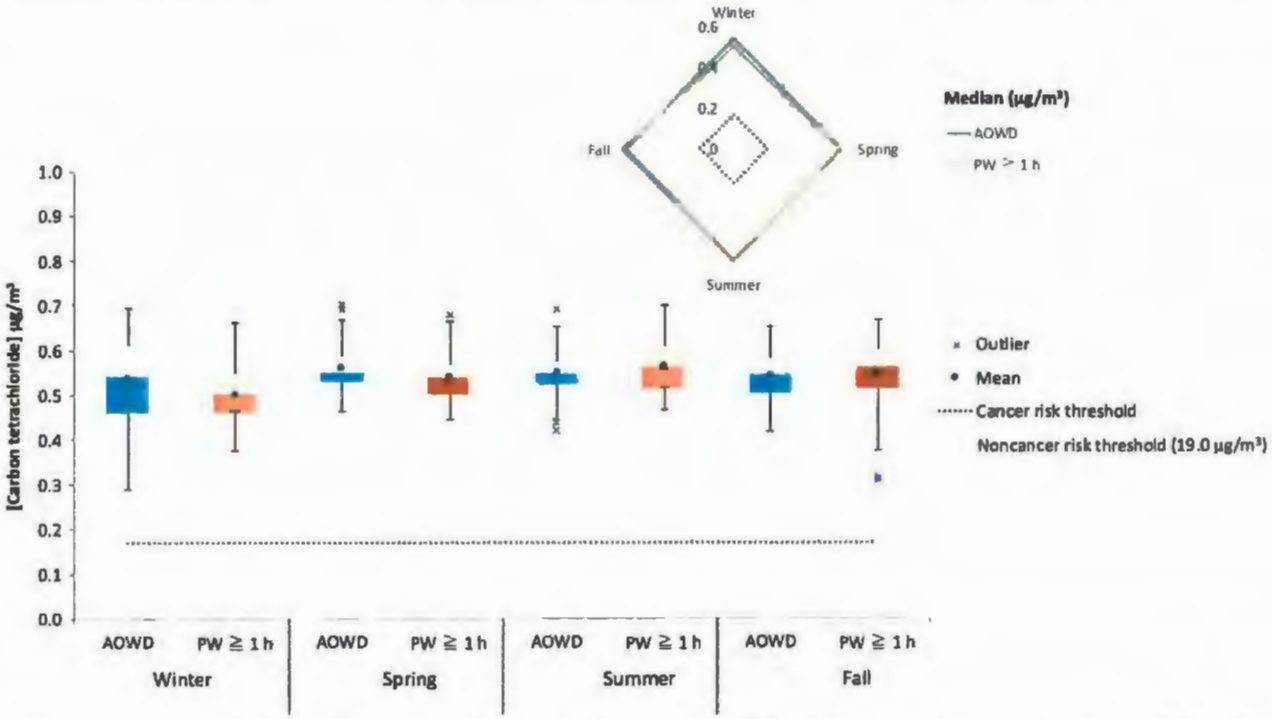

Fig. 6 Seasonal variation (2006–2013) of [carbon tetrachloride] (µg/m^3) comparing AOWD to PW for at least 1 h on sampling days (i.e., 360° − 80°), relative to associated cancer and noncancer risk thresholds

NPRI provides detailed information on pollutant releases, data are self-reported by facilities, with no audits to ensure accuracy. Consequently, data quality may be compromised.

The major chlorinated hydrocarbon emitted into the air from bleached kraft pulp mills of concern is chloroform, which is produced by heating a mixture of chlorine and either chloromethane or methane (EPA 1985). Although chloroform is a recognized by-product of the chlorination process in the P&P industry, it has been suggested that up to 90% of total emission sources may be natural in origin and is widely dispersed in marine environments (McCulloch 2003). As PC is located along the coast of the Northumberland Strait, marine environments may have contributed to the observed ambient chloroform concentrations (see Supplementary material).

Results implicate the mill as a source of air toxics (particularly 1,3-butatdiene and tetrachloroethylene); however, other local sources likely contribute to air toxics emissions. Area and mobile sources have been reported to largely contribute to concentrations of 1,3-butadiene (ATSDR 2014b) and benzene (ATSDR 2007a). Because the Granton NAPS site is located near a highway and access roads, vehicle emissions may have contributed to the observed concentrations of these compounds. A coal-fired thermal generating station and a tire manufacturing facility (located 7 km E and 1.5 km S from the Granton NAPS site, respectively) may be other local point source emitters of VOCs (e.g., 1,3-butadiene is used to make synthetic rubber [ATSDR 2014b]) (Fig. 1). According to the latest NPRI substance reports: the tire manufacturing facility released 220 t of atmospheric VOCs, whereas no VOC releases were reported by the thermal generating station (ECCC 2015b), despite that coal combustion is a significant contributor (Chagger et al. 1999). Direct links between 1,3-butdiene and vinyl chloride with P&P industries were not found in the literature.

Major monitored pollutants at the mill include NO_x, sulfur dioxide (SO_2), and total PM ([TPM] upper size limit of 100 µm diameter) (NP 2016a). A 2013 study concluded that $PM_{2.5}$ concentrations were highest (0.88 µg/m^3) downwind from the mill from using an AERMOD atmospheric dispersion model (Gibson et al. 2013), though this investigation used Halifax wind speed and direction meteorological data (130 km to the south). Hoffman et al. (2015) reported an analysis of 2013 data showing that when Pictou is downwind of the mill, average 1 h ambient $PM_{2.5}$ concentrations result in a twofold increase (12.96 µg/m^3), compared to all other wind directions (5.73 µg/m^3), suggesting the mill is likely the primary contributor of ambient $PM_{2.5}$ in the community. Additionally, TRS, TPM, $PM_{2.5}$, and coarse particulate matter ≤10 µm (PM_{10}) emission exceedances at the mill during 2012 were two to three

orders of magnitude higher than five similar Canadian kraft P&P mills; however, VOC emissions were comparable (Hoffman et al. 2015).

A comparable ambient air toxics monitoring study of a P&P community was conducted in the metropolitan Lewiston, Idaho area and the Nez Perce Reservation (STI 2009). Findings revealed that concentrations of formaldehyde and acetaldehyde were much higher than expected relative to Lewiston's size. Chloroform, tetrachloroethylene, and trichloroethylene were highest at monitoring sites nearest the mill, which presumably contributed at least 50% to pollutant concentrations (STI 2009). However, due to insufficient information on local concentrations of anthropogenic and biogenic VOCs, it was inconclusive whether the mill was a causal factor.

Recent (2009–2013) measurements of ambient CEPA-toxic or equivalent agents monitored at NAPS sites revealed that 11 air toxics, including benzene, chloroform, trichloroethylene, and tetrachloroethylene exceeded ambient air quality guidelines set by respective Canadian jurisdictions (Galarneau et al. 2016). An additional 16 air toxics approached guidelines. Although these guidelines are not necessarily enforceable, CEPA outlines provisions for toxic compounds and are thus subject to risk management actions. Air toxics' contribution to poor health on a regional and national scale has not been thoroughly investigated; therefore, calls into question the effectiveness of current toxic substance management in Canada.

Nova Scotia is known as the "tail pipe of North America," due to being within the trajectory of long-range transport of emissions from transboundary sources along the Eastern Seaboard, plus central and eastern Canada (NSE 2014). Background levels of air pollution that originate from resuspension and natural sources has been found to be major contributors to concentrations of carbon tetrachloride and benzene (Morello-Frosch et al. 2000). Background levels, in combination to carbon tetrachloride's capacity to persist in the atmosphere for a least a year, may explain why observed concentrations are consistently above its associated cancer risk threshold at the Granton NAPS site, regardless of wind direction.

Atmosphere circulation plays a complex role in dispersion, transformation, and removal of pollutants. The dispersion of pollutants from source emitters (e.g., smokestacks) is affected by crosswind mixing in both horizontal and vertical directions. Meteorological variables, including wind speed, wind direction, temperature, humidity, precipitation (process of removal), and atmospheric pressure are the main drivers of variation in pollutant concentrations and dispersion (Bates and Caton 2002). Furthermore, gravitational settling is important for pollutants with larger molecular weights (Oliver 2008); heavier particles settle or deposit closer to emission sources (Walker et al. 2003a, 2003b). Gravitational settling may also explain the high concentrations of carbon tetrachloride.

Topography and coastal conditions can affect wind characteristics (e.g., direction, speed) and the behavior of pollutant transport. A sea breeze that is trapped under descending warmer air from land can exaggerate conditions at coastal zones, a phenomenon known as coastal inversion (Bates and Caton 2002). In addition, turbulent winds along the coast may influence wind characteristics at the Caribou Point meteorological station, and the fate and transport of pollutants. Such coastal conditions, in combination with transboundary air pollution, may be occurrences that coastal areas experience in Nova Scotia, including PC.

Seasonal variability

Seasonal variability exists for both meteorological conditions and VOC concentrations. Variations in meteorological conditions, the nature and intensity of emissions from nearby sources, and photochemical activity are factors that could have led to the observed seasonal variability of outdoor VOC levels (Al-Khulaifi et al. 2014). Of the three VOCs considered particular concern in this study, 1,3-butdaiene and benzene exhibited the highest concentrations during winter. Photochemical reactions involved with ground-level O_3 formation are catalyzed by ultraviolet radiation and temperature. Therefore, peak ground-level O_3 levels typically occur during warm days with sufficient sunlight exposure; thus, people are more vulnerable to exposure during summer. The opposite is true during winter, when available light is diminished, and temperatures are colder (ATSDR 2014b).

Demographic behavior and technological improvements that aim to mitigate emissions (e.g., smokestack precipitator installation in 2015) also need to be considered when evaluating pollutant concentrations. For instance, households in the Atlantic provinces are heated primarily with oil, electricity, and wood or wood pellets (Statistics Canada 2011); therefore, as residential heating increases during winter, biogenic VOCs (e.g., benzene [ATSDR 2007a], 1,3-butadiene [ATSDR 2014b]) from wood burning may have contributed to higher concentrations of these compounds observed in this study. As the mill operates on a 24/7 schedule (ECCC 2012), atmospheric VOC emissions were assumed consistent throughout the year.

Implications

Location of ambient air quality monitoring stations has a direct impact on the observed concentrations of pollutants

(Craig et al. 2008). Based on the time series and spatial analyses, wind direction appears to play a key role in the Granton NAPS site's ability to monitor ambient VOCs from the mill. PW ≥ 1 h from the selected range (360°–80°) typically resulted in equal or higher VOC concentrations for all compounds, except carbon tetrachloride, compared to AOWD (Figs. 4, 5, and 6; Supplementary material), suggesting that the mill is likely a causal factor. Furthermore, as there is a higher frequency of northerly winds blowing towards the south during winter (Fig. 2), the Granton NAPS site is more likely to capture ambient pollutants from the mill's atmospheric emissions. Southwest PW blowing towards Pictou dominate during the summer months when people are more vulnerable to ambient air pollution exposure. Due to Pictou's geography, air toxics from the Eastern Seaboard in combination with local emission sources, including the mill, converge there; hence, higher concentrations of VOCs are expected in Pictou during summer. Subsequently, southwest PW are expected to result in lower VOC concentrations at the Granton NAPS site, as capturing the mill's atmospheric emissions would not be optimized. Therefore, VOC concentrations at the Granton NAPS site during winter would likely be representative of ambient VOC concentrations in Pictou during summer. Moreover, Pictou's considerably larger population base compared to the rural area of Granton further confirms that the NAPS site is not strategically positioned to accurately represent ambient levels of air toxics where there is higher residential exposure.

Study limitations

This study only evaluated exposure to ambient VOC air pollutants. Human exposure to air pollution is a combination of both outdoor and indoor environments and varies according to daily activity patterns and the conditions of specific settings. Secondary data analysis was used in this study; therefore, the ecological nature of these findings limit the explicit attribution of ambient air toxic exposures to the risk potential for cancer for community residents. Personal exposure monitoring, more detailed spatial analysis of ambient conditions, and source apportionment studies would be required to establish more explicitly the health risk associated with these exposures. The analysis was limited by the inability to examine the interaction of local meteorological conditions. Meteorological data were retrieved from Caribou Point, located approximately 10 km from the mill; consequently, coastal conditions may cause differences in meteorological measurements between sites.

Future research and monitoring

A *field component* consisting of real-time measurements of ambient air toxics would improve the rigor and validly of the present study. Although labor intensive, air toxics samples can be analyzed with a high degree of accuracy (Craig et al. 2008). Because monitoring stations are typically fixed, government-approved *atmospheric dispersion modeling* that considers landscape dynamics and seasonal meteorological variability (e.g., ©CALPUFF, ©AERMOD) would more accurately estimate spatial patterns of air toxics dispersion, and human exposure at the population or individual level (EPA 2013). This would require numerous stations within the community so would likely only be feasible for a specific research investigation. Further, installation of a new precipitator in 2015 has likely changed in ambient conditions. A follow-up assessment would provide a comparison to these findings to determine if VOC levels have improved. Additional research includes applying a *Conditional Probability Function* to calculate the probability that an air pollution source is located within a particular wind direction sector to help determine direction of a source from a NAPS discrete receptor site, and conducting an analysis of the effect of mixing height on measured VOC concentrations to further investigate seasonal patterns.

Investigation of health outcomes might involve longitudinal epidemiological research of human exposures to air toxics emissions in the ambient Pictou environment with appropriate consideration for latency of health outcomes, while controlling for indoor and occupational sources and other contextual factors. Several recent Canadian nationwide cohort studies that may provide a foundation for such investigations have been described (e.g., Crouse et al. 2012).

A *comprehensive risk assessment* investigates uncertainties that have implications for risk estimates in the present study, including those surrounding toxicity information (Morello-Frosch et al. 2000). More research is required to determine what cancer and noncancer risks are from ambient air toxics exposure. Further, it is important to consider synergistic effects of a full suite of ambient pollutants, and physical and chemical processes involved in fate and transport of these compounds. Comprehensive emission inventories are necessary to thoroughly address (i.e., characterize, model, and manage) air quality issues (CEC 2009). Collectively, these research efforts aim to better inform air quality management, composed of federal (e.g., ECCC, Health Canada) and provincial (e.g., NSE, Nova Scotia Department of Health and Wellness) government and public health agencies, how best to proceed to ensure the health of residents in industrial communities is prioritized. Implications of the current findings warrant further investigation.

Given the contribution emissions from local sources have to regional, national, and global airsheds, local mitigation initiatives should be an integral part of air quality strategies. There is no common approach to assess health effects of a mixture of pollutants, as they tend to be site specific; hence, an assortment of effective measures may be required. Case studies that provide evidence of effective of air quality

management interventions and guidance documents for risk managers may help inform air quality management for stakeholders (Craig et al. 2008).

To address potential adverse health effects associated with degraded air quality, Health Canada, the Public Health Agency of Canada (PHAC) and provincial partners might work collaboratively with local stakeholders to mitigate health risks and improve efficient industrial technology, while balancing economic, political, and social factors in development and implementation of air quality management. Mitigating industrial emissions has beneficial outcomes for wellbeing (Clougherty 2010); environmental stewardship and governance fosters a more proactive and cleaner environment, while building trusting relationships between industrial stakeholders (Pascal et al. 2013). "A comprehensive enforcement program with mandatory reporting of emissions, [...] and meaningful penalties for noncompliance ensures that emission standards are being met" (Craig et al. 2008), and facility operators are held accountable. Data collected internally by the mill is not readily available. To improve transparency, siting rationale for air quality monitoring stations and accompanying data should be provided as part of a commitment to corporate responsibility of the mill (Hoffman et al. 2015).

To improve air quality conditions, stakeholders could increase the capacity for surveillance, assessment, and response to air quality. Furthermore, evaluation of a wide-suite of air toxics, including NATA compounds not measured by the NAPS network (particularly prioritized air toxics) would contribute to ensuring that air quality in Canada is adequately studied. Therefore, ECCC and NSE should consider implementation of a long-term monitoring program for priority air toxics that is comparable to the NATA network monitored by EPA to characterize air toxics exposure on local, regional, and national scales. Data will be useful to help mitigate emissions and achieve acceptable air quality standards that do not exceed cancer or noncancer risk thresholds.

ECCC should also consider the feasibility of installing and maintaining additional strategically placed NAPS sites to improve air pollution evaluation in both rural and urban areas, as well as in microenvironments (e.g., near point source emitters, high-traffic areas) (Craig et al. 2008). More effective communication of the results is required to increase transparency among stakeholders, including the public (Hoffman et al. 2015). Based on the population's risk of exposure, it is strongly recommended that ambient air toxics monitoring to be incorporated at the established NAPS station in Pictou to optimize capturing of said air toxics, and to best correlate pertinent results. Additionally, atmospheric dispersion modeling should use local meteorological data; therefore, meteorological data should also be collected concurrently at NAPS sites to help identify source emitters.

Measurement of individual VOC compounds is necessary to provide insight into their contribution to $PM_{2.5}$ and ground-level O_3 formation. Data would be useful to help target large source emitters and aid regulatory enforcement. Establishment of stringent and/or adapted air quality standards that encompass more air toxics (e.g., VOCs) fosters strong public support and political engagement to address air quality issues. Moreover, health impacts associated with background air pollution should be estimated. Air quality management programs are human resource intensive; therefore, they must have clear and feasible short- and long-term objectives. These initiatives gain predictive insights on atmospheric chemistry, and engage and support relevant sectors in the development and implementation of policies to reduce health risks associated with air pollution exposure (Craig et al. 2008).

Conclusions

Findings reveal that 1,3-butadiene, benzene, and carbon tetrachloride exceeded their respective cancer risk thresholds and are of primary health concern in terms of population risk. Results highlight associations with wind direction and the Granton NAPS site's ambient VOC concentrations in relation to location of the pulp mill. Compared to AOWD, PW from the selected range (360°–80°) typically resulted in higher VOC concentrations for all compounds, except carbon tetrachloride, suggesting that the mill is likely a contributor to increased concentrations. In addition, there are clear seasonal variations of meteorological conditions and VOC concentrations. Southwest PW blowing towards Pictou dominate during summer months, when people spend more time outdoors, and consequently are exposed to higher concentrations. Due to Pictou's geography, air toxics from transboundary and local sources may converge in summer, resulting in higher VOC concentrations. Findings suggest the Granton NAPS site is not positioned to accurately represent ambient levels of toxicity in PC. Therefore, ECCC and NSE should consider incorporating ambient air toxics (e.g., VOCs) monitoring at the established Pictou NAPS site where there is higher residential exposure.

Future research will provide air quality management with a comprehensive characterization of air toxics to support informed public health decisions. Moreover, this pilot study may serve as a precursor to gaining awareness, so that government agencies adopt more stringent air quality regulations and monitoring programs to ensure health of citizens is safeguarded and prioritized.

Dear Minister Rankin;

I am writing on behalf of the Town of Pictou to inform you of a motion passed by Council at its Regular meeting on December 18, 2017.

The motion was passed following presentations made to Council by the **Northumberland Fisherman's Association** and **Friends of the Northumberland** expressing their concerns regarding the plan for effluent treatment at the Northern Pulp, Paper Excellence Facility located at Abercrombie Point in Nova Scotia. More specifically, both groups are against the dispersion of the effluent via pipe, into the Northumberland Strait.

We believe that the motion as passed speaks to the expectations of Pictou Town Council that all aspects of the effluent treatment plan are thoroughly examined by both provincial and federal departments prior to making a decision regarding its construction.

Motion: **It is moved that a letter be written to the Nova Scotia Environment Minister, and the Federal Ministers of the Environment and Climate Change and Fisheries and Oceans, requesting a review of the environmental assessment process being employed to assess the Northern Pulp proposal for effluent treatment. This request supports the completion of an Environmental Assessment Report and the possibility of a Class 2 environmental assessment to insure that the best possible solution for effluent treatment, disposal and monitoring is used and the fishing industry on the Northumberland Strait is not placed at risk.**

Dear Mr. Ryan,

Thank you for your email dated December 18, 2017, expressing concern regarding the Northern Pulp Effluent Treatment Facility Replacement Project proposed by Northern Pulp Nova Scotia Corporation.

The Canadian Environmental Assessment Agency recently received a request for the Minister of Environment and Climate Change Canada to designate the Project for a federal environmental assessment under section 14 of the *Canadian Environmental Assessment Act, 2012* (CEAA 2012). The Agency is currently assessing the applicability of CEAA 2012 to this Project and is seeking input from other government departments and Indigenous groups on whether the Project should be designated under CEAA 2012. The Agency will reflect the input received in its advice to the Minister.

Further questions regarding the Project and this analysis can be directed to Ms. Melanie Smith, Team Leader, at (902) 426-6623 or by email at Melanie.Smith@ceaa-acee.gc.ca.

Yours Sincerely,

M. J. Atkinson

October 24, 2018.

Mr. Bruce Chapman
General Manager
Northern Pulp Nova Scotia Corporation
260 Granton Abercrombie Branch Road
Abercrombie, NS B2H 5C6

Mr. Chapman:

I have become aware, through media reports, that the draft of a revised proposal by Northern Pulp for the disposal of treated effluent involves the installation of a pipe along TCH 106 to the Caribou Harbour. I am very disappointed that the Town was not consulted, or at least, informed of this potential proposal prior to its release to the media.

Assuming the media reports to be factual, the proposed route for the pipe will not only pass through the Town of Pictou, but will pass directly over the Caribou wellfield which is a major source of domestic drinking water for residents of the Town of Pictou and many residents of Central Caribou.

In light of recent events, I believe the proposed pipeline route will, and should, cause a great deal of concern for all residents of the Town and surrounding area.

As the owners of the Water Utility, the Town of Pictou holds water withdrawal approvals issued by the Nova Scotia Department of Environment for both the Caribou and Pictou wellfields along with the approval to operate a water treatment and distribution system.

In 2002, NSE introduced its Drinking Water Strategy to ensure safe, clean drinking water to its customers. As part of this strategy and the approval process, the town has fulfilled its responsibility to:

1) Form a Source Water Protection Advisory Committee
2) Delineate a Source Water Protection Area Boundary
3) Identify Potential Contaminants and Assess Risk
4) Develop a Source Water Protection Management Plan; and
5) Develop a Monitoring Program to Evaluate the Effectiveness of a Plan.

town of PICTOU
Birthplace of New Scotland

The Caribou/Pictou Source Water Protection Advisory Committee includes representation from both the Town of Pictou and the Municipality of Pictou County. It takes the responsibility to protect our source water for current and future generations very seriously and will continue to do so.

In conclusion, I am requesting that any future consideration of proposals that could have implications for the Town and its residents be communicated directly as part of your due diligence.

Sincerely,

James Ryan

October 26, 2018

His Worship James Ryan
Town of Pictou
40 Water Street
Pictou, NB B0K 1H0

Dear Mayor Ryan:

Thank you for your letter of October 24th and for the opportunity to speak with you that same day regarding the additional proposed route for an effluent pipeline.

Northern Pulp's effluent treatment facility (ETF) replacement project is a major undertaking. With work being carried out simultaneously on many files, timely communication with all stakeholders can be challenging. Unfortunately, due to unexpected circumstances, the past few days did not unfold as planned. Once again, please accept my apologies for not contacting you earlier.

Work on the Environmental Assessment (EA) submission documents for the ETF replacement project is still in progress. An important part of finalizing those documents is a feasibility study of the additional proposed pipeline route. Please understand that discovery on this additional proposed route is in its very early stages – there is much work yet to be done.

Northern Pulp acknowledges the Town of Pictou's responsibilities and interests in this matter. As part of our due diligence we will continue to engage and consult with all stakeholders, and look forward to those discussions, as we prepare to register for an EA.

I would welcome your call at any time throughout this process.

Sincerely,

Bruce Chapman
General Manager

Mr. Chapman;

Thank you for your prompt response to my letter of October 24th.

I appreciate that you are in the 'very early stages' of a feasibility study of proposed route(s) for an effluent pipe as part of the effluent treatment process.

Following consultation with Town Councillors, I believe it is a good time to inform you that any plans to install the pipe across the Town of Pictou watershed would be unacceptable.

As a stakeholder in the recently proposed plan, we look forward to future communications.

Sincerely,

James Ryan

Re: Northern Pulp Effluent Treatment Facility
Environmental Assessment

In November 2017, the Town of Pictou passed a resolution calling for letters to be written to the Nova Scotia Minister of Environment, the Federal Minister of Environment and Climate Change and the Minister of Fisheries and Oceans supporting 'the completion of an Environmental Assessment Report and the possibility of a Class 2 Environmental Assessment' and that the 'fishing industry on the Northumberland Strait is not placed at risk'. It is my understanding, from the correspondence I received from Mr. Mike Atkinson dated March 27, 2018, that the information (letter) to the Hon. Catherine McKenna was forwarded to CEAA for consideration. This is greatly appreciated.

Since that letter was written in 2017, a great deal has transpired with respect to the proposed Northern Pulp Treatment Facility including a modified plan for effluent disposal and consideration of a possible review of the project by CEAA.

At this time, I feel it to be prudent, as Mayor of the Town of Pictou, to elaborate on our original position and comment on additional concerns regarding the modified plan.

We, the Town, remain firm in our position that Federal oversight of this project would provide the most comprehensive assessment of 'risk' to the Northumberland Strait fishery. Due to the financial and regulatory relationship between the mill and the Province, and the potential effects of the project on a lucrative and sensitive marine environment shared by multiple provinces, trust can only be restored with a full Environmental Assessment.

In addition to our originally stated concerns, the modified proposed route for the pipe carrying treated effluent will pass directly over the Caribou/Pictou Watershed. As you can imagine, in light of recent breaks in the current system feeding the Boat Harbour Effluent Treatment Facility (ETF), this causes concern for residents of our Town. Recognizing that water is a Provincially regulated resource the contents of the treated effluent and the security of the transmission system must be adequately addressed within the scientific studies to ensure safety of our water supply.

The Town also has concerns about any potential for increased odour produced by the re-location of the AST (Activated Sludge Treatment) process and risks associated with the emissions from the power boiler when the sludge is burned. We do not have in-house expertise to adequately assess potential effects and how they might affect air quality (safety), but believe the EA Proposal submitted by Northern Pulp may not fully address these concerns.

Thank you for your consideration of this matter.

Sincerely,

James Ryan, Mayor

RE: **Environmental Registration**
EA 19-02-07 Northern Pulp Effluent Treatment Facility

Staff of the Department of Communities, Culture and Heritage has reviewed the EA document for the Northern Pulp Effluent Treatment Facility and have provided the following comments:

Archaeology

Staff reviewed the Registration Document and the sections particular to archaeology. There is considerable archaeological content. The sections that cover both marine and terrestrial archaeology (8.16 and 8.17), clearly indicate that work has been completed, but there is more work to be done including a marine Archaeological Resource Impact Assessment and monitoring during construction, possible shovel testing, and contingency planning; see section 8.16.3.2 for all recommendations for marine archaeology mitigation and section 8.17.3.2 for all recommendations for terrestrial archaeology mitigation. The ARIA by CRM Group Ltd. for terrestrial resources is noted, as well as the list of recommendations.

CCH has no additional comments at this time. However, this project will be followed to ensure future archaeological work and planning as noted in the EA document is conducted.

Botany

Staff reviewed the Registration Document and the sections particular to botany. The data and analysis completed to date are mostly reasonable. As noted in the document some key surveys for terrestrial plants and marine biota have not been completed.

Table E.1.1-1 lists all project-related residual environmental effects as NS, no significant residual environmental effects predicted. However, some key surveys for terrestrial plants and marine biota have not been completed. It is recommended that this table be revised once these surveys have been completed and the proponent can assess the residual environmental effects on the terrestrial plants and marine biota that are present in the study area.

Table 3.1-1 the federal Species at Risk Act should be included in this table. Until the additional botanical surveys are completed it is unknown if a species protected under SARA is present in the study area.

Section 8.7.2.4 notes that "The overstory (trees) within the wetland was dominated by white pine (*Picea glauca*) and American mountain-ash (*Sorbus americana*); as well, the overstory also consisted of red maple (*Acer rubrum*). The shrub layer was dominated by broadleaf cattail (*Typha latfolia*) and also contained field horsetail (*Equisetum arvense*), woolgrass (*Scirpus cyperinus*), cinnamon fern (*Osmunda cinnamomea*), sweet pea (*Lathyrus* sp.), Valerian (*Valeriana officinalis*), and common marsh bedstraw (*Galium palustre*)." Please note there are several errors of the Latin species names. The Latin name for eastern white pine is *Pinus strobus*. *Picea glauca* is the Latin name for white spruce. The currently accepted Latin name for cinnamon fern is *Osmundastrum cinnamomeum* (L.) C. Presl. It is unlikely that the canopy found in a natural swamp is white pine or white spruce. It is recommended that this be clarified through subsequent plant surveys. It is recommended that the proponent refer to and cite the Canadian Wetland Classification system in these descriptions (National Wetlands Working Group 1997).

Section 8.8.2.2 states that Jelly lichen (*Collex tenax*) "are typically calciphiles however salt from the ocean would increase the pH of coastal soils allowing them to thrive." Increases in pH due to excessive sodium are not the same as a calcium-rich habitat for plants. The reference that supports this statement should be cited.

The plant species list in Appendix P should include the subspecific designations where possible. E.g., *Phragmites australis*: one subspecies is an exotic invasive, while the other is not. Exotic & invasive species should be controlled, where possible, to prevent spread into surrounding habitats.

Palaeontology

Staff have reviewed the Registration Document, and sections particular to geology and paleontology resources and do not see any omissions or errors in the characterization of the risk to paleontology heritage resources within the project zone. The document notes that no disruption of bedrock geology is planned, so there appears to be little or no risk of damage to potential fossil sites in the area.

Zoology

Staff have reviewed the Registration Document, and sections particular to zoology. The VEC approach has been used for this review. This project has a potential wider ecological impact and perhaps should have used a different approach, since potential mitigation for rare species may not necessarily be consistent with the maintenance of ecological integrity (depending on the basis for designation of the species at risk).

Within the broader context of the project, it should be noted that there are relatively recent reports in the public media concerning the occurrences and changes of abundances of some "priority" fish and mammal species (Blue Whales, Striped Bass). It is recognized that the registration document reflects the state of knowledge at a given time and may not capture more-current events. It is expected that the review by the pertinent Regulatory agency (Fisheries and Oceans Canada) will capture those comments (especially the SARA-listed species).

Environmental Assessment Review-

March 8, 2019

NSE Engineers and ICE Review

PLANNING /DESIGN ISSUES

EFFLUENT FLOWS

1. FLOW DATA TO SUPPORT DESIGN FLOWS MUST BE PROVIDED.
    - The proposed treatment facility and accompanying receiving water study are based on an annual average flow rate of 62,000 m^3/day and a maximum daily flow rate of 85,000 m^3/day. No data has been provided to support the basis of the design. Appendix C of the Registration Document states the average flow is 70,000 to 75,000 m^3/day, not 62,000 m^3/day.
    - The EA submission does not provide an explanation of how flows will be reduced to achieve an annual average flow rate of 62,000 m^3/day (a reduction of 8,000 to 13,000 m^3/day by the data provided in the EARD). NPNS is required under their current IA (Conditions 5f) to submit a plan, including modelling, 1 year prior to proposed implementation of projects. To date, NPNS has not submitted any planned water/wastewater reductions.
    - Unclear if design flows presented were based on Point A or Point C flows. Flow measurements from Point C of the BHTF may not be representative of the actual peak flows which will be experienced by the new ETF. The BHTF has the ability to buffer flows due to it's sheer size (days retention), the new ETF will not have the capacity to do so (hours retention). Water usage data for 2017 from Internal Services indicates the Facility used more than 85,000 m^3 23.85% of the year, (83 days of the 348 operational days) and the data submitted monthly by NP indicates more than 85,000 m^3 27.9% of the year (97 days). The table below represents the number of days each month that 85,000 m^3 was exceeded in 2017 and the maximum volume withdrawn on a single day during each month:

MONTH	# DAYS >85,000 m3	MAXIMUM 1 DAY WATER USE
January	1	94,029 m^3
February	1	92,023 m^3
March	3	90,275 m^3
April	3	99,306 m^3
May	1	86,951 m^3
June	9	91,054 m^3
July	21	94,495 m^3
August	17	120,731 m^3
September	16	109,716 m^3
October	4	99,185 m^3

November	3	96,350 m^3
December	4	97,031 m^3

Please note any influent volumes to the new ETF or discharge from the proposed outfall pipe in excess of 85,000 m^3/day would invalidate the ETF design and the receiving water study results.

INFLUENT/EFFLUENT PARAMETERS

2. COMPLETE CHARACTERIZATION OF INFLUENT (AT POINT A) HAS NOT BEEN PROVIDED TO ASSESS THE APPROPRIATENESS OF THE PROPOSED TREATMENT TECHNOLOGY.
3. RATIONALE FOR THE INCREASE IN NUTRIENT LOADING MUST BE PROVIDED.

   The receiving water study undertaken for the Pictou Road discharge location proposed a daily maximum total nitrogen concentration of 3.0 mg/L. The revised receiving water study included in the EARD indicates a daily maximum of 6.0 mg/L. No explanation has been provided with respect to increase in total nitrogen.

4. DATA TO SUPPORT COD REDUCTIONS (TOTAL AND SOLUABLE) AS WELL AS FRACTIONIZATION OF COD IN NPNS INFLUENT IS REQUIRED TO DETERMINE IF THE PROPOSED TREATMENT TECHNOLOGY IS APPROPRIATE.
   - Under the current IA (Condition 6(e)), NPNS must achieve a 50% reduction from the benchmark total COD concentration of 1900 mg/L on the influent to the ETF by January 31, 2020. This means the influent total COD to the new ETF must not exceed 950 mg/L.
   - The receiving water study proposes a COD effluent limit from the ETF of 725 mg/L.
   - The EARD Section 5.2.2.6 indicates the ANOXKALDNES BAS™ system will reduce soluble COD by approximately 70% and the MBBR should be capable of removing approximately 40% of the easily biodegradable soluble COD. There is no data provided to support these assertions.
   - The EARD does not provide data on current influent COD fractionization (i.e. what portion of NPNS' influent at Point A is readily biodegradable, slowly biodegradable, soluble non-biodegradable and particulate non-biodegradable) in order to understand the treatment efficiency of the proposed ETF with respect to total COD. In the absence of this information, an assessment of the new ETF's ability to achieve compliance can not be completed.

ETF TECHNOLOGY

5. TREATMENT TECHNOLOGY SPCEIFICATIONS WERE NOT PROVIDED TO ASSESS THE EFFICACY OF THE TECHNOLOGY
6. MITIGATION OF MEDIA LOSS.
   - Table 4.2-1 indicates MBBRs are sensitive to risk of loss of media and the technology has a limited degree of process automation. The EARD does not address how these highlighted drawbacks will be mitigated by NPNS. Please note, under-design of the system in terms of flows could increase the risk of media loss.
7. OPTIMUM TEMPERATURE OPERATING RANGES FOR THE ETF HAVE NOT BEEN PROVIDED.

- The temperatures indicated are above the range of optimum treatability, generally accepted to be between 25 to 35. °C The highest temperatures and highest flows will occur simultaneously during the summer months. What effect will these facts have on the ability of ETF to consistently meet and not exceed effluent limits?

SPILL BASIN

8. INSUFFICIENT INFORMATION TO ASSESS THE SIZING AND APPROPRIATENESS OF THE DESIGN OF THE SPILL BASIN.
    - The EARD indicates a retention time of 10-13 hours at a design capacity of 35,000 m^3. The basis of this design has not been provided therefore there is insufficient information to assess the appropriateness of the design.
    - If flows exceed 85,000m3 per day on a consistent basis (77 out of 92 days for 3 consecutive months in the summer where daily water use is >85,000 m3), there will not be sufficient recovery time in ETF to empty the basin before it is required.
    - There is only a mention of a "the standard operating procedure will be to keep the spill basin nearly empty so the full volume is available when needed" the document does not discuss how this will be accomplished.
    - Is there an overflow? If so, where will the overflow be directed?

RECEIVING WATER STUDY

9. BASELINE DATA USED FOR THE UPDATED RECEIVING WATER STUDY DOES NOT REFLECT THE NEW LOCATION. BASELINE WATER QUALITY STUDIES ALONG WITH ADJUSTMENT TO THE MODEL ARE REQUIRED.
10. IT IS NOT CLEAR THAT THE SALINITY AND TEMPERATURE DIFFERENTIAL OF THE EFFLUENT HAS BEEN ACCOUNTED FOR IN THE MODELING.
    - Regardless of allowable dimensions for mixing zones indicated by CCME, effluent plumes shall not create changes to aesthetics or use at the water's surface. The study indicates color will reach background and not be visible at surface. When buoyancy differences are greater in winter, it results in a faster rising plume. Has this been accounted for?
11. 2 PORT DIFFUSER MODELING WAS NOT PROVIDED.
    - A 1-port and 3-port diffuser were modeled. The modeling indicates the plume will touch the seabed at 200 m and 10 m respectively. This is a large difference. Was a 2-port diffuser modeled? If so, at what distance does the plume interact with the seabed and what are the dilution factors?
12. DATA FROM LAB TRIALS ON NPNS RAW WASTEWATER AT SIMILAR FACILITIES NOR MODELLING OF NPNS RAW WASTEWATER PARAMETERS WERE NOT PROVIDED TO ASSESS THE EFFICACY OF THE PROPOSED TECHNOLOGY.

PIPELINE

13. DETAILS OF TRENCH LINING AS SECONDARY CONTAINMENT WERE NOT PROVIDED.
    - Trench lining as secondary containment could divert shallow groundwater and change flow regimes. This would be of greater concern within the Town of Pictou Watershed.

14. DETAILS OF LEAK DETECTION WERE NOT PROVIDED IN THE EARD.

- Insufficient information was provided in the EARDregarding the proponent's plan for monitoring and mitigating potential leaks along the pipeline route. Detailed plans regarding monitoring and mitigation measures for the prevention/containment of potential pipeline leaks should be provided for further evaluation. This is particularly important in sensitive areas, such as the Town of Pictou's Source Water Protection Area and areas in proximity to private water supply wells, watercourses, and wetlands.
- Viable options for leak detection technologies and inspection methodologies should be provided.

OPERATIONAL ISSUES/OTHER PERMITTING PROCESSES

SPILL BASIN

1. DANGEROUS GOODS/WASTE DANGEROUS GOODS SPILL CONTAINMENT WHICH IS COMPLIANT WITH THE DANGEROUS GOODS MANAGEMENT REGULATIONS HAS NOT BEEN ADDRESSED.
    - The EARD proposes a spill basin for "excess process flows that are outside the tolerances of the ETF to handle". Current, any spills of dangerous goods from within the Facility go directly to the settling basins at BHETF. NPNS is currently not in compliance with the Dangerous Goods Management Regulations as the BHETF is not Approved to accept and/or treat dangerous or waste dangerous goods. NPNS has indicated since 2015 that spill containment would have to be addressed when a new ETF is proposed. NPNS has not provided details on spill containment for dangerous goods in accordance with the Dangerous Goods Management Regulations nor does the EARD address treatment of dangerous or waste dangerous goods within the new ETF.

TOWN OF PICTOU WATERSHED

2. CONSULTATION WITH THE TOWN OF PICTOU SHOULD BE REQUIRED.
    - The proposed pipeline location passes through the Town of Pictou watershed. The aquifer serving the Town is a shallow, sand and gravel aquifer. It is unclear in the EARD if NPNS consulted directly with the Town on potential concerns and mitigation measures.

ETF

3. TRAINED OPERATOR FOR THE NEW ETF.
    - The AnoxKaldnes BAS^{TM} process is more complex than the existing lagoon based system with significantly less retention time available. Treatment systems only perform well when they are operated well. The submission does not comment on the specific training and experience of the proposed operator. Due to the complexity of the system and the importance of precise operation in order to achieve regulatory compliance, the system should be operated by an individual with education and experience necessary to operate the new ETF such as an individual who has achieved minimum of a Level 4 Operator Certification. These qualifications should be demonstrated to the Department. This individual would also be in direct responsible charge of the operation of the ETF.

COLOUR

4. O2 DELIGNIFICATION REQUIRED.

- The receiving water study indicates the colour of the effluent will be 750 TCU at the point of discharge. Although background samples were not collected at the proposed discharge location, colour at the previously proposed Pictou Road discharge location was measured at an average value of 10.8 TCU. A BC Government document entitled "Ambient Water Quality Criteria for Colour in British Columbia" (https://www2.gov.bc.ca/assets/gov/environment/air-land-water/water/waterquality/wqgs-wqos/approved-wqgs/colour-tech.pdf) indicates colour is an issue for several Mills in BC who discharge freshwater effluent to freshwater receiving bodies, including some with diffusers. There is insufficient information and data provided to assess if temperature and salinity differential will have an effect on the visibility of the effluent.
- Alberta Environment regulate colour discharges at the Weyerhaeuser Grande Prairie kraft pulp mill.
- Dark coloured effluents could create a visual barrier for aquatic species to find food sources and also prevent/restrict light penetration, necessary for the growth of aquatic plants.
- The EARD Appendix C states O_2 delignification has many benefits to the process and the environment. NPNS does not commit firmly to an installation date for O_2 delignification.
- O_2 delignification will significantly reduce colour and COD to the influent of the new ETF.
- O_2 delignification would generate cost savings to the Mill in reduced chemical demands.
- A study entitled "Marine Pollution Effects of Pulp and Paper Wastes" by T.H. Pearson indicates the ferric oxides in mill effluent impart a yellow/orange colour to the marine sediments, becoming progressively black as the ferric compounds are reduced to ferrous compounds, nitrates are reduced to nitrites and ammonia, which have a negative influence on the macrobiology of the sediments. With the employment of O_2 Delignification, the management of transition metals, such as ferric oxides, is very important for the selectivity of oxygen delignification (Gullichsen and Fogelholm, 2000). Therefore removing transition metals by prior acid washing and/or chelation and stabilizing the transition metals by adding magnesium salts and silicates not only helps maintain pulp strength but also reduce the oxide redox reactions at the point of discharge.

ODOURS

5. ODOUR ISSUES AT THE NEW ETF LOCATION HAVE NOT BEEN FULLY DISCUSSED.
    - The EARD does not discuss measures to control odours from the new treatment system during times of upset conditions.

STUDIES

6. SITE SPECIFIC PRE-DISCHARGE STUDIES OF THE POTENTIAL EFFECTS ON THE MARINE ECOSYSTEM.
    - The submitted Scientific Literature Effect of BKME on Lobster report recommends site specific studies using actual Mill effluent to more accurately assess the potential for impact to adult lobsters including lethality, behavior, and sublethal impacts. The EARD proposes a post discharge survey within 24 months of the initiation of discharge from

the new outfall location. This study should be conducted before the discharge location is approved as there is insufficient information in the EARD to assess the appropriateness of the proposed discharge location in relation to the effects of BKME on the lobster population.

7. MARINE GEOTECHNICAL SURVEYS NEED TO BE COMPLETED.
    - Insufficient information has been provided in the EARD to determine if the proposed discharge location is acceptable. Marine geotechnical surveys are required to determine the exact scour range the pipeline needs to be protected against.
8. DOMESTIC WELL SURVEY
    - A pre-construction domestic well survey along the pipeline route would be beneficial as a means of collecting baseline data from nearby private water supply wells. Typical domestic well surveys include wells within a 500 m radius of the proposed activity and involve both water quality sampling and water level measurements. It is important to verify the number and location of wells to include in the survey in the field rather than relying on NSE's Well Logs Database.
9. SEASONAL ASSESSMENTS ARE REQUIRED FOR WETLAND ALTERATIONS AS WELL AS FOR GEOTECHNICAL ASSESSMENTS IN WATERCOURSES.
    - Methods and locations for watercourse and wetland crossings have not been confirmed therefore additional information is required to assess the potential environmental impacts.
10. GROUNDWATER AND SURFACE WATER MONITORING (ETF SITE).
    - There is an existing groundwater and surface water monitoring program at the mill site, which would have to be modified to accommodate the proposed project. Changes to the current monitoring locations, parameters, and frequency would be based on the proposed new infrastructure, such as the spill basin, clarifiers, and chemical storage, and effluent quality. Additional baseline data would also have to be collected.
11. GROUNDWATER MONITORING (PIPELINE ROUTE).
    - The EARD suggests pre- and post-construction groundwater monitoring along the pipeline route to ensure no alterations to groundwater from the construction process. Details of this proposed monitoring program were not provided, and the EARD did not discuss the potential for impacts to groundwater associated with the operation of the pipeline. The potential for impacts to groundwater associated with the operation of the pipeline and should be evaluated along with the need for groundwater monitoring along the pipeline route. This is particularly important in sensitive areas, such as the Town's Source Water Protection Area, areas in proximity to private water supply wells, and locations where the proposed pipeline location is below the water table.
12. SURFACE WATER MONITORING (PIPELINE ROUTE).
    - Surface water quality along the pipeline route was assessed in December 2018, including both field measurements and water quality samples. The EARD indicated that baseline surface water monitoring along the pipeline route would include, at a minimum, collection of water quality data over three seasons. It would also be beneficial to conduct post-construction water quality sampling for comparison to baseline to evaluate potential impacts to water quality associated with construction activities.
13. EXCAVATION BELOW THE WATER TABLE.

- According to the EARD, there is potential for some of the infrastructure associated with the project to be installed below the local groundwater table, e.g., clarifiers at the ETF site. The report indicates that water removed from the excavation(s) will be tested and released appropriately; however, no details were provided. Typically, such plans would be reviewed and approved by NSE prior to construction.

14. PILOT SCALE TESTING OF THE PROPOSED ETF TO CONFIRM ASSUMPTIONS.
    - Pilot scale testing of treatment technology at the Facility on the actual effluent would provide confirmation that the technology can consistently achieve the effluent discharge concentrations outlined in the EARD.
15. POTENTIAL FOR CONTAMINATION
    - Given the location of the proposed project, i.e., on an existing industrial site and within the highway right of way, there would be potential for contamination to be encountered during the construction phase of the project. NPNS committed to developing a contingency plan for managing any contamination that is encountered during construction. Typically, such plans are reviewed and approved by NSE.
    - The EARD mentions the potential for encountering contaminants from the adjacent Canso Chemical site, however there is no specific plan for the management of the potentially encountered soil and groundwater. It is important to have a plan prepared prior to encountering materials.
16. CHEMICAL STORAGE (ETF SITE)
    - The EARD states the ETF will require several chemical inputs, which will be stored on site. The proposed location of the chemical storage area(s) should be identified.
17. BASELINE STUDIES
    - Many baseline studies have yet to be completed. These studies should be completed in order to assess the appropriateness of the proposed pipeline location.

TEMPERATURE

18. MITIGATION MEASURES FOR THE PROTECTION OF AQUATIC LIFE NEAR THE DIFFUSERS SHOULD BE REQUIRED.
    - Temperatures could be as high as 37 ^{o}C (summer) and 25 ^{o}C above background (winter).

PIPELINE

19. PIPELINE INSTALLATION METHODS SHOULD BE PROVIDED.
    - Several land-based installation options have been provided however the location where each option is proposed has not therefore there is insufficient information to provide comment.
    - Detailed plans regarding directional drilling should be provided.
20. PERMISSIONS FROM TIR OPERATIONS AND TRANSPORT CANADA HAVE NOT BEEN OBTAINED.
    - Based on previously reviewed projects proposed for installation within the TIR RoW, such installations have not been approved by TIR Operations. It is important for NPNS to obtain approval prior to EA approval as if the pipeline installation proposal changes to include widening of the shoulder of the road, an alteration of a wetland or wetland complex greater than 4 hectares may be triggered.

21. ADDITIONAL INFORMATION IS REQUIRED TO ASSESS THE POTENTIAL ENVIRONMENTAL IMPACTS OF BLASTING.
    - Blasting has not been excluded as an option and could have significant impacts on the aquatic environment.

OPERATION & MAINTENANCE

22. DETAILS OF AND SCHEDULES FOR MAINTENANCE AND INSPECTION SHOULD BE PROVIDED.
    - Operation and maintenance procedures for the spill basin should been provided.
    - The diffusers are an integral component for NPNS to achieve water quality requirements.
    - Pipeline operation 5.3.2.4 indicates that incremental replacement of components may be required, however, a maintenance and monitoring schedule based on the industry standards was not provided.
23. SPILL RESPONSE PLAN SHOULD BE PROVIDED.
    - The document does not discuss in detail a coastal response plan for release from either the proposed new system or the pipeline.

OTHER OBSERVATIONS

1. Town of Pictou Source Water Protection Area: further delineation of the wellhead protection areas, i.e., 5, 10, and 25-year time of travel zones, would be beneficial in assessing the potential impacts to the municipal wells associated with operation of the proposed pipeline.
2. Existing Monitoring Well Network (ETF Site): as stated in the EARD, the existing monitoring well network should be protected during construction activities. As with all industrial sites, NSE requires any monitoring wells that are destroyed or damaged be decommissioned and replaced or repaired. Any change to the existing monitoring well network will trigger a change to the groundwater monitoring program for the mill site.
3. Existing Surface Water Monitoring Network (ETF Site): as stated in the EARD, there is one, possibly two, watercourses that fall within the footprint of the proposed project, which may have to be reconfigured. Any watercourse alterations would have to meet NSE requirements. Both watercourses are included in the existing surface water monitoring network for the mill site; therefore, the suggested reconfiguration may trigger a change to the existing surface water monitoring program for the mill site.
4. Comparison of the actual effluent plume travel from Point D into Pictou Road (actual data collected under current seasonal conditions) with the EARD proposed discharge location would have been useful for the public to compare current conditions with anticipated conditions from the new proposed discharge location.
5. 2017 and 2018 data reported for Pt. C indicates 9% and 13.7% of TSS samples had concentrations greater than 48 mg/L (33 of 365 for 2017; 50 of 365 for 2018) and 5% and 9.6% of BOD samples were greater than 48 mg/L (8 of 156 for 2017; 15 of 156 for 2018). Data also indicates 2017 and 2018 discharges into the Northumberland Strait at Pt. D were all below 48 mg/L with the exception of two TSS samples.
6. There was no in-depth discussion or analysis of the use of physico-chemical processes as an option to provide treatment of the effluent. Weyerhaeuser Grand Prairie bleached kraft mill in Alberta compared the efficiencies of ultrafiltration and reverse osmosis in a 1997 study conducted to reduce colour and total organic carbon (Sierka et al.). The study concluded UF and

RO gave excellent results removing 99% of colour and more than 80% of TOC from the effluent tested. Pilot scale studies have been conducted on pulp mill effluent using two-stage membrane filtration, ultrafiltration and reverse osmosis resulting in very high removals of COD, colour and conductivity from the effluents (Koyuncu et al.)

7. Acid Rock Drainage Potential: according to the EARD, it is not anticipated that bedrock with acid producing potential will be encountered during construction. As with all construction projects, any acid producing bedrock that is encountered during construction should be properly managed.
8. EPP and EMP have not been developed and throughout the documentation these future documents are referenced as the guiding principles of a large portion of the mitigation during all construction phase of the project. These are also mentioned as guiding documents for the project.
9. A statement is made in the Vernal Pools section *"Wet areas that are greater than 100 m^2 are not considered wetlands by the Nova Scotia Wetland Conservation Policy, and therefore receive no legal protection",* NSE defines wetlands as follows*: Land commonly referred to as marsh, swamp, fen or bog that either periodically or permanently has a water table at, near or above the land's surface or that is saturated with water, and sustains aquatic processes as indicated by the presence of poorly drained soils, hydrophytic vegetation and biological activities adapted to wet conditions.* Wetland alteration exemptions exist only for certain activities and in specific wetland types.
10. It is important that re-vegetation adjacent to wetlands not introduce alien species into the wetland environment. It was noted that DOT mix was proposed for all revegetation.
11. Based on a compliance history report from 2009 to present ICE 286 complaints about the operation of the mill.
12. Northern Pulp Nova Scotia Corporation has to date complied with all compliance items. Between 2009 to present this included thirteen directives, nine deficiencies, and one warning ticket.
13. Northern Pulp Nova Scotia Corporation received one Summary Offence Ticket.

From: Peveril, Michele

Subject: DoB EA comments
Date: March 11, 2019 5:31:23 PM

Northern Pulp EA Comments from DoB:

The Nova Scotia Department of Business has reviewed the January 2019 Environmental Assessment Registration Document for the Replacement Effluent Treatment Facility as provided by Northern Pulp Nova Scotia Corporation in the context of the Department's mandate to lead and align government efforts behind a common agenda for inclusive economic growth. That means ensuring we have the economic conditions so businesses can thrive and all Nova Scotians can participate and benefit. The department focuses on strategic priorities and opportunities that encourage Nova Scotia's innovation, competitiveness, entrepreneurship, and export orientation. In particular, the department concentrates on key sectors that represent a competitive or comparative advantage for Nova Scotia that will create opportunities for enterprises and entrepreneurship to thrive and lead to the export of more products and services. That includes private businesses, social enterprises, and institutions, working together in clusters in all regions of the province. To achieve government's mandate, the department works collaboratively with our Crown corporations (Develop Nova Scotia, Halifax Convention Centre Corporation (Events East Group), Innovacorp, Invest Nova Scotia, Nova Scotia Business Inc. and Tourism Nova Scotia), key partners in other levels of government, entrepreneurs, large businesses, post-secondary institutions, venture capital investors and Nova Scotians to create a dynamic environment for businesses to succeed. Working together, reinforcing each other's activities, creates a stronger, collective impact that can realize the province's inclusive economic growth objectives.

The Environmental Assessment Registration Document for the Replacement Effluent Treatment Facility section 8.14 "Socio-Economic Environment" (page 431) states that "The Valued Environmental Components (VECs) identified for the project include plants and wildlife on land and in the water – all of which directly or indirectly support coastal fisheries, aquaculture, tourism and recreation in the region and in the Northumberland Strait. Cultural heritage and other direct interactions with residents' health are also VECs." Each of these VECs is discussed subsequently in the Registration Document. The existing environment, potential effects, residual effects and mitigation during the construction phase and operation/maintenance phase were outlined. A listing of the VECs interdependent to the socio-economic environment and a summary was provided in the Registration Document to address residual environmental effects to the socio-economic environment. The activities, effects, mitigative factors/measures and residual effects were each characterized as "Not Significant – Adverse" in summarizing the significance of the residual effects. There is insufficient evidence presented in the Registration Documents to support the proponent's conclusions that the impacts are "Not Significant-Adverse". For instance, impact ranges were not estimated in quantified terms to fully address the various VECs identified.

Halifax, NS B3J 2P8

Dear Ms. Yeh:

Re: Northern Pulp Effluent Treatment Facility Replacement Project Environmental Assessment Registration

Environment and Climate Change Canada (ECCC) has reviewed the Environmental Assessment Registration (submitted February 7, 2019) for the above-noted project proposal.

ECCC's review of the project is based on the department's mandate and responsibilities under the *Canadian Environmental Protection Act*, *Fisheries Act* (Section 36 and the Pulp and Paper Effluent Regulations), *Species at Risk Act*, and the *Migratory Birds Convention Act.* Stemming from this, ECCC has identified a number of requirements for regulatory compliance the proponent will have to meet should it proceed to construct and operate the proposed facility.

For other matters, the level of information in the EA Registration is not sufficient for ECCC to determine that the project will conform to all applicable legislation or to understand the magnitude of impacts to environmental features of concern to the department. ECCC is prepared to work with Nova Scotia Environment and other regulatory departments and agencies to identify the timing and mechanisms to address these issues.

Please feel free to contact me or Stephen Zwicker at (902) 426-0992 / Stephen.Zwicker@canada.ca who is coordinating ECCC's review of this project if you have any questions or concerns.

Yours truly,

for Jeffrey Corkum
Regional Director
Environmental Protection Operations Directorate, Atlantic

Northern Pulp Replacement Effluent Treatment Facility Project – Environment and Climate Change Comments, March 18, 2019

Applicable Legislation

The proponent should be made aware of federal legislation described in the following sections that falls under the mandate of Environment and Climate Change Canada (ECCC), and could be applicable to this project.

Effluent Discharges

The deposit of effluent from the facility would be subject to the *Pulp & Paper Effluent Regulations* https://laws-lois.justice.gc.ca/eng/regulations/SOR-92-269/ (under the *Fisheries Act*), which prescribe certain deleterious substances related to the effluent from Pulp & Paper Mills, and authorizes the deposit of limited quantities of those deleterious substances under certain conditions. These regulations include a requirement to conduct environmental effects monitoring studies of the potential effects of effluent on fish, fish usability by humans and fish habitat. The facility would also be subject to the *Pulp & Paper Mill Effluent Dioxin and Furan Regulations* https://laws-lois.justice.gc.ca/eng/regulations/SOR-92-267/, and the *Pulp and Paper Mill Defoamer and Wood Chip Regulations* https://laws-lois.justice.gc.ca/eng/regulations/SOR-92-268/, (both under the *Canadian Environmental Protection Act*).

ECCC has been consulting with interested parties including industry, the provinces and territories, and Indigenous groups regarding the Modernization of the *Pulp & Paper Effluent Regulations*. Public consultation documents prepared to date include:

- *Proposed Modernization of the Pulp and Paper Effluent Regulations – Consultation Document September 2017*

Further information on the regulatory approach and/or status of the regulatory development process can be obtained from:

Marine Pipeline Construction

In Table 3.1.1 and on page 21, the potential need for a Disposal at Sea Permit in relation to possible “ocean based disposal of dredged material” is acknowledged. To be clear, Disposal at Sea of dredged material would include any permanent sidecasting of sediment during the trenching of the pipeline route. ECCC will also need to determine the applicability of CEPA 122(1)(i) which speaks to “the placement of a substance for a purpose other than its mere

disposal…". This permit exemption may potentially apply to any planned backfilling of the pipeline trench using sidecast material. If it is determined however, that the criteria for CEPA 122(1)(i) has not been met, then a Disposal at Sea permit would be required.

Page 20 of Appendix F states that the pipeline route will be verified with marine surveying and soil testing. Given that activities related to the pipeline installation may require a Disposal at Sea permit, it is strongly recommended that the proponent take that opportunity to characterize the sediment in a manner that meets ECCC's requirements for a Disposal at Sea permit application.

The proponent is encouraged to contact ECCC directly to discuss minimum sampling requirements as well as evaluation criteria regarding CEPA 122(1)(i).

ECCC administers and enforces Subsections 36(3) to (6) of the *Fisheries Act*, which prohibits anyone from depositing or permitting "*the deposit of a deleterious substance of any type in water frequented by fish, or in any place under any conditions where the deleterious substance, or any other deleterious substance that results from the deposit of the deleterious substance may enter such water*". Consideration of this must be given to all aspects of the project, including but not limited to on-land pipeline construction.

Wildlife and Wildlife Habitat

Migratory birds, their eggs, nests, and young are protected under the *Migratory Birds Convention Act* (MBCA). Migratory birds protected by the MBCA generally include all seabirds (except cormorants and pelicans), all waterfowl, all shorebirds, and most landbirds (birds with principally terrestrial life cycles). The list of species protected by the MBCA can be found at: https://www.ec.gc.ca/nature/default.asp?lang=En&n=496E2702-1. Bird species not listed may be protected under other legislation.

Under Section 6 of the *Migratory Birds Regulations* (MBR), it is forbidden to disturb, destroy, or take a nest or egg of a migratory bird; or to be in possession of a live migratory bird, or its carcass, skin, nest or egg, except under authority of a permit.

Furthermore, Section 5.1 of the MBCA describes prohibitions related to deposit of substances harmful to migratory birds:

> "5.1 (1) No person or vessel shall deposit a substance that is harmful to migratory birds, or permit such a substance to be deposited, in waters or an area frequented by migratory birds or in a place from which the substance may enter such waters or such an area.
>
> (2) No person or vessel shall deposit a substance or permit a substance to be deposited in any place if the substance, in combination with one or more substances, results in a substance — in waters or an area frequented by migratory birds or in a place from which it may enter such waters or such an area — that is harmful to migratory birds."

Information Required to Support EA Conclusions

The following sections relate to information that would be required to support EA conclusions about the nature and magnitude of potential environmental effects that, in ECCC's view are not adequately described in the EA Registration Document.

Effluent Treatment and Discharges

- Without empirical baseline information on the Caribou Harbour area associated with the proposed outfall location, ECCC is not in a position to assess the predictions made in the report, nor to evaluate the potential environmental impacts related to that aspect of the project.

- Mixing Zone as defined in the report glossary in the context of this project, refers to the marine area within a 100 m distance from the termination of the effluent pipeline (page xxviii). However, several of the effluent plume figures refer to a "regulatory mixing zone." There is no federal regulatory mixing zone, however effluent concentration at fixed distances from discharge are relevant to determining EEM requirements. Clarification on what is intended by the term "regulatory mixing zone", and what regulations might be referred to here is needed.

- Table 3.1.1, p.17
    - *Fisheries Act* Section 36 is referenced in the "Summary of Applicability" column and then states no permit or approval is required. While there is no approval required, it should be clear that all activities must be carried out in compliance with Section 36(3)
    - *The Pulp and Paper Mill Effluent Dioxin and Furan Regulations* and *the Pulp and Paper Mill Defoamer and Wood Chip Regulations* (both under CEPA) have not been identified. The proponent currently submits information under these regulations and this would be expected to continue with a new treatment facility.

- Table 4.2.1, p.28
    - In reference to tertiary treatment, it is stated under the advantages: "Used when conventional treatment cannot remove a specific contaminant that is found harmful to a specific local ecosystem". Tertiary treatment is considered a general term rather than a process, so any "Tertiary Process" being referred to should be identified along with the parameter(s) that may require such treatment.

- Section 5.2.2.3, p.42. A discussion on the potential need and options for leak detection should be included as part of the Spill Collection System.

- Section 5.3.1.6, p.54. While it is stated effluent from the ETF will meet NSE requirements, it should be noted that the effluent discharged must also be in compliance with the *Pulp and Paper Effluent Regulations* (under the Fisheries Act) and the *Pulp and Paper Mill Effluent Dioxin and Furan Regulations* (under CEPA). The mill must also comply with the *Pulp and Paper Mill Defoamer and Wood Chip Regulations (under CEPA)*.

- Section 5.6.1, p.83. It is stated "The PPER, and those regulations cited by the PPER, regulate the quality of effluent and remain under the jurisdiction of ECCC." Similar statements are made in other sections. Any regulations, other than the PPER, that are being referenced should be specified.

- Section 8.4.1, p.168. This section references the *Fisheries Act* – Deleterious Substance Provisions (Section 36), as a guideline, standard or regulatory requirement related to surface water that may apply to the project. It should be clear that Section 36 of the *Fisheries Act* does apply to activities related to the project and any references to this section should be consistent with the specific regulatory language.

- Section 8.11.2.4, p.343. It is stated: "Pictou Harbour is used as a proxy for Caribou Harbour with respect to water quality, in the absence of available water quality data for Caribou Harbour. Pictou Harbour is similar to Caribou Harbour in terms of depth and geography, but likely has greater freshwater influence." Without empirical baseline data from the actual discharge location, it is not possible to assess such statements or to evaluate the potential environmental impacts of the effluent discharge.

- Section 8.11.3.1, p.346. This section summarises the predicted residual effects on the physical environment of Caribou Harbour (sediment and water quality) despite the absence of baseline information on water and sediment quality in the assessment area.

  No information has been provided with respect to the physical and chemical characteristics of the sediments to be excavated to install the pipeline. Conclusions on environmental quality resulting from the project are presented after extrapolating from data from Pictou Road.

  Empirical baseline information on the Caribou Harbour and Caribou Point area of Northumberland Strait is necessary to estimate with some confidence the direction and impact of residual effects on the physical environment within the marine assessment area.

  The follow-up and monitoring program outlined in Appendix H should be considered preliminary only, subject to modification once predictions, conclusions and decisions based on site specific data are made regarding the project.

- Appendix E1, Section 2.0. It appears that the Far-Field model simulations were run before the Near-Field model. One could expect that the behavior of the plume further afield depends to a large extent on how it behaved at the diffuser, i.e. how quickly it mixed and spread and rose to the surface. It should be explained how the initial mixing and dispersal of the plume was taken into account when simulating Far-Field extent and concentrations of effluent in Section 3.

- References should be provided to support the arguments on page 3. An alternative would be to provide the equivalent plume simulation during winter conditions to compare to the summer modelling results.
- Appendix E1, Table 2.1. The table identifies the simulation time step as 60 seconds. Is this correct? An explanation on the step interval used for the plume simulation should be provided.

- Appendix E1, p.6 and Figures 2.5 to 2.13. The explanatory details provided on far-field simulations are very brief and do not permit a full appreciation of the model's robustness or the credibility of its results.

  Figure 2.13 shows the final state of the plume at the end of one month, more than 9 days after the tidal phase depicted by the preceding Figure 2.12. It is not specified whether any of these figures depict the maximum extent of the simulated plume, nor how isolated effluent patches form, nor why the final plume at the end of the month is further south-east than any of the preceding snapshots provided.

  Given that EA predictions for the aquatic environment are based on the premise that simulated conditions return to surrogate (Pictou area) background levels within 2- to 100 m from the diffuser depending on the parameter in question, it is important to establish a high degree of confidence in the model simulation and input parameters.

  It would be helpful in understanding the simulation to see how the isolated patches form and disintegrate, as well as an animation of the plume for the few days leading to the final state of the plume in Figure 2.13. The maximum extent of the modelled plume should have been provided, if it is not depicted in one of the figures.

- Appendix E1, p. 16. The report indicates that higher background level of contaminants from the Pictou area of the Strait were used as input parameters for background water quality, (due to a lack of data from the Caribou area), and as such can be considered more conservative. This may not be accurate: the Caribou Harbour area is expected to be less contaminated than Pictou Harbour, such that the effluent being discharged near Caribou would in reality be more concentrated relative to receiving water than what is suggested by the simulation based on Pictou baseline data. In other words, it would require greater dilution than estimated based on Pictou data to achieve a return to the levels theoretically prevailing in the Caribou area. To use an example from page 24, where TN is taken to be 0.24 mg/L (as in Pictou Road), a 1:25 dilution of effluent is needed to return TN levels to "background". But if TN in Caribou area were, say, 0.1 mg/L, then a 1:60 dilution would be required to return TN concentrations to ambient levels. The dilution ratios and distances required to achieve background levels for most other water-quality parameters may also be underestimated on page 24-25.

- Appendix E1, Table 3.1. The table presents some water-quality parameters used as background conditions for Caribou Harbour. The title of the table should have identified the source of the samples as being from Pictou rather than Caribou area. As well, the depth in the water column at which samples were collected to obtain these averages was not provided.

- Appendix E1, Figure 3.2. The figure shows the frequency and force of prevailing currents derived from the MIKE 21 model. A more intuitive representation of current directions and speeds would be a current "rose" as is commonly done with winds. The figure's title should have specified that these are depth-averaged speeds and directions. Their pertinence to effluent mixing and entrainment at the discharge point near the bottom is not obvious.

  Current directions should have been provided to aid in the visualization of prevailing currents. A rationale for the use of depth-averaged currents instead of near-bottom currents when simulating effluent mixing and entrainment at the diffuser should also be presented.

- Appendix E1, p.25. The dilution ratio required (1:7) to return salinity to ambient levels appears to be underestimated, as ambient salinity is being *reduced*, not increased, by mixing with freshwater effluent. The correct dilution and distance estimates for the return to ambient salinity should be provided. A discussion on how the adjustments affect all conclusions based on dilution throughout the EA registration document should also be provided.

- Appendix G, p.2.2. The proponent proposes to confirm the spatial extent of the effluent plume empirically with the use of a tracer dye once the project is operational.

  Empirical verification of the plume will be important not only for validating the simulations but also for confirming the location of the exposure area(s) for EEM studies.

- Appendix G, p.2.8. The proponent plans to execute the fish-population component of the EEM study by deploying caged mussels in exposure and reference areas from early April to end of June. The overall approach for the fish population study appears sound, but ice conditions in early April could interfere with the deployment schedule.

  The design for such a study should consider and plan for the possibility of the field schedule being delayed. Study designs must be submitted to ECCC at least 6 months before the beginning of sampling (subsection 4(1) of Schedule IV.1 of the Pulp and Paper Effluent Regulations).

- Appendix G, p.3.1. Although no sampling areas are specifically identified in Appendix G, the proposal to measure, using recommended methods for EEM, the baseline conditions in both the future exposure and reference areas before the new effluent outfall becomes operational is strongly supported by ECCC. Such a BACI (Before-After/Control-Impact) design can be very useful for distinguishing effluent effects from natural differences between reference and exposure areas that may have existed before the discharge of effluent. It is crucial, as with any EEM study, that a suitable reference area(s) with similar characteristics and habitat to the exposure area(s) be selected so that any future effects observed in the effluent exposure area(s) are not confounded by other factors.

The proposal of collecting baseline EEM information at the project site's future exposure and reference areas is supported by ECCC. The reference area(s) should match the characteristics of the exposure area as closely as possible.

- Appendix H, Section 2.0. The proponent proposes to monitor several ecosystem components, beginning with baseline (pre-operational) data and continuing once the effluent discharges from its new location. Vertical tows for phytoplankton and zooplankton, as well as more intensive horizontal tows targeting specifically fish larvae and emerging lobster larvae, benthic community along the pipeline corridor, and fisheries-resources tissue analyses for various chemicals will all contribute to filling the current information gaps and improve the understanding of the area.

  The absence of substantive baseline information specific to the Caribou area of the Strait is a significant gap in the EA that makes evaluating potential environmental effects of the project difficult as well as developing a representative monitoring program.

- Appendix H, Section 2.2. The proposed sub-lethal toxicity tests on lobster larvae and herring eggs are scheduled to begin only once the new treatment facility and effluent outfall are operational.

  According to the Registration document, the current and future mill effluents are not expected to be identical, while the mill's process is expected to remain unchanged. It is further stated that testing the current effluent's toxicity to lobster and herring could therefore provide invaluable baseline information to inform a decision regarding the potential toxicity of mill effluent to major fisheries resources in the Caribou area of Northumberland Strait.

  In ECCC's view, toxicity testing on lobster larvae and herring eggs with current NPNS effluent would not provide baseline effluent toxicity information for the future effluent.

- Appendix J. While not directly applicable to the project's future effluent quality and discharge location, the Cycle 7 EEM interpretive report provides a useful summary of effects seen previously in the aquatic receiving environment for the mill's current effluent and of the mill's subsequent investigations into their likely causes.

<u>Wildlife and Wildlife Habitat</u>

Barrow's Goldeneye

For federal environmental assessments, ss. 79(2) of the Species at Risk Act requires that persons responsible for an environmental assessment "must identify the adverse effects of the project on the listed wildlife species and its critical habitat and, if the project is carried out, must ensure that measures are taken to avoid or lessen those effects and to monitor them." These measures must:

- be consistent with best available information including any Recovery Strategy, Action Plan or Management Plan in a final or proposed version; and

- respect the terms and conditions of the SARA regarding protection of individuals, residences, and critical habitat of Extirpated, Endangered, or Threatened species.

Environment and Climate Change Canada is the lead jurisdiction for birds, including SAR, protected under the MBCA, and offers the information, expertise and advice below as the primary management jurisdiction:

Barrow's Goldeneye, a species of Special Concern, is listed on Schedule 1 of SARA. Barrow's Goldeneye and other waterfowl are known to winter in ice-free areas near the Venoit Causeway. The proponent indicates that "Several Barrow's goldeneye were observed during the January 2018 surveys west of the ETF site and along the shores of Pictou Harbour from Highway 106" (Section8.10.2.4). However, potential adverse effects of this project on Barrow's Goldeneye are not clearly identified, nor mitigation measures identified. For instance, when referring to blasting and other obtrusive activities related to the construction of the Pictou Causeway crossing of the pipeline, adverse effects to birds during the breeding season are considered, but no such consideration is given to avoidance of adverse effects to Barrow's Goldeneye and other staging/wintering waterfowl.

The proponent should clearly identify the potential adverse effects of project-related activities, including cumulative effects and effects of accidents, on Barrow's Goldeneye, as well as measures to avoid or minimize those effects, and to monitor them.

Migratory Bird Surveys along the Proposed Pipeline Route

Section 8.10.2.3. It is indicated that bird surveys in the vicinity of the proposed pipeline have not yet been conducted due to a change in design and location of the proposed pipeline, and surveys are planned for spring and summer 2019. Due to this lack of data, ECCC is not position to assess the predictions made in the report, nor to evaluate the potential environmental impacts related to that aspect of the project.

Migratory Birds and the Proposed ETF

Section 8.10.3.1. It is acknowledged that "The spill basin may attract birds, especially waterbirds and waterfowl" and that "Waterfowl may use open clarifiers as foraging or migratory habitat". However, the potential effects of bird use of these project components have not been identified. Measures to deter birds from using these project components have also not been described.

The Registration Document refers to bird deterrent devices to be used prior to blasting activities. The devices to be used should be identified.

The Registration Document states that the existing NPNS wildlife policies will be enforced, however they have not been provided or described.

Some aspects of the proposed project involve relatively standard activities typical to many project types. For these activities, ECCC recommends that the proponent undertake appropriate mitigation and project design including in the following areas:

Migratory Bird Interactions with Lighting

Birds may be attracted to lights at on-land coastal construction sites or on the vessels involved in the placement of the pipeline, even with the mitigation measures proposed by the proponent (e.g. reducing deck lighting on project vessels wherever practical).

On page 419, the proponent proposes to do routine checks of project vessels for stranded birds, and refers to the protocol described in Williams and Chardine's 1999 document entitled, *The Leach's Storm-Petrel: General information and handling instruction.* Williams and Chardine (1999) is specific to storm-petrels, and due to a better understanding of bird strandings at sea since 1999, ECCC's Canadian Wildlife Service (CWS) now expects proponents to implement protocols that are also applicable for other species of seabirds and for other bird groups, as in the CWS document *Procedures for handling and documenting stranded birds encountered on infrastructure offshore Atlantic Canada* (2017).

The proponent should therefore be prepared to conduct systematic checks for stranded birds, rather than only conducting routine checks, whereby designated crew members record search effort (even when no birds are found). Should storm-petrels or other species become stranded on vessels or on land, the proponent is expected to adhere to the attached *Procedures for handling and documenting stranded birds encountered on infrastructure offshore Atlantic Canada* (2017), which provides safe and effective procedures for dealing with and documenting live and stranded birds. A permit is required to implement this protocol. The proponent should be advised that it is required to complete a permit application form prior to proposed activities. Permit application forms can be obtained by contacting ECCC's Canadian Wildlife Service (CWS) via email at ec.scfatlpermis-cwsatlpermits.ec@canada.ca .

The proponent should also be advised that any storm-petrels that are found dead should be collected and sent to CWS. This is not a requirement that is mentioned in the Procedures document, but is a current requirement of permittees.

Also, as is mentioned in the Procedures document, CWS expects to be contacted within 24 hours in the event of mortality of an individual migratory bird species at risk or 10 or more migratory birds in one event or night.

Bird collisions at lit and floodlit structures are a known problem. In coastal area, nocturnal migrants and night-flying seabirds (e.g. storm-petrels) are the birds most at risk of attraction to lights and lit structures. Attraction to lights may result in collision with lit structures or their support structures, or with other birds. Disoriented birds are prone to circling a light source and may deplete their energy reserves and either die of exhaustion or drop to the ground where they are at risk of depredation.

It is recommended that proponents avoid or restrict the time of operation of exterior decorative lights such as spotlights and floodlights whose function is to highlight features of buildings, or to illuminate an entire building. Especially on humid, foggy or rainy nights, their glow can draw birds from far away. It would be best for the birds if these lights were turned off, at least during the migratory season, when the risk to birds is greatest and also during periods when Leach's storm-petrels would be dispersing from their colonies.

Lighting for the safety of the employees should be shielded to shine down and only to where it is needed, without compromising safety.

Street and parking lot lighting should also be shielded so that little escapes into the sky and it is directed where required. LED lighting fixtures are generally less prone to light trespass and should be considered.

Spills and Releases

It is not clear what measures would be taken to protect birds (including avian species at risk) or sensitive habitats in the event of a spill of a substance harmful to birds. Even a small spill could be significant if it were to impact avian species at risk, sensitive habitats, or large numbers of birds. A spill response plan for the project should be prepared, for each phase of the project, and which includes a response plan for environmental emergencies that involve wildlife, and including detailed information regarding:

- measures to be taken to contain a spill and to clean up an area;
- individuals/groups responsible for the cleanup;
- equipment to be available to contain spills;
- measures to be taken to prevent birds from becoming oiled (i.e. deterrents/measures to get oil off the water or land);
- wildlife monitoring in the area (i.e. surveys)
- a strategy to deal with accidents where birds were oiled (i.e. discussion of rehabilitation or euthanization) and/or sensitive habitat(s) was(were) contaminated.

In order to assist proponents in preparing a plan for dealing with an oil spill which would potentially threaten birds, CWS has prepared the attached draft guidance document.

Site Rehabilitation

If there is ultimately a need to decommission a building or structure used for nesting by gulls, swallows, or other species of migratory birds, Environment Canada's Canadian Wildlife Service (CWS) should be consulted in a timely manner in advance of any proposed decommissioning activities for species-specific considerations including potential permitting requirements.

A variety of species of plants native to the general project area should be used in revegetation efforts. Should seed mixes for herbaceous native species for the area not be available, it should be ensured that plants used in revegetation efforts are not known to be invasive.

Measures to diminish the risk of introducing invasive species be developed and implemented during all project phases. These measures could include:

- cleaning and inspecting construction equipment prior to transport from elsewhere to ensure that no matter is attached to the machinery (e.g., use of pressure water hose to clean vehicles prior to transport); and

- regularly inspecting equipment prior to, during and immediately following construction in areas found to support Purple Loosestrife to ensure that vegetative matter is not transported from one construction area to another.

Compliance with the MBCA

It is the responsibility of the proponent to ensure that activities comply with the MBCA and regulations. In fulfilling its responsibility for MBCA compliance, the proponent should take the following points into consideration:

- Information regarding regional nesting periods can be found at http://www.ec.gc.ca/paom-itmb/default.asp?lang=En&n=4F39A78F-1 . Some species protected under the MBCA may nest outside these timeframes.

- Most migratory bird species construct nests in trees (sometimes in tree cavities) and shrubs, but several species nest at ground level (e.g., Common Nighthawk, Killdeer, sandpipers), in hay fields, pastures or in burrows. Some bird species may nest on cliffs or in stockpiles of overburden material from mines or the banks of quarries. Some migratory birds (including certain waterfowl species) may nest in head ponds created by beaver dams. Some migratory birds (e.g., Barn Swallow, Cliff Swallow, Eastern Phoebe) may build their nests on structures such as bridges, ledges or gutters.

- One method frequently used to minimize the risk of destroying bird nests consists of avoiding certain activities, such as clearing, during the regional nesting period for migratory birds.

- The risk of impacting active nests or birds caring for pre-fledged chicks, discovered during project activities outside the regional nesting period, can be minimized by measures such as the establishment of vegetated buffer zones around nests, and minimization of activities in the immediate area until nesting is complete and chicks have naturally migrated from the area. It is incumbent on the proponent to identify the best approach, based on the circumstances, to complying with the MBCA.

Further information can be found at http://www.ec.gc.ca/paomitmb/default.asp?lang=En&n=C51C415F-1

The proponent should also be reminded that the prohibitions under the *Species at Risk Act* (SARA) are now in force. The complete text of SARA, including prohibitions, is available at www.sararegistry.gc.ca .

McKiggan Hebert
LAWYERS

March 9, 2018 File No. 8463-019

The Honourable Margaret Miller
Minister of Environment
Barrington Tower
1894 Barrington Street, Suite 1800
P.O. Box 442
Halifax, NS
B3J 2P8

Dear Ms. Miller,

Re: Consultation with Pictou Landing First Nation on an Application by Northern Pulp Nova Scotia Corporation for Approval of a Replacement Effluent Treatment Facility at Abercrombie Point and Pipeline to Caribou Harbour pursuant to the Environment Act.

Introduction

We understand that your department is currently the lead department on the formal consultation between the Crown and Pictou Landing First Nation with respect to the proposed replacement effluent treatment facility and pipeline for Northern Pulp's mill at Abercrombie Point, Nova Scotia (the "Project").

Pictou Landing First Nation was advised by letter dated February 6, 2019 from Lynn Bowen of your department that the Project would be registered pursuant to the ***Environment Act*** the following day (February 7, 2019) and that Pictou Landing First Nation would have until March 9, 2019 to provide written comments on the Project. In a subsequent exchange of correspondence with Ms. Bowen, she confirmed that the Crown intended to rely on the environmental assessment process to fulfil, in part, its s. 35 duty to consult.

Pending Decision

The decision currently before you is whether to approve the Project, reject the Project or require further steps be taken or other information provided before a final decision on the Project is made: ***Environment Act*** (the "***Act***"), s. 34(1).

In ***Pictou Landing First Nation v. Nova Scotia***, 2018 NSSC 306, Justice Timothy Gabriel ruled that the Province has a duty to consult with Pictou Landing First Nation in respect of the pending decision as to whether or not to fund the Project. While the Province has appealed that decision, the decision stands as good law until such time as the Court of Appeal rules otherwise. In light of this, we must make it clear that the comments which follow are restricted

to the decision whether to approve the Project under the ***Environment Act*** and are not intended to constitute the comments of the Pictou Landing First Nation on the impending decision whether to fund the Project.

Summary of PLFN Position

Pictou Landing First Nation urges you to exercise your discretion to require an environmental-assessment report pursuant to s. 34(1)(c) of the ***Act***. The environmental assessment registration document ("EARD") filed by Northern Pulp establishes that there are a number of studies that are missing, not complete or require additional data collection before a full assessment of the impacts of the Project on the environment can be undertaken. In short, baseline information is lacking. There is no doubt that the Project will lead to the discharge of known contaminants into the waters of the Northumberland Strait and that the adverse impacts of those substances are not fully understood at this time. The same is true of the impacts of burning sludge in the power boiler – this will certainly lead to the emission of contaminants into the air, but these too are not fully understood at this time. For the reasons that follow, the only approach that respects the significance of the risks to Pictou Landing First Nation Aboriginal and Treaty tights is a full environmental assessment report.

Factors to Consider

The ***Environmental Assessment Regulations***, N.S. Reg. 26/1995 as amended, set out the factors to be taken into account in making a determination under s.34(1) of the ***Act***.

> 12 All of the following information shall be considered by the Minister in formulating a decision under subsection 34(1) of the Act:
>
> (a) the location of the proposed undertaking and the nature and sensitivity of the surrounding area;
>
> (b) the size, scope and complexity of the proposed undertaking;
>
> (c) concerns expressed by the public and aboriginal people about the adverse effects or the environmental effects of the proposed undertaking;
>
> (d) steps taken by the proponent to address environmental concerns expressed by the public and aboriginal people;
>
> (da) whether environmental baseline information submitted under subclause 9(1A)(b)(x) for the undertaking is sufficient for predicting adverse effects or environmental effects related to the undertaking;

(e) potential and known adverse effects or environmental effects of the proposed undertaking, including identifying any effects on species at risk, species of conservation concern and their habitats;

(f) project schedules where applicable;

(g) planned or existing land use in the area of the undertaking;

(h) other undertakings in the area;

(ha) whether compliance with licences, certificates, permits, approvals or other documents of authorization required by law will mitigate the environmental effects;

(i) such other information as the Minister may require.

These submissions will address the factors relevant to this assessment in order.

Location of Project

Effluent

The proposed effluent treatment facility would be located next to the mill at Abercrombie Point. The proposed pipeline would be buried along an overland route from Abercrombie Point to Caribou, Nova Scotia where it would continue as a subsea pipeline buried under the bottom of the Northumberland Strait for 4 kilometers where it would rise out of the seabed and terminate at a diffuser. Effluent will flow through the pipeline from effluent treatment facility to the diffuser where it will be discharged into the waters of the Northumberland Strait.

The Northumberland Strait, and in particular, the area surrounding the proposed discharge point, is part of the traditional fishing territory of the Mi'kmaq, and Pictou Landing First Nation commercial, food and ceremonial fishers in particular. The diffuser is located in DFO Lobster Fishing Area 26A where many PLFN fishers participate in the lobster fishery pursuant to private and communal commercial lobster licenses. The Pictou Landing First Nation commercial fishery is the single biggest industry within the community employing 100 people each year out of a population of 280 working age members: EARD, p. 450. Species that are fished within the vicinity of the proposed diffuser are rock crab, lobster, scallops, herring, mackerel and tuna.

The unique characteristics of the Northumberland Strait are described in other submissions and will not be repeated here.

Air

The mill at Abercrombie Point is located approximately 6 kilometers Southwest of IR 24 where the Pictou Landing First Nation makes its home. The prevailing winds blow from the mill in the direction of the Pictou Landing First Nation: EARD, Appendix K, pp. 9-12.

Size, Scope and Complexity of the Project

Effluent

The effluent treatment facility is designed to discharge up to 85 million litres of effluent each day into the Northumberland Strait, although the anticipated daily average is predicted to be 63.6 million litres. The operations are projected to continue 24 hours per day, seven days per week non-stop for several decades.

Adding to the complexity of the Project is the fact that Northern Pulp is unable to identify what chemicals and other substances may be in the treated effluent: EARD, pp. 489, 493, 506.

Further adding to the complexity of the Project is that the interaction of the chemicals in the proposed effluent, even if they are known, with living organisms is species dependent and cannot be extrapolated from one species to another: EARD, Appendix R, p. 1.

The complexity of the Northumberland Strait makes it difficult to model and predict water movement: EARD, Appendix R, p. 11. In addition the effects of climate change and acidification further complicate the predictive value of any modelling: *ibid*. The Stantec Receiving Water Study was not supported by actual sampling and could be wrong: *ibid*, pp. 1-2.

Air

Sludge collected from the effluent treatment process is proposed to be burned as fuel in the power boiler of the mill: EARD, p. 45. The EARD does not indicate the volume of sludge to be burned but does indicate that it will be burned with the existing hog fuel in a ratio of 7 parts hog fuel to 1 part sludge: EARD, Appendix K, p. 7. In terms of rate of total particulate matter (TSP) emitted into the air during operations, Stantec predicts this to be 8.38 grams/second: Appendix K, p. 7. This equates to 257,755 kilograms per year. Not all of the anticipated emitted TSP will be attributable to the burning of sludge, but this gives an idea of the volumes emitted by the mill. They are not insignificant.

Adding to the complexity of the Project is the fact that the composition of the sludge is unknown at present: EARD, Appendix K, p. 6.

Predictive Value of Environmental Baseline Information

Effluent

As noted above, the effluent will contain chemicals and substances that are harmful to living organisms in the Northumberland Strait. In the EARD, Northern Pulp acknowledges that there are gaps in the information needed for an environmental assessment.

Pictou Landing First Nation retained the services of Exp Services Inc. to review the EARD and provide a summary of the information gaps, both those acknowledged by Northern Pulp in the

EARD itself, and those identified by Exp. In a letter dated March 8, 2019 to Chief Andrea Paul (enclosed), Exp listed the following deficiencies in the environmental information and studies:

1. Marine Benthic Habitat Studies

No study of the marine benthic habitat has been undertaken along the proposed pipeline route although it is suggested that one will be conducted as part of the design and to facilitate a request for review by DFO: EARD, p. 21. It does not appear that a benthic habitat study within the mixing area (100 metres from the diffuser) is being considered. There is no mention that any baseline studies have been undertaken to date either along the proposed pipeline route or in the mixing area. Once the seabed has been disturbed by trenching for the pipeline, no pre-Project baseline will be available. The same can be said of the mixing area – once it begins to be impacted there is no possibility of obtaining baseline information. Marine benthic habitat studies are carried out over a yearlong cycle.

2. Geotechnical Studies along Proposed Pipeline Route

No geotechnical studies have been carried out on the seabed along the proposed pipeline route: EARD, p. 21. Information from the geotechnical study would allow a determination as to whether the proposed route will support the pipeline without risk to the integrity of the pipeline from future geological events.

3. Harmful Alteration, Disruption or Destruction (HADD) of Fish Habitat Assessment

The Project has not been assessed from the point of view of impacts on fish and fish habitats. It is said that these studies will be developed later to support a Request for Review from DFO: EARD, p. 21. Given the potential for serious harm to the Pictou Landing First Nation commercial, food and ceremonial fisheries from the chemicals contained in the effluent, this is a glaring omission from the EARD.

4. Lethal and Sub-lethal Effect of Effluent on Lobsters (and Other Species)

The EARD contains a summary of existing research on the effects of bleached Kraft mill effluent on lobster prepared by Fraser Clark: EARD, Appendix R. While the conclusions of the research summary are based on the Receiving Water Study modelled by Stantec, the existing literature seems sparse and the author himself recommends further study on lethal and sub-lethal effects of bleached Kraft mill effluent on adult lobster and lobster larvae using current effluent. Exp makes a similar recommendation. In addition, Exp notes that the same testing should be carried out on other species of fish in the affected area. While Exp notes that testing ideally would be carried out with the actual effluent being produced, the studies could, and should, have been done using the current treated effluent in the meantime.

5. Mi'kmaq Ecological Knowledge (MEK)

No MEK has been obtained regarding the current proposed pipeline route: EARD, p. 451. No assessment has been made of the Pictou Landing First Nation's interactions with the marine environment: EARD, p. 490.

6. Human Health Risk Assessment

No human health risk assessment has been completed: EARD, p. 490. This is said to be due to in part from the lack of information concerning the chemical composition of the effluent after treatment. However, Exp points out that while it is impossible to know now what the final composition of the *treated* effluent will be, the current *untreated* effluent will not change with the proposed effluent treatment facility. Therefore it is, and has been, possible to analyze the current *untreated* effluent for the presence of various chemicals of interest. This would serve to identify any potential chemicals of concern that may find their way into the treated effluent. If this has been done, it has not been reported in the EARD and the results of the analysis have not been considered.

Exp notes that there are official sources which identify a number of contaminants of potential concern that are relevant and could be tested for in the current untreated effluent: *Nova Scotia Environment Contaminated Sites Regulation, Tier 1 Environmental Quality Standards Surface Water Parameters for Fresh Water and Marine Environments* and the *Halifax Regional Municipality Construction Dewatering Assessment Parameters*: Exp., pp. 5-7. Exp has set out the chemicals in two tables. There is considerable overlap in these tables. The current untreated effluent can be tested to determine which of these chemicals of concern are present in the untreated effluent and could therefor find their way into the treated effluent. This has apparently not been done.

This is particularly appropriate because some of the claims being made about the anticipated *treated* effluent in the EARD are based on the characteristics of the untreated effluent. For example, the presence of dioxins and furans was ruled out because these are not expected in the elemental chlorine free bleaching process: EARD, p. 509. Yet the analysis of water following the recent escape of untreated effluent from the existing pipeline did show elevated levels of dioxins and furans, according to your department's own records. Accordingly, rather than relying on assumptions about the characterization of the effluent, the actual untreated effluent should be analyzed before any decision is made.

Another flaw in the EARD analysis is that it focuses only on the regulated chemicals of interest, primarily those regulated under the federal *Pulp and Paper Effluent Regulations*. Presumably this would carry through to a future human health risk assessment. Exp recommends characterizing the effluent by testing for the chemicals of concern noted above rather nthan restricting the analysis to regulated chemicals.

Current effluent could be analyzed for those parameters recommended by Exp at two accredited laboratories in Nova Scotia - Maxxam Analytics Inc. and Agat Laboratories - both of

which are accredited by both the Canadian Association for Laboratory Accreditation (CALA) and Standards Council of Canada (SCC).

The human health risk assessment should be completed before any decision is made and should follow the guidelines contained in *Federal Contaminated Site Risk Assessment in Canada, Part I: Guidance on Human Health Preliminary Quantitative Risk Assessment (PQRA)*, Version 2.0, 2010, Revised 2012.

Air

As noted above, burning of sludge could have an adverse impact on the air quality as it will be burned in the power boiler and existing prevailing winds will carry emissions towards Pictou Landing First Nation.

Exp notes that the 2019 Stantec air modelling report limited itself to an analysis of those few contaminants currently regulated in Nova Scotia either under the *Air Quality Regulations* or under the existing industrial approval applicable to Northern Pulp's operations: EARD, Appendix K, pp. i and ii. However, there is no reason to limit the analysis to those contaminants. For one thing, the present operation does not burn effluent sludge, whereas the proposed Project contemplates that 1/7 of the fuel burned in the power boiler will be sludge. As a result one cannot rely on the existing Industrial Approval to address contaminants that may be emitted from the burning of sludge.

In fact, Exp notes that it is well recognized that pulp and paper mills and their effluent treatment processes emit more air contaminants than those identified in the Stantec report. These include: volatile organic compounds (VOCs) and total reduced Sulphur (TRS) compounds consisting of H_2S, methyl mercaptan, dimethyl sulphide, dimethyl disulphide as well as chlorinated compounds.

There are existing guidelines on the contaminants released by the burning of effluent sludge. These are found in *AP-42 Chapter 1.6 Wood Residue Combustion in Boilers*, *AP-42 Chapter 2.2 Sewage Sludge Incineration* and *AP-42 Chapter 10.2 Chemical Wood Pulping*. Stantec was obviously aware of those guidelines: EARD, Appendix K, p. 6. These guidelines identify contaminants of concern. These contaminants were not addressed by Stantec.

Exp notes that the *Air Dispersion Modelling Guideline for Ontario, 2017* (ADMGO) lays out a procedure for modelling the dispersion of air contaminants. ADMGO is also cited by Stantec in its report: EARD, Appendix K, p. iii.

ADMGO requires, as a first step in the air modelling process, a source summary table for all contaminants emitted including a full rationale for any contaminants deemed insignificant. This was not done in the Stantec analysis and is a serious omission. As noted above, Stantec focused only on regulated contaminants. As such the analysis did not conform to ADMGO standards.

As part of a comprehensive environmental assessment report, Northern Pulp should provide a source summary table of all contaminants of interest.

ADMGO lays out an emission summary and dispersion modelling (ESDM) procedure to be followed. This requires that sample calculations be provided detailing emission rates determined, significance of each possible contaminant and emission factor ratings assigned to all possible contaminants. Again this is not contained in the Stantec report and is a major omission. It should be part of a required environmental assessment report.

The analysis should take into account future changes. For example in Ontario, sulphur dioxide will be reduced from 275 µg/m3 (1- hour) and 690 µg/m3 (24-hour) to 100 µg/m3 (1 -hour) and 10 µg/m3 (annual) in the year 2023. This not discussed in the EARD.

Finally, Exp notes that emissions of odorous contaminants should be assessed based on the criteria in the *Ontario Air Contaminants Benchmark* (ACB) list.

Given these gaps, it is difficult to see how the Project can be approved at this time. More information is required. The predicative value of the environmental baseline provided in the EARD is severely restricted due to the absence of baselines in key areas.

Potential and Known Adverse Effects

Effluent and Air

There are clearly contaminants of concern in the effluent: EARD, p. 503-504. Likewise, as noted above, there are contaminants of concern that will be released by burning sludge. The EARD is silent on the potential effects of each of these contaminants as they were not fully listed in the EARD.

The lack of information on the environmental and health impacts of these chemicals of concern is a major deficiency in the EARD.

Mitigation Effects of Permits, etc.

While the operations of the mill and the effluent treatment facility will require an Industrial Approval under the Nova Scotia ***Environment Act***, the terms of the industrial approval are unknown at this time as the existing Industrial Approval will expire on January 31, 2020 before the new treatment facility begins operation.

Without knowing the terms of a new Industrial Approval, it is impossible to know what mitigating impacts the Industrial Approval may have on the potential adverse impacts from contaminants in the effluent and air emissions.

Since your department is involved in both this environmental assessment and the presumed application for a new Industrial Approval, it makes sense that a full environmental assessment

report be required at this time so that the two processes can work together based on a full understanding of the environmental impacts of the Project. It makes little sense to approve a project only to have it come to a halt by the terms of an Industrial Approval. Conversely, if adverse impacts are not addressed at this stage, we should not rely on the Industrial Approval process to correct fill in the blanks.

The effluent must also met the standards set out in the federal ***Pulp and Paper Effluent Regulations.*** As Exp notes, the ***PPER*** are under review and will likely change given that they have been in place since 1992. Further, the ***PPER*** only address a handful of parameters: EARD, Appendix E, p. 16. As noted above, there are many more chemicals of concern that are in the effluent.

The EARD notes that DFO will be asked to provide comments. Because of the ***PPER***, DFO's role in reviewing the Project will be limited to considering the impacts of the construction phase only. DFO will not be independently assessing the effects of effluent on the marine fish habitat or fish themselves. A pulp mill is allowed to discharge effluent into the marine environment as long as it complies with the PPER, whether or not the effluent is a deleterious substance. Thus Pictou Landing First Nation's concerns about the adverse impacts of effluent on its fishery will not be addressed by DFO above and DFO's inquiry will be limited to the impacts of the pipeline construction. Pictou Landing First Nation's concerns will only be addressed in this environmental approval process.

Air quality standards are governed by the Nova Scotia ***Air Quality Regulations***: EARD, p. 135. However, as noted above, the contaminants regulated under those regulations are limited in scope compared to the potential contaminants known to be generated in the pulp and paper industry and from burning sludge. Compliance with the ***Air Quality Regulations*** will not mitigate the adverse impacts of other contaminants.

Other Information

History of Government Failing to act Honourable

In making a determination under s. 34(1), it is important to consider the Honour of Crown vis-à-vis Indigenous peoples potentially impacted by the pending Project. In this case, the Project will be a component of the pulp mill. Since 1967, effluent from the mill has been discharged into Boat Harbour and this has had a significant and life altering adverse impact on the Pictou Landing First Nation.

The members of Pictou Landing First Nation are asking for a full environmental assessment report of the new treatment facility. There is good reason for this. In addition to the deficiencies in the EARD noted above, it must be remembered that the members of the Pictou Landing First Nation were lied to by representatives of the Provincial Water Authority about the potential impacts of treating effluent at Boat Harbour. They were advised there would be no odor problems associated with the facility. To further this deception, the Chief and one Council member were taken to Saint John, New Brunswick and shown a residential wastewater

treatment facility that had not yet begun to receive any wastewater. The Chief and Councillor were told that the Boat Harbour waters would be just as clean. The sad part is that when deciding to accept the mill, the Chief and Council of the day were acting in the best interests of all of Pictou County with the Chief writing that "it would be good for the whole area".

Pictou Landing First Nation knew that they had been deceived immediately after the dark brown effluent began to flow into Boat Harbour. Fish were killed en masse as community members watched them trying to escape from the water onto the shores of Boat Harbour. This was soon followed by the putrid stench of Sulphur. The community protested to the Province and despite the Province's commitment to the federal government, as owner of the Reserve, the Province took several years to acknowledge the problem. It added infrastructure to aid in the treatment of the effluent. However, the odours remained and the fish did not come back. The effluent flowed out of Boat Harbour and affected Lighthouse Beach, with piles of brown foam constantly visible. Chemicals in the air, which could not be seen, reacted to the paint on people's houses, turning them black.

It was not until a lawsuit against the federal government was started in 1986, that the Province took Pictou Landing First Nation's demands to close Boat Harbour seriously. By 1992 the Province promised to close Boat Harbour at the end of 1995 when its agreement to treat the effluent would expire. However, that didn't happen. Instead the treatment facility was leased to the owners of the mill for a 10 year period to the end of 2005. Then in 2002 the Province extended the lease to 2030 based on a promise by the mill owner to build a by-pass pipeline within Boat Harbour which it represented would allow the Province to remediate most of Boat Harbour after 2005. The by-pass pipeline was not built and at the end of 2005 the Province asked Pictou Landing First Nation for a three-year extension which the community granted. When the extension was about to expire Pictou Landing First Nation announced that it would not grant a further extension.

In light of this the Province agreed in writing that it would close the treatment facility as soon as a new facility was built. However, within 6 months a new provincial government changed its mind and decided to study the problem. Over a year later the Province decided to renege on its commitment to close the Boat Harbour treatment facility.

It was not until the existing pipeline broke and the Pictou Landing First Nation refused to allow representatives of Northern Pulp onto its burial grounds at Indian Cross Point to fix the pipeline that the Province once again agreed to close the Boat Harbour treatment facility. This of course led to the ***Boat Harbour Act***.

The past 5 decades of deceit and indifference coupled with the Province's financial interest in the Project, have left the people of Pictou Landing First Nation very skeptical of the provincial government when it comes to environmental impacts associated with the Northern Pulp mill. This was recognized by Justice Gabriel in ***Pictou Landing First Nation v. Nova Scotia***, *supra*, at paragraph 74:

> This will do nothing to assuage whatever cynicism has been engendered in the past by the already significant environmental impact which has been visited upon Treaty lands and environs by the mill and its facilities to date.

While the Province has appealed Justice Gabriel's decision that the Province has a duty to consult with Pictou Landing First Nation regarding the funding of the Project, his words should be weighed carefully in the disposition of this application for environmental approval of the Project.

Justice must not only be done, but must be seen to be done. Having rejected a Class II environmental assessment, Pictou Landing First Nation now asks for a full environmental assessment report. The Honour of Crown requires it in light of the cruel treatment of Pictou Landing First Nation by successive provincial governments. Now is the time to do the right thing. Pictou Landing First Nation deserves a high level of assurance that their Aboriginal and Treaty rights to fish in the Northumberland Strait and to reside on Reserve lands free of airborne contaminants are not impacted by the Project.

PLFN Limited Time to Respond

PLFN has had an inadequate amount of time in which to respond to the 2,000 page EARD.

It appears even from the EARD itself, that further studies and investigations are required. These will take time in any event. Pictou Landing First Nation urges you to require the completion of these studies as part of a full environmental assessment report pursuant to section 34(1)(c) of the ***Act***. This will allow fuller participation by Pictou Landing Frist Nation.

Exp Comments

Exp has provided comments on other aspects of the EARD which are relevant if the Project is approved. We include portions of a Review Document that Exp prepared for Pictou Landing First Nation for your review. If the Project is approved Pictou Landing First Nation respectfully requests that these issues be considered and addressed in the conditions to the approval where appropriate. Further, Pictou Landing First Nation expects that consultation would continue on the terms of any environmental effects monitoring program that is established.

Tertiary Treatment

In 2011 Pictou Landing First Nation requisitioned a report from Exp. Exp was asked to review a 2010 report from Amec (now Wood) setting out options for the treatment of effluent from the Northern Pulp mill and in particular one option that was very similar to the Project under consideration. That option involved an AST system located adjacent to the mill much like the present Project. Exp was asked to report on feasible enhancements to the proposed treatment system that would allow the effluent to meet the same standards as the Town of Pictou would need to meet under the anticipated federal municipal waste water regulations. The resulting report is enclosed. Essentially Exp identified three options for a tertiary level of treatment to allow the pulp effluent to meet the federal municipal wastewater standards. The costs of these additional treatment modalities at the time ranged from $7 million to $12 million. While the

EARD suggests that tertiary treatment was considered, no detailed analysis is provided as to why these tertiary treatment options were ruled out.

Pictou Landing First Nation urges you to require a tertiary treatment system for the Project if it is approved.

Summary

Pictou Landing First Nation is concerned primarily about the impacts of the proposed Project on its fisheries and on its air quality on Reserve. There are significant gaps in the baseline information provided in the EARD and it would be difficult for Pictou Landing First Nation to understand how, in light of the decades-long history of environmental harm caused by the existing effluent treatment system, the Project could be allowed to proceed without a full environmental assessment report. The Honour of Crown requires it. If the Project is allowed to proceed, then conditions will be required to address the gaps identified herein as well as the additional comments of Exp in the documents enclosed. A tertiary treatment system should be mandated.

Yours very truly,

Re: Northern Pulp Nova Scotia Replacement Effluent Treatment Facility Environmental Assessment Registration Document
Follow Up Studies and Further Assessment Required

EXP Services Inc. (EXP) is providing the following list of follow up studies and areas of further assessment based upon our review of the "Northern Pulp Nova Scotia Replacement Effluent Treatment Facility Environmental Assessment Registration Document (EARD), January 31, 2019".

This list is being provided in two sections; follow up studies as identified by the proponent (Northern Pulp Nova Scotia) and recommended follow up studies as identified by EXP.

1 Proponent Identified Follow Up Studies

The following reports and studies have been identified in the EARD by the proponent as either requiring further work or have yet to be completed.

1. Marine Benthic Habitat Study Along the Proposed Pipe Line Route
    a. EXP notes that the study should also include the 100 metre radius at the discharge point.
    b. EXP notes that the Metal Mining Technical Guidance for Environmental Effects Monitoring, Chapter 4, Effects on Fish Habitat: Benthic Invertebrate Community Survey offers a solid framework for establishing the scope of the Benthic Habitat Study.
    c. EXP notes that the study should be completed at a minimum of four sites along the proposed pipeline route, before construction.

   d. EXP anticipates that this study would require 2 days in the field to complete the sampling followed by a six week period for development of the report.

2. Geotechnical Assessment along the land and underwater pipeline route.

   a. EXP notes that the sediments along the underwater pipe route should also be assessed for chemicals of concern which could include, at a minimum, metals, Polycyclic Aromatic Hydrocarbons (PAH) and Petroleum hydrocarbons (PHC).

   b. DFO may supply additional parameters to be analyzed once they review the application to dredge along the proposed route.

   c. The program should include assessment for the presence of unique habitats associated with submarine groundwater discharge sites.

   d. The Geotechnical assessment would be estimated to be completed within a two month window.

3. Harmful Alteration, Disruption or Destruction (HADD) of Fish Habitat Assessment for the Pipe Line and Water Crossings

   a. Preliminary assessment of fish habitat along the pipeline route was done in December 2018 and is to be supplemented with habitat assessment at a more appropriate time (early summer). It is incumbent on the project to avoid, mitigate or offset the harmful alteration, disruption or destruction of fish habitat. This work needs to be addressed in consultation with Fisheries and Oceans. It is EXPs experience that between the field work, submittal and approval there is a two to three month turnaround time.

4. Further assessment on Species At Risk (SAR) due to the Wetland Survey being completed in December 2018.

   a. EXP notes that wetland surveys for SAR should be completed at least twice during the plant growing season. Once in June (late spring) and secondly in September (early fall).

5. The construction phase environmental management plan

6. The construction phase environmental protection plan

7. Final reporting on the Mi'kmaq Ecological Knowledge (MEK)

   a. Has the MEK been resubmitted with the new pipeline route included?

8. Archaeological Assessments along the New Route

   a. This ties in with the MEK.

9. Human Health Risk Assessment (HHRA)

a. Federal Contaminated Site Risk Assessment in Canada, Part I: Guidance on Human Health Preliminary Quantitative Risk Assessment (PQRA), Version 2.0, 2010, Revised 2012.

10. Follow Up work on the Pipeline Preliminary Assessment completed in Fall 2018.

    a. Nova Scotia Transportation and Infrastructure Renewal (NSTIR) right of way access permission for placement of the effluent pipeline.

    b. Discussions should be held with the Town of Pictou to assess potential impacts of pipeline routing as it passes through their well head protection areas. Formal discussions with the Town of Pictou should be undertaken to ensure proper mitigative methods are employed for this section of pipeline that is acceptable to the Town of Pictou.

    c. In field inspections for nearby potable water wells

    d. Preparation of design and request for permitting associated with wetlands and other water crossings

11. The EARD indicated that a detailed response plan will be developed to manage malfunctions and accidents.

12. The EARD indicates aggregate will be required for the construction of the pipeline. It will be necessary to identify the source aggregate pits to ensure they are permitted and any quality issues pertaining to acid drainage or natural mineralization are accounted for.

2 EXP Identified Areas of Further Study

1. Studies to date have been deficient when examining the lethal and sub lethal effects of the proposed treated effluent on the various life stages of Lobster. It is recommended that both the larval and adult stages be assessed with the proposed treated effluent. The timeline for completion of this type of test is contingent on the availability of the new treated effluent. This is the difficulty with this study, in that it cannot be completed until after a new treatment system is in place. In terms of timing, it can be completed at anytime as it is a laboratory study, once the proposed effluent is available. This type of assessment could also be completed on any larval or adult species that is commercially fished in the Northumberland Strait.

2. Development of the Sediment and Erosion Control Plan for the Construction Phase.

3. Development of a monitoring plan for the Construction Phase to meet regulatory stipulations.

4. Details of the design storm (i.e. 1 in 100 year storm with a 24 hour duration) for the spill collection system basin should be provided.

5. What project bonding will be required for the proponent.
6. Nova Scotia Environment should be requested to identify how they will manage the project – with First Nations – to ensure design plans are followed in the field and monitoring meets stipulations.
7. Based on EXPs review of the Stantec 2019 Ari Modeling Study the following areas for consideration were identified:
    a) It is well recognized that pulp and paper facility and ETF process operations emit more air contaminants than the priority pollutants assessed. Volatile organic compounds (VOCs) and total reduced Sulphur (TRS) compounds consisting of H_2S, methyl mercaptan (CH3SH), dimethyl sulphide ($CH_3)2_S$), dimethyl disulphide ($(CH_3)_2S_2$), and chlorinated compounds are potentially emitted by the kraft (bleached) pulping process. Established emission factors for additional contaminants than assessed from the pulp and paper making processes, co-combustion of hog fuel, and wastewater sludge incineration are available in the reference chosen (AP-42 Chapter 1.6 Wood Residue Combustion in Boilers, Sewage Sludge Incineration AP-42 Chapter 2.2) as well as within AP-42 Chapter 10.2 Chemical Wood Pulping.
        i. Provide a source summary table for all contaminants emitted from the ETF and the Kraft Pulp Mill facility in accordance with the ADMGO, including a full rationale for justification of any contaminants deemed insignificant.
        ii. Identify emission factors representative of the processes to assess potential contaminants of interest not included in priority contaminants assessed. (e.g. AP-42 Chapter 10.2 Chemical Wood Pulping, Table 10.2-1 lists Methyl mercaptan, Dimethyl sulfide and Dimethyl disulfide emissions (Emission Factor Rating: A); AP-42 Chapter 1.6 Wood Residue Combustion in Boilers; and AP-42 Sewage Sludge Incineration Chapter 2.2, Table 2.2-3.)
        iii. Assess emissions of odourous contaminants at 10- minute time interval based on criteria in Ontario Air Contaminants Benchmark (ACB) list.
        iv. Consideration should be given to the potential of changes in regulatory criteria, in particular sulphur dioxide, in the assessment of future operations scenario.
    b) The assessment of future operations should also consider the potential of changes in regulatory criteria. In particular, sulphur dioxide which in Ontario will be reduced from 275 µg/m3 (1- hour) and 690 µg/m3 (24-hour) to 100 µg/m3 (1 -hour) and 10 µg/m3 (annual) in 2023.

c) Emission factors used, for burning of sludge, by Stantec were US EPA AP-42 Chapter 2.2 Sewage Sludge Incineration for CO, SO2, NOx, TSP, and PM2.5. Both this reference and AP-42 Chapter 1.6 Wood Residue Combustion in Boilers lists other contaminants of interest that were not included in the assessment. Regardless of emission factor reference consideration should be given to assess all contaminants of interest within the reference chosen. EXP recommends:

   i. Provide a source summary table for all contaminants emitted from the ETF and the Kraft Pulp Mill facility in accordance with the ADMGO.

   ii. Provide sample calculations detailing emission rates determined, significance of contaminant, and emission factor rating in accordance with the ESDM Procedure.

   iii. Include assessment of emissions of potential contaminants from co-combustion of sludge and hog fuel in addition to priority contaminants.

8. Human Health Risk Assessment (HHRA) – The proponent has noted that the HHRA will look to exclude many parameters from the assessment based on prior studies and based on what is required under the PPER.

   The Pulp and Paper Effluent Regulations, Current to February 14, 2019 list only the following minimum parameters for effluent monitoring:

   a) Acute Lethality and Effect on *Daphnia magna*;

   b) Biological Oxygen Demand;

   c) Total Suspended Solids;

   d) Volume;

   e) pH; and

   f) Electrical Conductivity.

   Since the PPER are presently under evaluation, with an update pending, and likely additional parameters being added. EXP is proposing that chemical analysis on the untreated effluent be conducted for the following parameters listed in Table 1 and Table 2 below. These parameters have been selected based on present existing guideline information pertaining to protection of drinking water, marine aquatic life and fresh water aquatic life.

   Table 1 shows the parameters that are regulated in Nova Scotia under the Contaminated Sites Regulations.

Table 1: Nova Scotia Environment Surface Water Parameters for Fresh Water and Marine Environments

Nova Scotia Environment Surface Water Parameters for Fresh Water and Marine Environments				
Aluminum	Zinc	Bromoform	Vinyl Chloride	Lindane
Antimony	Benzene	Bromomethane	Aldicarb	Linuron
Arsenic	Toluene	Carbon Tetrachloride (Tetrachloromethane)	Aldrin	Malathion
Barium	Ethylbenzene	Chlorobenzene	Atrazine	MCPA
Beryllium	Xylene	Chloroethane	Azinphos-methyl	Methoxychlor
Boron	Modified TPH	Chloroform	Bendiocarb	Metolachlor
Cadmium	MTBE	Chloromethane	Bromoxynil	Metribuzin
Chromium (hexavalent)	Naphthalene	Dibromochloromethane	Carbaryl	Paraquat
Chromium (total)	1 - Methylnaphthalene	1,2-Dichlorobenzene	Carbofuran	Parathion
Cobalt	2 - Methylnaphthalene	1,3-Dichlorobenzene	Chlorothalonil	Phorate
Copper	Acenapthene	1,4-Dichlorobenzene	Chlorpyrifos	Picloram
Cyanide	Acenapthylene	1,1-Dichloroethane	Cyanazine	Simazine
Iron	Anthracene	1,2-Dichloroethane	2,4-D	Tebuthiuron
Lead	Fluoranthene	1,1-Dichloroethylene	DDT	Terbufos
Manganese	Fluorene	cis-1,2-Dichloroethylene	Diazinon	Toxaphene
Mercury (total)	Phenanthrene	trans-1,2-Dichloroethylene	Dicamba	Triallate
Methylmercury	Pyrene	1,2-Dichloropropane	Dichlorfop-methyl	Trifluralin
Molybdenum	BaP Total Potency Equivalents	1,3-Dichloropropene	Dieldrin	Polychlorinated Biphenyl (Total PCB)
Nickel	Benz[a]anthracene	Ethylene Dibromide	Dimethoate	Dioxins and Furans (TEQ)
Selenium	Benzo[a]pyrene	Methylene Chloride (Dichloromethane)	Dinoseb	Pentachlorophenol (PCP)
Silver	Benzo[b,j,k]fluoranthene isomers	Styrene	Diquat	Organotins - Tributyltin
Strontium	Benzo[g,h,i]perylene	1,1,2,2-Tetrachloroethane	Diuron	Ethylene Glycol
Thallium	Chrysene	Tetrachloroethylene	Endosulfan	Propylene Glycol
Tin	Dibenz[a.h]anthracene	1,1,1-Trichloroethane	Endrin	Phenol
Uranium	Indeno[1,2,3-c,d]pyrene	1,1,2-Trichloroethane	Glyphosate	
Vanadium	Bromodichloromethane	Trichloroethylene	Heptachlor	

As an example of what would be required for discharge to a storm sewer from a routine construction project, EXP has presented the HRM's list of minimum parameters to be assessed in Table 2.

Table 2: HRM Construction Dewatering Assessment Parameters

HRM Construction Dewatering Assessment Parameters				
Arsenic, Total	Copper, Total	Nickel, Total	Toluene	trans -1,3 - Dichloropropylene
Benzene	Cyanide, Total	Phenols	1,1,2 -Trichloroethylene	Methylene chloride
Biochemical Oxygen Demand	Ethylbenzene	Phosphorus, Total	Xylene, Total	1,1,2,2 - Tetrachloroethane
Cadmium, Total	Fluoride	Selenium, Total	Zinc, Total	1,1,2,2 - Tetrachloroethylene

HRM Construction Dewatering Assessment Parameters				
Carbon tetrachloride	Lead, Total	Silver, Total	1,2 - Dichlorobenzene	Di-n-butyl phthalate
Chloroform	Mercury, Total	Suspended Solids, Total	1,4 - Dichlorobenzene	Bis (2-ethylhexyl) phthalate
Chromium, Total	Nickel, Total	Total Thallium	cis -1,2 - Dichloroethylene	PAHs

The parameters listed in Tables 1 and 2 are both available for analysis from two Canadian Association for Laboratory Accreditation (CALA) and Standards Council of Canada (SCC) accredited laboratories in HRM; Maxxam Analytics Inc. and Agat Laboratories.

While it is obviously not possible to test what the effluent would be from the new treatment system, it is possible to have the untreated effluent tested for the parameters listed in Table 1 and Table 2 to assess what chemicals of concern could be added to the list for assessment under the HHRA.

3 Standard Limitations

The information presented in this report is based on information provided by others and observations designed to provide a peer review of the reports provided.

Achieving the objectives of this report has required us to arrive at conclusions based upon the best information presently known to us. No investigative method can completely eliminate the possibility of obtaining partially imprecise or incomplete information; it can only reduce the possibility to an acceptable level. Professional judgment was exercised in gathering and analyzing the information obtained and in the formulation of the conclusions. Like all professional persons rendering advice, we do not act as absolute insurers of the conclusions we reach, but we commit ourselves to care and competence in reaching those conclusions.

Our undertaking at EXP, therefore, has been to perform our work within the limits prescribed by our clients.

4 Closure

We trust this summary report is satisfactory for your purposes. If you have any questions regarding our review, please do not hesitate to contact this office.

Sincerely,

Project Manager
EXP Services Inc.

Introduction

EXP Services Inc. (EXP) has been retained through McKiggan Hebert Lawyers (McKiggan Hebert) on behalf of the Pictou Landing First Nation (PLFN) to provide document review and advisory services as it pertains to the Northern Pulp Nova Scotia Corporation's (NPNS) bid to replace their existing effluent treatment facility (ETF).

The document review is based on information provided through McKiggan Hebert as it pertains to the existing effluent treatment system at the NPNS facility; the mechanical design of the proposed new ETF; the environmental studies and approvals associated with both the existing and approved ETF.

The document review will be provided in Chapters in this "living" document. As documents for review are added to EXP's mandate, they will be registered in this Introduction Section under the Document Register and a new Chapter will be added and referenced in the Document Register.

1.0 Reviewer Scope

EXP's mandate is to provide technical advice on the engineering, environmental and other technical aspects of the proposed ETF replacement project. EXP's reviewers are to examine each document provided by McKiggan Hebert and provide a brief, plain language synopsis of the report and outline any key deficiencies; errors and omissions; bias; applicable science; key findings; and any other points of interest. Some document reviews may be focused on a specific request or assignment from PLFN or McKiggan Hebert.

2.0 Reviewers

Redacted as per Section 20(1) of the FOIPOP Act

Redacted as per Section 20(1) of the FOIPOP Act

Redacted as per Section 20(1) of the FOIPOP Act

Redacted as per Section 20(1) of the FOIPOP Act

Chapter 6 - Context for 2016 EEM Report

The "Context for 2016 EEM Report" is a one page cover letter that accompanied the 2016 EEM Cycle 7 report prepared by Dillon for NPNS. The purpose of the cover letter is to ensure that reviewers of the EEM Cycle 7 report understand that the monitoring report applies to the existing ETF System and not the proposed replacement.

The cover letter notes that while the EEM presented in the Cycle 7 report would be similar, it will not be the same. The new EEM will require to take into account any findings or actions from the EA report; will need to have new benthic and fish surveys completed; a new plume delineation study will be required; and will require new sampling locations to be defined. Overall, Dillon is noting that there will be significant due diligence required to properly update the EEM program should the proposed treatment facility move forward.

Chapter 7 - EEM Cycle 7 Interpretive Report for the Northern Pulp Nova Scotia Corp. Facility Near Pictou, Nova Scotia

The "EEM Cycle 7 Interpretive Report for the Northern Pulp Nova Scotia Corp. Facility Near Pictou, Nova Scotia" prepared by EcoMetrix Incorporated for NPNS in March 2016. This is a comprehensive review/summary of the Ecological Effects Monitoring (EEM) of the existing ETF at Boat Harbour from EEM Cycles 1 to 7. It gives a summary of work done and findings from EEM's 1 to 6 (1996 onward) and then the methods and results from the EEM Cycle 7 (2014 to 2015).

Work done is essentially limited to the PPER regulatory requirements and then, sometimes, modified from the results of prior years.

There is an Executive Summary that describes a bit of the history of the Plant and how the effluent is handled – noting that the 1% effluent concentration is highly variable in the receiving environment from many variables such as wind and tides. The summary then focuses on the EEM Cycle 7 dealing with:

- Sub-lethal toxicity of the effluent – concludes that even though effects (sea urchins and algae) are measured, what causes them is not clear.
- Benthic (Bottom) Macroinvertebrates (worms, snails, clams) – the Invertebrate Community Survey (ICS) showed variation, but not readily explainable – some exposure areas showed greater diversity and density, likely due to habitat variation as opposed to effluent discharge. They note that effluent is buoyant and so does not impact the bottom community easily.
- Fish – tries to answer two things noted in earlier EEM cycles:
    - Why the fish in Boat Harbour appear to be older than in reference areas – sampling gear? oxygen levels?
    - Why the fish in Boat Harbour have larger livers and higher lipid content – not diet?
- Supporting Environmental variables measured as other studies were carried out – chemical and physical aspects of the waters. Water chemistry from the mill (Boat Harbour) is measurable.
- Sediment Chemistry – as seen in other EEM studies, decreases in sulphide and higher C:N ratios were positive.

There is a lot of detail on each of these areas. All data from EEM 1 to 6 are summarized. The science looks as good as can be expected.

EXP concludes that, although there are measurable differences between exposed and reference sites, sometimes the differences are not what you would expect, and the reasons are usually unexplainable. Boat Harbour is essentially a treatment lagoon, but after the effluent is discharged, the differences are not clear nor dramatic. They conclude that it is not clear that the effluent is having any discrete effect, it is just suggestive and needs more monitoring.

1.0 Applicability to the Proposed Treatment System

Dillon goes out of its way with the "Context" page, before the main report, to make sure the reader does not confuse what they looked at for Cycles 1 to 7 as opposed to what type of EEM studies will be required with the new effluent discharge facility.

As Dillon noted, and EXP agrees, the discharge will happen in a much different place (at the bottom of the Northumberland Strait versus at the surface outlet from Boat Harbour) and will likely have a different chemical nature as it meets the receiving waters.

However, the EEM for the new system will have similarities to this methodology.

Discharge from plants such as NPNS will require a monitoring program with many of the same elements as in these studies (e.g., sub-lethal toxicity tests, benthic invertebrate community studies and water chemistry sampling).

The sampling program that will be laid out by ECCC will want to answer the question "Is the discharge having any effects on the receiving environment?" and, getting to your question...what they have been doing, in terms of approach, is what "they typically do".

This will involve a measure of how toxic the discharge is using standard toxicity testing of different concentrations on specific species, both animal and plant. This is also known as the "acute lethality of the discharge".

The impact zone is set at "where the effluent concentration has been diluted to 1%" and so they should measure where that zone is and sample for organisms and water chemistry inside and outside that zone.

Without getting into a detailed EEM plan, it should look at the chemical nature of the effluent, the benthic (bottom) communities around the discharge area, the potential effects on finfish moving through the area, and the impact on crab, lobster and scallop distribution.

There will likely be an amended version of the PPER created by ECCC and DFO for the new effluent facility with regulations for maximum levels of certain parameters in the effluent itself (e.g., total suspended solids (TSS), biochemical oxygen demand (BOD), acute lethality, sub-lethal effects, as well as the other potential impacts already mentioned).

Any proposed EEM program for the new system should also be available for review before it is implemented and will likely be included in the Provincial EA.

Chapter 9 - Preliminary Engineering for ETP Replacement Technology Selection Summary

The *"Preliminary Engineering for ETP Replacement Technology Selection Summary"* document was prepared by KSH for NPNS in July 2017.

General comments taken from the report are as follows.

1. Overall the report appears to have been developed as a PowerPoint presentation as opposed to a traditional Engineering report. A report of this significance (i.e. the main treatment technology review and selection) would benefit from a better overall structure with more defined sections including recommendations and conclusions. The report should also include some references where appropriate for some of the industry specific statistics that are provided.
2. Parameters such as flow, BOD, TSS and absorbed organic halogens (AOX) in the effluent per tonne of final product in the existing ETF system has improved from 2012 to 2016; in some cases, dramatically.
3. Current mill effluent flow ranges from 70,000 to 75,000 cubic metres per day (m^3/d). The report goes on to recommend a design flow for the plant of 85,000 m^3/d. It is not indicated whether this is an average daily flow, peak daily flow, or peak instantaneous flow – typically it would be recommend values for all of these flow capacities be defined. It also provides no description as to how this capacity was selected (i.e. was any future growth taken into account, how were ongoing water reduction efforts factored in, etc). Additional calculations should be provided to support the selection of this capacity.
4. Options for ETF included: aerated stabilization basin (ASB), activated sludge treatment (AST), and AST-like "high rate" systems, anaerobic treatment and tertiary treatment.
5. The use of moving bed bioreactor followed by activated sludge treatment seems to be a reasonable concept.
6. Selection of treatment technologies consisted of comparison between ASB and AST advantages and disadvantages. This selection was not guided by assessment of receiving water or environmental impact.
7. There is only one treatment process train so that if/when a treatment component is down for servicing, the process is either shut down or bypassed. This configuration seems to add a bit of risk for extended untreated by pass discharges. There should be multiple treatment trains.
8. Very little data is presented from the existing plant operations. Some average flows and contaminant loadings are provided in charts per metric tonne of final product. EXP would recommend that a summary table be provided to clearly define the effluent flow rate and the relevant contaminant concentrations in mg/L or similar applicable units.
9. The discharge limits or treatment objectives for the effluent treatment system are not given in the report. A summary of these limits should be provided.

10. The report summarizes two options for treating the D0 and E1 filtrate streams separately but neither are recommended.
11. The report discusses two options for modifications to the pulp making process that could reduce the downstream loading to the treatment system: extended delignification and oxygen delignification. The report rejects extended delignification outright but does not appear to reject oxygen delignification, however, nor does it specifically recommend it. If oxygen delignification is recommended, this needs to be clearly stated in the report as well as the impacts/benefits it might have on reduced loading to the downstream treatment system.
12. The report clearly identifies aerated stabilization basins (ASB), also known as an aerated lagoon) and the conventional activated sludge process as the two most prevalent treatment processes in the industry. The report does a good job of summarizing the key points of each treatment technology including the benefits and drawbacks. In general EXP is in agreement on the comments although detailed verification on the statistics given for the pulp industry was not completed and no references were provided. There are several reasons given for why ASB was ruled out and these seem reasonable. It is assumed that some investigation was done to determine that land availability would be an issue as no background was provided such as a site plan or property map.
13. The report goes on to briefly identify other technologies including several variations on the activated sludge process as well as anaerobic treatment. There is very little discussion other than a couple of bullets for each of these technologies with a bullet to state that conventional activated sludge process is the preferred technology. While EXP would not disagree that the final technology selection is potentially valid, this section would benefit from some significant discussion as to why these other technologies were rejected.
14. There is a final summary of potential tertiary treatment objectives and the recommendation is not to include tertiary treatment unless there is a very specific reason to do so. EXP would agree with this as a rule of thumb but the report does not provide enough information to independently draw conclusions as to whether tertiary treatment may be required in this case. Reasons could include specific contaminants that are untreatable by the activated sludge process or overly stringent discharge limits. With no summary of the contaminant concentrations or the effluent treatment objectives, it is difficult to comment on whether tertiary treatment might be required.
15. Some preliminary capital cost estimates may have helped justify any technology selections made.
16. The report would benefit from some basic process flow block diagrams to better illustrate the processes.

Chapter 17 - Draft and Final EEM Program

The "Environmental Effects Monitoring Program Investigations Associated with The New Proposed Treated Effluent Discharge Configuration at The Northern Pulp Nova Scotia Corporation Mill" was prepared by EcoMetrix Incorporated. The draft version was completed in August 2018 while the final version was issued in January 2019.

This review was based on the draft versions of the documents and amended where applicable based on EXPs review of the final document issued in January 2019.

This document was reviewed by Jim Foulds, Ph.D., EP and Steven Schaller, B.Tech., EP. Generally speaking this document contains the monitoring regimes that are being proposed for after the completion of the replacement ETF. One of the underlying comments that EXP noted is that it is suggested that any of the monitoring programs do not have to be completed for up to 24 months after commencement of discharge from the ETF. It would be expected that any discharge from the Plant would need to be tested prior to discharge into the environment. If this is going to be conducted, it was not discussed in this document.

It would be expected that a second version of this document would be created following the completion of the EA and will take into account any new regulatory requirements that are in place at that time.

1. The draft report describes the work that will be part of an EEM program if the EA is approved and the proposed outfall (12 km out) goes ahead as proposed. The final report was based on the revised outfall location that requires 11 km overland and 4km under water.
2. The report summarizes the many years of previous EEM studies to date – not sure of the relevance of that history since the effluent is being treated differently and discharged in a different manner. It I noted that both the draft and final documents nit that empirical confirmation of the predicted spatial extent of the effluent plume (as documented by Stantec in the RWS 2017 and RWS Addendum 2018) will be needed to support the EEM program design.
3. The work described has been derived from the PPER requirements as well as the EEM's technical guidance document from Environment Canada, i.e., it is designed to meet the requirements for effluent discharge for Pulp and Paper Mills in Canada.
4. This work will comprise a "first" program or cycle for the new effluent treatment and discharge location.
5. Elements of the work to include:
    a. Treated Effluent Plume Delineation – to verify the theoretical studies predicting certain dilution rates at 100 m from the diffuser – the "mixing zone".
    b. Biological monitoring of:
        i. benthic community "condition";
        ii. fish population health; and

iii. dioxins and furans levels in fish.

6. Page 14 - Plume delineation defines the "exposure area" to be where the concentration of effluent to seawater is periodically 1% or greater. They also define long-term conditions for this zone, but the definition is incoherent. Viz. …. "the zone within which effluent concentrations of 1% or greater, and 0.1% or greater would be regularly detectable."
7. Page 16 noted that the PPER state that monitoring of Benthic Communities is not required if the dilution from the diffuser is down to 1% within 100 m and Fish Population studies are not required if the dilution is down to 1% within 250 m of the diffuser.
8. The dioxins and furans sampling in fish tissues are also not required if the levels of dioxins and furans are below a defined amount in the raw effluent. Since these two groups have been below the defined PPER level for a number of years, the authors concluded that testing for dioxins and furans in fish tissue is not likely to be required. The final version of the document updated this section to note that annual testing for dioxins and furans would continue to be performed on the treated effluent.
9. The report describes, generally, the approach to be taken to monitoring if these studies are required. They give general approaches and state that detailed study plans will be developed as needed.
10. Fish population health is proposed to be measured by the effect on mussels. This has been done earlier and seems a reasonable alternative to assessing fish populations themselves, in Control and Exposed areas….. they move around too much!
11. In terms of a Work Schedule, they recommend doing a survey for the Benthic Community and the Fish Population health before any effluent is discharged as a baseline. The EEM from PPER does not require that any of this start before discharge of effluent begins. It will allow for more statistical analyses along a time axis, as well as a spatial one.

Chapter 18 - Draft and Final Follow-Up Studies

The "Follow-Up Studies Associated with The Environmental Assessment Process for The New Treated Effluent Discharge Configuration at The Northern Pulp Nova Scotia Corporation Mill" prepared by EcoMetrix Incorporated. The draft version was completed in August 2018 while the final was completed in January 2019.

The main difference between the draft and the final document is the reference to the change in the discharge point from the ETF from the initial option of a 12 km offshore pipeline to a 11km over land pipeline with 4 km in the water.

This document was reviewed by Jim Foulds, Ph.D., EP and Steven Schaller, B.Tech., EP. Generally speaking this document contains the proposed monitoring regimes that are being contemplated for after the completion of the replacement ETF. One of the underlying comments that EXP noted is that it is suggested that any of the monitoring programs do not have to be completed for up to 24 months after commencement of discharge from the ETF. It would be expected that any discharge from the Plant would need to be tested prior to discharge into the environment. If this is going to be conducted, it was not discussed in this document.

It would be expected that a second version of this document would be created following the completion of the EA and will take into account any new regulatory requirements that are in place at that time.

The document describes the proposed follow-up monitoring program to be completed following the Environmental Assessment process and commencement of the ETF Plant. The proposed monitoring plans include options for both baseline (preconstruction) monitoring and performance monitoring. The objective of the monitoring programs is to be able to evaluate the effectiveness of the new ETF by measuring its effect on the receiving environment.

1. The document notes that the proposed monitoring programs are considered provisional and may be revised based on feedback during the EA process.
2. Toxicity testing of treated effluent on lobster larvae and herring eggs looks good. Something similar will also be part of any required monitoring in the EEM program mandated by the PPER.
3. Baseline phytoplankton and zooplankton sampling not spelled out in terms of time should be done for 1 year before construction. There is so much patchiness and seasonal changes in these planktonic communities that any effect of the ETF will be undetectable. Seems to be work that we know will not yield useful data.
4. Why would vertical tows for zooplankton be restricted to the photic zone?
5. A focus on zooplanktonic lobster sampling seems like it is trying to assure fishers that they are looking after lobsters, but it really will not show anything better than the toxicity testing of the effluent.
6. Benthic community to be sampled every 500 m along outfall pipe corridor with a small bottom grab. This approach seems acceptable, but other aspects of benthic community structure will also be covered by the EEM program. The number of sample stations in the draft report was noted at 24 based on the length of

marine pipe, however the final document notes that there will be only 8 sample stations. The reduction in sample stations is only because of the reduction in the length of pipe required to traverse under water.

7. On Page 2.5, Section 2.5 there is a reference to a footnote "[4]" next to sediment sample analysis for acid-volatile sulphide and low level mercury however there is no foot note corresponding in the document.
8. Supporting Environmental Data: Long list of other parameters to be measured, but no rationale provided. Suspect these parameters will be refined through the EA process.
9. Water Quality Samples: There was no details on where these samples are to be taken in the water column. A rationale for these parameters would make a stronger case for the time and expense. It would be expected that water quality samples would accompany any toxicity testing samples, but this was not defined.
10. Fish Community and Fisheries Resource Characterization: The document notes that this type of study will not be completed and concludes that there is sufficient data from existing information.
11. Tissue Chemistry Testing: Done on a wide range of species found in the area, mostly those that are associated with the fishing industry. Need to sharpen that list of species and give a rationale for the items being measured.
12. The Proposed Schedule is overly simplistic and does not contain significant information.

Chapter 19 – Addendum Receiving Water Study

The "Addendum Receiving Water Study for Northern Pulp Effluent Treatment Facility Replacement Project – Additional Outfall Location CH-B, Caribou Point, Nova Scotia" prepared by Stantec in 19 December 2018 was reviewed by EXP.

This document was reviewed by Jim Foulds, Ph.D., EP and Fred Baechler, M.Sc., P.Geo.

Stated Rationale: Earlier study for effluent outfall indicated that a site, Alt-D, in the Northumberland Strait, was the preferred outfall location. Subsequent field investigations of the Alt-D location indicated that ice scour at that depth (11 m) would preclude that site and so alternate sites were required – at greater depths. This report attempts to do this and is an Addendum to the Stantec (2017) document[1].

Stantec identified (but don't explain how or why) a new alternative outfall location - offshore of Caribou Harbour, off Caribou Point. They picked 2 locations, CH-A and CH-B at 25 and 20 m depths respectively.

They applied the same modelling (MIKE 21 and CORMIX) as was done for the earlier study (Stantec, 2017). These models are industry standards for this type of assessment. The approach Stantec has taken – with conservative assumptions for dilution and dispersion (Table 2.1) – is well-founded.

Stantec conclude that dilution, dispersion and meeting compliance levels of discharge elements (parameters of concern) would be achieved by a 3-port diffuser at CH-B. Modelling results also suggest this design would be better than the 6-port diffuser at Alt-D and a 3-port diffuser would take up less space on the bottom of the ocean.

Far-Field Modelling:

Modeling of far-field dispersion characteristics indicated that CH-B was better at dispersing the discharge. Results under various tidal conditions in Figures 2.5 to 2.13 seem to indicate concentrations in surface waters but they only demonstrate the concentrations from the CH-B model. For comparison, CH-A should also be shown. Further, the locations of CH-A and CH-B should be shown on each of these Figures for relative notation of the predicted concentrations shown. There is no figure to show dispersion throughout the water column, ie a cross section.

Near-Field Modelling:

Used the same approach (CORMIX model) as in the 2017 study. They compare a one port and three port diffuser design and conclude that a 3-port diffuser at CH-B would be better than at the Alt-D location and without the issue of ice scour.

Ultimate Recommendation from this report:

Change the design and location of the diffuser – i.e. a 3-port diffuser at CH-B.

---

[1] Stantec Consulting Ltd. (Stantec). 2017. Preliminary Receiving Water Study for Northern Pulp Effluent Treatment Plant Replacement, Pictou Harbour, Nova Scotia. August 2017.

EXP commentary:

1. The Alt-D site has received an enormous negative public response – especially from the fishing community. This new site for the diffuser/outfall takes it away from "highly valued" fishing grounds and puts it beside the ferry routing between Caribou, NS and Wood Islands, PEI. It also reduces the length of the underwater transmission footprint.
2. The report does briefly discuss the role of ice conditions by saying more dilution/dispersion is expected under winter ice regimes. However, Table 2.1, which summarizes conditions and assumptions used in hydrodynamic modelling, doesn't outline how ice is modelled e.g. extent, thickness, type.
3. There is no mention of sea level rise in this or the main report of the engineered life time of the facility. This becomes important in addressing the impact/adaptation strategies required for handling changing climate; in particular sea level rise for this assignment. There is no indication in either report of how the modelling results would differ with rising sea level.
4. The modelling exercise appears to focus on dilution/dispersion of the effluent as dissolved load within the water column. EXP hasn't noted anything in either report on the impact of natural suspended sediment loads in the Northumberland straits after large storm events. This suspended sediment may act on the positive side to ad/absorb contaminants. However, the key for impacts is then to determine where this sediment would settle out, which maybe much farther away than 100 m discussed in the report. Assessing this transport method would also require:
    a. sedimentological transport modelling;
    b. an assessment of natural concentrations for the COCs in existing fine grained sediment deposition areas; and
    c. biological assessment of what is present in those deposition areas.
5. Sub-marine Groundwater Discharge (SGDs) are becoming more important worldwide in understanding the interaction between fresh terrestrial and saline marine waters. Freshwater sub-marine springs can be critical in supporting local, diverse biological communities on the sea floor. There is no discussion on whether such ecosystems are present at the diffuser site locations.

3.3 Section 3.0 Regulatory Environment

The Federal Agencies and Departments have been waiting for the submission of the EARD to make their decision as to whether a Federal CEAA will be required. The EARD references that several consultations have been made with Federal regulators. Copies of these correspondence should be made available to PLFN.

This Section also identifies the following studies, which EXP would consider significant to the EA, that need to be completed:

1. Marine benthic habitat study along the proposed pipe line route.
2. Geotechnical Assessment.
3. Harmful Alteration, Disruption or Destruction (HADD) of Fish Habitat Assessment for the Pipeline and the water crossings.
4. Archeological Assessments along the new route, to be started in 2019.

Risk that a "listed species" was not seen because of the wetland survey was done in December.

Section 3.4 Other Relevant Guidance notes the guidelines being looked at as it pertains to the project. Omitted from the list is the Federal Wastewater System Effluent Regulations.

3.4 Section 4.0 Project Justification and Alternatives Considered

This section presents the project alternatives, but EXP is of the opinion that the section has a slight bias towards the chosen project option.

The original outfall location was abandoned ostensibly because of the potential for ice scour and yet the design of the new outfall location will be engineered to resist ice scour damage.

The section does present some information on the performance of the chosen system in an existing application in the United States where the effluent discharge is to a fresh water stream. EXP recommends that the Environmental Effects Monitoring that has been completed on similar facilities be reviewed as a comparison of similar installations from around the world.

3.5 Section 5.0: Project Description:

Section 5.2.2: It is noteworthy that the regulatory compliance point is positioned before the effluent enters the transmission pipeline and so the regulators are not including natural attenuation in the Strait as part of the treatment chain.

Section 5.2.2.3: Discussion on the Spill Effluent Basin that will be used to add retention time of 10 to 13 hours of effluent diversion if needed. The EARD notes that the basin should never be full but there is no mention of what controls will be in place to monitor the ponds level and prevent overfilling. This basin will be located between 80 to 100 metres from the Harbour with only an elevation change of 5 to 6 metres.

Section 5.2.3: While the report identifies that the spill collection system basin will be lined. However, since the basin is apparently open to precipitation what is the design storm for the basin so that it doesn't overflow? What happens if the effluent still doesn't meet specs prior to overflow?

Section 5.2.2.8: Appropriate to see that the sludge management system allows for burning to create energy.

Section 5.3.1.10: Pipe Installation – Marine Portion. This section notes that the trench will be 3 metres deep and will affect a 13 m wide swath. Further details on the pipe installation we presented in Appendix F.

Appendix F contains the Pipeline Conceptual Design and Construction Methodology Report prepared by Makai Ocean Engineering Inc. EXP's review of this report revealed the following:

1. Pages 14-15. The proposed trench cross section is approximately 3 m deep and 13 m wide and almost 4 km long. Per kilometer, the estimation is approximately 13,500 m^3 of material that needs to be removed for the trench. 156,000 m^2 of sea bed will be disturbed without considering additional area from over-excavation. If the side-casting method for dredged material is used, that could affect twice that area of sea bed.

   The report should mention considerations from an environmental/resource perspective looking to either minimize habitat destruction or establish a zone of ground fish/shellfish over fishing in an effort to harvest existing resources there instead of simply mulching it up and burying it. Perhaps this will follow with some of the further assessment work to be completed in 2019.

   Page 21. In three instances, utilizing a grading beam to regrade the trench backfill, after pipe installation is complete, was mentioned. Pulling a submerged bar blindly through possibly turbid water while trying to follow the previously dug trench, that is not visible from the surface, seems quite difficult to ensure quality and effectiveness of the backfilling procedures without doubling or tripling the impact on the adjacent ecosystem. What considerations are in place to ensure the grading beam stays within the trenches foot print and what tolerances are expected under normal operation conditions with the grading beam method?

2. Understanding the sea floor soil conditions will guide the proponent on how to handle the dredged materials. This is an unknown variable at this point but in a theoretical situation where a large quantity of the dredged material is classified as contaminated, what method of trench development would be most cost effective? There was a brief mention in the document about NSE Guidelines for Disposal of Contaminated Solids in Landfills. There is a large cost associated with transporting contaminated materials to a landfill facility capable of accepting the materials. Would a method such as the ploughing method, where sea soil material is displaced then reinstated almost immediately while burying the pipe at the same time, provide economic and environmental incentives? If so, it would be a good idea to include something in the literature to identify whether it as a viable option.

Will there been any chemical testing along the trench to assess the types and concentrations of contaminants that may be disturbed as a result of the dredge?

Section 5.3.2 Operation and Maintenance Phase: notes that through the NPNS O&M manuals there are already existing EMP provisions. If they have an existing EMP manual for their current ETF then it would be appropriate to request a copy of this document for review to assess what potential care for the environment will be employed with any future EMP or EPPs developed.

Ongoing maintenance issue: What materials are used to clean the effluent pipe along its length? Would there be caustic chemicals that are discharged into the Northumberland Strait?

Section 5.6.5: How will heavy equipment be fueled up - on-site at specially designed locations?

Section 5.6.6 Surface Run-off and Sedimentation. Noted in this section and elsewhere in the EARD the proposed pipe line will follow along the existing roadways and make use of the shoulder for the installation of the pipe. There are several drawings and schematics that show the route. On these schematics it shows that the shoulder will be expanded in most cases to accommodate the pipe installation. The EARD seems to rely heavily on the fact that this is an existing roadway as the mitigation factor for potential risk (surface run ff and sedimentation). As a result EXP has identified the following points to consider:

1. Has NSTIR approved the use of their road system?
2. There will still be a requirement for water crossings with the most significant being across the causeway through the harbour.

Section 5.7.2.3: provides just general comments on sediment erosion control plans. EXP trusts that regulatory stipulations applied to permits will required detailed plans for review, including monitoring and compliance points/parameters/concentrations.

Section 5.7.2.4: How and where will grubbings be disposed of?

Section 5.7.2.6: provides general comments on water crossings. EXP trusts that the detailed plans required as a results of regulatory stipulations applied to water crossing permit application, will be provided for review.

Section 5.7 general: What quarries will provide aggregate and fill materials? Do they have permits? Has the quality of the aggregate been tested for sulfide bearing capacity and/or acid rock drainage (ARD) potential.

3.6 Section 7.0: Environmental Scope and Methods

Acceptable approach to defining Valued Environmental Components (VEC's) and their boundary conditions.

To better define temporal boundaries they should identify what is the expected life time of the facility.

Table 7.4-1 doesn't include:

1. No mention of odour from the new ETF;
2. Continued impact to PLFN, Town of Pictou or tourism industry as a result of odours.
3. Springs, Pictou well field and domestic wells not included under groundwater
4. Submarine groundwater discharge zones not included under Harbour physical Environment

3.7 Section 8.0: Environmental Effects Assessment

Section 8.3.2 Discussion of surficial geology doesn't include:

1. sand/gravel outwash plain which forms one of the aquifers from which town Pictou draws water from
2. natural geochemistry of overburden materials.
3. Discussion of erosion potential doesn't identify natural inherent erodibility factor of soils and glacial materials

Section 8.3.2 Discussion of bedrock geology doesn't include a discussion of any natural mineralization.

Section 8.3.3.3 Discussion of characterization of residual effects during construction phase doesn't discuss where grubbing materials will be disposed of and how.

Section 8.4.1.2 It was indicated that no watercourses were identified as potable water sources- but did they check in the field and talk with residents? How did they define watercourses – from existing mapping or in the field?

Section 8.4.2.2: Did water quality monitoring between 2012 and 2017 include discharge and stream sediment geochemistry? Where the analyses on filtered and/or non-filtered samples? Based upon the program what statistics were applied to determine "background" conditions and identify anomalous situations? Any monitoring of where grubbed materials placed?

Section 8.5.1: Groundwater VEC – scope doesn't include the well head protection area for the Town of Pictou's Caribou well field; although it is mentioned later.

Section 8.5.2: Did they augment the well log data base search with field inspections?

Section 8.5.3.2: Appropriate to see that where the pipeline route crosses the Town of Pictou's source water protection area that additional mitigative measures will include lining the trench with an impermeable material to contain any leak and a leak detection system. However, a review of the details of that design should be undertaken by at least Town of Pictou personnel prior to construction.

Section 8.7.2.3: Text notes that as an alternate pipeline route was selected in fall 2018 only preliminary recon visits of the new pipeline footprint area undertaken in late fall. The text Indicates follow up work to be undertaken in spring summer 2019. The resultant report should be reviewed.

Section 8.11.2: Submarine groundwater springs are not included in Harbour physical environment.

Section 8.18: The impact of sea level rise is not included in the effects of the environment on the project

Section 8.18.4.1: Why use wind data from Halifax Airport – nothing closer?

Section 8.18.4.2 Discussion of seismicity doesn't include discussion of related tsunami events from submarine landslides

Section 8.18.6: Appropriate that the project should be designed to 1:100 - 24 hr duration flood event during construction period. Will require review of that design prior to construction

3.8 Section 9: Human Health Evaluation

The Human Health Evaluation (HHE) section is presented primarily as a scoping exercise to define what NPNS will assess should they be regulated to complete a Human Health Risk Assessment (HHRA).

The HHE notes that PLFN will be a key receptor but they note that it would not be feasible to have health surveys completed in the FN community. It is noted that data will be based on existing studies and literature, if they are not able to complete the Surveys.

The HHE notes that "many" if the chemicals in treated effluent and air emissions will be treated as COPC. They note the limitations associated with not having the actual effluent available to analyze as well as not having the completed ETF design to fully develop the COPCs. The HHE also notes that there will be an effort to utilize screening approaches to reduce the lists for COPC down to a reasonable and representative list. It would be suggested by EXP that if the engineering design is not able to clearly define what will be in the effluent, than caution should be employed as it pertains to how many elements are screened out of the list of COPCs.

The Air emission COPCs are being restricted to only those that are regulated or stimulated in the existing environmental approval.

The HHE section reviews the Air Dispersion Modeling study (also reviewed in this Document, Chapter 12) and basically refutes the claim that VOCs are associated with NPNS and further note that VOCs will not be considered any further at this time.

The HHE notes that AOX will likely be omitted from any future HHRA as AOX is type of analysis that covers a multitude of compounds. This does not mean it should not be assessed or included in any monitoring.

They will be looking to use some of the data and concentrations from the Toxikos HHRA to serve as an indication of what the NPNS plant might produce.

- The HHE notes that there were at least four (4) previous HHRA associated with the Boat Harbour Site. It noted that there were not reviewed in detail but that they contained conclusion that there were no risk to human health under reasonable or realistic exposure scenarios for the COPCs.
- There was a sample collected in 2018 of the raw effluent that was found to contain: "hydrocarbons, toluene, cyanide, metals and metalloids, phenol, o-cresol, a phthalate ester compound (likely from pipe materials rather than due to mill processes), chloroform, total trihalomethanes, and trace PAHs (phenanthrene and pyrene only)". There was no note how these parameters and concentration compared to any guidelines, jus that they were detected in the sample.

A review of the sediments from the existing Boat Harbour settling pond may provide useful insight into some of the expected chemicals of concern. This information should be publicly available as part of the Boat Harbour Remediation Project.

3.9 Section 10.0: Accidents, Malfunctions and Unplanned Events

Risk of pipeline break/leak. Dealt with in Chapter 10. E.g., What would be the effect of a break in the well field for Pictou or Caribou?

Risk of diffuser caught in a bottom trawl.

Risk of the diffuser being fouled by an anchor.

Risk of ice scour.

Risk of the berm forming the walls of the spill basin having a failure resulting in a spill or release of contained effluent. Not mentioned was an overfill of the spill basin resulting in an overflow.

Domestic wells may be impacted by a pipeline spill. Is there a contingency plan for a compromised water supply?

Surface water might be threatened by a spill during the operational phase but is not addressed in Section 8. Not mentioned for the Groundwater section either.

Risk of pipeline spill from road accidents on bridge.

Section 10.2.7: Vehicle accident – no discussion of spill during fueling heavy equipment

Section 10.5: The text notes that an EPP for management and prevention of such accidents will be developed. It will also develop effective response mechanisms for accident, malfunctions or unplanned events. This will require review.

3.10 Section 12.0: Cumulative Environmental Effects Assessment

Table 12.1-2 identifies activities with environmental effects that might overlap those of the proposed project. There is no discussion of tourism, increased traffic on road to Ferry terminal, road wash runoff.

Section 12.3.10.3: The EIA quite rightly focuses on significant negative impacts. Perhaps it should also provide a discussion of significant positive impacts of the proposed work.

3.11 Section 13.0: Follow-up and Monitoring Summary

Follow up and monitoring is critical to ensure that the non-significant impacts stay non-significant. The Environmental Effects Monitoring (EEM) program is entirely compliance driven – as per the PPER and EEM program obligations. The programs should also give consideration to assessment of any collected data to background and baseline conditions, not just stipulated compliance values.

The significance of impacts is compliance driven and, for the marine component, are at 100 m from the diffuser. This means that the baseline assessment area would be a circle of 100 m diameter which would be roughly 31,416 m^2 or 5 football fields to give some perspective.

The text notes that monitoring programs identified are conceptual and presented at a relatively high level. As project advances through detailed design, permitting, construction and into operation and as follow-up or monitoring programs are carried out the methodology for each program will be documented and adjusted as

necessary to meet the environmental protection requirements or commitments. These changes will need to be reviewed not only in their design – but how the data will be utilized – by whom – how often - who will analyze – what are the action levels etc.

3.12 Appendix K

3.12.1 Background

The Stantec report was conducted to support the Environmental Assessment for the replacement of the Effluent Treatment Facility (ETF) owned by the Government of Nova Scotia and operated by the Northern Pulp Nova Scotia Corporation, located at Abercrombi Point, Pictou County, Nova Scotia. The stated objective of the Stantec report is "to assess the potential effects of the existing operation of the Facility with the existing wastewater treatment system in place and the future operation with the new wastewater treatment system in place, on air quality in the region around the pulp mill."

EXP's scope of work is to conduct a peer review of the Stantec report and provide a professional opinion on its suitability as an assessment of the potential effects on air quality in the region around the pulp mill.

The following report reviews the approach, findings, and recommendations of the Stantec report and provides recommendations in regard to an assessment of the potential effects on air quality in the region.

3.12.2 Assessment

3.12.2.1 Documents Reviewed

The following documents were provided for review:

- Dillon Consulting, January 2019. Appendix J2 Environmental Assessment Registration Document Replacement Effluent Treatment Facility.
- Stantec Consulting Inc., Appendix K1, Air Dispersion Modelling Study – Replacement Effluent Treatment Facility. January 21, 2019.
- Stantec Consulting Inc. Comments on Paper – Pilot study investigating ambient emissions near a Canadian kraft pulp and paper facility in Pictou County, Nova Scotia by Hoffman et al (2017 a b). June 15, 2018.
- Northern Pulp's Industrial Approval 076657-A01.

3.12.2.2 Assessment of Method

Stantec conducted air dispersion modelling of contaminants regulated by the Government of Nova Scotia under the Air Quality Regulations, as amended on October 12, 2017 as well as fine particulate matter (PM2.5). The air dispersion modelling program used was AERMOD Modelling System promulgated by the US EPA and approved for use by Ontario and Nova Scotia regulatory authorities. The analysis of the modelling results is based on Air Dispersion Modelling Guideline for Ontario [Guideline A-11] (ADMGO) due to the absence of a suitable air dispersion modelling guideline adopted by the Province of Nova Scotia.

3.12.2.3 Choice of Model

The choice of models for a scenario depends on the scale of the sources and complexity of atmospheric and topographical conditions. The U.S EPA AERMOD modelling system is a Gaussian-plume model which accounts for the majority of dispersion modelling scenarios. Gaussian-plume models assume spatial uniformity in meteorology. In situations of complex terrain or near coastal boundaries significant changes in meteorological conditions can occur over short distances. The proposed ETF is located 0.2 km from the coast line with other on-site sources with elevated stacks located within 0.35 km of the shoreline, therefore, special consideration for shoreline fumigation is required (i.e. the use of fumigation option within AERMOD or advanced models e.g. CALPUFF.)

AERMOD requires specific model input data representative of site and source conditions and accurate emissions inventory. It is important to note that the model input and output data files were not provided and therefore cannot be verified.

EXP Review Findings

- Details on calculation of emission rate estimates were not provided.
- Assessment of quality of emission rate factors were not provided.
- The model input and output data files, typically attached as a CD or flash drive, were not provided, therefore, the input and output parameters cannot be verified.
- Modeling results for 10-min averaging time were not assessed.
- Use of fumigation option is not stated.

EXP Review Recommendations

- Provide model input and output electronic files to verify model parameters and model processing.
- Provide details on calculation of emission rates as recommended in the Ontario Procedure for Preparing an Emission Summary and Dispersion Modelling Report version 3.0 PIBs # 3614e03 (ESDM Procedure)
- Provide an assessment of quality of emission rate factors as recommended in the ESDM Procedure.
- Assess for 10-minute time averaging in accordance with ADMGO

3.12.2.4 Air Contaminants of Interest and Assessment Criteria

The following air contaminants of interest were assessed based on those regulated by the Government of Nova Scotia under the Air Quality Regulation, as amended on October 12, 2017, as well as fine particulate matter (PM2.5) as regulated under the Norther Pulp's Industrial Approval # 076657-A01:

- carbon monoxide (CO)
- hydrogen sulphide (H_2S)
- nitrogen dioxide (NO_2)

- sulphur dioxide (SO_2)
- total suspended particulate matter (TSP)
- fine particulate matter ($PM_{2.5}$)

It is well recognized that pulp and paper facility and ETF process operations emit more air contaminants than the priority pollutants assessed. Volatile organic compounds (VOCs) and total reduced Sulphur (TRS) compounds consisting of H_2S, methyl mercaptan (CH_3SH), dimethyl sulphide $(CH_3)_2S$), dimethyl disulphide $(CH_3)_2S_2$), and chlorinated compounds are potentially emitted by the kraft (bleached) pulping process. Established emission factors for additional contaminants than assessed from the pulp and paper making processes, co-combustion of hog fuel, and wastewater sludge incineration are available in the reference chosen (AP-42 Chapter 1.6 Wood Residue Combustion in Boilers, Sewage Sludge Incineration AP-42 Chapter 2.2) as well as within AP-42 Chapter 10.2 Chemical Wood Pulping.

The assessment of future operations should also consider the potential of changes in regulatory criteria in the future. In particular, sulphur dioxide which in Ontario will be reduced from 275 µg/m^3 (1- hour) and 690 µg/m^3 (24-hour) to 100 µg/m^3 (1 -hour) and 10 µg/m^3 (annual) in 2023.

EXP Review Recommendations

- Provide a source summary table for all contaminants emitted from the ETF and the Kraft Pulp Mill facility in accordance with the ADMGO, including a full rationale for justification of any contaminants deemed insignificant.
- Identify emission factors representative of the processes to assess potential contaminants of interest not included in priority contaminants assessed. (e.g. AP-42 Chapter 10.2 Chemical Wood Pulping, Table 10.2-1 lists Methyl mercaptan, Dimethyl sulfide and Dimethyl disulfide emissions (Emission Factor Rating: A); AP-42 Chapter 1.6 Wood Residue Combustion in Boilers; and AP-42 Sewage Sludge Incineration Chapter 2.2, Table 2.2-3.)
- Assess emissions of odourous contaminants at 10- minute time interval based on criteria in Ontario Air Contaminants Benchmark (ACB) list.
- Consideration should be given to the potential of changes in regulatory criteria, in particular sulphur dioxide, in the assessment of future operations scenario.

3.12.2.5 Emission Inventory and Emission Factors

The Facility rates of emissions for CO, NOx, SO_2, TPM were based on Facility stack emission testing reports and H_2S based on Site specific data for TRS. The ETF emission rate was based on site testing at the Boat Harbour ETF in 2012. While the use of source testing data typically has a high emission factor rating (A – high quality) it should be noted that no speciation or details on Total Reduces Sulphur (TRS) monitoring and emission factor rating are provided. It is recognized that the majority of the TRS Compounds emissions (facilities that are part of the class identified by NAICS code 3221 (Pulp, Paper and Paperboard Mills) are Facility emissions, with H2S emissions from

the ETF are less than 1.2% of total H_2S emission, however, the total H_2S emissions for the future operations has increased by more than 3 times.

Emission factors used, for burning of sludge, by Stantec were US EPA AP-42 Chapter 2.2 Sewage Sludge Incineration for CO, SO_2, NOx, TSP, and $PM_{2.5}$. Both this reference and AP-42 Chapter 1.6 Wood Residue Combustion in Boilers lists other contaminants of interest that were not included in the assessment. Regardless of emission factor reference consideration should be given to assess all contaminants of interest within the reference chosen.

EXP Review Recommendations

- Provide a source summary table for all contaminants emitted from the ETF and the Kraft Pulp Mill facility in accordance with the ADMGO.
- Provide sample calculations detailing emission rates determined, significance of contaminant, and emission factor rating in accordance with the ESDM Procedure.
- Include assessment of emissions of potential contaminants from co-combustion of sludge and hog fuel in addition to priority contaminants.

3.12.3 Model Results

Stantec states that based on the modelling results, with the exclusion of meteorological abnormalities, the existing and future operations meet the criteria for carbon monoxide (CO), hydrogen sulphide (H_2S), nitrogen dioxide (NO_2), sulphur dioxide (SO_2), total suspended particulate matter (TSP), and fine particulate matter (PM2.5). Modelling was not conducted for TRS species or assessment at 10 min criteria, and wood-sludge co-combustion emissions.

EXP Review Recommendations

- Provide model input and output electronic files to verify model parameters and model processing.

3.12.4 Conclusion

EXP cannot verify Stantec's findings without provision of the model input and output files and supporting calculations for emission rates as identified above. Further the assessment is restricted to priority pollutants regulated (CO, H_2S, NO_2, SO_2, TSP, and $PM_{2.5}$) without consideration of other potential pollutants associated with the pulp and paper process or wood residue combustion in boilers.

3.13 Appendix R

Appendix R is a literature review summarizing what is known about the effects of BKME (Bleached Kraft Mill Effluent) on lobsters. It concludes that any studies done before have used the former effluent - not the new effluent and so there should be studies to look for effects of the new effluent on lobster.

Appendix R also generally concludes that most studies to date all indicate little to no effect on the benthic animal community - including lobsters.

This being stated, EXP identifies the need for an additional study to better delineat the lethal and sub-lethal effects of treated effluent on larval and adult lobsters.

Executive Summary

Boat Harbour, a small body of water located just to the south of Pictou Landing First Nation that flows into Pictou Road, was incorporated into a wastewater treatment facility in 1967 when the facility was constructed by the Province of Nova Scotia as part of an agreement for the construction of a kraft pulp mill at Abercrombie, NS. Currently, the source of wastewater being treated in the facility is the pulp mill owned and operated by Northern Pulp Nova Scotia (NPNS).

It has been recognized that the use of Boat Harbour as a component of the wastewater treatment facility needs to be re-evaluated. A commitment has been made by the Provincial Government to address the issue of returning Boat Harbour to a natural state and to provide solutions to the decades-long problem. The objectives of this study are:

1. Consider additional effluent tertiary cleaning processes that would be applicable to kraft pulp secondary wastewater treatment systems which could result in improved effluent quality;
2. Evaluate the required level of tertiary treatment required for direct discharge into Pictou Harbour;
3. Summarize the Provincial and Federal permits and water-quality testing and quality requirements for discharging secondary and tertiary treated wastewater;
4. Identify any scheduled or anticipated changes in kraft pulp discharges (both Provincial and Federal);
5. Summarize all Municipal, Provincial and Federal discharge regulations for effluent discharges in Pictou Harbour;
6. Identify potential business opportunities to use the waste heat from the tertiary treated effluent (potential of 15,950 m^3/d at 43^{o}C); and,
7. Provide probable costs (±30%) for additional treatment, outfall options and associated equipment.

Maintaining just a secondary level of wastewater treatment and bypassing Boat Harbour will require that the effluent discharge point be relocated out into the Northumberland Strait. Conversely, if tertiary treatment is added, it may be possible to discharge the effluent into Pictou Harbour resulting in a shorter (and more economical) outfall. Several tertiary treatment systems were investigated for their appropriateness in treating pulp mill wastewater after secondary treatment. They are:

1. clarification
2. ozone addition;
3. engineered wetlands;
4. enhanced filtration; and,
5. membrane filtration.

Of these, the first three are of the most interest from a technical and financial perspective. The last two, while technically feasible, would be significantly more expensive and likely cost prohibitive.

There is also the potential for capturing a quantity of heat that is being released with the wastewater. The secondary treatment system would benefit in its operation if the pulp mill effluent temperature was reduced to less than 30^{o}C. A wastewater temperature any higher than 30^{o}C increases the difficulty of treating the wastewater as well as the operational costs. However, reducing the mill effluent temperature also reduces the amount of thermal energy available for recovery by potential external users as well as the potential uses for such low-grade thermal energy.

The operation of the wastewater treatment system for the pulp mill falls under federal jurisdiction (Pulp and Paper Effluent Regulations (PPER) under the Fisheries Act). While some provinces regulate the wastewater effluent quality generated by pulp and paper mills, Nova Scotia does not. As such, the current quality of the wastewater treatment plant effluent meets the requirements of the PPER.

There are no anticipated changes to the PPER, or any other regulations, that would impact on the current wastewater treatment plant operation. As well, there are no technical or regulatory reasons to prevent discharging the current treatment plant effluent to Pictou Harbour. However, aesthetically, the conditions within the harbour would, in all likelihood, deteriorate due to the size of the harbour and the volume of the effluent. Discharging effluent directly to the harbour would benefit from the addition of a tertiary treatment process following the secondary wastewater treatment system.

Various opportunities have been presented that would benefit from the waste heat being discharged in the treatment plant effluent. All of the opportunities have focussed on the non-contact use of the effluent; the use of the treated effluent in a direct-contact manner is deemed not feasible. In most cases, the quality of the water is not of a major concern; the water should be "clean" enough to be utilized in a heat exchanger with minimal fouling.

The opportunities examined included:

- District heating;
- Lumber drying;
- Power generation;
- Aquaculture; and,
- Agriculture.

As well, the mill could investigate the feasibility of reclaiming the heat to pre-heat the raw water for the appropriate processes requiring "hot" water. Regardless of the end use, the wastewater treatment process would benefit if the heat was removed prior to the wastewater being introduced into the secondary treatment system.

The district heating option, in and of itself, would not be considered feasible since the existing building density/building types in the vicinity of the mill are not conducive to that type of an operation. There may be possibilities within an industrial park complex adjacent to the mill configured to attract a cross-section of businesses that could make use of the waste heat year round.

Using the waste heat for lumber drying, only, particularly with the current state of the lumber industry, may be a difficult opportunity to promote.

Both the aquaculture and agriculture industries are well established in Nova Scotia. Using the waste heat in the agricultural industry, however, may require a different business model than currently practiced. Most greenhouse operations that would benefit from this heat source are seasonal whereas a year-round operation would be better suited to take advantage of this heat source. Conversely, a land-based aquacultural operation would require the heat on a continuous basis throughout the year.

"Green" power generation, on the other hand, could be located at the mill site. The infrastructure is, for the most part, already in place to accept the extra power allowing it to be used at the mill or to be introduced onto the grid.

Various costs have been presented for the three tertiary treatment options deemed most appropriate for treating the pulp mill wastewater prior to discharging to Pictou Harbour, though the costs are, for the most part, for illustration purposes. The costs vary from $ 7.8 M to $ 17.4 M. If effluent from a tertiary treatment plant being discharged to Pictou Harbour appears economically feasible, the process(es) need to be pilot tested to determine design criteria as well as the quality of effluent that could be produced.

Similarly, costs for the two discharge options have been determined. More accurate cost information would be made available once the actual discharge point is chosen, an environmental assessment of the project is undertaken, and preliminary design work is completed. For comparison purposes, the cost of the Pictou Harbour outfall is in the order of $ 7.13 M whereas the Northumberland Strait (MacKenzie Head) outfall is $ 23.76 M. In the event that the discharge point has to be moved further out into the harbour or ocean from the point(s) shown, the additional underwater piping cost will be in the order of $300,000/100m.

1.0 Introduction

1.1 Background

Boat Harbour is a small body of water, located just to the south of Pictou Landing First Nation, that flows into Pictou Road, a bay that connects Pictou Harbour to the Northumberland Strait. Boat Harbour was incorporated into a wastewater treatment facility in 1967 when the facility was constructed by the Province of Nova Scotia as part of an agreement for the construction of a kraft pulp mill at Abercrombie, NS. Currently, the source of wastewater being treated in the facility is the pulp mill now owned and operated by Northern Pulp Nova Scotia (NPNS).

It has been recognized that the use of Boat Harbour as a component of the wastewater treatment facility needs to be re-evaluated; previous studies have examined options for alternative treatment processes and effluent discharge points so Boat Harbour can be returned to a natural state[1,2].

1.2 Objectives of Study

A commitment has been made by the Provincial Government to address this issue and to provide solutions to this decades-long problem. The objectives of this study, as presented to ADI Limited in an RFP dated May 24, 2010, are:

1. Consider additional effluent tertiary cleaning processes that would work on kraft pulp secondary wastewater treatment systems which could result in improved effluent quality;
2. Evaluate the required level of tertiary treatment required for direct discharge into Pictou Harbour;
3. Summarize the Provincial and Federal permits and water-quality testing and quality requirements for discharging secondary and tertiary treated wastewater;
4. Identify any scheduled or anticipated changes in kraft pulp discharges (both Provincial and Federal);
5. Summarize all Municipal, Provincial and Federal discharge regulations for effluent discharges in Pictou Harbour;
6. Identify potential business opportunities to re-use tertiary treated effluent (potential of 15,950 m^3/d at 43°C); and,
7. Provide probable costs (±30%) for additional treatment, outfall options and associated equipment.

It must be noted that any reference to wastewater treatment made in this report focuses on **tertiary** treatment, a treatment process that would follow secondary wastewater treatment. Previous reports[1,2] have addressed the possible secondary wastewater treatment process and their associated costs.

2.0 Pulp Mill Wastewater Effluent Treatment

2.1 Secondary Treatment vs. Tertiary Treatment

2.1.1 Secondary Wastewater Treatment

There are varying levels of wastewater treatment available to municipalities and industry to remove pollutants from their wastewaters. Primary or chemically-enhanced primary treatment is used in many municipalities to remove solids, floatables and, to some degree, BOD (organics). A recent strategy proposed by the Canadian Council of Ministers of the Environment (CCME)[3] and currently under review by the Federal Government[4] would require municipal wastewater treatment systems to meet a National Performance Standard. To achieve this, secondary wastewater treatment technology is required; secondary treatment utilizes biological systems to consume the organics followed by solids removal devices (clarifiers, dissolved air flotation units, filters, membranes, etc.) to remove the pollutants allowing the discharged effluent to approach the quality of the receiving stream. The CCME strategy, currently under review by the Federal government, does not include industrial wastewaters directly discharged to the receiving environment.

However, under the Federal Fisheries Act (Chapter F-14), several industries are regulated as to the quality of the effluent they can discharge to the environment, one of which is the pulp and paper industry[5]. In order to meet these regulations, pulp and paper mills generally use a form of secondary wastewater treatment.

2.1.2 Existing Wastewater Treatment

The existing wastewater treatment system for the Northern Pulp mill consists of sedimentation basins followed by a four-cell aerated stabilization basin (ASB) with the effluent being discharged to Boat Harbour then flowing to Pictou Road. If required, nutrients can be added to the wastewater prior to its introduction into the ASB; the nutrients are provided to promote the appropriate biomass growth to consume the organics in the wastewater. There is no active wastewater treatment in Boat Harbour other than providing a degree of suspended solids removal (polishing step).

One aspect of this study is to evaluate options of final effluent discharge and treatment required for eliminating the use of Boat Harbour as part of the wastewater treatment process for the operation of the Northern Pulp mill in Ambercrombie, Nova Scotia. Past study reports (AMEC, 2010; AGRA Simons, 2000) have investigated this issue and two re-occurring options for proceeding toward the final corrective action have been:

[3] "Canada-wide Strategy for the Management of Municipal Wastewater Effluent", CCME, February 2009
[4] "Wastewater Systems Effluent Regulations" Canada Gazette, Volume 144, No. 12, March 20, 2010
[5] "Pulp and Paper Effluent Regulations, SOR/92-269", Minister of Justice, February 26, 2011

1. Construct a treatment plant using an activated sludge process (ASP) on the mill site, construct a storage basin and pumping system for 6hr capacity, discharge the effluent in 6hr (tidal) cycles to a new outfall located at Lighthouse Beach (or other location).
2. Construct a treatment plant using an activated sludge process (ASP) on the mill site, along with a tertiary treatment system and pumping system for a new continuous outfall into Pictou Harbour.

The commonality of these two different plans is the inclusion of an ASP plant located on the current mill site. The new ASP plant will be able to deliver effluent to the same standard, if not better, than the current lagoon system. It is also assumed that an overall plant-wide reduction of wastewater flows will occur and will have the overall flow volume reduced to at least 45,000 m^3/d. It is likely possible to improve on this wastewater reduction, which can result in better effluent quality from the ASP. However, for the evaluation of options for this outfall, the following has been assumed:

1. Effluent quality is equivalent to current discharge at Point "C" and typically includes the characteristics as presented in Table 1 (based on 2010 data).
2. Effluent flow is 45,000 m^3/d and is a combination of process/alkali sewer collection, acid sewer collection and sanitary with expected effluent characteristics as presented in Table 2.

Table 1: Currently Reported Effluent Levels

	UNITS (SI)		Units (kg/ADT)	Units (kg/day)	Effluent Regulation	
					kg/day	mg/L**

It should be noted that the existing effluent meets the current federal pulp and paper regulations.

2.1.3 *Tertiary Wastewater Treatment*

By definition, tertiary treatment is applied after a traditional mechanical process. The term tertiary treatment typically applies to reducing the BOD and TSS in the effluent to levels lower than 20 ppm (known as the 20-20 level). This is usually the case when specific issues are present with the receiving water such that lower BOD and TSS concentrations are necessary. Tertiary treatment is also considered as advanced wastewater treatment for specific issues with the effluent. Typically this is not related to BOD and TSS (i.e., an effluent with a BOD and TSS concentration of 20/20 is generally suitable and acceptable for the receiving stream); however, it is related to other detrimental attributes of the effluent. Some examples of this include nutrient removal (nitrogen and phosphorous), hardness removal, reduction of endocrine disrupters or removal of colour from the effluent.

Additional or tertiary treatment for this effluent source is currently not required by the governing regulations of the Pulp and Paper industry. The regulations specify the levels of BOD and TSS only, based on the mill production level, average daily tonnage produced, and on the potential detrimental impact and toxicity to the local environment. However, it has been indicated that the local users of Pictou Harbour and Boat Harbour feel that the current level of treatment is not adequate due to the presence of colour and odour within the treated effluent. This would indicate that an aesthetic improvement in the effluent is desired.

An aesthetic improvement is mainly reflected in improving the appearance and the odour of the effluent, but is not dependant on any improvement of toxicity or contamination of the local environment. The reduction of colour from a pulp mill effluent would be a considerable improvement to the aesthetic qualities of the effluent. One means of colour removal is using a chemical precipitation /oxidation process followed by clarification. That is, the colour causing particles (long organic chains from lignins and tannins in the wood fibre) must be gathered together chemically (coagulation/flocculation) and then removed from the effluent via clarification (settling or flotation). This can be a costly and chemically intensive process when treating large volumes of water with limited amounts of colour after a secondary treatment. An alternative to this would be the isolation of the raw high colour source stream prior to it being blended with all other sewer streams and treating the high colour waste localized, prior to the full treatment system. **This option could potentially be a more cost effective treatment than the full colour removal system for all effluent. Current upgrades being made in the mill (with funding from the federal Green transformation Program) are expected to reduce the wastewater generated within the mill. There may also be a positive impact on the colour of the wastewater generated.**

Additional forms of tertiary treatment can in be in the form of filtration. Filtration covers a wide variety of methods of removing contaminants in effluent. A multi-media sand filter for removal of particulate can be a good "polishing" method for many secondary treatment plants to bring the effluent quality to below 10 ppm TSS and BOD. A more elaborate filtration method would be a membrane filter unit that would concentrate most contaminants and permit virtually zero TSS and reduced colour. This is a very costly option for large volumes, such as is the case for Northern Pulp. Ozonation (the injection of ozone into the wastewater) can also provide colour reduction in the effluent through the oxidation of the colour-causing compounds.

A less complicated approach to tertiary treatment is the use of an engineered wetland. An engineered wetland replicates the filtration, aeration and organic/nutrient consumption of a naturally occurring wetland, with the safeguards of a lining to prevent any unplanned effluent entering the environment. An engineered wetland is a very low maintenance operation with a variety of "bed" designs depending on the treatment that is required. For the flow requirements at Northern Pulp, a wetland area of 15 to 20 acres would be required.

2.2 Appropriate Tertiary Effluent Treatment Systems for Kraft Pulp Mills

With the proposed upgrades at Northern Pulp, it is understood that a significant improvement in the quality of effluent that will require tertiary treatment may occur and significant reduction of the flow of effluent may be realized. Based on the AMEC report (April 2010) primary clarification followed by a secondary aerobic activated sludge process is assumed to be incorporated as the initial wastewater treatment. Based on available information, the TSS and BOD will be reduced to 30mg/L each, but the colour will not be significantly reduced so is assumed to remain at the current 1500 PtCU (mg/L) level.

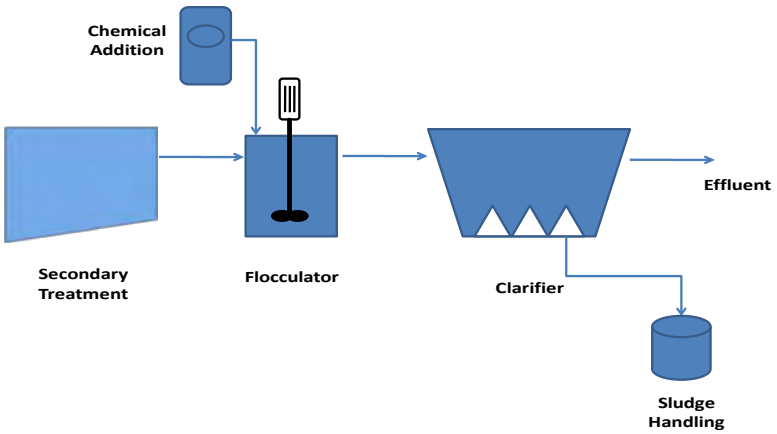
The tertiary treatment designs that are proposed follows up the primary/secondary treatment upgrades that have been undertaken by others. The scope of our investigation will be for the additional treatment required for further reduction of BOD and TSS as well as the reduction of colour in the effluent.

2.2.1 *Clarification*

The clarification process (Figure 2-1) is primarily a chemical treatment stage that forces dissolved colour particles to combine and form a bulky floc (an agglomeration of smaller particles) that can be settled or floated for removal. This chemical treatment will lower colour and COD (Chemical Oxygen Demand) as well as potentially reduce TSS and BOD further. This equipment would be installed inline at the end of the secondary treatment process. The configuration of equipment would include a flocculation tank (gentle mixing) and clarification units. Multiple clarifier units should be installed so that regular maintenance can be performed without completely stopping the flow or bypassing the process.

The clarification technology would likely include a clarifier with lamella plates for enhanced clarification and the reduction of the required footprint. With this technology, the overflow rate can be increased and the final size of the clarifying units can be reduced. The clarification stage will require the addition of chemical for the creation of a settable floc. The chemical design must be done with jar testing that will trial a variety of coagulants and dosages. This chemical addition can then be further controlled in the full-scale system with the use of online analyzers for Turbidity / TOC (Total Organic Carbon) levels and coagulant dosages using streaming current (zeta potential). With a highly automated system, the chemical consumption can be minimized as much as possible. There is potential for a very high level of process control and quality control of the effluent because of the relatively low possibility of upset from the upstream activated sludge process. For cost calculation purposes, a dosage of 150 ppm of an alum-based chemical has been selected but this has not been confirmed by specific analysis or pilot work.

Figure 2-1: Clarification Process

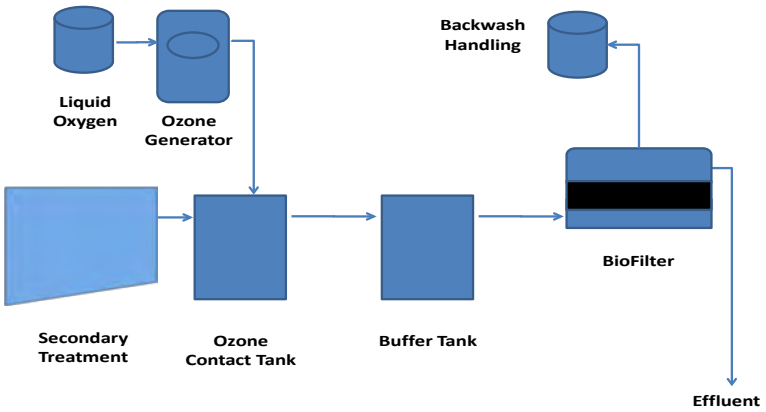


2.2.2 *Ozone Addition*

Tertiary treatment using ozone for the additional removal of colour from the secondary treated effluent would be undertaken using an onsite ozone generation system, an injection system and a reaction tank (Figure 2-2). The ozone would react with the long tannins and lignin organic chains and break them apart. However, it is impossible to predict the effluent characteristics of this reaction with respect to creation of biodegradable matter or any level of harmful bi-product. With this technology, it will require further investigation through a pilot test to determine the bi-product formation and the dosage of ozone required.

The generation of ozone is done onsite with electric-powered ozone generators that are supplied air or oxygen in order to create ozone. For a large application such as this, an onsite oxygen generation system would be required to feed multiple ozone generation units. The dispersion disks used to entrain the ozone in the water should be submerged in at least 5 meters of water to ensure a transfer of at least 75% of the ozone. A recycle system may be employed to "super saturate" the ozone into the water as required. The use of standardized equipment with the feed stream of purified oxygen from an onsite oxygen generation skid would likely be the best application for the supply of oxygen. A biofilter would be used to remove the BOD that would have formed from the conversion of some COD to BOD. It is anticipated that up to 40% of the COD may be converted to BOD and would require further treatment; however, this can only be confirmed with a pilot analysis.

Figure 2-2: Ozone Process

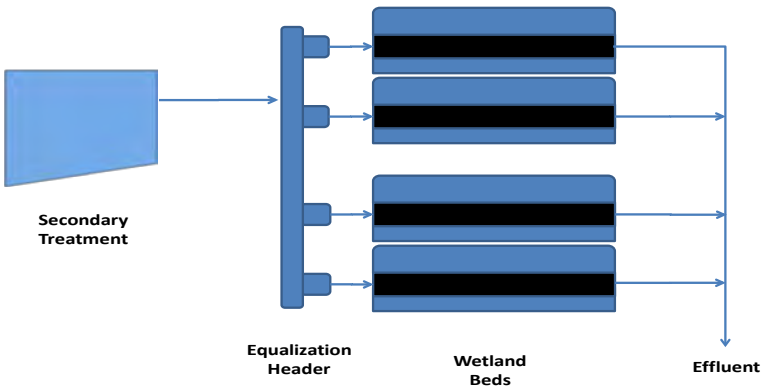


2.2.3 *Engineered Wetland*

Engineered wetlands take advantage of the natural processes that occur for the breakdown of colour-forming constituents (Figure 2-3). They also filter the suspended solids (TSS) and further remove (BOD). A typical engineered wetland would be constructed with a geo-membrane liner that would prevent the effluent from coming in contact with the natural environment. In the lined bed, a configuration of various media types and a piping distribution network would distribute the effluent and treatment will occur with a variety of plant species and micro-organisms that naturally occur in the root structure. This

technology would typically require at least 15 acres of usable area for the potential flows that are predicted from the mill. Given that the design will largely be dominated by the hydraulic requirements of such a large flow (and not the biodegradation capabilities), the use of an engineered wetland could potentially reduce the treatment requirements of secondary treatment or at a minimum, provide additional protection in the event of a process upset in the secondary treatment operation.

Figure 2-3: Engineered Wetland

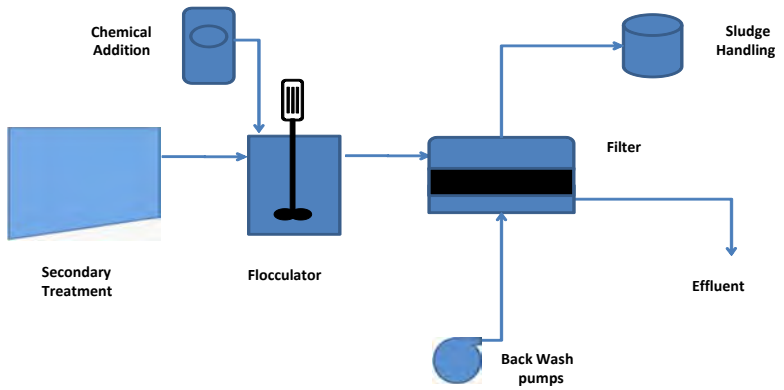


2.2.4 *Enhanced Filtration*

An enhanced filtration technology would utilize the addition of chemicals to aid with conventional filters (Figure 2-4). The use of chemical addition would be very similar to the chemical addition required for clarification, only the resulting floc would not be removed with a settling or floating operation, rather the filters would cause the removal. The additional filters would have to be conservatively designed to accommodate for the higher solids loading that would be provided by the flocculation process. The filters would have to be designed with a minimum of 150% treatment ability and a filter backwash handling system.

With this technology the main drawback would be the requirement for backwashing the filters. The backwash requirements would be considerable from the perspective of the pumping power required as well as the storage of backwash water. Additionally, the handing and treatment of the backwash water is considered problematic because removing the contaminants is more desirable than reintroducing them to the beginning of the treatment system.

Figure 2-4: Enhanced Filtration

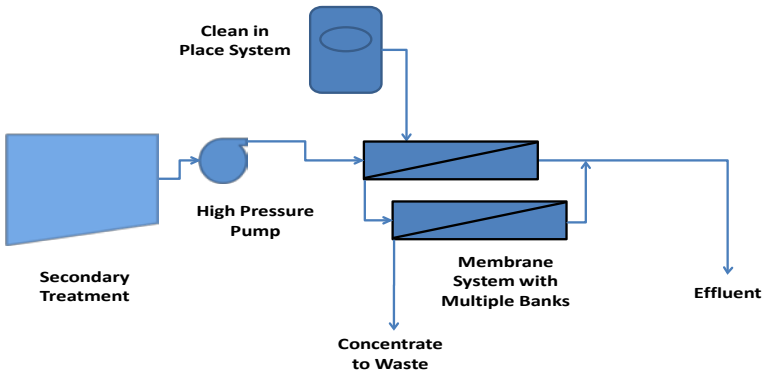


2.2.5 *Membrane Filtration*

The use of membranes for the removal of colour and polishing of suspended solids is an energy intensive operation. The effluent (after secondary treatment) would be pressurized against a microfiltration membrane (Figure 2-5). The clean water would pass through the membrane and the dirty water would be concentrated and have to be further treated. The use of micro filtration is recommended instead of reverse osmosis, as the colour particle is typically 0.45microns in size, so filtration with RO (openings 0.001 microns) would be considered to be in excess.

The use of membrane technology is typically quite costly from the perspective of the pumping power requirements. Additionally, the use of membranes for the removal of colour (although effective) is typically very detrimental to the membranes due to very high organic fouling. This results in an increase in operational cost that would continue to climb as the system aged. Further to this, the handling of the concentrated waste could prove to be problematic. The use of membrane technologies is good for concentrating the particles in the water that are undesirable, however dealing with these after they have been separated is not a straight forward task. Much like the filter backwash, recycling this to the front end of the waste treatment system is undesirable.

Figure 2-5: Membrane Process



2.2.6 *Process Selection*

Moving forward, the most promising opportunities for additional treatment would appear to be in the form of:

- Engineered Wetland
- Clarification
- Ozone Treatment

There are other options for this tertiary treatment; however, these three have the potential to be the most cost effective in terms of improving the effluent from the BOD, TSS and colour perspective.

For any large process application, a significant amount of design must be undertaken prior to implementation and pilot testing of the process should be considered. A pilot plant is essentially a small-scale version of a full-scale treatment plant. Piloting will allow the process to be exposed to the actual wastewater allowing the designers to determine the appropriate criteria for design purposes. Any major process changes are easily implemented so that operational parameters can be well established prior to the design of a new plant. The use of pilot scale testing for wastewater processes is particularly useful because water-quality related issues are location and industry specific.

The scale of a pilot may be in the range of 10-200 Litres per hour (and, on occasion, larger). With the pilot testing, the primary, secondary as well as tertiary treatment processes can all be studied. This additional testing will aid in the final process selection which can be completed with sound economic understanding of reagent chemical cost, vessel sizing and sludge volumes that all greatly effect operational requirements and costs.

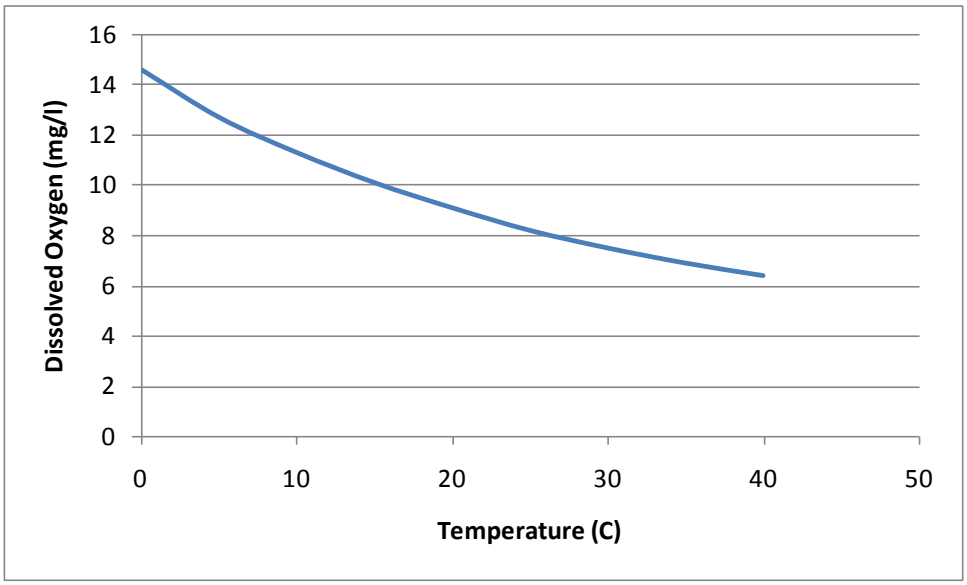
2.3 Heat Re-use and the Impacts of Effluent Treatment

As noted elsewhere in this document, the impacts of temperature of the effluent greatly affect the magnitude of the treatment equipment that will be required. A cooler effluent results in typically lower sizes of many treatment methods. Specifically aeration, ozone and membrane filtration all benefit from

having cooler temperatures. The enhanced filtration and the clarification will not be as greatly affected and having a warmer effluent will assist with the flocculation needed for these treatment types. Additionally (outside the scope of this investigation) there would be significant improvement to the secondary treatment (proposed activated sludge) for two reasons: oxygen transfer rate and biomass. Should there be a decrease in the temperature of the wastewater entering the aeration stage, then the oxygen transfer will greatly increase and thus a reduced energy input for aeration. With a decrease in the temperature, the aerobic micro-organisms associated with the activated sludge wastewater treatment process perform better; ideally, activated sludge systems work best with wastewater temperatures < 30°C.

In the following diagram, it can be observed that more oxygen can be saturated and held in water at a cooler temperature. The difference in temperature from 40° to 10° can be from 6.5 to 11 mg/L of dissolved oxygen. This, in turn, offers a substantial reduction in aeration equipment requirements.

Figure 2-6: Dissolved Oxygen Saturation Curve



Energy recovery scenarios (use of waste heat) can have either the current water as the carrier of the thermal energy or transfer the energy to another media. From the treatment perspective the transfer of energy should occur prior to treatment and transfer the energy to another media. A selection of energy recovery technologies should be considered that would result in the energy removal process (i.e., heat recovery) being applied prior to the secondary and tertiary treatment.

That being said, the use of heat exchangers or any sort of heat pump to compound the energy in the wastewater would likely be subject to fouling when passing a wastewater stream through it. The prevention of fouling in any heat exchanger would be by using the highest quality of effluent possible. This is a balancing act of “treatability” of warm water and “heat potential” for energy recovery. Therefore, likely the best location for heat recovery would be after primary clarification and before the

aeration stages. The primary clarifier(s) would remove a great deal of the suspended solids; however, there may still be some potential "fouling agents" in the effluent. The proposed modifications in the mill should significantly reduce the quantity of fouling agents. The recycled activated sludge from the proposed new secondary treatment stage should be returned to the system downstream of the heat exchanger so that the biomass does not contribute to the fouling in the heat exchanger. With heat being recovered prior to the aeration stage, better oxygen transfer will be achieved in the aeration basin and the secondary clarifier will be sized more conservatively based on the increased density of the micro-organisms in the sludge blanket.

The concept of water re-use from a large effluent stream can be implemented either one of two ways: either a non-contact or a direct-contact application. With a non-contact application for this waste stream, heat is transferred from the effluent to a new media, usually a clean and pristine supply of water that can be used for a variety of uses including aquaculture, agriculture or highly sensitive heating equipment (heat pump or radiant heating). The use of the mill effluent in a direct-contact application is more limited due to the sensitivity to trace pollutants for any sort of food or health-related water use. The use of tertiary treated water for any sort of food-related use is not a standard practice and not generally accepted in industry due to the inherent risks associated with potentially adverse health effects. In many jurisdictions, any form of contact water is strictly used for non-consumable crop irrigation and for some sanitary applications (i.e., grey water uses). There are a variety of applications that use non-contact heated water, and these would appear to be more desirable from the perspective of treatability and public scrutiny.

The other potential use of the non-contact heating system would be for mill reuse potential. The benefit to preheating much of the water for the mill would be seen mainly in the inlet water treatment and chemistry demands. With an elevated temperature, the coagulation and flocculation chemicals used in the raw water treatment would be more effective and likely reduce dosage requirements as well as reduce the mixing energies required. With warmer water, coagulation chemicals are more effectively used and carryover of these chemicals into the final treated product water is minimized. Additionally, this water stream would be preheated for use in boiler applications and other warm water applications. There would still be the need for raw cooling water at a lower temperature particularly in the steam turbine/generator surface condenser; however the treated, warm water could still be used at various processes throughout out the mill.

2.4 Outfall Relocation

2.4.1 *Background*

In order for Boat Harbour to be returned to its natural state, a new effluent discharge location is required for the mill wastewater treatment plant. Two candidate locations (Pictou Harbour, MacKenzie Head*)* have been selected as potential discharge points. Routing plans and budgetary opinions of the probable costs associated with these endeavours (Figure 2-7) have been prepared. Various factors (social, political, technical, financial, etc.) may force a change in the actual location but these locations provide an appropriate level of detail to provide preliminary costs.

To calculate costs, the pipe material, shipping and installation costing were calculated separately. A crew and production quantity was estimated and applied. Costs are based on pricing for high-density polyethylene (HDPE) DR-17, 900mm pipe, which was sized to accommodate a flow of 45,000 m^3/d.

2.4.2 *Site Selections*

The Pictou Harbour effluent main would begin at the new treatment facility location, located southeast of the current Northern Pulp facility. The effluent pipe will run terrestrially underground for 600m from this location to Abercrombie Point, where it would enter the Pictou Harbour. After entering the Harbour, the pipe would then travel underwater for approximately 1100m to the offshore diffuser.

The Mackenzie Head route will begin by travelling the length of the existing effluent main to 150m northeast of Pictou Landing Road, where the installation of the new pipeline will begin. The pipe then would travel along the existing gravel roadway 1150m north-northeast to the west edge of Boat Harbour. At this point, the pipe would cross the most westerly projection of Boat Harbour then head approximately 4575m East through the wooded area, around the Fishers Grant Indian Reserve to Pictou Landing Road. The exact route through the wooded area would be subject to possible land acquisitions. The option has been designed to avoid crossing the Fishers Grant Indian Reserve. The pipe route would then carry 1100m along the Pictou Landing roadway to Macleannans Memorial Camp Road. It would then travel 100m up Macleannans Memorial Camp Road to Cameron Lane, which it would follow until its termination (approximately 950m). A 325m route through the wooded area from the termination of Cameron Lane to the Northumberland Strait would be chosen based on possible land availability. The pipe would finally travel underwater 900m to the offshore diffuser located in the Northumberland Strait.

The two potential locations of the diffusers have been selected solely based on achieving the required depth as identified in the ARGA Simons (2000) Report. Other factors have not been taken into account at this time and will likely impact the final location of the pipe. In the case of the Pictou Harbour option, there could be exclusion zones for fisheries or shipping channels as well as any environmental and social impacts. The Mackenzie Head (Northumberland Strait) location may possibly encounter ice scouring depending on ice flows, fishery and shipping channel exclusions as well as other local environmental (sensitive land impacts) and social impacts. In the event the diffuser has to be placed further offshore in the Strait, a cost-per-100m value has been provided.

3.0 Kraft Pulp Mill Effluent Requirements

3.1 Federal and Provincial Pulp Mill Treatment Requirements

In Canada, both the federal and provincial governments have the power to enact legislation relating to the environment. Federal legislation includes:

- Canadian Environmental Protection Act (CEPA);
- Canadian Environmental Assessment Act (CEAA);
- Pest Control Products Act;
- Canadian Shipping Act;
- Arctic Waters Pollution Prevention Act;
- Fisheries Act; and,
- Transportation of Dangerous Goods Act.

One of the primary federal laws relating to water pollution is the Fisheries Act. This act gives the federal government certain regulatory powers to pass regulations to establish standards for certain industries, one of which is the pulp and paper industry. The Pulp and Paper Effluent Regulations (SOR/92-269) lists the following classes of substances from a mill or an off-site wastewater treatment facility as "deleterious substances" (as defined in the Fisheries Act, subsection 34(1)):

a) acutely lethal effluent;
b) BOD matter; and,
c) suspended solids.

In and of itself, colour is not deemed as a "deleterious substance" and is not listed.

The Pulp and Paper Effluent Regulations (PPER) also includes an Environmental Effects Monitoring (EEM) program which provides Environment Canada with information to help assess the adequacy of the PPER in protecting fish, fish habitat and the use of fisheries resources. The results of the EEM are combined with information from other factors (ecological, economic, social and technical) to determine the adequacy of the regulations.

From a provincial regulatory standpoint, while other provinces (particularly British Columbia and Ontario) have specific regulations for pulp and paper mill effluents, the Province of Nova Scotia does not. The Nova Scotia government has enacted the Environmental Act (1994-1995, c. 1, s. 1) and through it various regulations (e.g., *Activities Designation Regulations* (N.S. Reg. 352/2007), *Environmental Assessment Regulations* (N.S. Reg. 277/2009) and *Air Quality Regulations* (N.S. Reg. 187/2010)) that can be applied to pulp and paper mill operations. However, the Province essentially relies on the PPER to regulate the mill wastewater discharges.

3.2 Potential Changes to Federal and Provincial Discharge Regulations

On March 20, 2010, Environment Canada proposed *Wastewater Systems Effluent Regulations* under the *Fisheries Act* in the *Canada Gazette*, Part I, as the federal government's principal instrument to implement the "Canada-wide Strategy for the Management of Municipal Wastewater Effluents" proposed by the Canadian Council of Ministers of the Environment (CCME) in February 2009. The proposed regulations include baseline effluent quality standards, compliance timelines, and rules for monitoring and reporting. They would apply to municipal, community and federal wastewater systems (treating primarily municipal wastewater that could include an industrial contribution), including those on Aboriginal lands across Canada, except, initially, those in far northern regions. These are still in the proposal stage as what the federal government is proposing differs substantially from what was originally endorsed by the CCME and supported by the provinces.

The objective of the proposed Regulations is to reduce the risks to ecosystem health, fisheries resources and human health by decreasing the level of harmful substances deposited to Canadian surface water from wastewater effluent. To achieve the objective, the proposed Regulations would set national effluent quality standards that would require secondary wastewater treatment, or equivalent, in wastewater systems across Canada[6].

3.3 Treatment Requirements for Direct Discharge to Pictou Harbour

To determine the level of treatment required to discharge a wastewater treatment plant effluent to a receiving stream, several factors must be considered:

1. Location of the receiving stream;
2. Current status of the receiving stream;
3. Physical characteristics of the receiving stream (primarily to determine the configuration of the outfall and diffusers);
4. Flow variations within the stream (this is primarily for freshwater streams/rivers that experience seasonal flows);
5. Downstream uses of the receiving stream (water supply, fishing grounds, recreational purposes, etc.);
6. The assimilative capacity of the receiving stream; and,
7. Other site specific factors.

As mentioned above, CCME has developed the "*Canada-wide Strategy for the Management of Municipal Wastewater Effluent*" (February 2009) that is in the process of being adopted by the Federal Government (Environment Canada) with the Department of Fisheries and Oceans having the statutory authority. It specifically excludes industrial wastewater treatment plants. The strategy outlines two main objectives:

[6] Canada Gazette, Part 1: Notices and Proposed Regulations, March 20, 2010

1. Improved human health and environmental protection.
2. Improved clarity about the way municipal effluent is managed and regulated.

The strategy also specifies effluent discharge criteria identified as the minimum National Performance Standards (NPS). All facilities must meet these standards as a minimum with more stringent requirements being applied on a case-by-case basis by the jurisdiction having authority. The minimum standards from the strategy are:

- Carbonaceous Biochemical Oxygen Demand ($cBOD_5$) ≤ 25 mg/L;
- Total Suspended Solids (TSS) ≤ 25 mg/L; and,
- Total Residual Chlorine ≤ 0.02 mg/L

In addition to the minimum performance standards, plant-specific Effluent Discharge Objectives (EDOs) need to be developed based on a one-year characterization of the plant effluent quality and also taking into consideration the characteristics of the receiving environment (environmental effects monitoring) and mixing that occurs in a defined mixing zone associated with the point of discharge. For any discharged substance that is in excess of safe levels for human health or the environment, a discharge objective will be implemented. This could mean lower values for the minimum performance standards or an additional discharge limit for an entirely different substance.

Keeping in mind that the above only applies to municipal wastewater treatment plants, the process could be followed to determine the level of treatment required to have the mill wastewater treatment plant effluent discharged directly to Pictou Harbour. The current treatment system produces an effluent that is close to meeting the minimum NPS. Proposed changes within the mill that are planned to be completed in 2011 should positively affect the quantity and quality of the raw wastewater leaving the mill allowing a secondary treatment system to produce a better-quality effluent than is currently being produced; unfortunately, the extent of the changes are unknown at this time. It is believed, however, that the volume of raw wastewater flow will be reduced considerably which would have a positive impact on secondary treatment.

Replacing the existing treatment system (settling basins followed by aerated and non-aerated stabilization ponds) with a new secondary treatment system that is designed to provide better control of the effluent total suspended solids may produce an effluent that meets the minimum NPS. Again, with the in-plant changes that are being considered, the colour of the effluent may be improved (it should be noted that colour is not a parameter that is regulated though the reason for the colour may be regulated).

3.4 Federal, Provincial and Municipal Discharge Regulations to Discharge to Pictou Harbour

As stated above, the mill effluent is regulated under the Pulp and Paper Effluent Regulations. However, to change the point of discharge, whether it is to Pictou Harbour or the Northumberland Strait, would

require an Environmental Assessment under the *Canadian Environmental Assessment Act* pertaining to the *Fisheries Act* with reference particularly to the depositing of a deleterious substance. This EA process would preempt any provincial or municipal requirements but would allow any and all stakeholders (provincial, municipal, special interest groups, etc.) to have a part in the process.

Transport Canada would also become involved in the approval process for discharging to either point under the Navigable Waters Protection Program through the administration of the *Navigable Waters Protection Act*[7] (NWPA). This is to ensure that the public can navigate the waters without any obstructions. There is a detailed application process that is required of the proponent that can be viewed at the following transport Canada website: http://www.tc.gc.ca/eng/marinesafety/oep-nwpp-guide-2053.htm.

[7] "Navigable Waters Protection Act, Chapter N-22", Minister of Justice, February 28, 2011

4.0 Market Opportunities – Re-use of Treated Effluent

As described in Section 2.3, the treated effluent can be used either in a direct-contact or a non-contact basis. Given the source of the wastewater, a direct-contact application is not recommended. All the potential opportunities presented below are of a non-contact nature.

4.1 Waste Heat Utilization

Recovering heat or thermal energy from a wastewater stream that is otherwise of no further use and is going to be discharged or discarded and utilizing the recovered energy for a useful purpose is known as waste heat recovery. The higher the temperature of the waste stream from which it is desired to recover heat and the greater the quantity of thermal energy available to recover, the more uses that the recovered heat can be utilized for. This is largely due to the natural laws that govern heat transfer and thermodynamics, the branch of science that deals with the relationship between heat and work.

Waste heat is typically classified as being high, medium or low grade. The classification is based on the temperature of the waste stream. While the boundaries or temperature range for these classifications are not absolute or fixed, it is fairly common practice to regard waste streams at 650^{o}C (1200^{o}F) or hotter to be high-grade waste heat sources. Medium-grade heat includes the temperature range from 121^{o}C (250^{o}F) to 650^{o}C (1200^{o}F) and low-grade waste heat would encompass the range from 20^{o}C (68^{o}F) to 121^{o}C (250^{o}F). Not only is there more energy contained in the higher temperature waste streams per each kilogram (pound) of effluent, but as will be discussed further below, the greater the temperature difference between the waste stream or media from which the thermal energy is to be extracted and the stream or media receiving the thermal energy, the easier the transfer and the greater the amount of energy that can be transferred.

It is apparent from the above paragraph that the tertiary treatment effluent, which is expected to vary in temperature from approximately 43^{o}C (110^{o}F) to 63^{o}C (145^{o}F) during the course of a year, is at the low end of the low-grade heat classification. Existing as a low grade of heat or thermal energy puts limitations on the potential uses for the energy contained in the tertiary treatment effluent as well as the types of equipment that can be used for the energy transfer. Subsequent sections will describe one of the most common types of heat transfer equipment, namely, heat exchangers and the more complex heat pump as well as discuss potential uses for the thermal energy contained in the tertiary treatment effluent.

4.1.1 *Heat Exchangers*

Heat transfer, or more correctly thermal energy transfer, is the exchange of energy from one fluid or media to another. In conventional heat transfer, the direction of the energy transfer must be from the object at the higher temperature or thermal energy level to the object at the lower temperature. Additionally, the lower temperature object cannot be heated to a temperature above that of the higher temperature object. The device or piece of equipment that accomplishes the heat transfer is known as

a “heat exchanger”. One of the most commonly used heat exchangers is the automobile radiator where the engine’s cooling fluid is cooled i.e., transfers thermal energy to the air blown across the finned tubes carrying the engine fluid. The air is simultaneously heated by accepting the thermal energy from the engine cooling fluid. The cooling fluid can never be cooled below the temperature of the air blown through the radiator and the air can never be heated to a temperature above that of the cooling fluid. Similarly to voltage or electrical potential difference being the driving force for current flow in electrical circuits, temperature difference is the driving force for heat or energy transfer in heat exchangers. The greater the temperature difference between the two media, the greater the amount of thermal energy that can be transferred. Expressed in a different manner, for a given size exchanger (amount of transfer surface), the greater the temperature difference, the more thermal energy it can transfer between the two media.

One of the major classification criteria for heat exchangers is whether they are contact or non-contact pieces of equipment. In the contact type of heat exchanger, the two fluids or media which enter the exchanger actually mix with each other and leave as a single stream. In the non-contact heat exchanger, there is a solid physical boundary between the two fluids such as a tube wall or plate. When one of the fluids is a waste stream, particularly if it is toxic or otherwise hazardous, the heat exchanger would normally be of the non-contact type.

While there are some heat exchangers that utilize rotating parts to rotate or move heat from one process fluid or stream to another, the majority of heat exchangers are static, i.e., they contain no moving components. Three common forms of static heat exchangers are the double pipe, the shell and tube and the plate type. In the double pipe exchanger a smaller pipe is located inside a larger pipe. One fluid flows through the inner pipe while the other fluid flows in the annular space created between the two pipes. In the shell and tube exchanger, a series of tubes commonly secured at each end to a plate known as a “tubesheet” are enclosed inside a shell. One fluid flows inside the tubes while the other fluid flows over the outside of the tube bundle and is contained by the outer shell. In the plate type heat exchanger, a series of thin, separated plates are sandwiched together. The plates have large surface areas and narrow fluid flow passages. One of the two fluids flows on each side of the plates.

4.1.2 *Heat Pumps*

A heat pump allows for the normal restrictions of heat transfer to be overcome and for heat energy to be transferred from a source at lower temperature to a source at higher temperature. The most common example of a heat pump is a home refrigerator where heat is removed from the interior of the refrigerator and transferred to the ambient environment of the room containing the refrigerator, even though the refrigerator interior is at a lower temperature than the room in which it is located.

As a device that can transfer and recover energy from a waste stream that would otherwise be considered unusable and non-recoverable, to a higher temperature process where the energy does become usable, the heat pump may seem magical. However, the heat pump cannot achieve this transfer of heat energy without the input of energy from an external source, which typically takes the

form of mechanical energy or thermal energy, which may come from a source that would otherwise be considered unusable or waste. In the case of the home refrigerator, mechanical energy is supplied to the compressor by an electric motor. The goal of a properly selected heat pump application is to achieve the state where the amount of energy recovered from what would otherwise be a waste energy stream exceeds the energy input required by the heat pump.

Although there are several different types of heat pumps, all heat pumps accomplish the following three basic functions[8]:

- Absorb heat from the waste heat source;
- Increase the heat temperature within the delivery fluid; and,
- Delivery of the useful heat at the required elevated temperature.

A key parameter in determining the performance of a heat pump and therefore the energy savings that can be achieved is the temperature lift that the heat pump must produce. The temperature lift is the difference in temperatures between the waste heat source temperature at which the heat pump absorbs thermal energy and the temperature at which the heat pump delivers thermal energy. The lower the temperature lift, the better the performance of the heat pump, i.e., the greater the amount of heat energy transferred for each unit amount of external energy supplied to the heat pump.

The performance of a heat pump is usually expressed as the heat pump Co-efficient of Performance (COP_{HP}). COP_{HP} is defined as:

$$COP_{HP} = Q_{out} / W_{in}$$

where Q_{out} is the heat (thermal energy) delivered by the heat pump and W_{in} is the energy or "work" supplied to the pump driver. As an example, a COP_{HP} of 4 means that the heat pump is delivering four times as much thermal energy to the process it is supplying than the amount of work supplied to the pump driver.

Two major categories of heat pumps are mechanical and closed-cycle absorption. Mechanical heat pumps, which can be either open cycle or closed cycle, use mechanical compression of a fluid to achieve their temperature lift. In the closed-cycle mechanical heat pump (e.g. the household refrigerator) a working fluid is circulated through a closed loop in which it is alternately compressed and condensed. In the open-cycle mechanical heat pump a waste vapour is compressed (pressure increased). These mechanical vapour compression heat pumps are considered to be open cycle because the working fluid is a process stream. Typically, mechanical heat pumps are used in situations with temperature lifts less than 55^{o}C (100 ^{o}F).

[8] U.S. Department of Energy, Industrial Technologies Program, "Industrial Heat Pumps for Steam and Fuel Savings", DOE/GO-102003-1735, June, 2003.

Closed-cycle absorption heat pumps use a dual component working fluid and the fluid properties of boiling point elevation and heat of absorption to accomplish their temperature lift. Advantages of absorption pumps are that they can deliver a higher temperature lift than other types, their energy performance does not degrade rapidly at higher temperature lifts and they can be configured to provide combined heating and cooling. In order to obtain these advantages, however, they are more complicated and require more equipment than the other types of pumps. Typically, four separate heat exchangers are found in an absorption heat pump, designated as the evaporator, condenser, generator, and absorber. In some cases high lift or extended range absorption heat pumps can achieve a temperature lift exceeding 111^{o}C (200 ^{o}F).

4.2 District Heating

One possible use of the recovered energy from the warm tertiary treatment effluent is a district heating scheme. Such schemes have been receiving increasing attention in recent years as fuel cost have risen dramatically and concern for the global warming effects produced by the generation of greenhouse gases has similarly increased. District heating schemes have the potential to produce energy savings and reduce greenhouse emissions, particularly if they include recovery of thermal energy that would otherwise be wasted. Many communities have adopted "sustainability" as a key component in their planning. District heating or energy systems are increasingly being considered a part of the sustainability portion of municipal/community plans, particularly if they can contribute to the reduction of greenhouse gases through the recovery of waste energy or energy production from biomass. However, as will be discussed in more detail below, there can be a large difference between technical feasibility and financial feasibility; thus, even though something may be easy to accomplish from a technical perspective it may not prove to be financially viable.

One of the parameters, normally considered to be critical to achieving a successful district heating project is the population density for the district to be serviced. The population densities of most districts in Europe are larger than those in Canada, particularly rural Canadian villages and towns. The FVB report[9] indicates the following densities for a number of district heating schemes in southern Ontario as tabulated below:

Location	Net Hectares	Units/Net Hectare
Central Pickering – Low Density		25 – 40
Central Pickering – Med. Density		40 – 80
Central Pickering – High Density		140 – 250
Markham Centre	13.5	250
Regent Park	13.4	380
West Don Lands	12.27	470
East Bayfront	21.1	300

[9] FVB Energy Inc., "City of Pickering, District Energy Pre-Feasibility Assessment", January, 2007

Converting the density information provided by Nijjar *et al*[10] for some selected rural Nova Scotian towns to put it on the same land area basis as that utilized above for the southern Ontario district energy projects, produces the following tabulation:

Location	Hectares	Houses/Hectare
Trenton	600	1.85
Middleton	540	1.50
Berwick	680	1.33
Shelburne	900	0.97

It is obvious from a quick inspection of the two tables above that the densities in the rural Nova Scotian communities are more than two orders of magnitude less than for the projects in the greater Toronto area (GTA) (Markham Center, Regent Park, West Don Lands, and East Bayfront). An important reason for the difference in residential unit densities is that as Nijjar *et al* indicates, 96.8% of residential units in rural Nova Scotia are single, detached houses. However, FVB notes that approximately 90% of the residential units in the GTA projects will be apartments or Multiple Unit Residential Buildings (MURBs). It is further noted by FVB that 85% of the residential units in the new neighbourhoods of Central Pickering are expected to be single detached homes. Thus, it can be seen that the unit density in the lower density neighbourhoods of central Pickering are much closer to those for rural Nova Scotia than the projects in the GTA. FVB indicates that it is unlikely that with such densities (25 – 40 units/net hectare), that district energy could be justified on an economic basis. This would suggest that the rural Nova Scotia densities of 0.97- 1.85 houses/hectare would be very economically challenging to operating a district energy project.

FVB Energy indicate in their report that they consider building type to be even more important than housing/building density to a commercially viable district heating scheme. This is due to the ratio between connection cost and thermal energy revenue for the different building types. According to FVB this ratio should be as low as possible, i.e., the connection cost should be low compared to the estimated future revenue from the sale of thermal energy to increase the chance of commercial success due to the shorter payback period that will be realized by the purchaser of the thermal energy. However, this ratio is highest for detached, single family residences. As noted above, almost all housing units in rural Nova Scotia communities are single family, detached residences. FVB state that the preferred type of customers for a district energy project are apartments (MURBs), and commercial and institutional buildings such as shopping centers, office buildings, civic centers, churches and schools. It is expected that such buildings both in terms of number and percentage of total system energy demand would be a minority in rural Nova Scotia.

[10] Jaspreet S. Nijjar et al, "District Heating System Design for Rural Nova Scotian Communities Using Building simulation and Energy Usage Databases", Transactions of Canadian Society of Mechanical engineering, Vol. 33, No. I, pg 51-63.

There are also a number of technical and physical issues with the quality (grade) of waste heat available and its annual variation in quality compared with the requirements of a typical district energy system. Firstly, the waste heat is of a lower grade than is typically utilized for the supply of heat in a district energy system. Church[11] indicates that the hot water supply temperature for conventional district heating schemes is 90°C (194°F) and that many European systems operate with a temperature drop or "DELTA-TEE" of 30°C in the energy transfer station at the customer buildings. The use of higher supply temperatures (and therefore higher grade thermal energy) and higher temperature drops reduces the volume of water that has to be circulated and therefore the size of the piping required. However, the higher temperature drop requires additional heat transfer surfaces in the buildings supplied.

The waste energy available from the mill is expected to range from 43°C (110°F) in the winter to 60°C (140°F) in the summer. To transfer heat from this lower temperature waste water to the higher temperature district heating circulating water would require the use of a heat pump. The use of a water-to-water heat pump in such a situation is certainly technically feasible and it should be expected to achieve a fairly good COP.

The annual variation in waste water quality is the reverse of the annual heating load for a district heating system, i.e., the waste water is hottest in the summer when the load on the district heating system would be the lowest and is at the lowest temperature (grade) when the demand on the district heating system is the largest. Adding a geothermal energy storage component to a district heating scheme where during the summer the hot waste water could be used to store energy in the ground, which would be extracted during the winter heating period is a potential method of bridging the difference in the energy availability and energy demand annual profiles. It would, however, add to the capital cost of the project and requires suitable geology to implement. It is unknown at this time whether the Pictou area would offer suitable geology for geothermal energy storage.

There appears to be more than enough thermal energy in the tertiary treatment effluent to supply a district heating scheme. Based on the town of Berwick, which represents the average Nova Scotia rural town, Nijjar *et al* assumed a hypothetical community with 800 houses. For this hypothetical community they calculated an annual community heat load including losses of 24,880 MWh and a peak heating load of 8,670 kW. These loads included piping losses, which accounted for 6.4% of the total heat load. To meet the peak load would require a temperature drop of approximately 11°C in the tertiary effluent (e.g. enter at 43°C and leave at 32°C) if the transfer of energy from the effluent to the district heating circulating water was completed without loss.

Major commercial decisions that revolve around a proposed district heating project include what entity will own and operate the project and how the project will be funded. FVB Energy state that the most successful district energy projects are those that are municipally owned, which has been for most such

[11] Ken Church, "Is District energy Right for Your community? Part 2: Sizing the system", Municipal World, December, 2007.

projects in Ontario including those in Cornwall, Sudbury, Windsor, Markham and Hamilton. Church[12] indicates that: "The singularly independent nature of district energy development in Canada has led to the creation of a variety of business models, with ownership ranging from 100 percent private to 100 percent public." Church further notes that due to the moderate rate of return produced by most district energy projects the interest shown in such projects by the venture capital sector is limited.

District energy in Canada has been stagnant for some time. A number of proponents feel this is due to the "project" approach that has been utilized in the past where only the most attractive loads have been selected for inclusion in the project and the system has been designed and built to service only these loads. Potential customers (loads) who might want to connect to the system after its original construction are discouraged because of the cost to connect to the system (typically driven by the need to expand the system) and the smaller energy cost savings available when a relatively cheap alternative energy source such as natural gas is available in many jurisdictions. Some suggest that in order for district energy to really expand it needs to change from the project type approach to a "utility" approach where the system would be considered as a continuous and ever expanding entity in which the cost of system expansion should be aggregated and assessed against the levelized cost of heating to the customer base. The province of British Columbia is the first province in Canada to regulate district energy, which requires these systems to behave like a utility.

A district heating/energy scheme would not necessarily be limited to supplying energy to existing communities in the vicinity of the Northern Pulp mill. If other business could be attracted to the industrial park in which the mill is located, there might be a better fit in terms of annual load (energy) requirement than supplying heating to predominantly residential customers during the heating season. The lumber drying, aquaculture and agriculture applications discussed in subsequent sections might be among the possibilities of the types of businesses that could locate to the industrial park.

4.3 Lumber Drying

In order to be used for either construction lumber or wood products, the wood produced by sawmills has to be dried or thermally treated before it can be utilized. Even after a tree has been cut, the wood that is derived from the tree will continue to exchange moisture with the ambient air surrounding the wood until the moisture level in the wood and the moisture level in the air reach an equilibrium. If this equalization of moisture or drying of the wood is allowed to proceed in an uncontrolled manner a number of undesirable consequences such as splitting, checking, and warpage can occur which damage the wood and can render it unsuitable for its desired purpose. Further, natural air drying will take significantly longer than controlled drying in a kiln, and will not typically reach moisture levels low enough for uses such as furniture that will spend its life in climate controlled buildings.

Due to the above reasons, lumber and wood producers typically use kilns to maximize the amount of usable wood produced from the green (wet) wood sawn from trees and to minimize the time required

[12] Ken Church, "Is District energy Right for Your community? Part 3: Supporting Resources", Municipal World, January, 2008.

to dry the wood to the point where it can be utilized. The kilns typically form part of the sawmill plant. The kilns use heated, dry air to perform the wood drying and are also equipped with fans so that the flow of the heated air through the kiln can be controlled, which ensures a more positive and even distribution through the wood stacks located in the Kiln. Achieving a uniform distribution of air through the wood stacked in the kiln is important to ensure a more uniform quality in the dried wood.

The air in conventional kilns is typically heated by finned-tube heat exchangers (coils) through which steam, hot water, or hot oil are circulated. The steam, water or oil are heated in a boiler or heater that was most commonly fired by a fossil fuel but in recent years many sawmills have converted to boilers that burn biomass waste resulting from the sawmill's operation. After passing over the coils, the air flows through the lumber stacks in the kiln. The warm, moisture laden air leaving the lumber stacks is exhausted to atmosphere from the kiln.

A more recent development in wood drying kilns is the dehumidification kiln. The advantage that the dehumidification kiln has over a conventional kiln is that in the dehumidification kiln heat is continuously recycled rather than vented to atmosphere as occurs in the conventional kiln. The device that allows this savings in energy to be accomplished is a closed-cycle mechanical heat pump. The warm, moisture laden air leaving the lumber stacks is passed over a cooling coil, which serves as the closed-cycle heat pump's evaporator. As the air cools it gives up heat to the heat pump working fluid and moisture contained in the air is condensed. The condensed moisture is drained away and the air is then passed over heating coils, which serve as the heat pump's condenser.

In the heating coils, which serve as the heat pump's condenser, the energy which the air previously gave up in the cooling coils is returned to the air through the use of the closed-cycle heat pump. The heated, dehumidified air is then recirculated through the lumber stacks. Each time the air is recirculated through the coils its temperature is increased. The U. S. Department of Energy[13] indicates that the most common industrial application of heat pumping is the dehumidification drying of lumber.

Kilns used to dry softwood, which is the predominant type of wood used for structural or framing purposes, typically operate below 115^{o}C (240^{o}F). Kilns used to dry hardwoods, which are typically used for furniture, flooring, or other wood products, operate at lower temperatures commonly keeping the air temperature below 82^{o}C (180^{o}F). These operating temperature ranges are certainly at a workable level for recovery of waste energy from the tertiary effluent. However, a short search of kiln manufacturers did not find any who supplied kilns that utilized waste heat recovery from a waste liquid stream. Recovery of waste energy could take a number of different forms including using a conventional heat exchanger to preheat the circulating water in a conventional kiln and a boiler or other type of heater to raise the temperature the rest of the way, or utilizing a heat pump to transfer heat from the tertiary treatment effluent to the fluid being circulated through the heating coils. It would

[13] U.S. Department of Energy, Industrial Technologies Program, "Industrial Heat Pumps for Steam and Fuel Savings", DOE/GO-102003-1735, June, 2003.

appear, however, that a customized design would be required to utilize waste heat recovery from the tertiary effluent.

Discussions with a current large operator of lumber drying kilns indicate that the largest single cost of production for lumber is the energy required to dry it. However, to utilize the tertiary treatment effluent as a source of thermal energy for a lumber drying kiln would require that a new kiln be located within a reasonable distance from the source of the effluent since the energy spent pumping the effluent long distances would likely negate the value of the energy recovered. A major financial question for such a new venture would be whether the energy savings available by recovery of waste heat would offer a sufficient return on a fairly significant capital investment required to build a new lumber drying kiln, which typically would form part of a sawmill complex. It is a possibility to locate the kiln on a separate property from the sawmill which produces the wood to be dried; however, this would open the possibility that the energy saving achieved by recovering waste heat from the tertiary effluent was negated by the fuel (energy) cost to transport the lumber from the sawmill to the kiln.

Locating a sawmill complex including drying kiln adjacent to the Northern Pulp Mill could produce a potential business synergy between the two businesses. The sawmill would have an existing and nearby customer for some of its residue. The close proximity of the two mills would reduce transportation cost and would allow the sawmill to sell its residue at a lower cost to the pulp mill compared to more distant sources of wood fibre, which would benefit both parties. This would of course be in addition to the benefit of lower lumber drying costs for the sawmill produced by the energy recovery from the tertiary effluent.

Unfortunately, in recent years the business outlook for sawmills has been quite dark. The softwood lumber dispute with the United States, the significant increase in the value of the Canadian dollar, which hurts all exports including lumber, and most recently the housing crisis in the United States have had quite devastating effects on the commercial viability of sawmills. Indeed, the majority of sawmills in Atlantic Canada that were operating prior to the beginning of the current recession in mid-2008, have since closed. During a visit to the Northern Pulp mill in January, 2011, mill personnel indicated that a local sawmill that had been a source of wood chips for Northern had closed. Any further consideration of this potential usage of waste heat would therefore require a thorough investigation/market analysis of the lumber industry.

4.4 Organic Rankine Cycle Power Generation

A thermodynamic cycle is a sequence of thermodynamic processes that continuously repeat in the same order. A thermodynamic cycle uses a working fluid that changes state as it flows from one process step to another in the cycle returning to its original state at the end of the last process step to begin its flow around the process path again. The repeating nature of the process steps or process path permits continuous operation, which makes the cycle an important concept in thermodynamics.

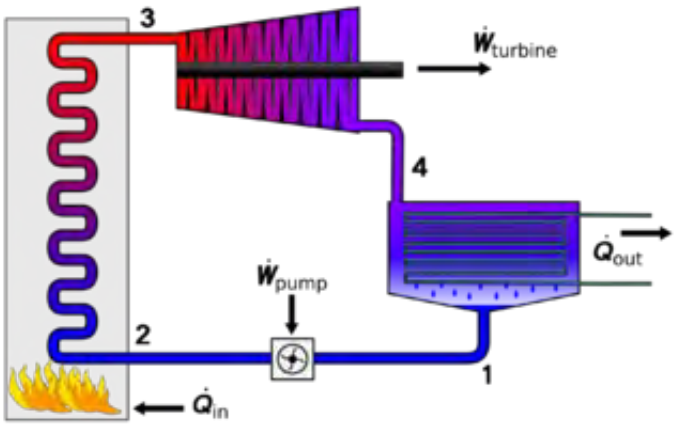
There are two major classifications of thermodynamic cycles, namely power cycles and heat pump cycles. In a power cycle a portion of the heat input to the cycle is converted to mechanical work output from the cycle. In a heat pump cycle, as previously discussed, heat is transferred in the opposite direction from which it would naturally occur, i.e., from low to high temperature media or fluids using mechanical work input.

Power cycles are the basis for the operation of the heat engines that power our cars and generate most of the world's electricity. The ubiquitous gasoline fuelled, spark ignited engine that powers most of the automobiles on the road is known as the "Otto" cycle, named after its German inventor. The heat engine that generates a majority of the world's electrical energy is the steam turbine. Its operation and performance is defined by the power cycle known as the "Rankine" cycle, also commonly known as the steam cycle.

The working fluid in the Rankine cycle is water which is vaporized into steam in the boiler by the addition of heat (the thermodynamic process of heat addition under constant pressure), and transfers thermal energy to the steam turbine in the vapour state. The steam turbine converts the thermal energy into mechanical shaft power or work (through the thermodynamic process of isentropic expansion), which is the input to the generator. The generator in turn converts the shaft work input into electrical energy. After exhausting from the steam turbine, the steam is condensed back into water in the condenser (the thermodynamic process of heat rejection at constant pressure) and starts the cycle over again.

The major components of the conventional Rankine cycle, namely, the boiler, the steam turbine, the condenser and the boiler feedpump are illustrated graphically below:

Rankine Cycle Schematic[14]



[14] http;//www.answers.com/topic/rankine-cycle?&print=true

The Rankine cycle uses heat at much higher temperatures than what is available from the tertiary treatment effluent. In many fossil fuel fired thermal generating stations, steam enters the turbine at 538°C (1000°F). In recent years generating stations known as supercritical Rankine cycle plants have been constructed that operate with steam temperatures in the order of 649°C (1200°C). The higher the steam temperature entering the turbine, the better the thermodynamic efficiency of the plant, i.e., the more electrical energy that is produced from a given amount of fuel (heat) input. The temperature at which most Rankine cycle plants reject heat, typically in the 38°C (100°F) to 43°C (110°C) range, is very close to the expected tertiary effluent temperature range of 43°C (110°C) to 63°C (145°C).

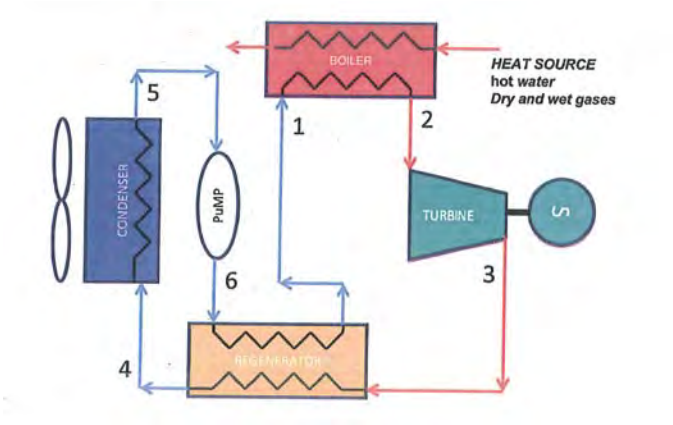
In an "organic" Rankine cycle, water is replaced as a working fluid by another fluid, with a lower boiling temperature than water. Organic refers to the fact that the alternate fluid contains carbon as one of the elements making up the fluid. The benefit of the lower boiling point of the organic Rankine cycle that is relevant to the area of focus for this study is that a lower grade of heat can be used as heat input to the cycle, including low grade industrial waste heat. The organic Rankine cycle is composed of the same four thermodynamic process steps as the conventional Rankine cycle, but operates at lower temperatures and pressures than the conventional cycle.

The selection of fluid is important to the organic Rankine cycle because its physical and thermodynamic properties, particularly its phase change or boiling point, determines what types of heat input to the cycle are viable. While fluids with lower boiling points will allow for lower grades of waste heat to be utilized, this also lowers the achievable thermodynamic efficiency of the cycle. However, if the waste heat would otherwise have to be discarded, the lower efficiency is secondary to the ability to achieve some energy recovery. Common fluids utilized in the organic Rankine cycle are refrigerants and hydrocarbons such as pentane.

A schematic of an organic Rankine Cycle is illustrated below. Instead of a boiler burning a fossil fuel, the boiler in this case is in fact a heat exchanger in which the thermal energy from the waste fluid is transferred to the organic cycle fluid, changing its state (vaporizing it). There is an additional heat exchanger called a "regenerator" utilized to cool the organic fluid being exhausted from the turbine.

Producing power from an organic Rankine cycle plant utilizing a waste industrial heat source as the heat input to the cycle has a number of advantages. Firstly, it eliminates the greenhouse gas generation which would result from producing the power in a conventional Rankine cycle plant where the heat input typically comes from burning a fossil fuel such as coal, oil or natural gas in a boiler. Secondly, it converts the waste heat energy recovered into an energy form, namely, electricity that can be transmitted substantial distances to prospective customers and thirdly, electricity is an energy form that is in constant demand. In a district heating scheme, heat demand is not constant and pumping hot water significant distances can reduce the overall energy savings associated with recovering the waste heat.

Organic Rankine Cycle Schematic[15]



Preliminary inquiries were made to a potential supplier of organic Rankine cycle technology and equipment, namely, Trans-Pacific Energy Inc., to determine if it was feasible to utilize the low grade waste heat contained in the tertiary treatment effluent and, if so, obtain an estimate of the potential electrical energy production. Trans-Pacific have developed a working fluid which is composed of four different refrigerants, which they claim allow it to use lower grade waste heat than most other suppliers of organic Rankine cycle equipment, e.g., down to 27°C (80°F).

With the estimated16,000 m^3per day of 43°C tertiary treatment effluent, Trans-Pacific estimates that a gross electrical power output of 949 kW could be obtained if a water cooled condenser was utilized and a gross electrical power output of 686 kW could be obtained if an air cooled condenser was utilized. It is apparent from the information obtained that water cooling provides a significant improvement in energy recovery. There is a readily available source of cooling water in the form of the treated portion (clarified) of the raw water intake to the mill. Therefore, it would seem most beneficial that if an organic Rankine cycle plant was utilized for energy recovery to locate it on the mill property and utilize the clarified water as the cooling fluid in the condenser before the water continued on to the intended process uses in the mill. Further, locating the equipment on the mill property would minimize piping (and therefore costs) required for the cooling water and the tertiary treatment effluent. Additionally, the mill has an existing connection to the NS Power transmission grid and internal power distribution buses that may have sufficient spare capacity to allow connection of the organic Rankine cycle generator to them. This could potentially eliminate the need for a new transformer and some or all of the switchgear and protective devices that would be required for a generator installation.

A subsequent, more detailed study of this option would be required to determine estimated costs, payback period and return on investment. At a first high level overview, however, this option does look technically feasible and potentially quite attractive. As well, the full wastewater flow could be utilized as a source of heat potentially making this a much larger project; the above is based on a flow approximately ⅓ of the total wastewater flow.

[15] TransPacific Energy Inc., Technical Bulletin

4.5 Aquacultural Applications

Land based aquaculture operations in Canada generally require energy to maintain water temperatures that ensure the health and efficient growth of the various finfish and other aquaculture products. To this end, there may be the potential to utilize waste heat from the Northern Pulp wastewaters to maintain the appropriate water temperatures.

Canada is a major player in the aquaculture industry due to its access to: suitable sources of fresh and sea water, feed, and land. Canada is also well positioned in terms of good access to major markets; particularly the US.

4.5.1 *Canadian Aquaculture Species*

Canadian aquaculture production is dominated by four main categories by volume: salmon 66.7%; mussels 15.8%; oysters 8.7%; trout 3.4%. Other commercial species include: Manila clams, Soft shell clams, Arctic char, Tilapia, Atlantic cod, Sablefish, Geoducks, Atlantic halibut, Quahogs, White Sturgeon and Scallops. Emerging aquaculture species include: Spotted wolffish, American eels, Abalone, Sea cucumbers, Sea urchins, Cockles and Marine plants.

More than 85% of Canadian aquaculture production is exported – the largest export market is the United States.

- **Salmon**

Farmed salmon is by far the most important finfish species grown by Canadian aquaculturists. With a production volume of 118,058 tonnes and a value of $748 million, farmed salmon accounted for ~85% of both the volume and value of finfish produced by Canada's aquaculture industry in 2006.

Canada accounts for 8.2% of global farmed salmon production – and ranks 4th behind Norway, the UK and Chile as a producer of farmed salmon.

British Columbia and New Brunswick are the predominant producers of Canadian farmed salmon. In 2005, British Columbia accounted for 59% of Canada's total farmed salmon production – while New Brunswick accounted for 36%. Farmed salmon is British Columbia's largest agricultural export product - and the largest crop in the New Brunswick agri-food sector.

The United States is Canada's major export market for farmed salmon - accounting for 93% of Canada's farmed salmon exports in 2006. In 2006, the US imported 78,733 tonnes of Canadian farmed salmon worth $505 million.

- **Shellfish**

Canada's total shellfish production in 2006 was 38,676 tonnes with a value of $71 million. By volume, mussels and oysters are the primary shellfish species cultured in Canada: in 2006, mussels accounted for 62% of the total national shellfish production while oysters accounted for an additional 32%. Canada ranks 12th globally in the production of both mussels and oysters.

The United States is Canada's major export market for farmed shellfish. In fact, Canada is the largest supplier of shellfish to the United States.

- **Mussels**

In 2006, Canadian farmed mussel production was 23,822 tonnes valued at over $33 million. Eastern Canada produced 99% of Canada's total production in 2006. Prince Edward Island is the major mussel producing province – followed by Newfoundland, Nova Scotia, Quebec and New Brunswick.

Eastern Canadian mussels are primarily marketed in the northeastern US and the Canadian fresh, live market – these markets consume 97% of the Canadian mussel harvest. In 2006, the value of the Canadian mussel exports to the United States was $23 million.

- **Oysters**

In 2006, Canadian farmed oyster production was 12,488 tonnes valued at $18.5 million. Oyster production is distinctly divided between two Canadian regions: in 2006, 60% of the volume of Canada's oysters were produced in British Columbia; the remainder were produced in Atlantic Canada.

- **Clams**

British Columbia is Canada's largest producer of farmed clams – in 2006, it produced 1,600 tonnes of farmed clams valued at $8.3 million.

- **Scallops**

Canadian production of farmed scallops occurs in British Columbia, Nova Scotia, New Brunswick and Quebec. In 2006, Canada produced 58 tonnes of scallops with a value of $0.5 million. British Columbia accounted for 76% of this volume.

Table 4.1 summarizes the major aquaculture species produced in Atlantic Canada.

Table 4.1

Major Aquaculture Species – Atlantic Canada

	AQUACULTURE SPECIES		
	Finfish	**Shellfish**	Output $ (2009)
New Brunswick	Atlantic Salmon Rainbow Trout Steelhead Trout Cod Halibut	Eastern Oysters Blue Mussels	$164 million
Nova Scotia	Atlantic Salmon Arctic Char Halibut Steelhead Trout Rainbow Trout Tilapia	Eastern Oysters Blue Mussels Clams Quahogs Abalone	$57 million
Newfoundland and Labrador	Atlantic Salmon Steelhead Trout Cod	Mussels Clams	$92 million
Prince Edward Island	Salmon Processing Rainbow Trout Arctic Char	Blue Mussels Eastern Oysters	$31 million

Like most of Canada, NS aquaculture is dominated by salmon production, which is primarily undertaken using ocean cages. However, there are also numerous land-based aquaculture operations raising such species as arctic char, halibut, rainbow trout and tilapia. The land based operations usually require some heating of the water to ensure the survival and growth of the fish. While the heating requirements vary by species and operation, energy for heating the water is considered a significant production cost, particularly for warm water species such as tilapia.

4.5.2 *Aquaculture Feasibility Considerations*

Any potential aquaculture operation looking at using the waste heat available from Northern Pulp will need to examine a number of key considerations.

- **Waste Heat Availability and Cost**

Potential users of the waste heat will need to know the quantity, quality, availability and cost of the waste heat. On the plus side, 16,000 m^3 of 40^o to 50^o C water would clearly meet the heating requirements of several land-based aquaculture operations. Any potential user of the waste heat will need to know the availability, reliability and cost of the waste heat. An aquaculture operation would

also require some form of backup heating system to protect their valuable products. This would be an additional cost.

- **Water Supply**

Water Supply is likely the most critical factor in determining the technical feasibility of an aquaculture operation. Water supply includes quality, quantity, and temperature. Some species require fresh water and others salt water. Fresh water supplies could be groundwater or surface water. Most aquaculture species are very sensitive to water quality and thus water quality has played a significant role in either the success or failure of many operations.

- **Land**

Aquaculture operations, either land-based or marine-based require suitable locations where they can be operated safely, securely and efficiently. In the case of a potential Northern Pulp waste heat operation it would need to be located adjacent to the mill to take advantage of the low-cost waste heat. The available land in the vicinity of the mill will need to be examined to determine its suitability.

- **Technology**

Aquaculture technology continues to evolve to address production challenges. The design of the production facilities and selection of the appropriate technology must match the unique circumstances of each operation.

- **Production and Management Expertise**

Aquaculture operations require a great amount of expertise and experience to address the ongoing production and management challenges. Successful track records in terms of operations and management will be a critical success factor for any operation.

- **Financing, Marketing, Human Resources Etc.**

Like any business operations, the execution of a sound business plan will be critical. Ignoring one factor, such as human resource requirements, can lead to serious problems and business failure.

4.5.3 Existing and Proposed Waste Heat Aquaculture Projects

There are a number of existing and planned aquaculture operations utilizing waste heat from industrial operations or from geothermal resources. The following examples illustrate the potential for a similar operation using the available waste heat from Northern Pulp wastewater.

- **Nofima Recycle Waste Heat Aquaculture Centre (Norway)**

This project entails the use of waste heat for a aquaculture research centre in Sunndalsøra, Norway. The waste heat comes from an aluminum plant. The research centre is focused on re-circulating aquaculture systems for Norwegian land-based aquaculture. Power company Sunndal Energi has laid a 750 m pipeline to connect the waste heat to the centre. The waste heat is used to heat the water in the tanks, the air used in the recirculation process and to heat the buildings. The water has a temperature of 90^{o}C when it reaches the centre, and it goes through two stages of heat exchange so that an optimal temperature of 12 ^{o}C is obtained before it reaches the fish.

- **MinAqua Fisheries – Minnesota (US)**

MinAqua Fisheries has an indoor aquaculture facility that annually produces approximately $1.5 million worth of tilapia. The water and building are heated by waste heat from a nearby sugar beet processing operation.

- **Shrimp Aquaculture with Waste Heat (Rotterdam, Holland)**

This project is located next to the Eon power plant in an industrial park at Rotterdam's port, known as the Maasvlakte. A 2.5-kilometre pipeline was constructed to the power plant to recover waste heat. The operation is located in a hangar, where sunlight filters through a white roof covering. The operation includes 24 tanks filled with sea water for the Pacific white shrimp, a popular species choice for shrimp farming that has had success elsewhere, notably Ecuador.

The sea water, warmed by a waste heat from the energy plant, is kept at 29 ^{o}C, the ideal temperature for this species of shrimp.

- **ADM Hydroponics and Aquaculture - Decateur, Illinois (US)**

The following section on greenhouse opportunities describe an integrated operation in Illinois, involving the use of waste heat for both greenhouse and aquaculture operations.

- **Other Examples**

Worldwide, there are numerous aquaculture operations producing a wide range of aquaculture products using the steady waste heat from electrical power generation. Often these are warm water species being produced in cold climates. Tilapia is a common aquaculture species requiring warm water. Seabait Ltd, in England, is using waste heat to grow worms that are used for many things beyond fish bait. A salmon aquaculture operation used waste heat from the Lingan thermal electric generation

facility in Cape Breton. A land based aquaculture based aquaculture and greenhouse operation was established in Minto, NB to use waste heat from a thermo electric generation facility.[16]

4.5.4 *Northern Pulp Waste Heat Aquaculture Opportunities*

The Northern Pulp waste heat would be potentially very attractive to the aquaculture industry, if it could be demonstrated that it would substantially reduce the heating costs compared to other heating options such as oil, natural gas or biomass. There appears to be available land adjacent to the Northern Pulp operations as well as access to both freshwater and sea water.

Among the potential aquacultural operations would be hatchery operations to supply salmon and other finfish operations. Numerous attempts have been made to establish land-based finfish production operations for salmon, halibut and other species. There have been a number of successes in Nova Scotia and elsewhere, including operations that tap into industrial waste heat and geothermal resources.

Tropical species such as tilapia would also be potential applications. There are numerous land-based tilapia aquaculture operations both in warm locations such as Asia and in colder regions in North America. Tilapia is a relatively easy species to raise, has an established market in North America, and requires significant energy input to maintain warm water conditions.

As mentioned previously, there are numerous factors beyond access to low cost heating source which will determine the economic feasibility of an aquaculture operation. In addition, aquaculture has proven to be a very challenging industry in Canada and elsewhere. The initial excitement of the early years has disappeared. Numerous aquaculture companies have been created and disappeared due to a long list of challenges (changing markets, production issues, emergence of new competitors, management). However, there are also numerous successes, demonstrating the potential for new operations and new species. While preliminary discussions have been held with aquaculture officials and industry experts, the next step should be to approach the Provincial government and existing aquaculture companies with a package of information on the availability of the waste heat, land, and water resources to determine the level of interest and development requirements.

4.6 Greenhouse and Other Agriculture Applications

Greenhouses are used for the production of various plants, flowers, seedlings and other agriculture products. Greenhouses allow production to take place year-round in locations such as Nova Scotia. Flowers, seedlings and bedding plants are likely the most common products produced by greenhouses in Canada; however, vegetables such as tomatoes and lettuce are becoming more common in Canada. Greenhouse operations in climates such as Nova Scotia's require significant heating to achieve adequate plant/crop growth. Heating cost are one of the most significant costs of production and is a major focus

[16] It should be noted that both the Lingan and Minto aquaculture operations are now closed due to production and financial reasons.

in terms of minimizing energy requirements and developing the most efficient heat sources. There are numerous examples of greenhouse operations (in other parts of Canada and elsewhere) taking advantage of heat sources such as waste heat from industrial and electrical power generation facilities. Whole greenhouse industries have grown up around industrial and geothermal heat sources.

The Northern Pulp waste heat represents a potential opportunity for existing and new greenhouse operations to reduce their very significant energy costs.

4.6.1 *The NS Greenhouse Industry*

The NS greenhouse industry consists of approximately 130 growers who together have in excess of 3 million ft^3 of production space under glass or plastic. The industry generates approximately $36 million in annual sales. The sector employs over 1250 people, contributing in excess of $9 million to the economy through annual payroll. [17]

Greenhouse operations are spread throughout Nova Scotia producing a variety of plant materials and food items. The list includes:

- Annuals and Perennials for gardens and landscaping
- Cut Flowers and potted plants
- Herbs and Vegetables - tomatoes, cucumbers, peppers etc.
- Trees - Christmas tree seedlings, fruit, ornamental

The Pictou-area greenhouse operations include Sunrise Gardens located just outside Pictou as well as Duykers Greenhouses in Antigonish.

4.6.2 *Greenhouse Operations Feasibility Considerations*

Any potential aquaculture operation looking at using the waste heat available from Northern Pulp will need to examine a number of key considerations.

- **Waste Heat Availability and Cost**

Potential users of the waste heat will need to know the quantity, quality, availability and cost of the waste heat. On the plus side, 16,000 m^3 of 40^o to 50^o C water would clearly meet the heating requirements of several major greenhouse operations. Any potential user of the waste heat will need to know the availability, reliability and cost of the waste heat. A greenhouse operation would also require some form of backup heating system to protect their valuable products. This would be an additional cost.

Depending on the product and market focus of the greenhouse operation, the heat requirements could be considerably different. As discussed elsewhere, most greenhouse operations in Nova Scotia are

[17] Source Greenhouse Nova Scotia www.greenhousenovascotia.com

seasonal operations, requiring heat during the late winter and spring period. These types of operations would not be as suitable as an operation that had a more consistent heat requirement throughout the year, or at least throughout the heating season (fall, winter, spring).

- **Water Supply**

Greenhouses require a reliable water supply. However the requirements would not be as large or as critical as the aquaculture industry. With the significant freshwater availability in the area, water supply is not anticipated to be a concern for greenhouse operations.

- **Land**

Greenhouse operations require significant space for the greenhouses, supporting operations and potentially for retail operations. In the case of the Northern Pulp waste heat operation, the greenhouses would need to be located adjacent to the mill to take advantage of the low cost waste heat. The available land and transportation access in the vicinity of the mill will need to be examined to determine its suitability.

- **Financing, Marketing, Human Resources Etc.**

Like any business operations, the execution of a sound business plan will be critical. Ignoring one factor, such as human resource requirements, can lead to serious problems and business failure.

4.6.3 Waste heat Use by Greenhouse Operations

There are numerous examples around the world of greenhouse operations using waste heat from industrial and electric power generation operations. Following are examples of a number of successful applications.

- **Greenhouse Operation Thermal Electric Facility Waste Heat (Italy)**

ENEL (the National Board of Electricity, in Italy) established a program to research the use of thermoelectric power plant cooling waters for aquaculture and agriculture. As a part of this program, in South Italy, some technological (greenhouse heating through buried pipes and water-to-air heat exchangers) and agronomical aspects (growing of different ornamental pot plants) related to the use of low enthalpy waters (20^{o} to 26^{o}C), were developed.

- **Burlington, Vermont Food Works Agricultural Eco-Park (US)**

The Agricultural Eco-Park in Burlington's Intervale project is using waste heat from a local wood-fired power plant to fuel a series of year-round greenhouses where byproducts from local food manufacturers and farms are converted to fish, shrimp, mushrooms, salad greens, and composts.

- **Quebec Agrothermal Projects (Canada)**

There has been considerable research and development work in Quebec related to the use of waste heat for greenhouses and aquaculture. There is a major proposal for a 10 hectare greenhouse operation to grow tomatoes, peppers, lettuce and other vegetables. This proposed project would be in Salaberry de Valleyfield. The original feasibility study was completed in 2004. While the study was quite positive, the Community has not been able to proceed to implementation. Other waste heat proposals have been developed for Saguenay Lac St-Jean, and Témiscamingue.

- **New Richmond Waste Heat Tomato Greenhouse Operation (Gaspe, Canada)**

A more modest waste heat/greenhouse project was developed in New Richmond (Gaspe Region). This 12,000 m^2 greenhouse produces tomatoes and other products for the local, Quebec and other Eastern Canada markets. The greenhouse was originally heated by waste heat from a Smurfit Stone Paper Mill. The Paper Mill has since closed and the heat is now provided by a biomass heating facility. The available waste heat was an impetus to develop the greenhouse. A solid business strategy and plan has allowed the greenhouse to remain in business despite the loss of the waste heat supply.

- **ADM Hydroponics and Aquaculture Decateur, Illinois (US)**

ADM is a large multinational agribusiness company headquartered in the US. It has a major production facility in Illinois, including a number of hydroponic greenhouse operations. It is using waste heat from one part of its operation to heat the hydroponic nutrient as well as the greenhouses. Waste heat is also used for an adjacent aquaculture operation that produces tilapia. Byproducts from processing operations also provide nutrients for the fish.

4.6.4 Northern Pulp Waste Heat Agriculture Opportunities

The application of waste heat to greenhouse operations is well established in many jurisdictions. The potential of a large volume of low grade waste heat from the Northern Pulp operation would be extremely attractive to a new greenhouse operation, provided the other critical business requirements can be met. Other requirements would include land, water, markets, labour, financing and operational/management expertise.

While heating costs are a very significant cost factor for greenhouses in Nova Scotia, there are many other factors that will determine if an operation would take advantage of the Northern Pulp waste heat. First on the list will be the actual cost of the waste heat in relation to existing heat sources such as oil or biomass.

Many greenhouses operate seasonally, in that their major markets are to serve the local and regional gardening and landscaping markets. These seasonal greenhouses start up operations in the late winter to be able to meet the spring and summer market requirements. This reduces the annual heat requirements. A greenhouse operation based on the use of Northern Pulp waste heat would likely need to be a year round operation to justify the investment in a waste heat recovery system.

Canada is seeing an expansion of year-round greenhouse operations producing vegetables for the local markets. The New Richmond operation is a good example. There are also other examples in Atlantic Canada. These types of operations would benefit more from the available waste heat.

Nova Scotia has a relatively modest greenhouse industry with not a lot of new operations occurring each year. The modest growth combined with the cost for an existing operation to relocate to the Northern Pulp site would mean there would likely be very few businesses that would seriously consider this opportunity.

On the plus side, there would be support from all levels of government to investigate and potentially implement such an operation. For example the Nova Scotia Government has funding programs for agriculture energy conservation and renewable technologies. These programs are available for the identification, assessment and implementation of energy conservation and renewable technologies. Furthermore, the Nova Scotia Department of Agriculture has an Energy Specialist to advise on the options and programs (Julie Bailey (902) 896-4473). The federal government has similar programs that generally mesh with the Provincial programs.

The next steps should be to enter into discussions with agriculture officials and the greenhouse industry to review the waste heat opportunities and receive feedback on how best to take advantage of this potential energy resource.

4.7 Summary of Waste Heat Utilization Options

The review of options for use of the available waste heat has identified a number of options that warrant further research and analysis. The nearly 16,000 m^3/d of 43^{o}C wastewater represents a very significant energy source that could potentially be used by both Northern Pulp and other new operations. All of the opportunities have focussed on the non-contact use of the effluent; the use of the treated effluent in a direct-contact manner is deemed not feasible. In most cases, the quality of the water is not of a major concern; the water should be “clean” enough to be utilized in a heat exchanger with minimal fouling.

The opportunities examined included :

- District heating;
- Lumber drying;
- Power generation;
- Aquaculture; and,
- Agriculture.

As well, the mill could investigate the feasibility of reclaiming the heat to pre-heat the raw water for the appropriate processes requiring “hot” water. Regardless of the end use, the wastewater treatment

process would benefit if the heat was removed prior to the wastewater being introduced into the secondary treatment system.

The district heating option, in and of itself at the high level of review conducted for this report, would not be considered feasible since the existing building density/building types in the vicinity of the mill are not conducive to that type of an operation. However, the concept of marketing the available waste heat as a regional asset to businesses and other forms of development could be considered.

Using the waste heat for lumber drying, only, particularly with the current state of the lumber industry, may be a difficult opportunity to promote.

Aquaculture and agriculture (greenhouse operations) are two examples of the types of industries that should be part of any attempt to develop markets for the waste heat. Lower cost heat sources are always of interest to these industries, particularly in a colder climate like Nova Scotia. The key to pursuing these opportunities will be to determine the delivered cost of the heat to these potential operations, along with the other required basic business inputs (land, water, transportation, markets etc.)

Electric Power Generation – There is limited demonstrated success of generating electricity from low grade heat sources such as is available. However, there is enough promising new developments to continue to investigate the potential. There is a well established and stable market for the electricity which will be key for any potential user of the waste heat. Locating a power generation system at the mill would provide access to their grid infrastructure. The generation of “green” power also conforms to the Nova Scotia provincial government’s policy to increase the percentage of power being generated from renewable resources.

5.0 Opinion of Probable Costs

5.1 Tertiary Effluent Treatment

The capital costs for the various process options of tertiary treatment have been calculated based on a variety of resources. All probable costs are preliminary and originate from vendors budgetary quotes, published R&D papers and ADI in-house experience. The capital costs, as well as operating costs, have all been calculated based on large equipment prices and considering industry standard construction rates. The installation of specialized equipment is anticipated to be challenging so it is included as a cost that is equal to that of the equipment costs. Any sludge handling equipment is not included in the probable costs as the secondary treatment will be required to do this operation and it is anticipated that it would be sized to accommodate the sludge handling requirements of the tertiary treatment system. It should be noted that this may impact the sizing of the secondary treatment sludge handling equipment and configuration. Additionally, all probable costs include a contingency for the purpose of covering currently unknown costs that will be realized when the piloting stage and detail design is undertaken.

The operational costs have been calculated based on estimated power costs, chemical consumption estimates and cross referenced to other installations. Not included is any additional labour costs as it is assumed that minimal operation time will be required and will be done by existing WWTP personnel.

The following tables provide the breakdown of the costs for the three tertiary treatment systems that are deemed the most appropriate for this project.

Table 5-1 Engineered Wetlands

ITEM NO	Definition	Units	Quantity	Unit Price	Total
1	Clearing & Grubbing	ha	6.1	$ 20,000	$ 122,000
2	Berms	m	1750	$ 200	$ 350,000

6	Contingency @ 20%				$ 2,902,680
	Total Opinion of Probable Cost				**$ 17,416,080**

Annual operating costs for the various tertiary treatment options are presented in Table 5-4.

Table 5-4 Annual Probable Operations and Maintenance Costs

Tertiary Treatment Process	Estimated Annual Operating Cost **
Ozonation	$ 2,363,000
Clarification	$ 2,063,000
Engineered Wetland	$ 500,000

**based on 350 days/year, $0.1 per kWh electricity

5.2 Outfall Extension to Northumberland Strait or Pictou Harbour

Probable costs have been developed for the two outfall options: to the inner harbour of Pictou Harbour and to the MacKenzie Head area in the Northumberland Strait. These costs provide order-of-magnitude values which should be refined once a decision has been made to proceed with the project, an environmental assessment has been completed and preliminary design work has been done.

Some assumptions which were made during the formation of this opinion of probable cost are as follows:

1. Locations where gravel roads currently exist, it was assumed that the pipe can be installed within the road itself, without causing traffic disruptions;
2. Pipe being installed within wooded areas, a swath width of 15m was deemed sufficient and that this area will serve as the permanent access road once work has been completed. As such, it was assumed that the permanent access road will be completed with access points (manholes for inspection, vacuum and air relief, etc.);
3. The underwater routes were assumed to be buried in armour rock. The volume of rock could vary depending on amount of protection required;
4. Additional costs would include survey, contractor's overhead and profit, mobilization and demobilization;
5. The engineering costs would include design and field services; and,
6. There has been no accounting for the possible costs of land acquisition or easements.

The following tables provide the breakdown of the costs for the two discharge location options. In the event that the discharge point has to be moved further out into the harbour or ocean from the point(s) shown in Figure 2-7, the additional underwater piping cost will be in the order of $300,000/100m.

Table 5-5 Outfall into Pictou Harbour

ITEM NO	Definition	Units	Quantity	Unit Price	Total
	Pipe Work				
1	Clearing & Grubbing	ha	0.23	$ 20,000	$ 5,000

6.0 Conclusions/Recommendations

6.1 Conclusions

The current use of Boat Harbour as a component of the wastewater treatment system for the Northern Pulp mill at Ambercrombie is being re-evaluated with a commitment being made by the Provincial Government to return Boat Harbour to its natural state. Previous studies have examined the changes required to the wastewater treatment system to remove the existing system form Boat Harbour as well as options for alternative outfall locations. This study further examined the additional treatment required to improve upon the quality of the final effluent to allow discharging into Pictou Harbour. This study also examined an alternative outfall location if tertiary treatment is not implemented.

From a regulatory perspective, there are no regulations preventing the effluent from being discharged into Pictou Harbour. In its current state, it is anticipated that the poor aesthetic quality could lead to a degradation of the visual quality of the Harbour and would require an improvement of the effluent qualities to have the discharge to the Harbour be acceptable from a public perspective. It is believed that, from a technical perspective, the addition of a tertiary treatment process would improve the effluent quality sufficiently to allow the effluent to be discharged into the Harbour.

Several tertiary treatment system options have been presented that could improve upon the secondary treatment (the option if tertiary treatment is not applied is to relocate the outfall to the Northumberland Strait a sufficient distance from Pictou Harbour such that tidal action does not pull the effluent into the Harbour on an incoming tide). The three tertiary treatment options that show promise are:

1. Engineered wetlands;
2. Chemical precipitation followed by clarification; and,
3. Ozonation.

Costs for the tertiary treatment ranged from $ 7.8M to $ 17.4M. Costs for the two outfall options (Pictou Harbour and Northumberland Strait (MacKenzie Head area)) range from $ 7.13M to $ 23.76M. However, it must be noted that the Pictou Harbour outfall cost ($ 7.13M) must be combined with a tertiary treatment cost (minimum of $ 7.8M) to realize the full cost of the discharge option to Pictou Harbour. Where there is no need for tertiary treatment to extend the outfall to the Northumberland Strait, this option will, in all likelihood, have the lowest operational and maintenance cost.

There are market opportunities that could benefit from the availability of heat that could be recovered from the wastewater effluent. The opportunities exist within the mill (pre-heat the incoming fresh water), in the aquacultural and agricultural industries, as well as potential “green” power generation. As well, it may be possible to combine opportunities (e.g., power generation plus raw water pre-heating for the mill).

6.2 Recommendations

The Northern Pulp mill has plans to implement in-mill process changes this year (2011) (using funding obtained from the federal Green Transformation Program) that may impact mill effluent quality. This impact is expected to be in both quantity (less wastewater produced) and quality (a reduction in the organic and solids loading requiring wastewater treatment as well as a possible colour reduction). It is, therefore, recommended that any decisions on effluent treatment options be delayed until after these changes are implemented. Further, it is recommended that at least three (3) months of effluent monitoring data be collected after the changes are implemented with this data being used in conjunction with the tertiary treatment option review.

If the decision is made to proceed with tertiary treatment to allow the outfall to be potentially relocated to Pictou Harbour, it will be necessary to pilot test the technologies so to gather additional data for design and costing purposes. Through the pilot-testing process, additional information will be collected regarding the improvement on the effluent quality as well as operational requirements. Pilot testing for the precipitation/clarification option would take six to eight weeks; the ozonation option may require four to six moths (due to the biological nature of the filter for the follow-up BOD removal); and the wetlands option should be pilot tested a minimum of one (1) year due to the biological nature of the process.

Additional preliminary design work will be required to determine the appropriate site for the new outfall. The best approach may be to continue to investigate both sites so that better pricing can be established. As well, the other factors that will determine the final location (social, political, regulatory, etc.) can be examined.

While several potential market opportunities for using the waste heat have identified, additional studies will be required to determine their feasibility. One promising opportunity is power generation; however, the quantity of heat available may change with the completion of the current modifications within the mill. While further preliminary studies can be undertaken to provide additional details, it is recommended that the results of the in-mill changes be reviewed so to provide better definition of the available waste heat. This study also only focussed on a portion of the effluent as a source of the heat available for such a project. In fact, the whole wastewater stream can be utilized for this type of non-contact application.

Identify an appropriate organization (e.g. Pictou Regional Development Agency) that would take the lead in identifying potential businesses that would locate in the proposed business/industrial park and take advantage of the available waste heat. Initial focus should include the aquaculture, agriculture and power generation sectors. However, there are many other businesses and institutions that would be attracted by access to a lower cost energy source. Then, develop a conceptual plan and preliminary cost estimate to develop serviced business/industrial lots in the park adjacent to Northern Pulp. These lots would include municipal services including access to the available waste heat from Northern Pulp.

Project: replacement_effluent_treatment_facility_project Comments: In my opinion, if a company doesnt provide an environmentally friendly output they shouldnt be operating. I know this is a big industry and by closing the mill it will hurt many NScotians in the industry. What about building another industry that doesnt cause deforestation, polluting of water ways and hurt our environment. Hemp anyone??

Project: replacement_effluent_treatment_facility_project Comments: Any plan that pipes effluence directly into the Strait is a no go. Period. End of story. If they want an extension, it should be to build a closed loop system. They had years to prepare this, to work with the government, the industry and the community to get this right and they were silent for the first 3 years and then came out saying No pipe, no mill. Finally something we can all agree on No pipe, no mill! Good riddance! :

Project: replacement_effluent_treatment_facility_project Comments: This project is very important for the longevity of the Forest Industry in Pictou Co.and for the economy of Nova Scotia. I feel NP has done their homework for this project and have presented the best replacement solution for Boat Harbour. Effluent has been pouring into the Northumberland Strait for 50 years with no harmful effects on the environment or the fishing industry. Now in 2019, NP will be using the best technology available for bleach kraft pulp mills in the world which will meet or excede provincial and federal guidelines for the environment.They have done 28 studies for the Government with consultation from the Environment,Transport Canada,Fisheries and Oceans and many other departments. They crossed all the Is and Ts necessary to be awarded an Environmental permit to procede with the construction and completion of the project to replace Boat Harbour. When completed there be safe guards in place to protect the environment and to continue to let the forest industry and fishery industry co-exist like they have in the past. I hope you will grant this permit to build this treatment plant as 12,000 jobs associated with the Mill are at risk as well as the economies of Pictou, Colchester, Cumberland Counties and the economy of our Province. The science is there to back this Mega project. Hopefully, calm and cool heads will look at this project which has turned into such a contentious issue when there is no need for it. I have no doubt in my mind when your Department looks at all the scientific data and studies by NP it will be a no brainer to approve the permit. Respectfully yours

Project: replacement_effluent_treatment_facility_project Comments: As a Pictou County Resident, a provincial tax payer, and most importantly, a father of three , I find it appalling that we are even contemplating allowing this Industry to dump toxic effluent into the Northumberland Strait in the hopes that dilution is a viable a solution. Northern Pulp continuously says the effluent is already going into the Strait, but fail to mention that that only happens after sitting for a month or more in a 300 acre tidal estuary which acts as a natural filter. The proof of Boat Harbours filtering ability lie in the sheer effort it will take to clean that environmental disaster up, and even after all that effort and money, it will never be the same. There seems to be a lot of focus on the people that will be forced to move away for work, however there also should be a focus on the young families who will choose to move away, or never relocate here in the first place should this proposal be allowed to go through. There are many of us that are not interested in being poisoned for the sake of Asia Pulp and Papers profit. Its time to think about the future, and dumping at minimum, 50-60 million liters per day of pulp waste into the Northumberland Strait, jeopardizing a more profitable fishing industry as well as severely limiting tourism and growth in the surrounding areas, is doing the exact opposite of that. As we move into the future there will be an even greater focus on environmental sustainability. Nova Scotia should be looking to invest in being a leader in that area, not taking significant steps backward in time.

Project: replacement_effluent_treatment_facility_project Comments: Good morning The government of Nova Scotia need to rely on the experts and engineers to base their decision on in this project. Let the science decide not peer pressure from the public on either side of the argument. There is a lot at stake here and I fear the decision will be based on whatever will gain the most votes. If the science displays the mill will produce an effluent that is better than it currently is and it will meet all the current regulations and the new regulations coming down soon it should be allowed to run. If the effluent is going to be worse than the current system then thatâ?Ts a different story. A lot of locals are uneducated and very determined to stop this project due to lack of knowledge and poor communication at all levels. We need a government that will take an unbiased stance on this and think of the whole province. The government must do the right thing and protect the environment and the economy.rely on the experts, do the right thing. Keep this province working. Currently all political parties have been playing politics on this matter and not taking a side. A lot of forestry families need a government that will be straight up and honest. Families are leaving this province and many are making plans to leave. This is no time for games. If the science works approve the project and let these families know they have a future here in Nova Scotia. Thanks

Subject: Feedback opposing the Northern Pulp Waste Proposal
Date: Thursday, February 07, 2019 2:18:23 PM
Attachments: ambient air study.pdf

NS Department of Environment and Premier McNeil,

I believe that the proposed effluent project SHOULD NOT be approved for the following reasons :

1. **The proposed waste process is not better than the current waste process**

Some say, "the effluent has been going out into the Strait for years anyway. " This is only partially true. A study conducted in 2005 showed that healthy mussels deployed into the Pictou Harbour and exposed to mill effluent and untreated municipal sewage for 6 months had developed leukemia. Another study showed that the effluent had never been flushing properly with a large amount settling back into Pictou Harbour. Because the old system was never flushing properly, most of the effluent has been confined to the local shoreline and has been flowing back into Pictou Harbour, rather than into the Strait. This was a good thing for the Strait, but not for area residents, especially Pictou Landing First Nation. In Northern Pulp's proposed new system, waste water would go straight out from the new Abercrombie Point treatment facility into "deeper waters. "This could result in the pollutants affecting a far wider area because of "improved flushing."

Old Waste Process

Northern Pulp's proposed new effluent treatment facility differs from the present facility in a number of ways. In the present system, untreated effluent is piped from the mill to the north settling ponds at Boat Harbour, where it remains for 12 hours for primary treatment. It then moves to an aerated stabilization basin where effluent is placed in contact with micro-organisms. The effluent remains there for 8 days for secondary treatment. After 8 days, the effluent is discharged from the aeration basin at what is known as Point C, and treatment is considered finished. At point C, samples are taken for testing to determine whether the treated effluent meets regulations. After point C, the effluent enters the 300-acre Boat Harbour lagoon, also known as Boat Harbour Basin. Boat Harbour Basin was initially used as a stand-alone effluent treatment facility. In 1972, settling ponds and an aerated stabilization basin were constructed to meet stricter regulations for pulp effluent treatment. Additional aeration and other upgrades were added from 1992-1996, as the federal government again adopted stricter regulations. The lagoon at Boat Harbour has not been officially part of the effluent treatment system since 1972. Official or not, treated effluent remains in the lagoon for an additional 20-30 days. Further aeration, settling, cooling, volatilization and breakdown of materials takes place during that time. This is referred to as "polishing" or tertiary treatment. Natural springs and surface run off further dilute the effluent. According to Northern Pulp's figures, during the time in Boat Harbour Basin, total suspended solids (TSS) and biochemical oxygen demand (BOD) decrease up to 30%, before the effluent flows out at the shore edge of the Strait at Point D.

NOTE : Northern Pulp's effluent meets the regulations at Point C in the above process. Point C is also now a DEAD ZONE.

Northern Pulp's own reports say that they release over 1000 kg (one metric ton) of suspended solids in their waste water each day. Test results have revealed the presence of dioxins, furans, chlorinated compounds, halogenated organic compounds and traces of heavy metals. These substances are known to have negative impacts to aquatic life. The study prepared for Northern Pulp by engineering consultants KSH Solutions Inc. clearly shows that there will be very little change in

wastewater quality with the new AST facility

The Proposed Waste Proposal

In the proposed new Activated Sludge Treatment (AST) system on the mill site, effluent will move through a primary clarifier to an aeration basin using micro-organisms to break down pollutants, and then to a secondary clarifier. The process will take less than 24 hours.

Therefore it will not have the 300 acre lagoon to provide further aeration, settling, cooling, volatilization and breakdown of materials that takes place during that time. This is referred to as "polishing" or tertiary treatment. That is one of the main reasons why the proposed system is not better since it doesn't have the time like the old process to settle, cool down, become further diluted etc.

Northern Pulp states that effluent from the new system, including an added oxygen delignification system (confirmed from mill execs that it will not be ready for the proposed launch of the new effluent system and does not have a timeline), will be similar to treated effluent leaving the present system at point C, with some (unspecified) reduction in biochemical oxygen demand (BOD.)

2. <u>Additional Air Quality Issues</u>

The new proposal also shows a plan to burn contaminated sludge in power boiler which raises new threats to air quality. The waste sludge contains toxins which would be released through the stacks of the mill's power boiler. The proposal is to "dewater the sludge prior to mixing it with bark and other woodwaste for combustion in the mill's power boiler." This is the same power boiler that is currently and repeatedly failing stack emissions tests. Problems with air quality from mill emissions have been documented for years. Lack of appropriate monitoring and enforcement already puts area residents at risk. Now, Northern Pulp is considering adding sludge containing toxins to the combustion mix, increasing health risks from NP's air emission

Recently a group of scientists decided to measure the levels of VOCs (volatile organic compounds) in Pictou County with an ambient air monitor. They chose Granton as the location and they found that when the mill blew toward the monitoring station that the cancer risk thresholds for VOC levels were exceeded. They also studied the seasonal wind directions and determined that the mill mostly blew in other directions where no monitoring stations were ever located to measure VOC levels. The study concludes by recommending that monitoring stations should be installed in higher populated areas such as the town of Pictou where exposure is greater. But instead of installing more monitoring stations to measure VOC levels the Provincial Government removed the monitoring station in Granton. The VOC monitoring station in Granton was decommissioned - An email response from NSE (Nova Scotia Environment) states "Environment Canada decided to decommission the Granton VOC monitor in 2015 after they analyzed the 10 years of data and determined there were no pollutants of concern in the area" - Yet this attached study is contradictory to the findings of this ambient air study.

According to the NPRI data on Environment Canada's website the VOC levels were not reduced since the installation of the new precipitator at Northern Pulp. The precipitator is designed to filter out visible particulate but does not lower the VOC levels. So Northern Pulp is still currently releasing cancer causing levels of VOCs and we can only assume this would become much worse once they would begin to burn their dried up waste sludge in their already failing power boiler.

The study shows that VOC levels (volatile organic compounds) in the air around Pictou County "exceeded their respective cancer risk thresholds and are of primary health concern in terms of population risk. Results highlight associations with wind direction and the Granton NAPS site's ambient VOC concentrations in relation to location of the pulp mill"

But most importantly the study revealed that there are no monitoring stations located in many of the populated areas that are susceptible to the pollution coming from the mill - "Findings suggest that Granton's NAPS site is not positioned to accurately represent ambient levels of toxidity in PC." And the study concludes that NSE should install the proper monitoring stations such as in Pictou where there is "higher residential exposure". This should also include places like New Glasgow, Trenton, Pictou Landing, Westville, Stellarton and other areas around the County where the population is being exposed.

Northern Pulp also doesn't have "Continual Emissions Monitoring" CEM on all of their stacks like other mills in Canada are required to do with live streaming to a website for everyone to see exactly what chemical compounds are being released and whether or not they are surpassing the risk thresholds.

Since this study was done (and since the new precipitator was installed), the NPRI data on the Environment Canada's website shows very little change in the amounts of VOCs being emitted to the present day. AND for some reason the Granton VOC air monitoring station was decommissioned approximately three years ago.

From NPRI data - Northern Pulp's Self Reported VOC Levels from 2010-2016:

2010 – 118

2011 – 108

2012 – 143

2013 – 144

2014 – 140

2015 – 132

2016 - 136

See Volatile organic compounds http://ec.gc.ca/inrp-npri/donnees-data/index.cfm…

In light of this new information about high cancer causing VOC levels coming from the mill, several monitoring stations would be required because readings from any one monitoring station will only detect pollutants from the mill if the wind happens to be blowing that way - the mill is the point source. An even better solution would be the mill having continuous air monitoring (CEM) on each of the three main stacks with set limits monitored by a third party and real time data made available to the public.

Another study in 2008 shows Pictou County had the highest rates of cancer in Nova Scotia with stillbirths and infant deaths amongst the highest in the province.

3. Bleach Chlorine Mills and the Impacts on Marine Life

The molecular chlorine or chlorine-containing compounds currently used as bleaching agents by the pulp and paper sector react with materials released from wood during the pulping process, resulting in the formation of chlorinated organic compounds which are in part discharged into the aquatic environment via effluents. Canadian mills are estimated to use over 610 000 tonnes of chlorine annually to produce over 10 million tonnes of bleached pulp and to release over a million tonnes of

chlorinated organic compounds to the aquatic environment.

- The dioxins and furans are part of the bleaching process and are considered “toxic" under Sections 11(a) and 11(c) of the Canadian Environmental Protection Act and I believe the Federal Government has more expertise and resources to asses this compared to the province.
- TSS and BOD are regulated under Sections 34 and 36 of the Fisheries Act which is a Federal act thus requiring Federal involvement.
- The chemical composition of bleached pulp mill effluents is variable and not well characterized. Approximately 250 compounds have been identified in bleachery effluents but many more remain unidentified. Thus, substantial quantities of chlorinated organic compounds, both of known and of unknown composition, enter the Canadian aquatic environment from bleached pulp mill discharges.
- Many of these chlorinated organic compounds are persistent and have been detected in water, sediments and biota up to 1400 km from bleached pulp mills outfalls. Compounds with low chlorine substitution degrade within hours to days, whereas highly chlorinated organic compounds may persist from days to weeks or longer. Persistence may be longer in winter, especially under ice. Some chlorinated organic compounds can be biologically degraded or transformed and transformation may lead to more persistent and bioaccumulative compounds.
- Chloroveratroles, for example, transformation products of chloroguaiacols which are unique to bleached pulp mill effluents, are capable of accumulating in fish up to 25 000 times the concentration in water.
- Some other chlorinated organic compounds detected in biological tissues downstream of bleached pulp mills reflect repeated or long-term exposure rather than high bioaccumulative potentials.
- Seventy-five percent of Canadian bleached pulp mills discharge effluents that are acutely lethal to fish, sometimes at concentrations as low as 3.2% effluent. A few individual chlorinated organic compounds in these effluents approach or surpass concentrations that cause mortalities in aquatic organisms ranging from algae to fish.
- Seventy percent of Canadian freshwater bleached pulp mills discharge whole effluent that, even upon dilution by the receiving waters, are at levels which cause chronic effects. Chronic effects, such as reproductive anomalies, biochemical changes, and behavioural alterations in aquatic organisms, have been observed in Canadian field studies at 0.5 to 5 % whole effluent.
- Laboratory studies using individual chlorinated organic compounds that are commonly discharged from bleached pulp mills have demonstrated such chronic effects as deformities, and embryo and larval mortalities in fish. These chronic effects include significant irreversible factors which jeopardize the continuance of the species and the integrity of the ecosystem. Thus, the levels of whole effluents discharged from Canadian bleached pulp mills to the aquatic environment and the resulting acute and chronic effects observed both in the field and in the laboratory combine to represent a

significant risk to the aquatic ecosystem.

Supporters of piping the effluent into the Strait say waste water will be diluted in the larger body of water, so the effluent will not cause harm to the fisheries or the larger environment. But that's not accurate. Even diluted, the toxins can have serious effects on aquatic life and the overall environment. Levels may be low at any one moment, but cumulative impacts over the longer term would have negative effects on aquatic life and the aquatic environment. In the case of NP's effluent, the volume of contaminants contained in the waste effluent is significant. Studies show that exposure even to low concentrations of heavy metals and other chemicals over time can disrupt reproduction, weight gain, and food sources of aquatic life. Also, bioaccumulation of toxins including heavy metals in aquatic species is of great concern.

Northern Pulp's proposal boasts about using an Activated Sludge Treatment (AST) effluent treatment system similar to the system used at Port Hawkesbury Paper for their treatment facility but it ignores the differences between the mills. Both mills produce pulp, but PHP is a thermomechanical pulp (TMP) mill, while NP is a chemical bleached kraft mill.

Port Hawkesbury Paper uses peroxide bleach and thermo-mechanical refining (no chemicals) to break down the lignin in wood fiber to produce pulp. Northern Pulp uses chemicals to produce pulp, plus additional chemicals to bleach the pulp. Northern Pulp bleaches with chlorine dioxide (ECF), and while, switching to ECF was an improvement from an older method used pre-1997, it does not eliminate the presence of dioxins, furans or other toxins in the effluent.

NOTE: Environment Canada has "Effluents From Pulp Mills Using Bleaching" listed as a toxic substance. This includes any mills still utilizing a chlorine or chlorine dioxide process. NP does not have an oxygen delignification system as most other modern pulp mills do. Oxygen delignification aids in reducing chemical usage and environmental impact. In addition, many mills recycle water, while NP does not.

A chemical-bleached kraft mill like Northern Pulp produces approximately 4 times more wastewater than Port Hawkesbury Paper. NP's waste water contains toxins that are not found in PHP's waste water, or in the waste water of most mills using AST systems that employ the use of oxygen delignification and recycle water. The new system proposed by Northern Pulp for treating effluent would use a multi-stage process to separate liquids and solids and then aerate. The wastewater would still contain toxic chemicals and traces of heavy metals which would accumulate at the 'point source' outflow location in the Strait.

4. <u>The Northumberland Strait – Depth and Ice Scouring</u>

The Strait is shallow and ice scouring occurs in the Winter. This presents a huge risk for the effluent pipe to get damaged. The Stantec Receiving Water Report calls this out - The general information provided below was obtained from the Canadian Coast Guard on Ice Climatology and Environmental Conditions (CCG, 2012). Generally, or normally, the first ice formation in the Gulf of St. Lawrence occurs in the St. Lawrence River in early to mid-December and progressively moves to Saguenay River and then forms along the coast of New Brunswick and progressively moves eastward. In January, the ice concentrations have reached very closepack range in the Northumberland Strait. By the end of February, thin first-year ice may be found in the Northumberland Strait. It is emphasized, however, that ice conditions in the Northumberland Strait are highly variable and the ice cover varies considerably from year-toyear.

There have been years when the entire Strait is frozen and totally ice-covered, while other years the Strait is relatively ice-free. It is quite possible for drift ice to be blown into the shore with winds out of the north. There is also the possibility of some ice-rafting along Nova Scotia's Northumberland shore where ice sheets over-ride each other and stack-up along the shore. Fast ice (ice which forms and remains fast along the coast) for most coastal regions in the Gulf has limited extents as it forms

in smaller bays and inlets which might be more typical and expected in Pictou Harbour (ENSR 1999).

The 1999 ENSR report included a review of available ice data for the Pictou area including consultation with researchers and review of published literature. It was determined that quantitative data in Pictou Road and Pictou Harbour was unavailable, while ice in the Northumberland Strait has been measured and studied extensively. Of particular interest were the events of ice scouring as it is well known that pipelines, outfalls, diffusers, and submarine cables are at risk during ice scour events.

It was reported (in ENSR, 1999) that Maritime Telephone and Telegraph (MT&T) performed an ice evaluation in support of an optical communication cable deployment across the Northumberland Strait. Based on MT&T's review, the estimated potential for damage to the cable from ice scour extended to water depths of 12 to 14 m. In 1991 their cable was trenched and buried to a selected depth (depth is unknown) and left on the surface of the sea bottom at greater depths. Unfortunately, the winter of 1991/1992 was severe and the cable was severed by ice keels at a water depth greater than 18 m towards the Woods Island, PEI side of the Northumberland Strait.

Based on the above, substantial ice pile-up should be expected near shore of the Northumberland Strait and ice scour is possible and should be anticipated anywhere in Pictou Road and the Northumberland Strait area. Available information suggests that there is a potential for damage to the pipe, outfall, and diffusers in the areas of Pictou Road out into the Northumberland Strait, based on ENSR (1999)

5. <u>The Northumberland Strait Cannot withstand Additional Pressures</u>

The Northumberland Strait Ecosystem Overview Report, prepared for DFO in 2007, documents increasing stresses on the Strait. "Increased nutrient loading from land-based activities was identified as the most important MEQ [Marine Environment Quality] issue in the near shore areas such as the estuaries, harbours, and bays. The principal sources of nutrients to the coastal areas of the Northumberland Strait are sewage, agricultural runoff, fish plant effluents, and pulp mill effluent." The Ecosystem Overview Report also states, "In addition to individual impacts of the various elements identified as having an impact on the environment in the Northumberland Strait, there can be cumulative impacts that exceed the individual effects." Ocean stresses are increasing generally. Anoxic areas, where there is insufficient oxygen for marine life, are growing, and are expected to continue to do so due to global warming and other factors. The discharge of pulp effluent, with significant amounts of total suspended solids, biochemical oxygen demand, chemical oxygen demand and contaminants including heavy metals and AOX, has to be evaluated in the context of cumulative impacts on an increasingly stressed ecosystem. The consequences will be greater now and in coming decades than they would have been 50 or 25 years ago in healthier oceans.

6. <u>Weak Regulations</u>

Pulp and Paper Effluent Regulations (PPER) in Canada cover two matters; total suspended solids (TSS) and biochemical oxygen demand (BOD.) Even though total discharges of TSS and BOD in pulp and paper effluent decreased by approximately 90% and 97% respectively from 1970-2008, pulp mill effluents continue to have harmful impacts on fish, fish habitat and the environment. Information gathered through environmental effects monitoring (EEM) at all Canadian mills points to the disturbing conclusion that although mills are meeting regulations and passing the PPER toxicity test, 70% are having harmful effects on aquatic life and habitat, and 55% are having harmful effects on the larger environment.

This information led the federal department of Environment and Climate Change to undertake a

modernization review of pulp and paper effluent regulations in 2017. “Results from EEM studies and the changing realities of the pulp and paper industry indicate a need to modernize the PPER to improve environmental protection,” the department states. If meeting regulations is not enough to prevent harm, neither is passing toxicity tests. Only one toxicity test is required under Canadian pulp and paper regulations. The required LC-50 test is for acute lethality. For this test, an effluent is considered acutely lethal if the treated effluent at 100% concentration kills more than 50% of the Rainbow Trout exposed to it during a 96-hour period. Long-term effects, including impacts on reproduction or growth, cumulative impacts on fish habitat and the larger environment or accumulation of substances harmful for human consumption are not regulated under the PPER. Testing for environmental effects is required for information purposes.

Only two mills in Canada test for and report impacts of effluent on the usability of fish resources by humans. Effluent from pulp and paper mills is regulated at the federal level principally by the Pulp and Paper Effluent Regulations (PPER), which form part of the Fisheries Act. The standards that apply to pulp effluent today were adopted in 1992 and have remained unchanged for 25 years. Highly toxic dioxins and furans are regulated under a separate Act.

70% of pulp & paper mills are having harmful effects on aquatic life and habitat despite meeting current regulations . Long term impacts on reproduction and growth are not regulated under PPER. Federal regulations cover only a few of the recognized harmful substances in pulp mill effluent. For example, there are no federal regulations for AOX compounds, a component of pulp effluent in mills that bleach with chlorine or a chlorine compound. AOX compounds are recognized as extremely toxic. They are not easily broken down by bacteria and thus bioaccumulate in the environment. Yet they are not included in PPER regulations. Neither are phenols, toluene, chloroform or chemical oxygen demand (COD).

For 25 yrs the regulations that apply to pulp effluent have remained unchanged. Provinces may go beyond Federal standards and adopt stricter regulations for effluent from pulp mills. British Columbia, Alberta, Ontario and Quebec have adopted stricter regulations. Nova Scotia does not have regulations, but sets limits through individual industrial approvals. The EU has more protective regulations than Canada does.

7. Effluent Make up Unknown

Hot water is a hazard to marine environment. NP presently releases 80 to 90 million litres of wastewater per day. This waste currently enters Boat Harbour at a temperature of approximately 40 degrees . A cooling tower as proposed by NP for its new treatment facility should lower waste effluent temperature to 32-36 degrees C. This would represent a 20 to 28-degree C water shock to marine life, if this water entered a marine habitat. This thermal shock would kill any marine life within meters of the discharge point. This thermal loading should be contrary to the Fisheries Act. Yet this issue is not addressed in KSH’s design proposal for a new facility. There is no plan to bring wastewater to within 1 to 5 degrees of the natural habitat. Further to this, Northern Pulp has been unable to release the exact composition of this proposed effluent.

8. Economics

The Nova Scotia Economy exports $1.5 Billion dollars worth of Shellfish per year. Shellfish that are caught in the Strait are sold under the “Atlantic Canadian” brand. Contamination of even a few shellfish would destroy the excellent reputation Atlantic Canada has in regards to this resource. The

results for Atlantic Canada would be catastrophic. Examples of similar situations would be:

1. In 2003, one case of mad cow disease was discovered in Alberta. The result, it collapsed the Canadian Beef market.
2. In 2018, a trace of GMO Wheat that came from Canada was discovered in Asia. The result, Asia declared they no longer would buy wheat from Canada until the issue was addressed.

Besides the $2 Billion dollar Commercial Fishery in NS, The Northumberland Strait also employs a lot of people in Tourism. There are 3200 jobs in this industry along the Strait that generates $200 Million in revenue and brings in about $24 Million in Tax Revenue.

In addition to those two industries, The NS Sportfishing industry is growing and more emphasis is being placed on attracting Fishers from outside our Province. This industry is currently worth $65 Million dollars to the economy, with the Strait bringing in a big piece of that. The Strait has 15 + rivers that come in off of the Strait that all have world class Atlantic Salmon, Brook Trout and Brown Trout. These species are considered in the top 5 in the world for Sport Fish.

9. Pictou Town Water Supply

Although very little info has been released by Northern Pulp on this, the latest proposed route show the effluent pipe going through the Pictou Town water supply. Should this pipe be compromised like it has multiple times with the current waste prices, the Pictou Town water supply would become contaminated.

10. Marine Protected Area

The receiving water area is part of a Marine Protected Area and a scallop buffer zone.

11. Trust/History

Northern Pulp has had over a dozen infractions since 2014 and 2 very large effluent spills that they did not report in a timely manner nor in an accurate manner per the Federal judge presiding over one of these spills

12. Federal Fishing Zone

The receiving water area is part of a Federal fishing zone and shared by 3 Provinces.

13. Pictou Landing First Nations

The Aboriginal rights of PLFN need to be considered. The new discharge location still has a direct affect on them and their livelihood, as it pertains to fishing.

14. Species at Risk and Species of Concern

There are 'Species at Risk' that potentially will be negatively affected via this effluent pipe during construction as well as at the outflow. They are listed on the DFO and NS websites.

15. Wild life Sanctuary

The proposed discharge location is directly adjacent to Caribou-Munroe's Island Park; a bird and wildlife sanctuary.

Thank you for this opportunity to provide my feedback. I look forward to the results of a thorough

review.

Sincerely,

Environ Sci Pollut Res (2017) 24:20685–20698

RESEARCH ARTICLE

Pilot study investigating ambient air toxics emissions near a Canadian kraft pulp and paper facility in Pictou County, Nova Scotia

Abstract Air toxics are airborne pollutants known or suspected to cause cancer or other serious health effects, including certain volatile organic compounds (VOCs), prioritized by the US Environmental Protection Agency (EPA). While several EPA-designated air toxics are monitored at a subset of Canadian National Air Pollution Surveillance (NAPS) sites, Canada has no specific "air toxics" control priorities. Although pulp and paper (P&P) mills are major industrial emitters of air pollutants, few studies quantified the spectrum of air quality exposures. Moreover, most NAPS monitoring sites are in urban centers; in contrast, rural NAPS sites are sparse with few exposure risk records. The objective of this pilot study was to investigate prioritized air toxic ambient VOC concentrations using NAPS hourly emissions data from a rural Pictou, Nova Scotia Kraft P&P town to document concentration levels, and to determine whether these concentrations correlated with wind direction at the NAPS site (located southwest of the mill). Publicly accessible Environment and Climate Change Canada data (VOC concentrations [Granton NAPS ID: 31201] and local meteorological conditions [Caribou Point]) were examined using temporal (2006–2013) and spatial analytic methods. Results revealed several VOCs (1,3-butadiene, benzene, and carbon tetrachloride) routinely exceeded EPA air toxics-associated cancer risk thresholds. 1,3-Butadiene and tetrachloroethylene were significantly higher ($p < 0.05$) when prevailing wind direction blew from the northeast and the mill towards the NAPS site. Conversely, when prevailing winds originated from the southwest towards the mill, higher median VOC air toxics concentrations at the NAPS site, except carbon tetrachloride, were not observed. Despite study limitations, this is one of few investigations documenting elevated concentrations of certain VOCs air toxics to be associated with P&P emissions in a community. Findings support the need for more research on the extent to which air toxics emissions exist in P&P towns and contribute to poor health in nearby communities.

Keywords Air toxics · Air quality · Volatile organic compounds (VOCs) · Community health · Pulp and paper · Cancer risk

Introduction

Poor ambient air quality is an increasing global concern with recent revelations that 92% of the world's population is exposed to air pollution levels above the World Health Organization (WHO) air quality guidelines (WHO 2006, 2016; Kelly and Fussell 2015). Ambient air pollution is widely recognized and increasingly associated with a wide range of acute and chronic adverse health effects, including cancer, cardiovascular, respiratory, and mortality outcomes (IOM 2011; Villeneuve et al. 2013; ECCC 2015a). The pathological mechanisms by which these toxic exposures exert their effects are not well understood. WHO highlights the need for research in order to better inform exposure-response relationships (WHO 2016).

Most air pollution surveillance activities are limited to measurement of respirable fine particulate matter ≤2.5 μm ($PM_{2.5}$), without regard to their specific chemical composition and criterion air contaminant (CAC) gases (i.e., nitrogen oxides [NO_x] and ground-level ozone [O_3]). There is growing concern about the toxicity of volatile organic compounds (VOCs) (Cicolella 2008) and the consequences of long-term, low-dose exposure to these agents. VOCs are varied and widespread air pollutants (e.g., hydrocarbons, aromatics, and some chlorinated compounds) that are increasingly recognized as important precursors to $PM_{2.5}$ and ground-level O_3 formation through photochemical reactions (Ryerson et al. 2001). Atmospheric deposition of VOCs may contaminate other environmental media (e.g., soils, sediments, and biota) (ATSDR 2014a; MacAskill et al. 2016). Many VOCs are included in the US Environmental Protection Agency (EPA) "air toxics" list. "Air toxics" are defined as "those pollutants that cause or may cause cancer or other serious health effects […] or adverse environmental and ecological effects" (EPA 2015a).

According to the Canadian Environmental Protection Act 1999 (CEPA), VOC releases are acknowledged as a health concern, but, due to their highly volatile properties, are challenging to monitor and manage (CCME 2011). Although no specific Canadian legislative or regulatory tools address ambient VOC levels, emissions are indirectly controlled through regulatory mitigation of $PM_{2.5}$ and ground-level O_3 under the Canadian Ambient Air Quality Standards (CAAQS). Under CEPA, it is mandatory for owners or facility operators, who meet reporting requirements, to self-report pollutant releases to air, water, and land to Environment and Climate Change Canada (ECCC)'s National Pollutant Release Inventory (NPRI) (ECCC 2014). While this provides a disincentive to those industries releasing these agents, there is less regulatory control or routine monitoring of these agents in Canada which, in turn, limits scientific understanding of sources, exposures, and the effectiveness of current control measures across the country.

Ambient air monitoring in the US is conducted in accordance with the *Clean Air Act* (CAA) (Clean Air Act 1970). CAA amendments identify 187 air toxics, which form the basis for EPA's approach to regulating emissions (EPA 2015a). Of these, EPA identified 30 air toxics that pose the greatest potential health threat in urban areas (EPA 2015b). Although many CEPA-toxic or equivalent agents are monitored by the National Air Pollution Surveillance (NAPS) network, it includes a selection (not all) of EPA's list of prioritized air toxics, and the main criteria for air toxics monitoring in Canada has been their potential contribution to ambient PM and ground-level O_3 (Galarneau et al. 2016). Consequently, there are gaps in understanding of air toxics concentrations across the NAPS network. Using the risk-based principles outlined in CAA, EPA developed the National Air Toxics Assessment (NATA), a comprehensive evaluation tool that prioritizes efforts to regulate emissions of air toxics (EPA 2015c). Such a rigorous initiative has yet to be implemented in Canada, where no federal guidelines exist for ambient air toxics.

Despite economic benefits of the P&P industry, it generates large quantities of atmospheric and effluent emissions, resulting in environmental degradation (Hewitt et al. 2006; Hoffman et al. 2015; Hoffman et al. 2017). P&P mill emissions vary depending on the pulping method, wood species, and by the age and technology used (Soskolne and Sieswerda 2010). P&P mills are industrial emitters of air toxics, although few investigations (e.g., the Nez Perce National Air Toxics Program, funded by EPA [STI 2009]) have characterized ambient concentrations in nearby communities.

Potential adverse health effects associated with exposure to air pollutants in the vicinity and downwind from P&P facilities include respiratory disease, neurophysical symptoms, and higher risks of contracting lung cancer (Soto et al. 1991; Toren et al. 1996; Mirabelli and Wing 2006). Yet, few investigations reported adverse health effects from chronic community-level ambient exposures to P&P mills emissions in Canada (Mirabelli and Wing 2006; Soskolne and Sieswerda 2010). While there have been a number of occupational epidemiological studies of P&P workers, these investigations have not been extended to examine community exposures, due to research design challenges including ecological fallacy (i.e., inferences made about individuals deduced from the population) in community studies (Soskolne and Sieswerda 2010). Additionally, most of these studies focused on respiratory disease outcomes; there is a dearth of epidemiological studies of cardiovascular effects or cancer effects in these communities.

Decades-long concerns for perceived higher incidence and mortality rates for all-cause cancer, cardiovascular disease, chronic respiratory disease, and diabetes (Reid 1989; PCHA 2008; Statistics Canada 2013) in PC, Nova Scotia, have generated considerable community antipathy among residents towards a local P&P mill (Hoffman et al. 2015). This bleached kraft P&P mill ("the mill") is located approximately 3 km south of the town of Pictou (population 3500) and produces approximately 280,000 t of bleached kraft pulp annually from softwood and hardwood chips (NP 2016b) (Fig. 1) and has been in production since 1967 (Ogden 1972). Public backlash gained momentum during 2014 due to the failure of the recovery boiler electrostatic precipitator (i.e., particulate filtration device).

Environmental reporting by the mill, when compared against provincial and federal regulatory compliance standards, contrasted to local perceptions of impacts. Most environmental monitoring reports indicated some

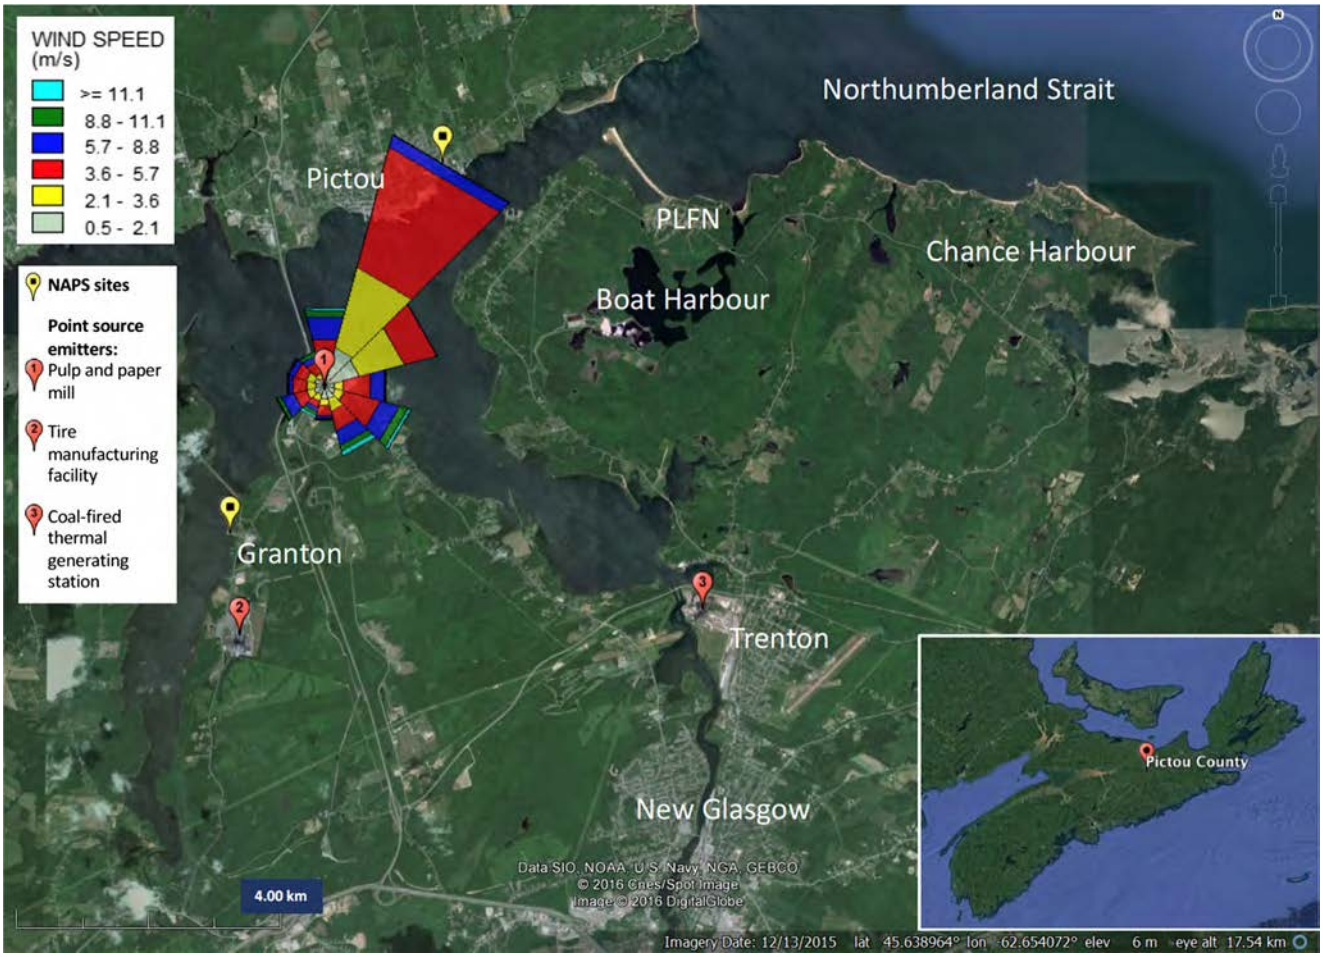

Fig. 1 Summer (2006–2013) wind rose simulation using WRPlot View™ (blowing to direction) with the mill as the focal point (*1*), relative to communities (e.g., Pictou and Pictou Landing First Nation [PLFN]), NAPS discrete receptor sites, and other local point source emitters (e.g., tire manufacturing facility (*2*), coal-fired thermal electrical generating station (*3*)). The length of each radial spoke represents the relative frequency of wind direction (©Google Earth)

level of compliance in atmospheric emissions, but when compliance targets were exceeded, there were inconsistent regulatory enforcement (Hoffman et al. 2015). The mill is required to report emissions to NPRI: conduct third-party stack testing, continuous emission monitoring of total reduced sulfur (TRS), and ambient air monitoring for pollutants found in the Nova Scotia Air Quality Regulations pursuant to the *Environment Act* (NSE 2015). The mill's air emission monitoring data are reviewed by provincial and federal regulators to ensure compliance with applicable environmental permits and air quality objectives (ECCC 2014). Hoffman et al. (2015) provided detailed information on new and existing environmental policies that impose pollution abatement in the P&P industry in Canada, particularly the PC mill (e.g., 2015 Industrial Approval).

These are critical research gaps both in relation to community exposures to VOCs in P&P communities and in regard to adverse health effects resulting from chronic exposure to P&P emissions which are a concern given the potential adverse health outcomes that VOCs and other P&P air emissions pose. This further justifies the need for more research to characterize air quality in this particular subset of industrial communities, which have often been neglected because of their remote locations.

An intensive study of specific ambient air toxic emissions in PC has not been undertaken. The aim of this pilot study was to assess levels of PC community exposures to VOC air toxics emissions from 2006 to 2013, and to evaluate these data in relation to potential risks suggested by EPA air toxic guidelines. The main objective of this study was to determine whether wind direction correlated with prioritized air toxic ambient VOC concentrations at a nearby NAPS site (Granton). As the Granton NAPS site is positioned southwest of the mill, it was hypothesized that prevailing winds (PW) from northerly and northeasterly directions would

positively correlate with an increase in ambient VOC concentrations, as capturing potential VOCs from the mill's plume would be optimized (Fig. 1).

Materials and methods

Spatial and temporal sampling

Historical meteorological and NAPS data from the Granton NAPS site discrete receptor (ID: 31201) were collected from publically assessable ECCC databases (http://climate.weather.gc.ca/climateData/; http://maps-cartes.ec.gc.ca/rnspa-naps/). Hourly surface wind observations (i.e., speed and direction to the nearest 10°) were obtained from the closest EC meteorological station, Caribou Point (45.767° N; 62.683° W), located ~10 km north of the mill (45.652° N; 62.718° W). Temporal data for ambient VOCs monitored at the Granton NAPS station were limited to 2006 to 2013.

Nova Scotia Environment (NSE) operates both NAPS monitoring stations in PC: (i) downtown Pictou (ID: 30901) located 3.5 km northeast of the mill and (ii) Granton (ID: 31201) located 2.5 km southwest of the mill (Fig. 1). The Pictou NAPS site routinely monitors NO, NO_2, NO_x, O_3, $PM_{2.5}$, TRS (not VOCs), and wind characteristics, whereas the Granton site monitors 36 VOC species. Multi-component VOC monitoring at NAPS sites are conducted using canister sampling and gas chromatography/mass spectrometry (GC/MS) (CCME 2011). Sampling of 24 h (midnight to midnight) cumulative ambient air samples ($\mu g/m^3$) are taken on a 1-in-6-day schedule by pumping ambient air into pressurized stainless steel SUMMA® canisters and analyzed by an EC accredited Laboratory (CCME 2011; Galarneau et al. 2016).

Statistical analyses

Variation of meteorological conditions and VOC concentrations were assessed by conducting a spatiotemporal analysis to characterize ambient air toxics emissions in PC from 2006 to 2013. Various analytical methods can be applied to concentration data to estimate source apportionments of air pollutants to provide additional insights into the source/receptor relationships to guide development of more effective air quality management strategies (Hopke 2016). However, given the limitations of having complete VOC data from only one NAPS monitoring station in the region, a full chemical mass balance analysis to identify and apportion sources of atmospheric contaminants were not conducted in this study.

Wind rose plots were generated with WRPlot View™ (©Lakes Environmental Software) to simulate seasonal and spatial variation of wind direction (°) frequency and wind speed (m/s) with the mill as the focal point. Although simplified, wind rose models have proven utility for estimating spatial gradients for fate and transport of pollutants from emission sources (Gibson et al. 2013). Summer, when local people spend more time outdoors (and more vulnerable to outdoor pollution exposure), was a focus of this study (Figs. 1 and 2).

This pilot study was conducted to determine whether ambient concentrations of VOCs exceeded their EPA-associated cancer and/or noncancer risk thresholds, to help identify potential human health concerns in PC. VOCs selected for analysis were based on EPA's list of 30 urban air toxics (EPA 2015b) and *National Air Toxics Trends Station Work Plan Template* (EPA 2015d). Health Canada and the province of Nova Scotia currently do not have specific guidelines for air toxics exposures. Therefore, EPA thresholds were considered a more acceptable standard for carcinogenic exposures in this study. Cancer risk threshold refers to the probability of contracting cancer if exposed to a substance every day over the course of a lifetime (assumed to be 70 years for the purposes of NATA risk characterization). Lower threshold values correspond with higher toxicity. Noncancer risk threshold is associated with effects other than cancer, based on reference concentrations via the "hazard quotient" ratio (HQ; exposure divided by appropriate chronic or acute value) (EPA 2015c). The HQ should not be interpreted as a probability of adverse effects. Noncancer risk thresholds are typically higher compared to cancer risk thresholds, as lower concentrations can elicit a carcinogenic response, whereas other diseases are not triggered until higher exposure thresholds are reached. US and Canadian method detection limits (MDL) are provided (Health Canada 2010; EPA 2015d) (Table 1).

The mill is located approximately 40° northeast of the Granton NAPS site. The selected PW range expected to result in increased VOC concentrations at the NAPS site (±40° either side of the mill [80° total]). A narrower range may be more accurate; however, due to the sample size of VOC samples, the selected range captured more data. All other wind directions (AOWD) represent ranges outside PW (i.e., >80°, <360°). AOWD represent sampling days when no time PW blew from the selected range (i.e., 0 h). VOC concentrations for AOWD were compared to when PW were present for at least 1 h.

Hourly meteorological data were compiled to correspond with ambient VOC sampling. Hourly wind direction within defined PW range (i.e., 360°–80°) was assigned a value of 1; AOWD were assigned a value of 0. Daily totals represented the proportion of time with PW (i.e., 1–24 h) compared to AOWD. Daily

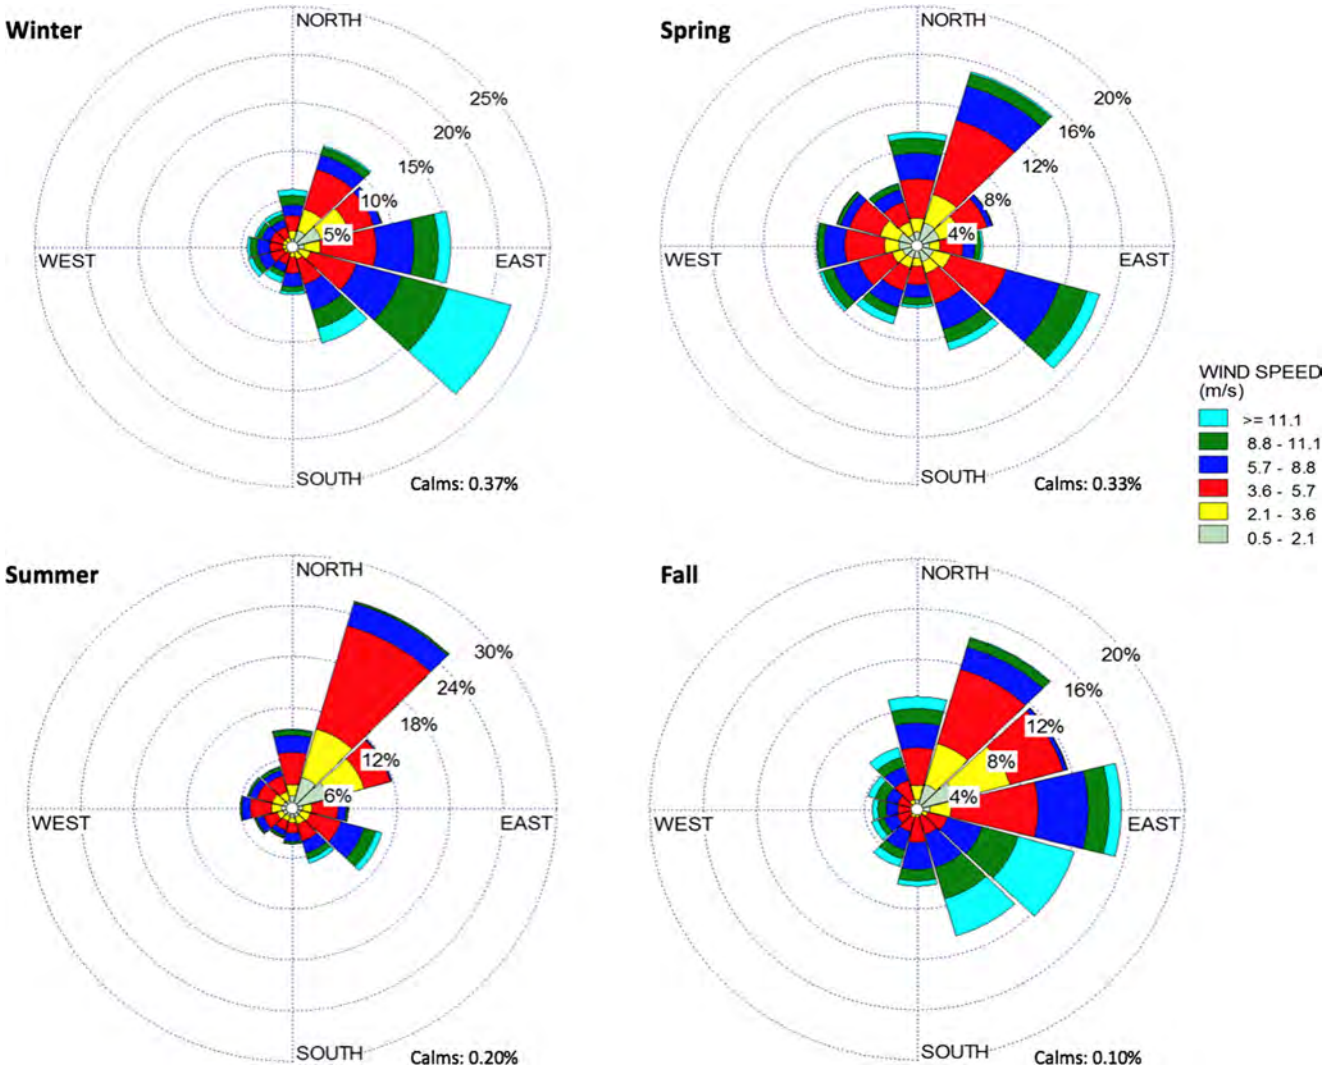

Fig. 2 Seasonal (2006–2013) wind rose simulations using WRPlot View™ (blowing to direction). Percentages represent frequency of wind direction

totals corresponding to VOC sampling were paired. Increasing proportions of PW (AOWD [0 h], ≥1 h, ≥4 h, ≥8 h, ≥12 h) categorized VOC concentrations, which were predicted to correlate with higher VOC concentrations. To test the effect of wind direction and season on ambient VOC concentrations, multivariate analysis of variance (MANOVA) and univariate analysis of variance (ANOVA) were applied in ©R. Due to right-skewed distributions for all VOCs, except for carbon tetrachloride, statistical procedures were performed on both raw and log-transformation of VOC concentrations (Supplementary material Table S1).

Box plots and histograms were used to compare VOC concentrations with PW ≥ 1 h to AOWD on an annual and seasonal basis in relation to their respective cancer and noncancer risk thresholds. See Supplementary material for histograms, and additional box-and-whisker plots illustrating VOC concentrations with increasing time categories with PW (AOWD [0 h], ≥1 h, ≥4 h, ≥8 h, ≥12 h) (Figs. S2 and S4). Box plots display the distribution of data based on a five-number summary: minimum, first quartile, median, third quartile, and maximum. The central rectangle ("box") spans the first to the third quartile (i.e., interquartile range [IQR]). The horizontal line segment within the box represents the median, and "whiskers" above and below the box represent the minimum and maximum. Radar plots consist of a sequence of angular spokes, whose length extending from the center along a separate axis is proportional to the magnitude of the variable relative to the magnitude of the variable across all data points. Lines connect the data values for each spoke. Radar plots were used to display seasonal variation of median VOC concentrations for PW ≥ 1 h and AOWD. One-tailed *t* tests, assuming unequal variance, were performed to determine whether seasonal variation associated with increasing proportions of time

Table 1 List of priority air toxics (i.e., VOCs), associated cancer/noncancer risk thresholds (μg/m^3), and method detection limits (MDL) (μg/m^3) (Health Canada 2010; EPA 2015d)

VOC	Cancer risk[a] (μg/m^3)	Noncancer risk at HQ = 0.1[b] (μg/m^3)	MDL[c] (NATS) (μg/m^3)	MDL (Health Canada) (μg/m^3)
Chloroform	–	9.8	0.50	0.089
1,3-Butadiene	0.0300	0.2	0.10	0.055
Vinyl chloride	0.1100	10.0	0.11	0.046
Benzene	0.1300	3.0	0.13	0.038
Carbon tetrachloride	0.1700	19.0	0.17	0.123
Trichloroethylene	0.2083	0.2	0.20	0.190
Tetrachloroethylene	3.8462	4.0	0.17	0.120

[a] Cancer risk threshold: the probability of contracting cancer over the course of a lifetime (assumed to be 70 years for the purposes of NATA risk characterization). Lower threshold values correspond with higher toxicity (EPA 2015c)

[b] Noncancer risk threshold: the risk associated with effects other than cancer, based on the reference concentration via a ratio known as the "hazard quotient" (HQ; the exposure divided by the appropriate chronic or acute value)

[c] MDL: the lowest concentration that can be detected with confidence. NATA and Health Canada's MDLs are listed for comparison (Health Canada 2010; EPA 2015d)

with PW (i.e., ≥1 h, ≥4 h, ≥8 h, ≥12 h) resulted in a significant increase ($p < 0.05$) in VOC concentrations compared to AOWD (see Supplementary material, Table S3).

Quality control

Standard procedures of the Meteorological Service of Canada have been developed in accordance with internationally recommended procedures established by the World Meteorological Organization (ECCC 2013a). As part of the quality assurance and quality control (QA/QC) program, observational meteorological data are subjected to a computer analysis or review to reveal possible errors. EC and the operating agency are jointly responsible for the NAPS network QA/QC program. Elements of the program include site selection, sampling system requirements, instrument calibration and reference standard requirements, and inter-laboratory testing and performance audits. With few exceptions, analyzers are accorded with EPA designation as either a reference or equivalent method for ambient air monitoring (ECCC 2004). ECCC's air quality laboratories use International Organization for Standardization requirements (i.e., ISO 9001:2008 or ISO/IEC 17025:2005) (ECCC 2013b).

Results and discussion

Meteorological observations

Wind rose simulations illustrate seasonal variability with respect to wind direction, with the mill as the focal point (Fig. 2). During summer, wind blew NNE (25.47%) and ENE (11.80%) directions (aggregate range 15°–75°) towards Pictou and Pictou Landing First Nation (PLFN) (Figs. 1 and 2). Wind blew less frequently towards S-NNW (aggregate range 165°–345°) towards the Graton NAPS site. During winter, wind typically prevailed from the north; the highest frequency (21.99%) blowing ESE, followed by E (15.37%) directions (aggregate range 75°–135°) (Fig. 1). Spring and fall have meteorological characteristics that are similar to summer and winter and were considered transitional periods. Pictou, PLFN, Chance Harbour, Trenton and New Glasgow are communities close to the mill that are downwind of annual PW (range 15°–165°). The Granton NAPS site correlates poorly with seasonal or annual wind directions (Fig. 2).

VOC concentrations

Carbon tetrachloride had the highest median concentration (0.5452 μg/m^3) and vinyl chloride had the lowest (0.0014 μg/m^3) (Fig. 3). Carbon tetrachloride concentrations exceeded its EPA cancer risk threshold (0.1700 μg/m^3) for all samples, with maximum and minimum concentrations of 0.7047 and 0.2892 μg/m^3, respectively. Benzene concentrations exceeded its cancer risk threshold (0.1300 μg/m^3) for most samples, with maximum and minimum concentrations of 1.889 and 0.0266 μg/m^3, respectively. Concentrations of 1,3-butadiene concentrations occasionally exceeded its cancer risk threshold (0.0300 μg/m^3), with maximum and minimum concentrations of 0.1062 and 0 μg/m^3, respectively (Fig. 3). Consequently, 1,3-butadiene, benzene, and carbon tetrachloride were air toxics of primary concern in terms of local

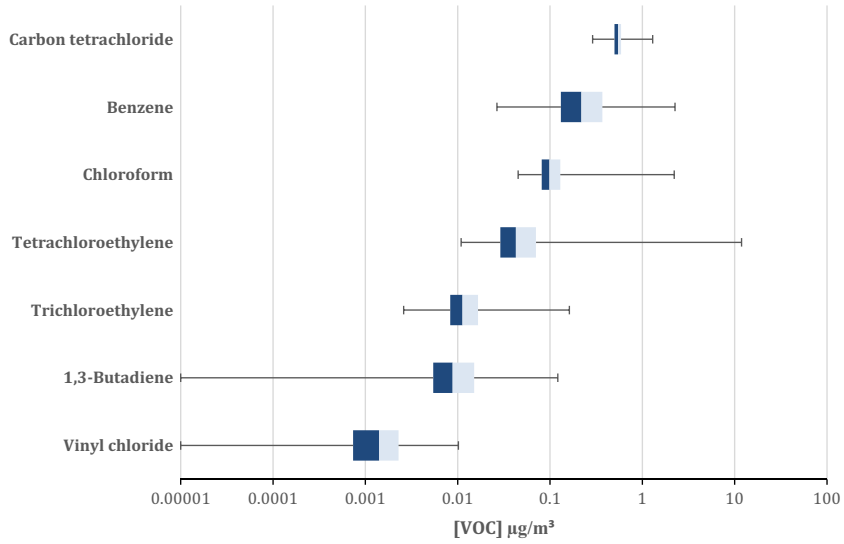

Fig. 3 Relative VOC concentrations (µg/m^3) (2006–2013). Should not be interpreted as orders of magnitude of toxicity. Minimum concentration for 1,3-butadiene and vinyl chloride is 0 µg/m^3 or undetectable

population risk. Other VOCs are presented in Supplementary material (Fig. S5).

ANOVA and MANOVA results revealed that 1,3-butadiene was significantly higher with the presence of PW ≥ 1 h (p = 0.001and p = 0.01 for raw and log-transformed data, respectively). Tetrachloroethylene was also statistically higher with the presence of PW ≥ 1 h (p < 0.01) for log-transformed data. Benzene approached significance with the presence of PW ≥ 1 h (p = 0.07) for log-transformed data. Although not statistically significant, median concentrations of other VOCs, except carbon tetrachloride, were equal or marginally higher with presence of PW ≥ 1 h compared to AOWD. Season had a consistent significant effect on VOC concentrations, except chloroform and tetrachloroethylene (Supplementary material Fig. S2 and Table S1).

Box plots combined with radar graphs illustrate seasonal variation of VOC concentrations of primary concern (i.e., 1,3-butadiene, benzene, carbon tetrachloride) under PW ≥ 1 h and AOWD conditions (Figs. 4, 5, and 6). Median VOC concentrations associated with PW ≥ 1 h and AOWD display parallel

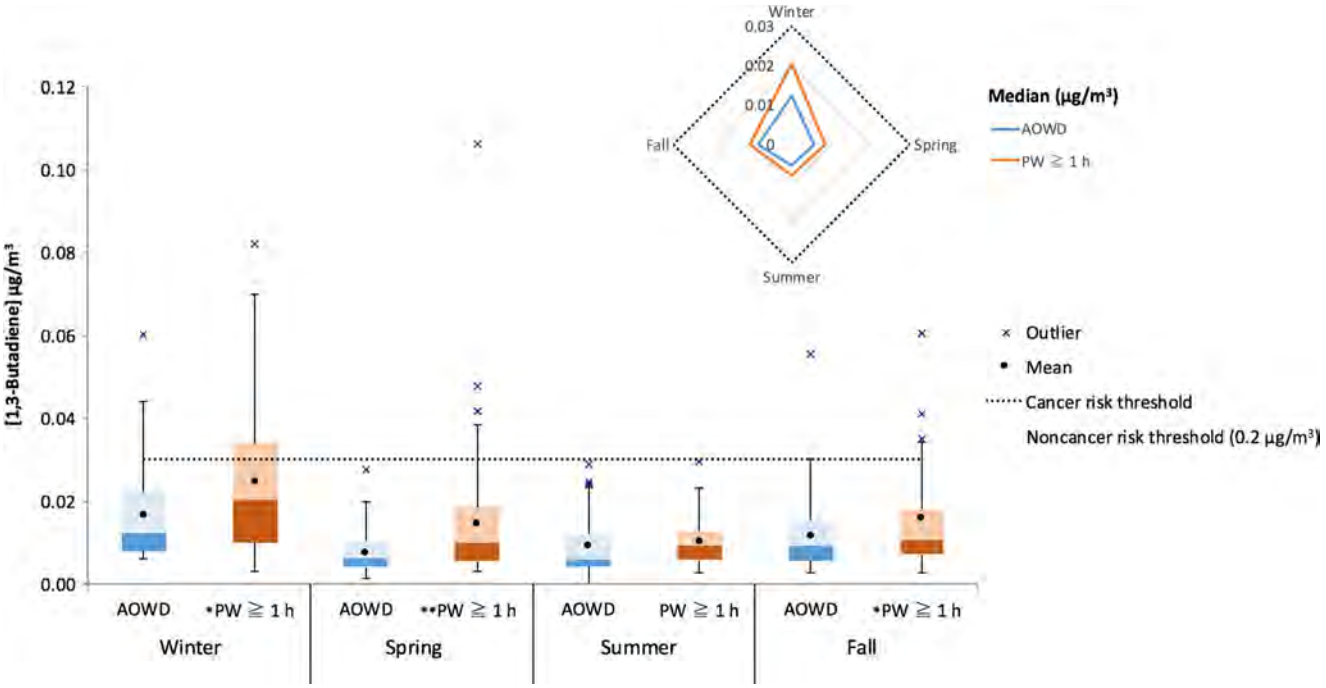

Fig. 4 Seasonal variation (2006–2013) of [1,3-butadiene] (µg/m^3) comparing AOWD to PW for at least 1 h on sampling days (i.e., 360° − 80°), relative to associated cancer and noncancer risk thresholds. Minimum concentration is 0 µg/m^3 or undetectable. Significant differences indicated as *<0.05; **<0.01

seasonal trends. Concentrations of 1,3-butadiene (Fig. 4) and benzene (Fig. 5) exhibit seasonal variation. Both have evidently higher concentrations during winter, with summer having overall lowest concentrations. In addition to exceeding cancer risk thresholds, *t* test results revealed that 1,3-butadiene and benzene concentrations were significantly higher with the presence of PW ≥ 1 h compared to AOWD during at least two seasons, including spring and fall. Conversely, median carbon tetrachloride concentrations showed little variation (Fig. 6). Regardless of season or wind direction, all carbon tetrachloride samples exceeded its associated cancer risk.

This pilot study presents findings of a secondary analysis of 8 years of air toxic VOC exposure data associated with ambient air quality in a Canadian P&P town. Concentrations of three ambient outdoor air toxics routinely exceeded EPA air toxics-associated cancer risk thresholds and are consequently of primary health concern in relation to population health risk in PC: 1,3-butadiene, benzene, and carbon tetrachloride. Exceedance in cancer risk thresholds for these air toxics is consistent in the literature (e.g., Morello-Frosch et al. 2000). The extent to which threshold exceedances of 1,3-butadiene adversely affect human health is poorly understood, with little toxicity information available to compare with cancer risk estimates (Morello-Frosch et al. 2000). With respect to benzene exposure, most monitoring data are associated with occupational studies (ATSDR 2007a), where long-term exposure can cause leukemia (ATSDR 2007b). High exposure to carbon tetrachloride can cause liver, kidney, and central nervous system damage (ATSDR 2005). Combinations of air toxics may have additive or synergistic adverse health effects (Morello-Frosch et al. 2000). Therefore, exposure to mixed VOCs might pose health risks to facility employees and neighboring residents (An et al. 2014; He et al. 2015).

Emission sources within the defined PW range, N to ENE of the Granton NAPS site, may be a causal factor for the increase in VOC concentrations, except carbon tetrachloride. The largest point source emitter within this range is likely the mill; however, the origin(s) of VOCs are inconclusive. According to the mill's most recent substance report submitted to NPRI in 2012, 143.18 t of VOCs were atmospherically emitted on-site (ECCC 2012). An estimated 3.195 t of benzene were released to the air from a stack higher than 50 m and 0.022 t were released within 50 m of the ground. Additionally, benzo(a)anthracene and of benzo(a)phenanthrene were emitted to the air (9.7 and 6.7 kg, respectively) and deposited on-site (0.753 and 0.142 kg, respectively) (ECCC 2012). Although trichloroethylene, tetrachloroethylene, and carbon tetrachloride were not reported to have been released, they may become airborne through evaporation from P&P wastewater (Soskolne and Sieswerda 2010). Boat Harbour (the mill's effluent treatment facility) may therefore contribute to ambient concentrations of VOCs. Collectively, these emissions may have contributed to the ambient atmospheric levels of VOCs measured at the Granton NAPS site. While

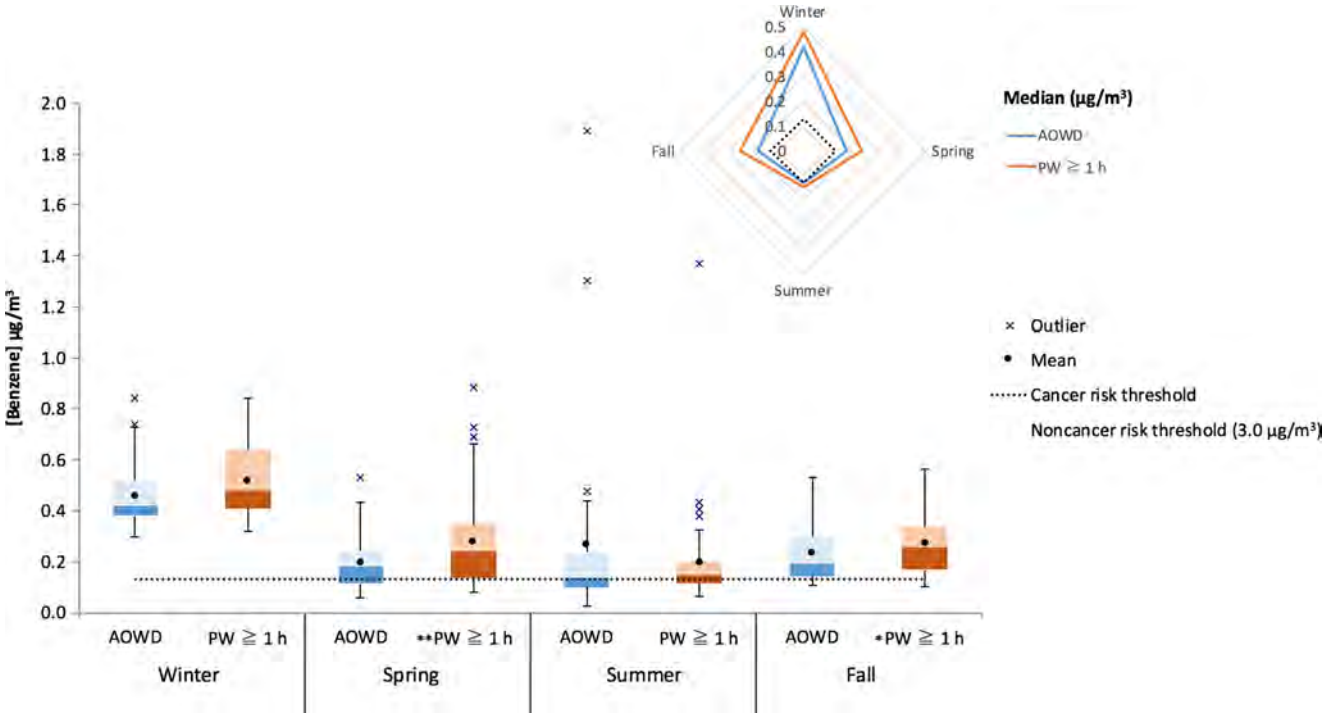

Fig. 5 Seasonal variation (2006–2013) of [benzene] (µg/m^3) comparing AOWD to PW for at least 1 h on sampling days (i.e., 360° − 80°), relative to associated cancer and noncancer risk thresholds. Significant differences indicated as *<0.05; **<0.01

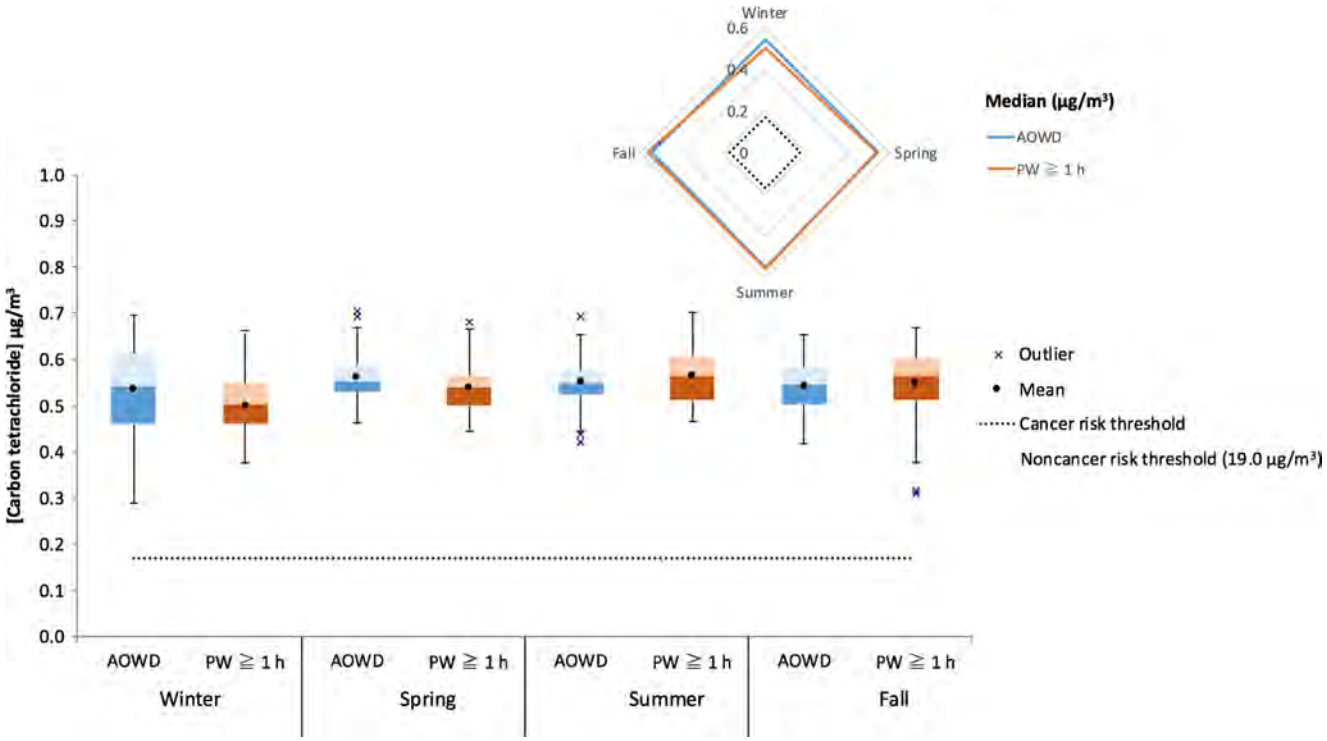

Fig. 6 Seasonal variation (2006–2013) of [carbon tetrachloride] (µg/m^3) comparing AOWD to PW for at least 1 h on sampling days (i.e., 360° − 80°), relative to associated cancer and noncancer risk thresholds

NPRI provides detailed information on pollutant releases, data are self-reported by facilities, with no audits to ensure accuracy. Consequently, data quality may be compromised.

The major chlorinated hydrocarbon emitted into the air from bleached kraft pulp mills of concern is chloroform, which is produced by heating a mixture of chlorine and either chloromethane or methane (EPA 1985). Although chloroform is a recognized by-product of the chlorination process in the P&P industry, it has been suggested that up to 90% of total emission sources may be natural in origin and is widely dispersed in marine environments (McCulloch 2003). As PC is located along the coast of the Northumberland Strait, marine environments may have contributed to the observed ambient chloroform concentrations (see Supplementary material).

Results implicate the mill as a source of air toxics (particularly 1,3-butatdiene and tetrachloroethylene); however, other local sources likely contribute to air toxics emissions. Area and mobile sources have been reported to largely contribute to concentrations of 1,3-butadiene (ATSDR 2014b) and benzene (ATSDR 2007a). Because the Granton NAPS site is located near a highway and access roads, vehicle emissions may have contributed to the observed concentrations of these compounds. A coal-fired thermal generating station and a tire manufacturing facility (located 7 km E and 1.5 km S from the Granton NAPS site, respectively) may be other local point source emitters of VOCs (e.g., 1,3-butadiene is used to make synthetic rubber [ATSDR 2014b]) (Fig. 1). According to the latest NPRI substance reports: the tire manufacturing facility released 220 t of atmospheric VOCs, whereas no VOC releases were reported by the thermal generating station (ECCC 2015b), despite that coal combustion is a significant contributor (Chagger et al. 1999). Direct links between 1,3-butdiene and vinyl chloride with P&P industries were not found in the literature.

Major monitored pollutants at the mill include NO_x, sulfur dioxide (SO_2), and total PM ([TPM] upper size limit of 100 µm diameter) (NP 2016a). A 2013 study concluded that $PM_{2.5}$ concentrations were highest (0.88 µg/m^3) downwind from the mill from using an AERMOD atmospheric dispersion model (Gibson et al. 2013), though this investigation used Halifax wind speed and direction meteorological data (130 km to the south). Hoffman et al. (2015) reported an analysis of 2013 data showing that when Pictou is downwind of the mill, average 1 h ambient $PM_{2.5}$ concentrations result in a twofold increase (12.96 µg/m^3), compared to all other wind directions (5.73 µg/m^3), suggesting the mill is likely the primary contributor of ambient $PM_{2.5}$ in the community. Additionally, TRS, TPM, $PM_{2.5}$, and coarse particulate matter ≤10 µm (PM_{10}) emission exceedances at the mill during 2012 were two to three

orders of magnitude higher than five similar Canadian kraft P&P mills; however, VOC emissions were comparable (Hoffman et al. 2015).

A comparable ambient air toxics monitoring study of a P&P community was conducted in the metropolitan Lewiston, Idaho area and the Nez Perce Reservation (STI 2009). Findings revealed that concentrations of formaldehyde and acetaldehyde were much higher than expected relative to Lewiston's size. Chloroform, tetrachloroethylene, and trichloroethylene were highest at monitoring sites nearest the mill, which presumably contributed at least 50% to pollutant concentrations (STI 2009). However, due to insufficient information on local concentrations of anthropogenic and biogenic VOCs, it was inconclusive whether the mill was a causal factor.

Recent (2009–2013) measurements of ambient CEPA-toxic or equivalent agents monitored at NAPS sites revealed that 11 air toxics, including benzene, chloroform, trichloroethylene, and tetrachloroethylene exceeded ambient air quality guidelines set by respective Canadian jurisdictions (Galarneau et al. 2016). An additional 16 air toxics approached guidelines. Although these guidelines are not necessarily enforceable, CEPA outlines provisions for toxic compounds and are thus subject to risk management actions. Air toxics' contribution to poor health on a regional and national scale has not been thoroughly investigated; therefore, calls into question the effectiveness of current toxic substance management in Canada.

Nova Scotia is known as the "tail pipe of North America," due to being within the trajectory of long-range transport of emissions from transboundary sources along the Eastern Seaboard, plus central and eastern Canada (NSE 2014). Background levels of air pollution that originate from resuspension and natural sources has been found to be major contributors to concentrations of carbon tetrachloride and benzene (Morello-Frosch et al. 2000). Background levels, in combination to carbon tetrachloride's capacity to persist in the atmosphere for a least a year, may explain why observed concentrations are consistently above its associated cancer risk threshold at the Granton NAPS site, regardless of wind direction.

Atmosphere circulation plays a complex role in dispersion, transformation, and removal of pollutants. The dispersion of pollutants from source emitters (e.g., smokestacks) is affected by crosswind mixing in both horizontal and vertical directions. Meteorological variables, including wind speed, wind direction, temperature, humidity, precipitation (process of removal), and atmospheric pressure are the main drivers of variation in pollutant concentrations and dispersion (Bates and Caton 2002). Furthermore, gravitational settling is important for pollutants with larger molecular weights (Oliver 2008); heavier particles settle or deposit closer to emission sources (Walker et al. 2003a, 2003b). Gravitational settling may also explain the high concentrations of carbon tetrachloride.

Topography and coastal conditions can affect wind characteristics (e.g., direction, speed) and the behavior of pollutant transport. A sea breeze that is trapped under descending warmer air from land can exaggerate conditions at coastal zones, a phenomenon known as coastal inversion (Bates and Caton 2002). In addition, turbulent winds along the coast may influence wind characteristics at the Caribou Point meteorological station, and the fate and transport of pollutants. Such coastal conditions, in combination with transboundary air pollution, may be occurrences that coastal areas experience in Nova Scotia, including PC.

Seasonal variability

Seasonal variability exists for both meteorological conditions and VOC concentrations. Variations in meteorological conditions, the nature and intensity of emissions from nearby sources, and photochemical activity are factors that could have led to the observed seasonal variability of outdoor VOC levels (Al-Khulaifi et al. 2014). Of the three VOCs considered particular concern in this study, 1,3-butdaiene and benzene exhibited the highest concentrations during winter. Photochemical reactions involved with ground-level O_3 formation are catalyzed by ultraviolet radiation and temperature. Therefore, peak ground-level O_3 levels typically occur during warm days with sufficient sunlight exposure; thus, people are more vulnerable to exposure during summer. The opposite is true during winter, when available light is diminished, and temperatures are colder (ATSDR 2014b).

Demographic behavior and technological improvements that aim to mitigate emissions (e.g., smokestack precipitator installation in 2015) also need to be considered when evaluating pollutant concentrations. For instance, households in the Atlantic provinces are heated primarily with oil, electricity, and wood or wood pellets (Statistics Canada 2011); therefore, as residential heating increases during winter, biogenic VOCs (e.g., benzene [ATSDR 2007a], 1,3-butadiene [ATSDR 2014b]) from wood burning may have contributed to higher concentrations of these compounds observed in this study. As the mill operates on a 24/7 schedule (ECCC 2012), atmospheric VOC emissions were assumed consistent throughout the year.

Implications

Location of ambient air quality monitoring stations has a direct impact on the observed concentrations of pollutants

(Craig et al. 2008). Based on the time series and spatial analyses, wind direction appears to play a key role in the Granton NAPS site's ability to monitor ambient VOCs from the mill. PW ≥ 1 h from the selected range (360°–80°) typically resulted in equal or higher VOC concentrations for all compounds, except carbon tetrachloride, compared to AOWD (Figs. 4, 5, and 6; Supplementary material), suggesting that the mill is likely a causal factor. Furthermore, as there is a higher frequency of northerly winds blowing towards the south during winter (Fig. 2), the Granton NAPS site is more likely to capture ambient pollutants from the mill's atmospheric emissions. Southwest PW blowing towards Pictou dominate during the summer months when people are more vulnerable to ambient air pollution exposure. Due to Pictou's geography, air toxics from the Eastern Seaboard in combination with local emission sources, including the mill, converge there; hence, higher concentrations of VOCs are expected in Pictou during summer. Subsequently, southwest PW are expected to result in lower VOC concentrations at the Granton NAPS site, as capturing the mill's atmospheric emissions would not be optimized. Therefore, VOC concentrations at the Granton NAPS site during winter would likely be representative of ambient VOC concentrations in Pictou during summer. Moreover, Pictou's considerably larger population base compared to the rural area of Granton further confirms that the NAPS site is not strategically positioned to accurately represent ambient levels of air toxics where there is higher residential exposure.

Study limitations

This study only evaluated exposure to ambient VOC air pollutants. Human exposure to air pollution is a combination of both outdoor and indoor environments and varies according to daily activity patterns and the conditions of specific settings. Secondary data analysis was used in this study; therefore, the ecological nature of these findings limit the explicit attribution of ambient air toxic exposures to the risk potential for cancer for community residents. Personal exposure monitoring, more detailed spatial analysis of ambient conditions, and source apportionment studies would be required to establish more explicitly the health risk associated with these exposures. The analysis was limited by the inability to examine the interaction of local meteorological conditions. Meteorological data were retrieved from Caribou Point, located approximately 10 km from the mill; consequently, coastal conditions may cause differences in meteorological measurements between sites.

Future research and monitoring

A *field component* consisting of real-time measurements of ambient air toxics would improve the rigor and validly of the present study. Although labor intensive, air toxics samples can be analyzed with a high degree of accuracy (Craig et al. 2008). Because monitoring stations are typically fixed, government-approved *atmospheric dispersion modeling* that considers landscape dynamics and seasonal meteorological variability (e.g., ©CALPUFF, ©AERMOD) would more accurately estimate spatial patterns of air toxics dispersion, and human exposure at the population or individual level (EPA 2013). This would require numerous stations within the community so would likely only be feasible for a specific research investigation. Further, installation of a new precipitator in 2015 has likely changed in ambient conditions. A follow-up assessment would provide a comparison to these findings to determine if VOC levels have improved. Additional research includes applying a *Conditional Probability Function* to calculate the probability that an air pollution source is located within a particular wind direction sector to help determine direction of a source from a NAPS discrete receptor site, and conducting an analysis of the effect of mixing height on measured VOC concentrations to further investigate seasonal patterns.

Investigation of health outcomes might involve longitudinal epidemiological research of human exposures to air toxics emissions in the ambient Pictou environment with appropriate consideration for latency of health outcomes, while controlling for indoor and occupational sources and other contextual factors. Several recent Canadian nationwide cohort studies that may provide a foundation for such investigations have been described (e.g., Crouse et al. 2012).

A *comprehensive risk assessment* investigates uncertainties that have implications for risk estimates in the present study, including those surrounding toxicity information (Morello-Frosch et al. 2000). More research is required to determine what cancer and noncancer risks are from ambient air toxics exposure. Further, it is important to consider synergistic effects of a full suite of ambient pollutants, and physical and chemical processes involved in fate and transport of these compounds. Comprehensive emission inventories are necessary to thoroughly address (i.e., characterize, model, and manage) air quality issues (CEC 2009). Collectively, these research efforts aim to better inform air quality management, composed of federal (e.g., ECCC, Health Canada) and provincial (e.g., NSE, Nova Scotia Department of Health and Wellness) government and public health agencies, how best to proceed to ensure the health of residents in industrial communities is prioritized. Implications of the current findings warrant further investigation.

Given the contribution emissions from local sources have to regional, national, and global airsheds, local mitigation initiatives should be an integral part of air quality strategies. There is no common approach to assess health effects of a mixture of pollutants, as they tend to be site specific; hence, an assortment of effective measures may be required. Case studies that provide evidence of effective of air quality

management interventions and guidance documents for risk managers may help inform air quality management for stakeholders (Craig et al. 2008).

To address potential adverse health effects associated with degraded air quality, Health Canada, the Public Health Agency of Canada (PHAC) and provincial partners might work collaboratively with local stakeholders to mitigate health risks and improve efficient industrial technology, while balancing economic, political, and social factors in development and implementation of air quality management. Mitigating industrial emissions has beneficial outcomes for wellbeing (Clougherty 2010); environmental stewardship and governance fosters a more proactive and cleaner environment, while building trusting relationships between industrial stakeholders (Pascal et al. 2013). "A comprehensive enforcement program with mandatory reporting of emissions, […] and meaningful penalties for noncompliance ensures that emission standards are being met" (Craig et al. 2008), and facility operators are held accountable. Data collected internally by the mill is not readily available. To improve transparency, siting rationale for air quality monitoring stations and accompanying data should be provided as part of a commitment to corporate responsibility of the mill (Hoffman et al. 2015).

To improve air quality conditions, stakeholders could increase the capacity for surveillance, assessment, and response to air quality. Furthermore, evaluation of a wide-suite of air toxics, including NATA compounds not measured by the NAPS network (particularly prioritized air toxics) would contribute to ensuring that air quality in Canada is adequately studied. Therefore, ECCC and NSE should consider implementation of a long-term monitoring program for priority air toxics that is comparable to the NATA network monitored by EPA to characterize air toxics exposure on local, regional, and national scales. Data will be useful to help mitigate emissions and achieve acceptable air quality standards that do not exceed cancer or noncancer risk thresholds.

ECCC should also consider the feasibility of installing and maintaining additional strategically placed NAPS sites to improve air pollution evaluation in both rural and urban areas, as well as in microenvironments (e.g., near point source emitters, high-traffic areas) (Craig et al. 2008). More effective communication of the results is required to increase transparency among stakeholders, including the public (Hoffman et al. 2015). Based on the population's risk of exposure, it is strongly recommended that ambient air toxics monitoring to be incorporated at the established NAPS station in Pictou to optimize capturing of said air toxics, and to best correlate pertinent results. Additionally, atmospheric dispersion modeling should use local meteorological data; therefore, meteorological data should also be collected concurrently at NAPS sites to help identify source emitters.

Measurement of individual VOC compounds is necessary to provide insight into their contribution to $PM_{2.5}$ and ground-level O_3 formation. Data would be useful to help target large source emitters and aid regulatory enforcement. Establishment of stringent and/or adapted air quality standards that encompass more air toxics (e.g., VOCs) fosters strong public support and political engagement to address air quality issues. Moreover, health impacts associated with background air pollution should be estimated. Air quality management programs are human resource intensive; therefore, they must have clear and feasible short- and long-term objectives. These initiatives gain predictive insights on atmospheric chemistry, and engage and support relevant sectors in the development and implementation of policies to reduce health risks associated with air pollution exposure (Craig et al. 2008).

Conclusions

Findings reveal that 1,3-butadiene, benzene, and carbon tetrachloride exceeded their respective cancer risk thresholds and are of primary health concern in terms of population risk. Results highlight associations with wind direction and the Granton NAPS site's ambient VOC concentrations in relation to location of the pulp mill. Compared to AOWD, PW from the selected range (360°–80°) typically resulted in higher VOC concentrations for all compounds, except carbon tetrachloride, suggesting that the mill is likely a contributor to increased concentrations. In addition, there are clear seasonal variations of meteorological conditions and VOC concentrations. Southwest PW blowing towards Pictou dominate during summer months, when people spend more time outdoors, and consequently are exposed to higher concentrations. Due to Pictou's geography, air toxics from transboundary and local sources may converge in summer, resulting in higher VOC concentrations. Findings suggest the Granton NAPS site is not positioned to accurately represent ambient levels of toxicity in PC. Therefore, ECCC and NSE should consider incorporating ambient air toxics (e.g., VOCs) monitoring at the established Pictou NAPS site where there is higher residential exposure.

Future research will provide air quality management with a comprehensive characterization of air toxics to support informed public health decisions. Moreover, this pilot study may serve as a precursor to gaining awareness, so that government agencies adopt more stringent air quality regulations and monitoring programs to ensure health of citizens is safeguarded and prioritized.

Project: replacement_effluent_treatment_facility_project Comments: I object to this facility going ahead. The environmental impact on our fisheries and the potential for future effluent spills as has happened in the past is incongruous with the safety of the local population. Furthermore, Northern Pulp refuses to accept that a closed pipe system would be practical citing that the effluent would be too harmful to their machinery. This is not true, but it does mean that they would have to change the nature of their end product. Even so the new end product would still be marketable in an open market. The issue is that the company doesnâ?Tt engage fully in an open market and is possibly participating in Base Erosion Profit Shifting Transfer Pricing. If so, you will be aware yhat this is an international crime within the signatories of the OECD countries. Name: Email: @eastlink.ca Address:

Project: replacement_effluent_treatment_facility_project Comments: Absolutely no pipe. It cannot and will no cross over the Pictou watershed land. This is not going to happen and will not get the approval needed to go ahead. There should never be an extension granted to the Boat Harbour ACT.Keep the chip plant open,go buy the Sheet Harbour chip plant, get the dock with it and ship the raw chips by ship to the motherland. The company will get the fibre they want, and we as taxpayers already know we will have to pay for list revenue. The sawmills will still have a market for their chips, the truckers will still truck, the woods guys will still cut. There will probably be 100 or so go to early retirement and pension bridging, about 60 red seal tradesmen that can work anywhere they want. Might be 100 jobs lost of unskilled labour that will need to find a new job. There will be some spin off work lost, but there will be no more effluent to worry about or where to put it. NO PIPE Name:

Subject: Nothern Pulp Effluent Proposal
Date: February 7, 2019 5:06:12 PM

Dear sirs,
Although the fate of the Northern Pulp Effluent Proposal will be decided by the Government of Nova Scotia, residents of New Brunswick will be impacted by the decision since our province also borders the Northumberland Strait. Although provincial governments have a legitimate interest in creating and keeping jobs for the residents of their province, it is counter productive to spend government funds to support industries that damage the health of the local environment, population and other local industry. Environmental regulations should be designed to protect us from industrial pollution, not make it more profitable for companies to carry out their operations and companies should have to spend their own money to meet those regulations. If they can't meet them and still make a profit, then their business plan is flawed and they should shut down. Governments are always talking about the impact of deficit spending on our children and future generations but the impact of the environmental deficit, destroying and polluting the environment faster than it can rehabilitate itself, will be far more burdensome - no air fit to breath, water fit to drink or land fit to produce food fit to eat.

Subject: NoPipe - No!
Date: February 7, 2019 5:19:18 PM

There isn't much I can say that you don't already know/have heard and seem intent on ignoring anyway.

My reasons to stop what is being proposed:
1. NO
2. NO
3. NO
4. NO
5. NO

If those supporting this destruction of the environment (yes, destruction) are so keen to allow it - then let them have the effluent disposed of by filling up the basements of their own homes or their wells or the homes and wells of their family and friends. Do Not Dump into into the home of life that lives in the ocean and waterways and into the backyards of people who did not create this ecological mess!!

The company that created the mess gets to clean it up - in a ethical and environmentally sound way! Costs too much? Too bad - it's the 'cost of doing business'. Destruction of the environment isn't a method they get to employ to 'clean up their mess'.

Despicable that yellow-bellied people are even Considering such an act!! You have to wonder about their 'payoff'...

In case you need a reminder - NO! Pipe!

Hi, I grew up in Pictou County,moved away and moved back home in 2014.The changes that the mill has wrought upon the area is astounding. Walk along the jitney trail,read the yellow signs about everything being poisoned and don't eat the shellfish.The beautiful West River ,polluted beyond belief.Boat Harbour completely destroyed.
We have a cottage on the Northumberland Strait and ours waters are beautifully clear and gorgeous .PLEASE PLEASE don't allow them to dump their poison in our strait . They don't care,they don't live here.

Project: replacement_effluent_treatment_facility_project Comments: I see this project as an oppurtunity for the provincal government to ensure a prosperous future for pictou county. A project of this magnitude will allow continued operation of the pulp mill for years to come while ending a legacy of boat harbour. Since the lease was terminated early i feel it reasonable to allow an extention to guarantee continued operation until completion. Since PLFN have already received settlement it seems unusal to allow them to dictate the usage of Boat harbour. In any event i feel a year extention is small request. This mill owner is committed to investing in this operation and i feel a number of improvements will follow after completion of their ast system. Name: Email: @hotmail.com Address:

Project: replacement_effluent_treatment_facility_project Comments: The Northumberland Straight and Cape Breton Shore of the Gulf of St. Lawrence provide stable income to many thousands of people through fishing and tourism. There has been an intentional lack of information to people outside of the Pictou region. I have tried several times to get information from my MLA PC Allan MacMaster and have been met with hostile comments and personal attacks. If there is nothing to be worried about our politicians should have no problem giving us straight answers. Name:

Project: replacement_effluent_treatment_facility_project Comments: I live in Pictou County at present and pumping any kind of effluent from this new treatment facility into the fishing grounds and tourist areas is violating federal fishery laws and should not me allowed no matter what the mill says about the quality of said effluent...There are no studies done about the long term affects of this affluent on our fish species or shellfish species that are a mainstay to our local fishery. The mill should keep all this affluent in house on site or close down the mill.... Also in no way should the Boat Harbour Facility closure date be extended pass Jan 2020.... Project: replacement_effluent_treatment_facility_project Comments: Hello my name is and I am from Maine. I travel 12 hours to Nova Scotia to fish for Atlantic Salmon every year. I would like to state that the Northern Pulp plan to dump affluent into the Northumberland straight is recklace and poor stewardship of the natural resources of Nova Scotia and Atlantic Canada. I would like to stress that if international buyers of Northumberland straight seafood and shellfish hear that Pulp mill affluent is being pumped into the waters these fish come from that they will most likely refuse and boycott future purchases from these waters. I am also extremely concerned about the trout and salmon that would be exposed to these contaminants! I am extremely concerned that one of the last places in North America to fish for Atlantic Salmon would be put on Jepardy by allowing this plan to go through!! I want to state that each year fishermen from the U.S. and Europe flock to Nova Scotia to fish for Atlantic Salmon, Trout and other spe cies along the Northumberland straight. We are depending on the wisdom of leadership in Nova Scotia to do the right thing and protect the Northumberland Straight This means we are depending on leadership to REJECT the plans of Northern Pulp to dump affluent into the Northumberland Straight. Thank you Name: Email: @yahoo.com Address: : Privacy-Statement: agree x: 64 y: 23

Project: replacement_effluent_treatment_facility_project Comments: I am adamantly opposed to this project. This 60 year old mill is grossly outdated, has never met even the lax standards of the past and the owners, Asia Pulp, have the worst environmental record in the world. There is no chance this is going to change. Allowing them to pour their pollution directly onto one of Nova Scotias richest shellfishing areas would be pure insanity. Even the suggestion that this might be done would be enough to kill our overseas markets. Can you imagine what the EU would do with lobster shipped to Europe from a province with so little environmental awareness? Our competitors in the US would have a field day with this. Name:

Project: replacement_effluent_treatment_facility_project Comments: It seems as though this project should meet or exceed all environmental requirements. The effluent has been running into the strait untreated for 50 years without contaminating any seafood. Now with modern, world class technology, the effluent will be treated before leaving the site and will meet all environmental standards. There are many other much more troubling environmental factors affecting the Northumberland Strait, such as untreated sewage, farm runoff from PEI, and many others. This company has been given an unfair timeline and has been the subject of political grandstanding. The company has put a large investment into improving the environmental impacts of this mill. Rural Nova Scotia needs this mill for its economic viability. Name: Email: @seasidehighspeed.com Address:

Project: replacement_effluent_treatment_facility_project Comments: Born and raised in Pictou I have 3 main concerns : 1 No where in this EA does it state Northern Pulp,s proposed pipe will run directly through the Town of Pictous watershed. Where are the facts of what happens if there was a leak in this area ? The Town of Pictou was NOT consulted on this information. 2 The effluent will be discharged directly into prime fishing grounds. This will greatly effect the marine life. Just the difference in the water temperature, not to mention the amount of chemicals, discharging from the pipe,destroying the eco system of several species of fish, birds etc.The time line of the release of the effluent into the lagoons of the heavily polluted Boat Harbour, gave it extra time to cool the water and settle some of the heavy toxins. This will no longer be the case as it will be piped within an 8-9 hour period directly into the Northumberland Stright, removing the 30 day period it had to cool and settle. It will destroy the Northumberland Stright as we know it. 3 Continuing to use Boat Harbour extension requested by Northern Pulp People have lived with the posion in this area long enough. Boat Harbour needs to be closed on the date legislated for it to close. It should have been closed and clean up started years ago. Name: Email: @hotmail.com Address:

Project: replacement_effluent_treatment_facility_project Comments: I feel it is imparitive that this new treatment system be installed and that the mill be given extra time to complete this project. The mills effluent has been flowing into Pictou Harbour for the past 50 years and the fishing industry has flurished. With the new system the effluent will be much better quality and if a break was to occur it has already been treated before it ever leaves the mill site ! We need both fishing and forestry to survive in Nova Scotia,so lets all work together to make this happen! Name: Email: @live.ca Address:

Project: replacement_effluent_treatment_facility_project Comments: We must preserve the Northumberland Strait Eco-system and the traditional way of life for those who rely on the Strait to provide for their families through fishing. We must protect the thousands of migratory sea birds, paleagic fish and sea mammals who move through this area and need it kept pristine in order to survive. The planet is warming, we have huge pollution problems, we all must make significant changes to the way we live in order to slow down these changes. Not to do so is to undermine the life support systems of the Earth. Hard decisions need to be made for the future. I compell the minister to not allow any effluent what so ever to be piped into the Strait, treated or not. No Pipe. However, it is incredibly important to me that if the mill were to close that we approach the mill/forestry workers and their families with the same compassion we must show the planet and provide them fully with monetary compensation and support. I feel for everyone involved in this, but it does not make any sense to allow effluent to be discharged into a body of water that defines this part of Nova Scotia. Name: Email: @gmail.com Address:

Project: replacement_effluent_treatment_facility_project Comments: ********* Environmental Assessment Feedback Needed ********* The time is now for you to provide feedback on the Northern Pulp Effluent Proposal. You can do so here: https://novascotia.ca/nse/ea/comments.asp See below for a few concerns around this waste proposal. THE TOP 5 REASONS TO SUPPORT #NOPIPE 1. For your HEALTH The composition of the toxic effluent will contain dioxins, furans, metals, 1000KG of solids and other contaminates at 90,000,000 Litres PER DAY. Dioxins and Furans can cause very serious health issues to humans and our food sources. Shellfish absorb dioxins and furans at 25,000-50,000 times the concentration in the water. The Northern Pulp treatment system proposal includes a plan to burn the waste sludge. The waste sludge contains toxins which would be released through the stacks of the millâ?Ts power boiler. The proposal is to dewater the sludge prior to mixing it with bark and other wood waste for combustion in the mills power boiler. This is the same power boiler that is currently and repeatedly failing stack emissions tests. Problems with air quality from mill emissions have been documented for years. Lack of appropriate monitoring and enforcement already puts area residents at risk. Now, Northern Pulp is considering adding sludge containing toxins to the combustion mix, increasing health risks from NPâ?Ts air emissions. It is also important to note, the route of this effluent pipe goes through the source water supply for the town of Pictou and community of Caribou and surrounding area. http://ec.gc.ca/inrp-npri/donnees-data/index.cfmâ?¦ https://www.nrcm.org/projects/waters/cleaning-up-the-androscoggin-river/maines-dioxin-problem/?fbclid=IwAR3gT3KRRmPu8j22heOksunum4i6VAp0cD-tb6hqJTVOTTyrGeRh7YAtZc8 https://docs.wixstatic.com/ugd/b61814_40a0f43682ee45d99af01fb432d910fd.pdf?fbclid=IwAR3a7QpiR253DqowGxu5DQK13vDIcJru0rFyGl1cYCrO4GsFjHKMp6aghz4 2. For the overall ECONOMY The proposed treatment system runs the risk of harming three lifelong Industries worth close to $4 Billion dollars to the Nova Scotia economy. The tourism industry is worth $2.7 Billion and prides itself on warm, clean water and world class sandy beaches. The Commercial Fishing Industry is worth over $1 Billion and prides itself on sustainable wild shellfish that is shipped all across the world. The Sport Fishing industry is worth $56 Million and the Northumberland Strait is home to the last remaining stable Atlantic Salmon stocks in the province. All of this is at risk due to 32,000,000,000 Liters of waste water PER YEAR that will be 37 Celsius that will contain deleterious substances harmful to Fish species and humans. https://docs.wixstatic.com/ugd/b61814_246fdf7e04a64e239be0fbf7dc64f976.pdf?fbclid=IwAR3JjsPZQ-_npJ0a5-B4Xv4-nJeqnSfkZk9an--3s0W92fB5oZrbUWFLTnU https://novascotia.ca/news/release/?id=20180222001 https://docs.wixstatic.com/ugd/b61814_f856b6a7c7b34ffb9eba165dc3ed894b.pdf?fbclid=IwAR3es-LiMLiVx1Lc-eJZI1TLQkqYBXBRw0OBS3upgGj9ibusKsO1wl_Uqfc 3. For the ENVIRONMENT â?" Meeting Regulations DOES NOT Prevent Harm Nova Scotia and the Northumberland Strait has many great resources. However, they are at risk with the proposed Effluent treatment process. As it stands right now, there are no CCME guidelines established for Marine Environments for some of the different chemicals and compounds that make up the pulp mill effluent. Pulp and Paper Effluent Regulations PPER in Canada cover two matters total suspended solids TSS and biochemical oxygen demand BOD. Even though total discharges of TSS and BOD in pulp and paper effluent decreased by approximately 90 and 97 respectively from 1970-2008, pulp mill effluents continue to have harmful impacts on

fish, fish habitat and the environment. Information gathered through environmental effects monitoring EEM at all Canadian mills points to the disturbing conclusion that although mills are meeting regulations and passing the PPER toxicity test, 70 are having harmful effects on aquatic life and habitat, and 55 are having harmful effects on the larger environment. This information led the federal department of Environment and Climate Change to undertake a modernization review of pulp and paper effluent regulations in 2017. â?oResults from EEM studies and the changing realities of the pulp and paper industry indicate a need to modernize the PPER to improve environmental protection,â? the department states. If meeting regulations is not enough to prevent harm, neither is passing toxicity tests. Only one toxicity test is required under Canadian pulp and paper regulations. The required LC-50 test is for acute lethality. For this test, an effluent is considered acutely lethal if the treated effluent at 100 concentration kills more than 50 of the Rainbow Trout exposed to it during a 96-hour period. Long-term effects, including impacts on reproduction or growth, cumulative impacts on fish habitat and the larger environment or accumulation of substances harmful for human consumption are not regulated under the PPER. Testing for environmental effects is required for information purposes. Only two mills in Canada test for and report impacts of effluent on the usability of fish resources by humans. Effluent from pulp and paper mills is regulated at the federal level principally by the Pulp and Paper Effluent Regulations PPER, which form part of the Fisheries Act. The standards that apply to pulp effluent today were adopted in 1992 and have remained unchanged for 25 years. Highly toxic dioxins and furans are regulated under a separate Act. 70 of pulp paper mills are having harmful effects on aquatic life and habitat despite meeting current regulations . Long term impacts on reproduction and growth are not regulated under PPER. Federal regulations cover only a few of the recognized harmful substances in pulp mill effluent. For example, there are no federal regulations for AOX compounds, a component of pulp effluent in mills that bleach with chlorine or a chlorine compound. AOX compounds are recognized as extremely toxic. They are not easily broken down by bacteria and thus bioaccumulate in the environment. Yet they are not included in PPER regulations. Neither are phenols, toluene, chloroform or chemical oxygen demand COD. For 25 yrs the regulations that apply to pulp effluent have remained unchanged. Provinces may go beyond Federal standards and adopt stricter regulations for effluent from pulp mills. British Columbia, Alberta, Ontario and Quebec have adopted stricter regulations. Nova Scotia does not have regulations, but sets limits through individual industrial approvals. The EU has more protective regulations than Canada does.
https://drive.google.com/file/d/1H1HltUnh9Oem_KpPHwxmye7z5mfJP5_W/view?fbclid=IwAR1WyzupTqjLC9u8tjxWpq94e5anlEQDs_-JTH0z8vPWAoaKkyIoGBuumdM 4. New treatment Facility is NOT BETTER Northern Pulpâ?Ts proposed new effluent treatment facility differs from the present facility in a number of ways. In the present system, untreated effluent is piped from the mill to the north settling ponds at Boat Harbour, where it remains for 12 hours for primary treatment. It then moves to an aerated stabilization basin where effluent is placed in contact with micro-organisms. The effluent remains there for 8 days for secondary treatment. After 8 days, the effluent is discharged from the aeration basin at what is known as Point C, and treatment is considered finished. At point C, samples are taken for testing to determine whether the treated effluent meets regulations. POINT C is also a DEAD ZONE!! After point C, the effluent enters the 300-acre Boat Harbour lagoon, also known as Boat Harbour Basin. Boat Harbour Basin was initially used as a stand-alone effluent treatment facility. In 1972, settling ponds and an aerated stabilization basin were constructed to meet stricter regulations for pulp effluent treatment. Additional aeration and other upgrades were added from 1992-1996, as the federal government again adopted stricter regulations. The lagoon at Boat Harbour has not been officially part of the effluent treatment system since 1972. Official or not, treated effluent remains in the lagoon for an additional 20-30 days.

Further aeration, settling, cooling, volatilization and breakdown of materials takes place during that time. This is referred to as â?opolishingâ? or tertiary treatment. Natural springs and surface run off further dilute the effluent. According to Northern Pulpâ?Ts figures, during the time in Boat Harbour Basin, total suspended solids TSS and biochemical oxygen below the proposed water quality standard of 1.â? The Stantec Preliminary Receiving Waters Study, August 2017, illustrates the same lack of dispersion. Treated effluent has never flowed directly into the deeper waters of the Strait. From its discharge at the shoreline, after 20-30 days in Boat Harbour Basin, tides and currents further break down, dilute and settle contaminants before they reach the deeper waters of the Strait. It is misleading to imply that effluent from the proposed new system pumped directly into the fishing grounds of the Strait within 24 hour that contains almost 1000kg of solids will have the same impact as the effluent which presently enters the Strait at the shore edge, hugs the shore and recirculates in and out of Pictou Harbour. Further to this, the same proposal was rejected in 1994 for the same concerns!! https://thetyee.ca/Analysis/2019/02/07/Pollution-Nova-Scotia-Pulp-Mill-Sink-Trudeau/?

fbclid=IwAR27oqDYJfCCBWdlMyNExvUrYZ_rBS86Gw77cT35IlLtVdyzh05AYwwcB1c 5. Better return for your TAX DOLLARS Nova Scotians are on the hook for the Boat Harbour clean up which is expected to be close to half a billion dollars once remediated. They also paid for the design process of the proposed effluent process at a cost of $6 Million dollars and will be expected to cover the construction, installation, labour etc for the proposed pipe estimated at $100 Million dollars. Further to that $127 Million dollars of NS Tax payers dollars have been given to the mill in the last several years. Meanwhile we have doctors over worked and leaving our province. We have ER closures and very long wait times for treatment and care. Our Education system is also at its max with constant cuts. Funding for Seniors and Veterans as well as many more public programs and services would benefit from the large sums of NS tax dollars instead of it going towards Northern Pulp.

Project: replacement_effluent_treatment_facility_project Comments: Please do not let this mill ruin our favourite beaches and fishing grounds. Who is going to want to fish and swim in a plume of effluent? Not me or anyone else. The fact this mill is turning up to 90 million litres of fresh water per day into waste is a tragedy in itself. Not to mention destroying our forests.

Project: replacement_effluent_treatment_facility_project Comments: This is not a project that fits into 2019 and the direction all of us need to go to ensure a healthy environment and to fight climate change. Nova Scotians and the Pictou Landing First Nation have supported this mill long enough. The economic benefits for some people is not more important than the harm this mill has done over 52 years of resistance. Pumping hot effluent deep into the Northumberland Strait is going to create another Boat Harbour situation, and we all know it. This pipe is a horrible idea, as it was when proposed a couple times in the past. The proposed effluent treatment facility is not going to make the effluent any less toxic. The taxpayers of NS are still on the hook to assess, build and run this project. There is a huge conflict of interest here. Sane minds need to prevail.in this process and see it for what it is: a multinational corporation that wants its maximum profit and the least expense to it, with no consideration of the damage it does, a nd not responsible for its environmental liabilities. This proposal must be rejected.

Project: replacement_effluent_treatment_facility_project Comments: I fail to understand why Northern Pulp isnt building an artificial wetland to further clean and naturally release their effluent rather than a pipeline to dump it. That is a 1960s strategy we do not want in our province. The creation of artificial wetland to treat this type of problem is the global standard. They need to get with the environmental times.

Project: replacement_effluent_treatment_facility_project Comments: In a recent scientific publication Pulp Mill Wastewater: Characteristics and Treatment By MarÃa Noel Cabrera Submitted: April 1st 2016Reviewed: January 19th 2017 Published: March 29th 2017 the author writes The concept of a closed loop mill aims to eliminate discharges to the aquatic environment.... and ...not much information on its effluents is available.... The mill is going to pump toxic waste directly into an aquatic environment. These waters are an important resource not only for Nova Scotia but also for Prince Edward Island and New Brunswick. It beggars belief that the pumping of effluent nearby to water sources on land and into the ocean is even being considered. If you allow this to happen you are not only going to harm fishing industries and ocean life you are threatening the health of Nova Scotians who live and work in the area. The mill have been given huge sums of money in the past and have had 5 years to fix the problem presumably relying on government to bail them out. Amongst many otherd, the family own Sinar Mas, Asia Pulp and Paper, P aper Excellnce and Northern Pulp. They are one of the richest families in the world. It is their waste and they need to deal with it, without threatening our pristine environment. Are you aware that Northumberland Strait water has been used as an indicator of quality for oyster cultivation within the European Union? If you allow this to happen you will be making a lot of people very unhappy. Dangerously and politically unhappy.

Project: replacement_effluent_treatment_facility_project Comments: The opposition to this seems to be based on a perception that Northern Pulp has historically been a poor corporate citizen. We have to look forward and ask ourselves what it will take to change that. One thing I do know is that the answer is not shutting down the plant, throwing all of those people out of work and creating chaos in the NS Pulp industry. Those who would do that should be asked what they will do to support those unemployed workers and their families. All I see from opponents to this project is their limits on what is permissible. What is their alternative to shutting down the plant, destroying jobs and disrupting a fundamental NS Industry? The pipeline into the strait will not measurably add to the Straits problems. Build it and solve the Boat Harbour problem.

Project: replacement_effluent_treatment_facility_project Comments: ********* Environmental Assessment Feedback Needed ********* The time is now for you to provide feedback on the Northern Pulp Effluent Proposal. You can do so here: https://novascotia.ca/nse/ea/comments.asp See below for a few concerns around this waste proposal. THE TOP 5 REASONS TO SUPPORT #NOPIPE 1. For your HEALTH The composition of the toxic effluent will contain dioxins, furans, metals, 1000KG of solids and other contaminates at 90,000,000 Litres PER DAY. Dioxins and Furans can cause very serious health issues to humans and our food sources. Shellfish absorb dioxins and furans at 25,000-50,000 times the concentration in the water. The Northern Pulp treatment system proposal includes a plan to burn the waste sludge. The waste sludge contains toxins which would be released through the stacks of the millâ?Ts power boiler. The proposal is to dewater the sludge prior to mixing it with bark and other wood waste for combustion in the mills power boiler. This is the same power boiler that is currently and repeatedly failing stack emissions tests. Problems with air quality from mill emissions have been documented for years. Lack of appropriate monitoring and enforcement already puts area residents at risk. Now, Northern Pulp is considering adding sludge containing toxins to the combustion mix, increasing health risks from NPâ?Ts air emissions. It is also important to note, the route of this effluent pipe goes through the source water supply for the town of Pictou and community of Caribou and surrounding area. http://ec.gc.ca/inrp-npri/donnees-data/index.cfmâ?¦ https://www.nrcm.org/projects/waters/cleaning-up-the-androscoggin-river/maines-dioxin-problem/?fbclid=IwAR3gT3KRRmPu8j22heOksunum4i6VAp0cD-tb6hqJTVOTTyrGeRh7YAtZc8 https://docs.wixstatic.com/ugd/b61814_40a0f43682ee45d99af01fb432d910fd.pdf?fbclid=IwAR3a7QpiR253DqowGxu5DQK13vDIcJru0rFyGl1cYCrO4GsFjHKMp6aghz4 2. For the overall ECONOMY The proposed treatment system runs the risk of harming three lifelong Industries worth close to $4 Billion dollars to the Nova Scotia economy. The tourism industry is worth $2.7 Billion and prides itself on warm, clean water and world class sandy beaches. The Commercial Fishing Industry is worth over $1 Billion and prides itself on sustainable wild shellfish that is shipped all across the world. The Sport Fishing industry is worth $56 Million and the Northumberland Strait is home to the last remaining stable Atlantic Salmon stocks in the province. All of this is at risk due to 32,000,000,000 Liters of waste water PER YEAR that will be 37 Celsius that will contain deleterious substances harmful to Fish species and humans. https://docs.wixstatic.com/ugd/b61814_246fdf7e04a64e239be0fbf7dc64f976.pdf?fbclid=IwAR3JjsPZQ-_npJ0a5-B4Xv4-nJeqnSfkZk9an--3s0W92fB5oZrbUWFLTnU https://novascotia.ca/news/release/?id=20180222001 https://docs.wixstatic.com/ugd/b61814_f856b6a7c7b34ffb9eba165dc3ed894b.pdf?fbclid=IwAR3es-LiMLiVx1Lc-eJZI1TLQkqYBXBRw0OBS3upgGj9ibusKsO1wl_Uqfc 3. For the ENVIRONMENT â?" Meeting Regulations DOES NOT Prevent Harm Nova Scotia and the Northumberland Strait has many great resources. However, they are at risk with the proposed Effluent treatment process. As it stands right now, there are no CCME guidelines established for Marine Environments for some of the different chemicals and compounds that make up the pulp mill effluent. Pulp and Paper Effluent Regulations PPER in Canada cover two matters total suspended solids TSS and biochemical oxygen demand BOD. Even though total discharges of TSS and BOD in pulp and paper effluent decreased by approximately 90 and 97 respectively from 1970-2008, pulp mill effluents continue to have harmful impacts on

fish, fish habitat and the environment. Information gathered through environmental effects monitoring EEM at all Canadian mills points to the disturbing conclusion that although mills are meeting regulations and passing the PPER toxicity test, 70 are having harmful effects on aquatic life and habitat, and 55 are having harmful effects on the larger environment. This information led the federal department of Environment and Climate Change to undertake a modernization review of pulp and paper effluent regulations in 2017. â?oResults from EEM studies and the changing realities of the pulp and paper industry indicate a need to modernize the PPER to improve environmental protection,â? the department states. If meeting regulations is not enough to prevent harm, neither is passing toxicity tests. Only one toxicity test is required under Canadian pulp and paper regulations. The required LC-50 test is for acute lethality. For this test, an effluent is considered acutely lethal if the treated effluent at 100 concentration kills more than 50 of the Rainbow Trout exposed to it during a 96-hour period. Long-term effects, including impacts on reproduction or growth, cumulative impacts on fish habitat and the larger environment or accumulation of substances harmful for human consumption are not regulated under the PPER. Testing for environmental effects is required for information purposes. Only two mills in Canada test for and report impacts of effluent on the usability of fish resources by humans. Effluent from pulp and paper mills is regulated at the federal level principally by the Pulp and Paper Effluent Regulations PPER, which form part of the Fisheries Act. The standards that apply to pulp effluent today were adopted in 1992 and have remained unchanged for 25 years. Highly toxic dioxins and furans are regulated under a separate Act. 70 of pulp paper mills are having harmful effects on aquatic life and habitat despite meeting current regulations . Long term impacts on reproduction and growth are not regulated under PPER. Federal regulations cover only a few of the recognized harmful substances in pulp mill effluent. For example, there are no federal regulations for AOX compounds, a component of pulp effluent in mills that bleach with chlorine or a chlorine compound. AOX compounds are recognized as extremely toxic. They are not easily broken down by bacteria and thus bioaccumulate in the environment. Yet they are not included in PPER regulations. Neither are phenols, toluene, chloroform or chemical oxygen demand COD. For 25 yrs the regulations that apply to pulp effluent have remained unchanged. Provinces may go beyond Federal standards and adopt stricter regulations for effluent from pulp mills. British Columbia, Alberta, Ontario and Quebec have adopted stricter regulations. Nova Scotia does not have regulations, but sets limits through individual industrial approvals. The EU has more protective regulations than Canada does.
https://drive.google.com/file/d/1H1HltUnh9Oem_KpPHwxmye7z5mfJP5_W/view?fbclid=IwAR1WyzupTqjLC9u8tjxWpq94e5anlEQDs_-JTH0z8vPWAoaKkyIoGBuumdM 4. New treatment Facility is NOT BETTER Northern Pulpâ?Ts proposed new effluent treatment facility differs from the present facility in a number of ways. In the present system, untreated effluent is piped from the mill to the north settling ponds at Boat Harbour, where it remains for 12 hours for primary treatment. It then moves to an aerated stabilization basin where effluent is placed in contact with micro-organisms. The effluent remains there for 8 days for secondary treatment. After 8 days, the effluent is discharged from the aeration basin at what is known as Point C, and treatment is considered finished. At point C, samples are taken for testing to determine whether the treated effluent meets regulations. POINT C is also a DEAD ZONE!! After point C, the effluent enters the 300-acre Boat Harbour lagoon, also known as Boat Harbour Basin. Boat Harbour Basin was initially used as a stand-alone effluent treatment facility. In 1972, settling ponds and an aerated stabilization basin were constructed to meet stricter regulations for pulp effluent treatment. Additional aeration and other upgrades were added from 1992-1996, as the federal government again adopted stricter regulations. The lagoon at Boat Harbour has not been officially part of the effluent treatment system since 1972. Official or not, treated effluent remains in the lagoon for an additional 20-30 days.

Further aeration, settling, cooling, volatilization and breakdown of materials takes place during that time. This is referred to as â?opolishingâ? or tertiary treatment. Natural springs and surface run off further dilute the effluent. According to Northern Pulpâ?Ts figures, during the time in Boat Harbour Basin, total suspended solids TSS and biochemical oxygen below the proposed water quality standard of 1.â? The Stantec Preliminary Receiving Waters Study, August 2017, illustrates the same lack of dispersion. Treated effluent has never flowed directly into the deeper waters of the Strait. From its discharge at the shoreline, after 20-30 days in Boat Harbour Basin, tides and currents further break down, dilute and settle contaminants before they reach the deeper waters of the Strait. It is misleading to imply that effluent from the proposed new system pumped directly into the fishing grounds of the Strait within 24 hour that contains almost 1000kg of solids will have the same impact as the effluent which presently enters the Strait at the shore edge, hugs the shore and recirculates in and out of Pictou Harbour. Further to this, the same proposal was rejected in 1994 for the same concerns!! https://thetyee.ca/Analysis/2019/02/07/Pollution-Nova-Scotia-Pulp-Mill-Sink-Trudeau/?fbclid=IwAR2_XplvKgfjWHCh2fTuzimxmeMsnWVTVVhE6agYFPiXSwR3VvkEXHB4GEA https://docs.wixstatic.com/ugd/b61814_ab61cca668f1432f890d2d0a7715a554.pdf?fbclid=IwAR27oqDYJfCCBWdlMyNExvUrYZ_rBS86Gw77cT35IlLtVdyzh05AYwwcB1c 5. Better return for your TAX DOLLARS Nova Scotians are on the hook for the Boat Harbour clean up which is expected to be close to half a billion dollars once remediated. They also paid for the design process of the proposed effluent process at a cost of $6 Million dollars and will be expected to cover the construction, installation, labour etc for the proposed pipe estimated at $100 Million dollars. Further to that $127 Million dollars of NS Tax payers dollars have been given to the mill in the last several years. Meanwhile we have doctors over worked and leaving our province. We have ER closures and very long wait times for treatment and care. Our Education system is also at its max with constant cuts. Funding for Seniors and Veterans as well as many more public programs and services would benefit from the large sums of NS tax dollars instead of it going towards Northern Pulp. https://www.halifaxexaminer.ca/featured/northern-pulp-scotsburn-lumber-and-u-s-tariffs/#News https://www.halifaxexaminer.ca/province-house/health-care-crisis-check-leadership-to-solve-it-another-question/?fbclid=IwAR1oPeQe3iFB-Oe0llwCNT9uax2Gos8ZQNhV3YYvTOO67j5aRX8p310_tQ8 #NOPIPE https://novascotia.ca/nse/ea/Replacement_Effluent_Treatment_Facility_Project/

Project: replacement_effluent_treatment_facility_project Comments: I do not support this for the following reasons: Environmental- Effluent is a toxic substance. I welcome any politician to drink some. The natives lost their land and fish were killed off. We have seen this in new Brunswick, marmachi and Irving recently. It is not worth the risk. Economic- our province was so desperate to pay the costs of cleanup. It is not worth it and now municipalities have rights with the most recent SCC decision, we are wasting money because of bad negotiations. Although the idea of diluting the substance into a straight appears nice. It fails to recognize the downstream effects fishing industry, tourism in shediac, seafood of the native people. Climate change- this plant produces ghgs and toxic pollution. The people of pictou are not healthy. We understand sea level rise is coming which will bring coastal erosion. This mill would be affected because most of it is 5 meters above sea level and the whole area is a flood plane. Tax revenue- this is a private company. They will file for bankruptcy protection and creditors will steal the workers pensions. In addition decrease tax revenue. Ecology- we have clear cut a huge chunk of nova Scotia, this mill encourages such actions which is degrading our natural wealth. It is harming species at risk which is illegal. Those trees took thousands of years to grow and they are not receiving a true value. Once our natural wealth is gone, we have nothing. Economy continued- closing that mill will open a free market where small businesses can mill their own wood again. It is more sustainable that way. International commitments- this does not mix with the paris agreement or the IPCC. We need to restore our forests not degrade them. Innovation and future- I would support destroying the mill and building another one in another location, but only for hemp based products. There is a business case for help plastics. If the tax payer is on the line, we should be forward thinking. Interprovincial relations- both nb and pei have expressed dissatisfaction towards these plans. Respect that we share close proximity to other jurisdictions. Public outcry- lots of protests have taken place and more to follow. This degrades confidence on democracy. That is all I can think of right now!

Project: replacement_effluent_treatment_facility_project Comments: I am not a scientist but I can only assume this to be an upgrade over the existing waste water treatment plant. It is extremely important to me and my employees/contractors that Northern Pulp be able to continue operations uninterrupted. It should have minimal impact on lobster and other fish. Furthermore I am a salmon fisherman that fishes the rivers of the Northumberland Strait. I cannot see how this would impact salmon as salmon are known to migrate in the top 4-5 meters of the ocean. The benefit to our economy far outweighs the environment footprint . I support the proposed effluent pipe 100.

Project: replacement_effluent_treatment_facility_project Comments: Nothing has changed. This wasnt allowed in 1994 and it shouldnt be today. How can NSE give NP permission to run an effluent pipe throught a community watershed and into the ocean. Its 2019, we need to be better. End the suffering for the people in Pictou County and beyond with air and water pollution. Do the right thing for the people and environment and deny NPs EA application. Attachment The Chronicle Herald Published: 3/26/1994 Day: Saturday Headlines: TOBIN VOWS TO PROTECT FISH HABITAT FROM EFFLUENT Reporter: BY BRIAN UNDERHILL OTTAWA BUREAU AND THE CANADIAN PRESS Ottawa â?" The Nova Scotia government wont be allowed to pipe Boat Harbour effluent into the Northumberland Strait if it poses a threat to fish habitat, federal Fisheries Minister Brian Tobin said Friday. And the minister said a decision on the controversial proposal wont be made until theres a full environmental assessment and fishermen are consulted. British Columbia Reform MP John Cummins raised the issue during the daily question period, saying groups in the area are justifiably apprehensive over proposals for a new facility to treat effluent from the Scott Maritime Ltd. pulp mill in Abercrombie Point. Plans are under way for a $17â?"million upgrade of the provincially operated Boat Harbour system, which treats about 87 million litres of waste from the nearby mill daily. The province wants to pipe effluent about two kilometres into the Northumberland Strait. The province hopes to award construction contracts by July and complete construction by September 1995. The issue has generated heated debate in Pictou County. Fishermen fear the proposal could damage spawning grounds and fish stocks, and theyve threatened to blockade the project. Mr. Cummins sought assurances the Liberals will not allow damage to the fish habitat. He said shellfish harvests in some areas off the West Coast had been curtailed because of poisoning from pulp mill effluents. Tobin said he had an obligation under the Fisheries Act to protect fish habitat. The easy decisions like not allowing pollutants that would be contrary to the Fisheries Act into critical spawning areas would be easy for us to take. This government will not compromise conservation habitat for any reason. Mr. Tobin said a full assessment of the proposal has not been completed and no decision will be made until that process is wrapped up.

Good Day Minister,

After all the mixed hype and media attention this past year, I have to say that I was truly very impressed reading up on Northern Pulps Replacement Effluent Treatment Facility Project for the environmental assessment, in accordance with Part IV of the Environment Act., submitted on February 7, 2019.

I personally feel that you should permit an extension to Northern Pulp in order that they will be able to complete this amazing project.

Thanking you,

<mailto: @hrsb.ca>

Project: replacement_effluent_treatment_facility_project Comments: A few reasons for a Federal Environmental Assessment, based on the negative impact the proposed discharge location and associated effluent will have on the Northumberland Strait: 1. The obvious conflict of interest of having the Province as both the supplier of the new treatment facility and regulator of the same. 2. Northern Pulpâ?Ts receiving water study is based on dated modeling of the Northumberland Strait. This modeling, to have any chance at accuracy, needs to be made current. 3. The receiving water area is part of a Marine Protected Area a scallop buffer zone. 4. This is within a Federal fishing zone. 5. The Aboriginal rights of Pictou Landing First Nations need to be considered. The new discharge location still has a direct affect on them and their livelihood, as it pertains to fishing. 6. The Northumberland Strait borders on Prince Edward Island, New Brunswick and Nova Scotia. There are fishers from all three provinces, including First Nations, that this proposed effluent, will impact. 7. There are â?~Species at Riskâ?T that potentially will be negatively affected. 8. The proposed discharge location is directly adjacent to Caribou-Munroeâ?Ts Island Park a bird and wildlife sanctuary. 9. Northern Pulp is undoubtedly going to take the Province of Nova Scotia to court, when Boat Harbour closes as per the â?~Boat Harbour Actâ?T. Consequently, there is pressure on the Province to expedite the environmental process, due to the Indemnity Agreement and lease arrangements between our Provincial government and Northern Pulp. 10. The proposed path of the pipe in Caribou Harbour will destroy fish habitat, eelgrass beds, etc. Northern Pulps EA suggests to avoid ice damage to the effluent pipe, a trench 9 meters wide by 3 meters deep for 4.1 kilometers in length to the discharge point would be installed. This construction would directly breach section 35.1 of the Federal Fisheries Act as it will kill fish and destroy fish habitat. 11. The 62 to 90 million liters of hot, according to Northern Pulp, summer temperature of effluent at the discharge point will be 38 degrees Celcius, treated effluent daily, containing approximately 1000 kg of solids which technically are toxic waste, will negatively impact and kill lobster and herring larvae directly breaching section 36 of the Federal Fisheries Act. Please ensure a Federal Environmental Assessment is applied, to adequately address these concerns.

Project: replacement_effluent_treatment_facility_project Comments: This is a good project that will have a very positive impact on Nova Scotias economy by preserving existing jobs and injecting millions of dollars in the local economy during construction. It will have no significant impact on the environment. We need to get this done and we need to amend the Boat Harbour Act to allow sufficient time for the project to be completed without forcing a temporary closure of the Northern Pulp mill.

Project: replacement_effluent_treatment_facility_project Comments: Thousands of people, consisting of fishers, fish buyers,deckhands, boat builders, restaurant owners, tourism operators --- living along the south shore --- are watching this unfold and have expressed grave concerns on social media about the negative impacts and reputation the pipe will have on the ENTIRE lobster/fishing industry and fish related exports. Think about it for a moment...you are living in Paris, France ----- London, England ----- Hong Kong ----- New York City ----- and you sit down at a high-end restaurant - Fresh Nova Scotia Lobster catches your eye...caught off the shores of Nova Scotia! You order, your mouth starts watering...and then - the person across the table from you leans in and says, Did you read that article? Those lobsters from Nova Scotia are caught where a pulp and paper company dumps their toxic effluent from their processing plant. Yes. Apparently the Nova Scotia Environment approved an effluent pipe that contains dioxins, furans, and metals from a company called Northern Pulp. All this goes into the ocean just off their coast. I wouldnt eat a lobster from there...it could be contaminated. All it takes is ONE NEWS ARTICLE - ONE POST and this damning information will be sent around the world that will CONTAMINATE the lobster fishing industry here in Nova Scotia...the #1 export. No pipe. No more cancer causing particulate. No extension. We want clean water - clean air - clean soil - and a cleaned up government system. We want ecological forestry and species at risk protect. We want jobs that are created from restoring the environment - not destroying it. We want a government with integrity.

Project: replacement_effluent_treatment_facility_project Comments: Northern Pulp has no interest in our ecosystems. They have had several opportunities to change the way the waste is processed. It is terrible they have already being poisoning the environment for so many years already. Now, because they did nothing in the time given - 5 years - they will not be able to meet the Jan 31, 2020 deadline. That was their choice. No extension should be allowed as they have proven they dont intend to comply. Now they are also telling the public about the job losses this will cause. They havent been concerned about those jobs while wasting time doing nothing to prepare. If people are out of work, it is on them, not the province. Not only have they condoned clear cutting which affects our wildlife, now they want to destroy our marine life the fishing industry. Please, I am asking for NO PIPE.

Project: replacement_effluent_treatment_facility_project Comments: We want federal involvement!!!! The province of NS ignores the precautionary principle at all costs, proving they are incompetent or complicit, but they do not have jurisdiction in the Northumberland Strait to do so. 2.4 Precaution in science-based decision making The Federal Government has developed a document entitled A Framework for the Application of Precaution in Science-based Decision Making about Risk [Privy Council Office PCO, 2003]. This paper addresses the application of precaution in its various forms - precaution, the Precautionary Principle or the precautionary approach - all of which have three basic components: the need for a decision a risk of serious or irreversible harm and a lack of full scientific certainty. As stated in the document, the application of precaution primarily affects the development of options and the decision phases within science-based risk management, is clearly linked to scientific analysis, and cannot be applied without an appropriate assessment of scientific factors and consequent risks. A key role of developing ecological and human health risk assessments is to provide the necessary evaluation of science and potential risks to support the use of precaution in the ultimate decision making process, at which point factors such as social and ethical values and political and economic considerations will also be taken into account. The precautionary principle is entrenched in CEPA 1999. In the preamble, CEPA 1999 recognizes that the Government of Canada is committed to implementing the precautionary principle. Where there are threats of serious or irreversible damage, lack of full scientific certainty shall not be used as a reason for postponing cost-effective measures to prevent environmental degradation. In addition, section 76.1 of CEPA 1999 specifically directs the Ministers to apply a weight-of-evidence approach and the precautionary principle when conducting and interpreting the results of assessments of existing substances. As described in greater detail in PCO 2003, the general principles outlining the distinguishing features of precautionary decision making are that: The application of precaution is a legitimate and distinctive decision-making approach, notably within risk management. It is legitimate that decisions be guided by societys chosen level of protection against risk. In risk management, sound scientific information and its evaluation must be the basis for the decision to apply precaution and the measure selected in applying precaution the scientific information base and responsibility for producing it may shift as knowledge evolves. Mechanisms should exist for re-evaluating the basis for decision and for providing a transparent process for further consideration, recognizing that in some cases re-evaluation may not be practical or productive. A high degree of transparency, clear accountability and meaningful public involvement are appropriate.

Project: replacement_effluent_treatment_facility_project Comments: This environmental assessment is to examine the efficacy of a proposed effluent treatment and evacuation system proposed by Northern Pulp. A clear deadline for the use of Boat Harbour as a depuration site by Northern Pulp was legislated and a commitment has been made to the community of Pictou Landing First Nation that Boat Harbour will stop being used as a depuration site in January 2020. Five years have gone by since the deadline was established. Northern Pulp says that the only alternative to Boat Harbour is a straight pipe into the Northumberland Strait. They have had to change the proposed site for the pipe at least once and have not been able to complete the marine surveys needed to evaluate the newly proposed site. This proposed site for the pipe is near a prime area for the lobster fishery. The waters in the Strait reach Prince Edward Island and New Brunswick. The premiers of these provinces are opposed to this pipe being installed without a full fed eral environmental assessment. The design of the effluent treatment system and the pipe to the Northumberland Strait has been subsidized by provincial funding. I believe that it is a conflict of interest for the province of Nova Scotia to carry out an environmental assessment of a project that it has subsidized. A recent change in federal regulations concerning effluents from pulp mills has raised the bar for treatment plants. The new standards are considerably more rigorous than those enacted into law in 1992. Will the proposed effluent treatment and evacuation system meet those standards? Will the provincial environmental assessment take the new federal standards into account? Or will a â?owork-aroundâ? solution promising upgrades to meet the more recent standards be allowed? Northern Pulpâ?Ts willingness to endanger the waters crucial for the lobster fishery of three provinces by releasing an effluent of unproven quality is frightening. We are told that the best science is being used, but do these â?obest practicesâ? apply to a tidal salt marsh that serves as a nursery for juvenile lobster? Scientists from government and university laboratories have voiced their concerns about this treatment system. A massive public relations campaign by Northern Pulp and the industrial forestry industry is trying to mobilize public opinion to accept an extension of their use of Boat Harbour. The long-standing environmental racism embodied by the poisoning of Boat Harbour cannot be continued. Given the strong conflict of interest the province of Nova Scotia has in this matter, given Nova Scotiaâ?Ts heavy financial involvement in the mill and its subsidizing of the plans for the effluent treatment system, given that the fishery in three provinces could be affected by the release of effluent into the Northumberland Strait, given that the evaluation of the proposed release site is incomplete, I strongly believe 1 that this project should be returned to Northern Pulp so that the crucial aspects concerning the proposed release site be validated by marine surveys, and 2 that the proposed effluent treatment system undergo a federal environmental impact assessment and be evaluated relative to the most recent federal standards.

Project: replacement_effluent_treatment_facility_project Comments: Absolutely NO PIPE in the Northumberland Strait. This mill and its operators have no respect for the environment and the people who live in northern NS and PEI. Countless articles to prove they are not environmental stewards. At the very least, this project demands federal assessment at the highest levels due to the potential risk of creating yet another environmental disaster like the one they created in Boat Harbor. There is NO science that you can find to support that there will be no harm done to fish, shellfish and all the other living organisms that live in the Strait. Technology is out there to keep all their pollution in house. They have no business running a pipe into the Northumberland Strait or any other body of water.

Project: replacement_effluent_treatment_facility_project Comments: For the sake of a few jobs, Northern Pulp has been allowed to operate in an incomprehensibly irresponsible manner. The ecological damage to Boat Harbour is unfixable. A few jobs does not justify the complete devastation of 350 acres of First Nations Territory. I stand with Pictou Landing First Nation. I demand that an extension not be given to Northern Pulp. And I demand that Northern Pulp not be allowed to put an effluent pipe into the Northumberland Strait that would have them continue to operate in an environmentally catastrophic manner. It is on Northern Pulp to figure out how to do what they do without causing the kind of damage to our land and water that they have been allowed to get away with for decades. If they cant, they must go. If it not perfectly clear, I am against a replacement effluent treatment facility project that would put any amount of effluent into the Northumberland Strait. I am categorically opposed to any additional timeline extension beyond the January 31, 2019 deadline.

As a human, i look for MY well being
As a parent, i look for MY kids' (grand kids') future
As a lobsterman (owner), i look for MY future in many years of fishing (the best « job » in the world)
As a biologist, i llook for MY planet
As a resident of a fishing community, i look for MY Community

So if the government asks us to not flush our boat toilet close to shore, to bring our garbage to shore,
to take care of the environment…
and if they ask our Community to be careful with garbage, sewage, rain water, road salt, road snow…
and if they ask our fish plants to restraint the quantity of blood water …

plus the fsihing industry is ask to keep the highest quality of product for the custumers around the world

then just one little so called mistake from a mill like that could result in a BIG part of our canadian Economy to be lost for a LONG time.

We are triing to protect the wright whales, so how is it OK to dump waste from a mill in the our community.

For your info, i live on an island up north New Brunswick, i know how fragile any ecosystem is, our planet included. The old saying : « Out of sight-Out of mind », just does not work any more, because we know about tidal mouvements, how the waters in the gulf of St-Laurence flow, so anything that is drop in Nova Scotia WILL end up around my place.

So every person living in the big community of the atlantic provinces should be consulted.

Subject: Northern Pulp Effluent Proposal
Date: February 9, 2019 7:32:51 PM

I am 100% opposed to the proposal by Northern Pulp to discharge its waste directly into the Northumberland Strait. There is no way this volume of warm, fresh, toxin filled water into a water body like the strait will not effect the delicate ecosystem. This massive volume of waste water will not just disappear when pumped into the strait, this is not the open ocean but a narrow strip of water with complex tides and incomplete flushing between two provinces who rely heavily on the fisheries industry. Northern Pulp should have to prove that this plan will not harm the marine environment, it is hard to take their word for it when common sense and science suggest that even minor changes in temperature and salinity will have a major impact on delicate lobster larvae. The proposal to dig up that much of the bottom to bury the pipe will have the potential to destroy many fishing lands with the sediment alone. There is no way the toxins and solid waste won't build up on the ocean floor and destroy the fisheries and buildup on our beaches and destroy tourism and the health of many families along these cottage lined shores. Please, put the environment first and stop this insanity! There is already a higher rate of cancer in Pictou County, I can only assume this will be worse when we are all swimming in these toxins without the settling time and filtering that boat harbour currently provides. At a minimum please let an unbiased federal assessment happen since this provincial government has a conflict of interest being on the hook financially. Current environmental standards and minimum requirements are outdated and being reviewed federally and I would hate to see our government push ahead with this ludicrous proposal before there is time for new standards to be implemented which surely would not allow this level of pollution to happen.
Sincerely,
Concerned mother, and citizen of County,

TO WHOM IT MAY CONCERN

I agree with all the reasons has carefully researched and written so I'm not going to reinvent the wheel. I present his five reasons not to allow this industry to put a pipe into the Northumberland Strait below.

I will say that the owner of this company (which is also responsible for clearcutting and using whole trees for an industry, biomass, that was brought in on the basis that only scrap wood would be used) is responsible for clearcutting the Borneo Rainforest--earth's lungs. This company must be regulated or, better still, removed from this province. Let the (wood) chips fall where they may regarding lost jobs, we need clean sustainable industry that doesn't contribute to destroying our precious resources in the Northumberland Strait and in the Acadian Forests, not to mention the carbon-sequestering capacity that is being removed by clearcutting and the deterioration of our air and waters.

wrote recently five reasons not to pass the Provincial EA that would allow this effluent to be piped into the Northumberland Strait:

"1. For your health
The composition of the toxic effluent will contain dioxins, furans, metals, solids and other contaminants at a rate of 90,000,000 Litres *per day*. Dioxins and furans can cause very serious health issues to humans and our food sources. Shellfish absorb dioxins and furans at 25,000-50,000 times the concentration in the water.

Dioxins and Furans - Canada.ca

Health Canada

2001 article (updated 2005) from Health Canada and the Public Health Agency of Canada. Dioxins and furans are co...

The Northern Pulp treatment system proposal includes a plan to burn the waste sludge. The waste sludge contains toxins which would be released through the stacks of the mill's power boiler. The proposal is to "dewater the sludge prior to mixing it with bark and other wood waste for combustion in the mill's power boiler."

This is the same power boiler that is currently and repeatedly failing stack emissions tests. Problems with air quality from mill emissions have been documented for years. Lack of appropriate monitoring and enforcement already puts area residents at risk. Now, Northern Pulp is considering adding sludge containing toxins to the combustion mix, increasing health risks from NP's air emissions.

It is also important to note, the route of this effluent pipe goes through the source water supply for the town of Pictou and community of Caribou and the surrounding area.

See also: Maine's dioxin problem; What you should know about Northern Pulp's proposed new treatment facility

2. For the economy

The proposed treatment system runs the risk of harming three lifelong Industries worth close to $4 billion to the Nova Scotia economy. The tourism industry is worth $2.7 billion and prides itself on warm, clean water and world-class sandy beaches. The commercial fisheries are worth over $1 billion and relies on sustainable wild shellfish that is shipped all across the world. The sport fishing industry is worth $56 million, and the Northumberland Strait is home to the last remaining stable Atlantic Salmon stocks on mainland Nova Scotia.

See also: Nova Scotia exports top 10; Nova Scotia celebrates seafood export success at fisheries conference

Nova Scotia Celebrates Seafood Export Success at Fisheries Conference

News releases from the Government of Nova Scotia

3. For the environment – Meeting regulations does not prevent harm

Nova Scotia and the Northumberland Strait are put at risk by the proposed effluent treatment process. As it stands right now, there are no CCME guidelines established for marine environments in terms of some of the chemicals and compounds that make up the pulp mill effluent.

CCME

Pulp and Paper Effluent Regulations (PPER) in Canada cover two matters; total suspended solids (TSS) and biochemical oxygen demand (BOD.) Even though total discharges of TSS and BOD in pulp and paper effluent decreased by approximately 90% and 97% respectively from 1970-2008, pulp mill effluents continue to have harmful impacts on fish, fish habitat and the environment.

Information gathered through environmental effects monitoring (EEM) at all Canadian mills

points to the disturbing conclusion that although mills are meeting regulations and passing the PPER toxicity test, 70% are having harmful effects on aquatic life and habitat, and 55% are having harmful effects on the larger environment.

This information led the federal department of Environment and Climate Change to undertake a modernization review of pulp and paper effluent regulations in 2017. “Results from EEM studies and the changing realities of the pulp and paper industry indicate a need to modernize the PPER to improve environmental protection,” the department states.

If meeting regulations is not enough to prevent harm, neither is passing toxicity tests. Only one toxicity test is required under Canadian pulp and paper regulations. The required LC-50 test is for acute lethality. For this test, an effluent is considered acutely lethal if the treated effluent at 100% concentration kills more than 50% of the Rainbow Trout exposed to it during a 96-hour period. Long-term effects, including impacts on reproduction or growth, cumulative impacts on fish habitat and the larger environment or accumulation of substances harmful for human consumption are not regulated under the PPER. Testing for environmental effects is required for information purposes.

Only two mills in Canada test for and report the impacts of effluent on the usability of fish resources by humans. Effluent from pulp and paper mills is regulated at the federal level principally by the Pulp and Paper Effluent Regulations (PPER), which form part of the Fisheries Act. The standards that apply to pulp effluent today were adopted in 1992 and have remained unchanged for 25 years. Highly toxic dioxins and furans are regulated under a separate Act.

70% of pulp & paper mills are having harmful effects on aquatic life and habitat despite meeting current regulations. Long term impacts on reproduction and growth are not regulated under PPER. Federal regulations cover only a few of the recognized harmful substances in pulp mill effluent. For example, there are no federal regulations for AOX compounds, a component of pulp effluent in mills that bleach with chlorine or a chlorine compound. AOX compounds are recognized as extremely toxic. They are not easily broken down by bacteria and thus bioaccumulate in the environment. Yet they are not included in PPER regulations. Neither are phenols, toluene, chloroform or chemical oxygen demand (COD).

For 25 yrs the regulations that apply to pulp effluent have remained unchanged. Provinces may go beyond Federal standards and adopt stricter regulations for effluent from pulp mills. British Columbia, Alberta, Ontario and Quebec have adopted stricter regulations. Nova Scotia does not have regulations but sets limits through individual industrial approvals. The EU has more protective regulations than Canada does.

Stantec_Receiving Water Study_Effluent Treatment Plant Replacement.pdf

4. The new treatment facility is not better than the current one

Northern Pulp's proposed new effluent treatment facility differs from the present facility in a number of ways. In the present system, untreated effluent is piped from the mill to the north settling ponds at Boat Harbour, where it remains for 12 hours for primary treatment. It then moves to an aerated stabilization basin where effluent is placed in contact with microorganisms. The effluent remains there for 8 days for secondary treatment. After 8 days, the effluent is discharged from the aeration basin at what is known as Point C, and treatment is considered finished.

At point C, samples are taken for testing to determine whether the treated effluent meets regulations. *Point C is also a dead zone!*

After point C, the effluent enters the 300-acre Boat Harbour lagoon, also known as Boat Harbour Basin. Boat Harbour Basin was initially used as a stand-alone effluent treatment facility. In 1972, settling ponds and an aerated stabilization basin were constructed to meet stricter regulations for pulp effluent treatment. Additional aeration and other upgrades were added from 1992-1996, as the federal government again adopted stricter regulations. The lagoon at Boat Harbour has not been officially part of the effluent treatment system since 1972. Official or not, treated effluent remains in the lagoon for an additional 20-30 days.

Further aeration, settling, cooling, volatilization and breakdown of materials takes place during that time. This is referred to as "polishing" or tertiary treatment. Natural springs and surface run off further dilute the effluent. According to Northern Pulp's figures, during the time in Boat Harbour Basin, total suspended solids (TSS) and biochemical oxygen below the proposed water quality standard of 1%."

The Stantec Preliminary Receiving Waters Study, August 2017, illustrates the same lack of dispersion. Treated effluent has never flowed directly into the deeper waters of the Strait. From its discharge at the shoreline, after 20-30 days in Boat Harbour Basin, tides and currents further break down, dilute and settle contaminants before they reach the deeper waters of the Strait. It is misleading to imply that effluent from the proposed new system pumped directly into the fishing grounds of the Strait within 24 hour that contains almost 1000 kg of solids will have the same impact as the effluent which presently enters the Strait at the shore edge, hugs the shore and recirculates in and out of Pictou Harbour.

Further to this, the same proposal was rejected in 1994 for the same concerns!

How Pollution from a Nova Scotia Pulp Mill Could Sink Trudeau on Both Co...

Michael Harris

PM's hands-off stance on threat to fisheries betrays environmentalist posture.

5. Better return for your tax dollars

Nova Scotians are on the hook for the Boat Harbour clean up which is expected to be close to half a billion dollars once remediated. They also paid for the design process of the proposed effluent process at a cost of $6 million and will be expected to cover the construction, installation, labour etc for the proposed pipe estimated at $100 million. Further to that $127 million of Nova Scotia taxpayers money have been given to the mill in the last several years.

Meanwhile, we have overworked doctors leaving our province. We have ER closures and very long wait times for treatment and care. Our education system is also at its max with constant cuts. Funding for seniors and veterans as well as many other public programs and services would benefit from these large sums of tax dollars."

Subject: Effluent pipe to Caribou Harbour

Honorable Ministers,

I have a hard time understanding how there is any confusion regarding how an effluent pipe, with a volume of this magnitude, directly to the Northumberland Strait, won't cause any negative effects to the marine environment and the existing fishery. Basically, Northern Pulp wants to redirect the majority of the flow from the Middle River – between 62 and 90 million liters per day, heat it up to 37 degrees Celsius, add 1 ton of what is technically toxic waste solids, then direct that to the mouth of Caribou Harbour. This effluent will kill lobster larvae; it's inevitable and would directly breach section 36 of the Federal Fisheries Act. The mill then states, 'it's unlikely there will be any harm to lobster', in their environmental assessment. It is virtually impossible that there will not be adverse effects from this dramatic redirection of the Middle River, to the mouth of Caribou Harbour. For our Provincial government to have not immediately sent this to the Federal government for environmental assessment is outrageous. To suggest, 'this is not a new facility, just replacement of an existing one', as the reason for a provincial assessment, is not reasonable or realistic. To completely redirect the flow of a major river to the mouth of Caribou Harbour, miles from where it's been flowing, into the very heart of the most lucrative lobster and herring grounds in the Northumberland Strait, a provincially shared Federal Fishing zone, this goes beyond responsible, honest government, with regards to the environmental assessment applied. Our government is in an obvious conflict of interest. The Supreme Court of Canada agrees, according to the ruling of Justice Timothy Gabriel last fall, with regards to Pictou Landing First Nations and the Provincial Government

with respect to the government funding of a replacement facility and the relationship with Northern Pulp. Justice Gabriel stated, "... it would essentially boil down to the Crown (wearing one hat) being called upon to determine whether a project which the Crown (wearing another hat) has funded passes muster. This will do nothing to assuage whatever cynicism has been engendered in the past."
I believe the working group of fishermen's organizations, together with Pictou Landing First Nations, should be taking the Province and Northern Pulp to Supreme Court on this basis; in the event the Federal Government does not step in and take control of this environmental assessment. I believe we, as Fishermen and First Nations, have a legal right to protect our industry – and Justice Gabriel has set the precedent.

We undoubtedly will lose our Marine Stewardship Certification, (a major marketing tool), for both our herring and lobster fisheries as a result of this new effluent pipeline, as part of the criteria is the species are harvested from a healthy environment, in a sustainable fashion. It's already affecting the existing fishery and not just here, in P.E.I as well. Fishermen are anticipating the value of their enterprises to be less than half what there are now, as soon as there is real indication of construction of this effluent pipe; and some have literally already sold out on this realistic assumption.

In Northern Pulps submitted environmental assessment, the pipe would be required to be set at a depth below the seabed of 3 meters due to potential from ice damage. To accomplish this, they submit the trench would have to be 9 meters across, for the entire length of 4.1 kilometers from where it enters the harbour adjacent to the ferry dock, to the mouth of the harbour, the proposed discharge location. The sediment alone from this construction would destroy the local fishery and directly breaches section 35 of the Federal Fisheries Act as it will destroy marine habitat, eelgrass beds, etc., killing juvenile fish, lobster and crab. The sediment dispersed will cause havoc with the marine environment for miles and for how long, is anyone's guess.

There came a point, when the environment outweighs the economy, it's past. In this day and age, to even consider directing this massive flow of 'treated', poisonous effluent directly to the Northumberland Strait, is not reasonable or remotely with noble conscience from Northern Pulp. There is an alternative, yet the mill will not consider it, as it would mean less profits – converting the mill to a mechanical process that separates the pulp, no effluent discharge required and less air emissions – this actual possibility could be discussed at length. The mill simply will not consider it, as it is less profitable and there would be 'downtime' at their expense while converting.

Our government is closing Boat Harbour in January 2020, ten years premature of the lease agreement, but actually 25 years late, from what was originally promised to Pictou Landing First Nations. To continue using Boat Harbour, is to continue with the current environmental racism that PLFN have been enduring for 52 years and are currently, on a daily basis, contending with. To ask for an extension, is simply ignorant. Because the closure of Boat Harbour is premature of this lease agreement that the Province agreed to without PLFN consent, Premier McNeil has been quoted saying that the monies our government will be giving Northern Pulp are not to directly pay for the estimated 130 million dollar 15.5 km pipe and new treatment facility, but in lieu of the lease agreements early closure….
Obviously, this 130 million could be better spent on converting the mill to a mechanical, closed loop system. The mill has no interest and has continually stated, no pipe = no mill. If all you are thinking about is profits, you can't blame them. This company, Asia Pulp and Paper, subsidiary, Paper Excellence, buys up moth balled pulp mills for peanuts in comparison to todays cost, (that would be upwards of 2 billion dollars), spends next to nothing on upgrades, rakes in government subsidies and hand-outs… and in the case of our mill, is not responsible for any environmental damage. What a deal! The mill with the worst environmental record in the Country, has no environmental consequence – a coincidence? Think about that, why would you improve your discharges, (air and water), if there are no consequences?
No you can't blame them for not wanting to convert the mill. There would be downtime and they couldn't sue our government for it – and they will be suing for any 'downtime' when Boat Harbour closes, you can count on that. They have a sweetest of deals right now and the fishing and forestry industries are both paying for it! The thing is, our government, (the people), have allowed this to happen. The question is, will we continue to?
This mill is not worried about our marine environment and really, other than from a profits perspective, they are not worried about the longevity of our forest industry either.
I don't suspect anyone in the forest industry would want any harm to the fishing industry and I know the reverse is the same; we in the fishing industry want the forest industry to thrive, but simply not at our expense.
There is a solution and the extension of Boat Harbour is not the solution. The solution is to covert the mill; this is what the Forest industry should be promoting to Northern Pulp.

Thanks,

Project: replacement_effluent_treatment_facility_project Comments: While all of the documentation provided about the proposed pipeline seems to go into great detail it seems to me that there is very little information that the general public would understand. It would take a chemist or scientist to understand the facts and figures in this document. I think something written that the average person would understand would be very helpful. My first instinct is that this pipeline is a very bad idea because the document as presented doesnt really tell me anything. I think after all of the years of seeing what has happened at Boat Harbour, the potential of disaster with the pipeline is very real. I certainly wouldnt like to see the pulp mill closed with great job loss but environmental protection must be first and foremost. Another thing that comes to mind is tourism with the pipeline right next to the P.E.I. ferry route. There is far to much at stake here for a quick decision and I think a lot of questions still to be answered. Thank Yo u, Name: Email: @gmail.com Address:

Project: replacement_effluent_treatment_facility_project Comments: I definitely support the proposal put forward by Northern Pulp.Every mill,no matter what type they are,needs a place to dispose of their waste water.I did not agree with dumping untreated waste,but technology has changed and we can safely treat waste water before it gets to the ocean.Our fishermen cry about pollution,but have they ever sold a contiamented lobster.Instead of everyone fighting among each other,it is time to start working together and install a proper treatment plant so this mill can coexist and be a welcomed member of our community and also supply very badly

Project: replacement_effluent_treatment_facility_project Comments: I took several hydrography courses at NSCC Centre of Geographic Sciences in Lawrencetown NS. I learned that when a steady stream of water enters the ocean at a different temperature, salinity, composition etc. It does not simply mix and dilute, this steady stream will create its own current and travel great distances before it dilutes. In this case with the effluent pipe, in my educated opinion, this waste product could remain concentrated for an extended period after it enters the strait and could be damaging to ocean life the comes in contact. This is a very high risk and irresponsible plan put forth by Northern Pulp. Project: replacement_effluent_treatment_facility_project Comments: I agree with everything Matt Dort said in a recent article in the Nova Scotia Advocate: https://nsadvocate.org/2019/02/08/matt-dort-five-reasons-to-support-nopipe/ The composition of the toxic effluent will contain dioxins, furans, metals, solids and other contaminates at a rate of 90,000,000 Litres per day. Dioxins and furans can cause very serious health issues to humans and our food sources. Shellfish absorb dioxins and furans at 25,000-50,000 times the concentration in the water. The Northern Pulp treatment system proposal includes a plan to burn the waste sludge. The waste sludge contains toxins which would be released through the stacks of the millâ?Ts power boiler. The proposal is to â?odewater the sludge prior to mixing it with bark and other wood waste for combustion in the millâ?Ts power boiler.â? This is the same power boiler that is currently and repeatedly failing stack emissions tests. Problems with air quality from mill emissions have been documented for years. Lack of appropriate monitoring and enforcement already puts area residents at risk. Now, Northern Pulp is considering adding sludge containing toxins to the combustion mix, increasing health risks from NPâ?Ts air emissions. It is also important to note, the route of this effluent pipe goes through the source water supply for the town of Pictou and community of Caribou and surrounding area. The proposed treatment system runs the risk of harming three lifelong Industries worth close to $4 billion to the Nova Scotia economy. The tourism industry is worth $2.7 billion and prides itself on warm, clean water and world class sandy beaches. The commercial fisheries is worth over $1 billion and relies on sustainable wild shellfish that is shipped all across the world. The sport fishing industry is worth $56 million, and the Northumberland Strait is home to the last remaining stable Atlantic Salmon stocks on mainland Nova Scotia. Nova Scotia and the Northumberland Strait are put at risk by the proposed effluent treatment process. As it stands right now, there are no CCME guidelines established for marine environments in terms of some of the chemicals and compounds that make up the pulp mill effluent. Pulp and Paper Effluent Regulations PPER in Canada cover two matters total suspended solids TSS and biochemical oxygen demand BOD. Even though total discharges of TSS and BOD in pulp and paper effluent decreased by approximately 90 and 97 respectively from 1970-2008, pulp mill effluents continue to have harmful impacts on fish, fish habitat and the environment. Information gathered through environmental effects monitoring EEM at all Canadian mills points to the disturbing conclusion that although mills are meeting regulations and passing the PPER toxicity test, 70 are having harmful effects on aquatic life and habitat, and 55 are having harmful effects on the larger environment. This information led the federal department of Environment and Climate Change to undertake a modernization review of pulp and paper effluent regulations in 2017. â?oResults from EEM studies and the changing realities of the pulp and paper industry indicate a need to modernize the PPER to improve environmental protection,â? the department states. If meeting regulations is not enough to prevent harm, neither is passing toxicity tests. Only one toxicity test is required under Canadian pulp and paper regulations. The required LC-50 test is for acute lethality. For this test, an effluent is considered acutely lethal if the treated effluent at 100 concentration kills more than 50 of the Rainbow Trout exposed to it during a 96-hour period. Long-term effects, including impacts on reproduction or growth, cumulative impacts on fish habitat and the larger environment or accumulation of substances harmful for human consumption are not regulated under the PPER. Testing for environmental effects is required for information purposes. Only two mills in Canada test for and report impacts of effluent on

the usability of fish resources by humans. Effluent from pulp and paper mills is regulated at the federal level principally by the Pulp and Paper Effluent Regulations PPER, which form part of the Fisheries Act. The standards that apply to pulp effluent today were adopted in 1992 and have remained unchanged for 25 years. Highly toxic dioxins and furans are regulated under a separate Act. 70 of pulp paper mills are having harmful effects on aquatic life and habitat despite meeting current regulations. Long term impacts on reproduction and growth are not regulated under PPER. Federal regulations cover only a few of the recognized harmful substances in pulp mill effluent. For example, there are no federal regulations for AOX compounds, a component of pulp effluent in mills that bleach with chlorine or a chlorine compound. AOX compounds are recognized as extremely toxic. They are not easily broken down by bacteria and thus bioaccumulate in the environment. Yet they are not included in PPER regulations. Neither are phenols, toluene, chloroform or chemical oxygen demand COD. For 25 yrs the regulations that apply to pulp effluent have remained unchanged. Provinces may go beyond Federal standards and adopt stricter regulations for effluent from pulp mills. British Columbia, Alberta, Ontario and Quebec have adopted stricter regulations. Nova Scotia does not have regulations, but sets limits through individual industrial approvals. The EU has more protective regulations than Canada does. The new treatment facility is not better than the current one. Northern Pulpâ?Ts proposed new effluent treatment facility differs from the present facility in a number of ways. In the present system untreated effluent is piped from the mill to the north settling ponds at Boat Harbour, where it remains for 12 hours for primary treatment. It then moves to an aerated stabilization basin where effluent is placed in contact with microorganisms. The effluent remains there for 8 days for secondary treatment. After 8 days, the effluent is discharged from the aeration basin at what is known as Point C, and treatment is considered finished. At point C, samples are taken for testing to determine whether the treated effluent meets regulations. Point C is also a dead zone! After point C, the effluent enters the 300-acre Boat Harbour lagoon, also known as Boat Harbour Basin. Boat Harbour Basin was initially used as a stand-alone effluent treatment facility. In 1972, settling ponds and an aerated stabilization basin were constructed to meet stricter regulations for pulp effluent treatment. Additional aeration and other upgrades were added from 1992-1996, as the federal government again adopted stricter regulations. The lagoon at Boat Harbour has not been officially part of the effluent treatment system since 1972. Official or not, treated effluent remains in the lagoon for an additional 20-30 days. Further aeration, settling, cooling, volatilization and breakdown of materials takes place during that time. This is referred to as â? opolishingâ? or tertiary treatment. Natural springs and surface run off further dilute the effluent. According to Northern Pulpâ?Ts figures, during the time in Boat Harbour Basin, total suspended solids TSS and biochemical oxygen below the proposed water quality standard of 1.â? The Stantec Preliminary Receiving Waters Study, August 2017, illustrates the same lack of dispersion. Treated effluent has never flowed directly into the deeper waters of the Strait. From its discharge at the shoreline, after 20-30 days in Boat Harbour Basin, tides and currents further break down, dilute and settle contaminants before they reach the deeper waters of the Strait. It is misleading to imply that effluent from the proposed new system pumped directly into the fishing grounds of the Strait within 24 hour that contains almost 1000 kg of solids will have the same impact as the effluent which presently enters the Strait at the shore edge, hugs the shore and recirculates in and out of Pictou Harbour. Further to this, the same proposal was rejected in 1994 for the same concerns! Nova Scotians are on the hook for the Boat Harbour clean up which is expected to be close to half a billion dollars once remediated. They also paid for the design process of the proposed effluent process at a cost of $6 million and will be expected to cover the construction, installation, labour etc for the proposed pipe estimated at $100 million. Further to that $127 million of Nova Scotia tax payers money have been given to the mill in the last several years. Meanwhile we have overworked doctors

leaving our province. We have ER closures and very long wait times for treatment and care. Our education system is also at its max with constant cuts. Funding for seniors and veterans as well as many other public programs and services would benefit from these large sums of tax dollars. It is time to close this mill and transition to more sustainable, environmentally-friendly forestry practices in our province. Name: Email: @gmial.com

Meeting Regulations DOES NOT Prevent Harm Nova Scotia and the Northumberland Strait has many great resources. However, they are at risk with the proposed Effluent treatment process. As it stands right now, there are no CCME guidelines established for Marine Environments for some of the different chemicals and compounds that make up the pulp mill effluent. Pulp and Paper Effluent Regulations PPER in Canada cover two matters total suspended solids TSS and biochemical oxygen demand BOD. Even though total discharges of TSS and BOD in pulp and paper effluent decreased by approximately 90 and 97 respectively from 1970-2008, pulp mill effluents continue to have harmful impacts on fish, fish habitat and the environment. Information gathered through environmental effects monitoring EEM at all Canadian mills points to the disturbing conclusion that although mills are meeting regulations and passing the PPER toxicity test, 70 are having harmful effects on aquatic life and habitat, and 55 are having harmful effects on the larger environment. This

information led the federal department of Environment and Climate Change to undertake a modernization review of pulp and paper effluent regulations in 2017. â?oResults from EEM studies and the changing realities of the pulp and paper industry indicate a need to modernize the PPER to improve environmental protection,â? the department states. If meeting regulations is not enough to prevent harm, neither is passing toxicity tests. Only one toxicity test is required under Canadian pulp and paper regulations. The required LC-50 test is for acute lethality. For this test, an effluent is considered acutely lethal if the treated effluent at 100 concentration kills more than 50 of the Rainbow Trout exposed to it during a 96-hour period. Long-term effects, including impacts on reproduction or growth, cumulative impacts on fish habitat and the larger environment or accumulation of substances harmful for human consumption are not regulated under the PPER. Testing for environmental effects is required for information purposes. Only two mills in Canada test for and report impacts of effluent on the usability of fish resources by humans. Effluent from pulp and paper mills is regulated at the federal level principally by the Pulp and Paper Effluent Regulations PPER, which form part of the Fisheries Act. The standards that apply to pulp effluent today were adopted in 1992 and have remained unchanged for 25 years. Highly toxic dioxins and furans are regulated under a separate Act. 70 of pulp paper mills are having harmful effects on aquatic life and habitat despite meeting current regulations . Long term impacts on reproduction and growth are not regulated under PPER. Federal regulations cover only a few of the recognized harmful substances in pulp mill effluent. For example, there are no federal regulations for AOX compounds, a component of pulp effluent in mills that bleach with chlorine or a chlorine compound. AOX compounds are recognized as extremely toxic. They are not easily broken down by bacteria and thus bioaccumulate in the environment. Yet they are not included in PPER regulations. Neither are phenols, toluene, chloroform or chemical oxygen demand COD. For 25 yrs the regulations that apply to pulp effluent have remained unchanged. Provinces may go beyond Federal standards and adopt stricter regulations for effluent from pulp mills. British Columbia, Alberta, Ontario and Quebec have adopted stricter regulations. Nova Scotia does not have regulations, but sets limits through individual industrial approvals. The EU has more protective regulations than Canada does.
https://drive.google.com/file/d/1H1HltUnh9Oem_KpPHwxmye7z5mfJP5_W/view?fbclid=IwAR1WyzupTqjLC9u8tjxWpq94e5anlEQDs_-JTH0z8vPWAoaKkyIoGBuumdM 4. New treatment Facility is NOT BETTER Northern Pulpâ?Ts proposed new effluent treatment facility differs from the present facility in a number of ways. In the present system, untreated effluent is piped from the mill to the north settling ponds at Boat Harbour, where it remains for 12 hours for primary treatment. It then moves to an aerated stabilization basin where effluent is placed in contact with micro-organisms. The effluent remains there for 8 days for secondary treatment. After 8 days, the effluent is discharged from the aeration basin at what is known as Point C, and treatment is considered finished. At point C, samples are taken for testing to determine whether the treated effluent meets regulations. POINT C is also a DEAD ZONE!! After point C, the effluent enters the 300-acre Boat Harbour lagoon, also known as Boat Harbour Basin. Boat Harbour Basin was initially used as a stand-alone effluent treatment facility. In 1972, settling ponds and an aerated stabilization basin were constructed to meet stricter regulations for pulp effluent treatment. Additional aeration and other upgrades were added from 1992-1996, as the federal government again adopted stricter regulations. The lagoon at Boat Harbour has not been officially part of the effluent treatment system since 1972. Official or not, treated effluent remains in the lagoon for an additional 20-30 days. Further aeration, settling, cooling, volatilization and breakdown of materials takes place during that time. This is referred to as â?opolishingâ? or tertiary treatment. Natural springs and surface run off further dilute the effluent. According to Northern Pulpâ?Ts figures, during the time in Boat Harbour Basin, total suspended solids TSS and biochemical oxygen below the

proposed water quality standard of 1.â? The Stantec Preliminary Receiving Waters Study, August 2017, illustrates the same lack of dispersion. Treated effluent has never flowed directly into the deeper waters of the Strait. From its discharge at the shoreline, after 20-30 days in Boat Harbour Basin, tides and currents further break down, dilute and settle contaminants before they reach the deeper waters of the Strait. It is misleading to imply that effluent from the proposed new system pumped directly into the fishing grounds of the Strait within 24 hour that contains almost 1000kg of solids will have the same impact as the effluent which presently enters the Strait at the shore edge, hugs the shore and recirculates in and out of Pictou Harbour. Further to this, the same proposal was rejected in 1994 for the same concerns!! https://thetyee.ca/Analysis/2019/02/07/Pollution-Nova-Scotia-Pulp-Mill-Sink-Trudeau/?fbclid=IwAR2_XplvKgfjWHCh2fTuzimxmeMsnWVTVVhE6agYFPiXSwR3VvkEXHB4GEA https://docs.wixstatic.com/ugd/b61814_ab61cca668f1432f890d2d0a7715a554.pdf?fbclid=IwAR27oqDYJfCCBWdlMyNExvUrYZ_rBS86Gw77cT35IlLtVdyzh05AYwwcB1c 5. Better return for your TAX DOLLARS Nova Scotians are on the hook for the Boat Harbour clean up which is expected to be close to half a billion dollars once remediated. They also paid for the design process of the proposed effluent process at a cost of $6 Million dollars and will be expected to cover the construction, installation, labour etc for the proposed pipe estimated at $100 Million dollars. Further to that $127 Million dollars of NS Tax payers dollars have been given to the mill in the last several years. Meanwhile we have doctors over worked and leaving our province. We have ER closures and very long wait times for treatment and care. Our Education system is also at its max with constant cuts. Funding for Seniors and Veterans as well as many more public programs and services would benefit from the large sums of NS tax dollars instead of it going towards Northern Pulp. https://www.halifaxexaminer.ca/featured/northern-pulp-scotsburn-lumber-and-u-s-tariffs/#News https://www.halifaxexaminer.ca/province-house/health-care-crisis-check-leadership-to-solve-it-another-question/?fbclid=IwAR1oPeQe3iFB-Oe0llwCNT9uax2Gos8ZQNhV3YYvTOO67j5aRX8p310_tQ8 #NOPIPE https://novascotia.ca/nse/ea/Replacement_Effluent_Treatment_Facility_Project/ Name: Email: @gmail.com Address: : Privacy-Statement: agree x: 70 y: 24

Project: replacement_effluent_treatment_facility_project Comments: I fully support the proposed effluent treatment facility project at Northern Pulp Nova Scotia. The level of investment that the company has spent on this project to date is significant and there is no doubt in my mind that the company has full intentions on building the best possible solution that is economically feasible. There has been a significant negative social impact to our region as a result of those who choose to refuse to trust in our forestry industry. Technology investments of the past 50 years make it possible to protect our environment and encourage industrial development, unlike the Boat Harbour facility as it currently sits. The findings of the provincial assessment should directly assess and evaluate the impacts to the local fisheries and waterways as this is undoubtedly at the forefront of the minds of many particularly those that are opposed to this facility. Project: replacement_effluent_treatment_facility_project Comments: I say NO to any extension of time to clean up! Northern Pulp has had ample time - which they agreed to. We want no effluent pipe, and grant no extra time to clean up. Northern Pulp should be facing crippling fines if they dont return the area to pristine condition by the date agreed upon. The NS government has dragged its feet, looked the other way, and dangled jobs in front of the local population. How about providing well-paid jobs that the clean up will create? Keeping jobs for Nova Scotians is not the problem, distorted profits for foreign companies is. We judge by results, not by promises and fantasy claims. The poisoning of our water, destruction of our rich fishing areas and their communities, and the battle-field scarring where our forests used to stand are the results that generations of Nova Scotians will live with. There is nothing that could be worth this rapid, wholesale destruction. No extension, and no effluent pipe! Hire real scientists to work out something that will in fact be good for the environment and people of Nova Scotia, now and down the generations. Project: replacement_effluent_treatment_facility_project Comments: It is completely irresponsible in this day and age to further consider allowing pollution to continue from this facility. The new plan is slightly better than the current condition but still allowing pollution to be introduced in to a natural habitat at an alarming rate. A slightly lesser evil is still an evil. And this new evil is being moved to a location that is potentially allowing the bad decision to reach further into the eco system and not only affect the environment and people of this province but neighboring ones. It is ridiculous that the tax payers of NS are on the hook for clean up of this companies negligent actions up until now due to the indemnity clause that should have never been approved, why on earth should we consider actions that will only increase this bill into the future. while I am admittedly not completely informed about how much government money in the way of tax cuts or grants go to this antiquated mill, I am sure they are getting some financial backing from the NS tax payers. Perhaps this should stop and the money be allocated to funding more environmentally sound companies to offset jobs that may be lost if the company were to pull up and leave because it didnt get its way and be allowed to continue to work towards destroying our environment. Why do we let foreign companies get rich at expense of our health and out land. I dont always agree with the view points of our indigenous peoples but in matters like this they do prove to be better stewards of the natural resources than the rest of us more often than not. In closing I think the only way northern pulp should continue is in an updated facility that does not in any way further our march into the climate crisis sitting before us and the measures that are required come out of their pockets not ours. If they decide they cannot part with the money required to be a responsible corporate citizen then I am sure the savings to our taxpayers can go to help find business partners who can. No extensions, no more corporate welfare, no more compromise on my daughters future. Name: Email: @hotmail.com Address: Municipality: Postal-Code: Phone: :

Project: replacement_effluent_treatment_facility_project Comments: To Ms. Miller Dept. of Environment NS, My wife and I have a cottage on Caribou Island. The island is beautiful. We swim there, dig quahogs and enjoy watching the ferry pass by every summer. We are literally a good golf ball drive from where Northern Pulp wants to have the outflow of its pipe. I see firsthand every winter the huge amount of sea ice that comes into the strait and Caribou Harbour. The harbour and strait are very shallow in places. Just this fall we had a huge storm that moved the entire beach and armour rocks. With rising oceans being the new normal, the extremes are only going to get worse and this pipe will not survive. What is in the pipe is also a problem. They say it is treated effluent but there will be solids and other leftover particles from what I have read. Even if the effluent was completely clean it is not a clever idea to release such a huge volume of fresh water into a salt water environment especially with temperatures between 24 and 34 degrees Celsius. We spend most of the su mmer at the cottage and get to see firsthand where the lobster traps are set. Many are set exactly where NP wants their pipe to go. We also see in September hundreds of herring boats that drop anchor in the evenings who fish just to the left of where the pipe is going to go. I have a daughter and I do not want her to have to witness what the people of Pictou Landing have had to do deal with and live with for the last 50 years. It is 2019, we know better now! We have not been able to trust this company. They have had 5 years to come up with a better plan and have let the citizens of NS and their own employees down by not doing so. They think they can continue to bully us and our governments into accepting their substandard operating methods. If they were serious about continuing to do business here they would have invested in a bleach closed loop system. They have been a bad neighbour and the smell every 2nd day is a continuous reminder of them and their arr ogance. I like anyone else hate to see jobs go but they are not worth the risk of wrecking the entire Northumberland Strait and its eco system. Please do the right thing and reject this and be on the right side of history. Sincerely,

Project: replacement_effluent_treatment_facility_project Comments: An environmental impact assessment needs to be done of the effluent treatment ponds that are directly adjacent to First Nations land. The health impacts of their exposure to these wastes should be performed - census of cancer, asthma and autoimmune disorders. The people who have been impacted by effluent from the Northern Pulp Mill should be compensated financially by the mill. The mill has negatively impacted the tourism industry in the Pictou area due to the foul odours emitted into the air. Another once prosperous industry - local fin fish and lobster fisheries - may also being impacted by treated effluent but this has not been investigated by the DFO although there is significant anecdotal evidence that this is the case. This mill has received large government handouts to remain in business as it contributed so much to the local economy even though this is a foreign owned company which employs merely hundreds of locals. The detrimental impact of the Northern Pul p Mill on the local fishery and tourism industries certainly outweighs the mere hundreds of jobs provided by this company. Name:

Project: replacement_effluent_treatment_facility_project Comments: We are a family of six who rely on the Mill and its projects to sustain our life here in Pictou County. The job loss that could be felt in our community if this project is not given the proper time to unfold will be catastrophe. My husband and I are already seeking employment and property in Prince George and Kamloops, British Columbia. If we can not maintain our life here due to loss of our primary source of income- our source to provide post second education for our four children to be a contributing member of our community to be able to be a consumer that allows our fellow community members to maintain their businesses than there is really no point in staying. Without Northern Pulp remaining open and continuing we will just be another statistic of young families leaving Nova Scotia to find a sustainable living. There is, in my mind, no need for the hype that the treatment facility will cause adverse affects to the surrounding waters and natures. There is no amoun t of tourism and other employment opportunities that can adequately provide for the economy of rural Nova Scotia than the NP mill and its 11000 spin off jobs.There is no way a government can sit by and allow this to happen in good conscious. The time for being environmentally friendly is upon us but we must not forgo the people who provide for the opportunity to create the change. This projects future is mandatory for Nova Scotia and my family personally. Name: Email: @hotmail.com Address:

Project: replacement_effluent_treatment_facility_project Comments: It is disgraceful to think that any government who says that they are for the environment and wants the people to pay for reducing the effects of pollution that cause global warming would think this is ok. Toxic effluent being pumped into the ocean, really! This will kill ocean life that is integral in producing oxygen and using carbon dioxide thus reducing the carbon in our atmosphere. Not only will it impact the algae and other sea plants that use carbon dioxide but it will poison fish and ruin the habitat where many species such as striped bass that were at risk in this area and have just now made a comeback but everything that feeds and spawns in this part of the ocean. Seams like the Liberal Party, provincial and federal talk the talk but dont walk the walk. Allowing spraying of toxic chemicals in forest to kill hardwoods off. Sprays that have been proven to be carcinogenic . Clear cutting of our forests, etc. The list of environmental issues that this governme nt endorses is disgusting. Never will I vote Liberal again. Project: replacement_effluent_treatment_facility_project Comments: This tremendous project should be approved without delay. Northern Pulp NP is replacing the old Boat Harbour facility it inherited with a modern, state-of-the-art system like those in the very best kraft pulp mills worldwide. There are no significant residual environmental effects on the 17 valued environmental components identified. Even under worst case conditions water quality will reach ambient conditions within 2m of the diffuser colour will return to baseline within 5m of the diffuser and temperature will be within 0.1C of background within 100M. Congratulations to the NP team for this comprehensive plan. It cannot be approved, built and commissioned soon enough. Name: Email: @hotmail.com Address:

Project: replacement_effluent_treatment_facility_project Comments: This mill is not worried about our marine environment Northumberland Strait Sportfishing Association Canada Feb 11, 2019 â?" I have a hard time understanding how there is any confusion regarding how an effluent pipe, with a volume of this magnitude, directly to the Northumberland Strait, wonâ?Tt cause any negative effects to the marine environment and the existing fishery. Basically, Northern Pulp wants to redirect the majority of the flow from the Middle River â?" between 62 and 90 million liters per day, heat it up to 37 degrees Celsius, add one ton of what is technically toxic waste solids, then direct that to the mouth of Caribou Harbour. This effluent will kill lobster larvae itâ?Ts inevitable and would directly breach section 36 of the Federal Fisheries Act. The mill then states, â?~itâ?Ts unlikely there will be any harm to lobster,â?T in their environmental assessment. It is virtually impossible that there will not be adverse effects from this dramatic redirection of the Middle River, to the mouth of Caribou Harbour. For our Provincial government to have not immediately sent this to the Federal government for environmental assessment is outrageous. To suggest, â?~this is not a new facility, just replacement of an existing oneâ?T, as the reason for a provincial assessment, is not reasonable or realistic. To completely redirect the flow of a major river to the mouth of Caribou Harbour, miles from where itâ?Ts been flowing, into the very heart of the most lucrative lobster and herring grounds in the Northumberland Strait, a provincially shared Federal Fishing zone, this goes beyond responsible, honest government, with regards to the environmental assessment applied. Our government is in an obvious conflict of interest. The Supreme Court of Canada agrees, according to the ruling of Justice Timothy Gabriel last fall, with regards to Pictou Landing First Nations and the Provincial Government with respect to the government funding of a replacement facility and the relationship with Northern Pulp. Justice Gabriel stated, â?oâ?¦ it would essentially boil down to the Crown wearing one hat being called upon to determine whether a project which the Crown wearing another hat has funded passes muster. This will do nothing to assuage whatever cynicism has been engendered in the past.â? I believe the working group of fishermenâ?Ts organizations, together with Pictou Landing First Nations, should be taking the Province and Northern Pulp to Supreme Court on this basis in the event the Federal Government does not step in and take control of this environmental assessment. I believe we, as fishermen and First Nations, have a legal right to protect our industry â?" and Justice Gabriel has set the precedent. We undoubtedly will lose our Marine Stewardship Certification, a major marketing tool, for both our herring and lobster fisheries as a result of this new effluent pipeline, as part of the criteria is the species are harvested from a healthy environment, in a sustainable fashion. Itâ?Ts already affecting the existing fishery and not just here, in P.E.I as well. Fishermen are anticipating the value of their enterprises to be less than half what there are now, as soon as there is real indication of construction of this effluent pipe and some have literally already sold out on this realistic assumption. In Northern Pulps submitted proposal, the pipe is required to be set at a depth below the seabed of three meters due to potential from ice damage. To accomplish this, they submit the trench would have to be 9 meters across, for the entire length of 4.1 kilometers from where it enters the harbour adjacent to the ferry dock, to the mouth of the harbour, the proposed discharge location. The sediment alone from this construction would destroy the local fishery and directly breaches section 35 of the Federal Fisheries Act as it will destroy marine habitat, eelgrass beds, etc., killing juvenile fish, lobster and crab. The sediment dispersed will cause havoc with the marine environment for miles and for how long, is anyoneâ?Ts guess. There came a point in

time when the environment outweighed the economy, it has passed. In this day and age, to even consider directing this massive flow of â?~treatedâ?T, poisonous effluent directly to the Northumberland Strait, is not reasonable. There is an alternative, yet the mill will not consider it, as it would mean less profits â?" converting the mill to a mechanical process that separates the pulp, no effluent discharge required and less air emissions â?" this actual possibility could be discussed at length. The mill simply will not consider it, as it is less profitable and there would be â?~downtimeâ?T at their expense while converting. Our government is closing Boat Harbour in January 2020, ten years premature of the lease agreement, but actually 25 years late, from what was originally promised to Pictou Landing First Nations PLFN. To continue using Boat Harbour, is to continue with the current environmental racism that PLFN have been enduring for 52 years and are currently, on a daily basis, contending with. To ask for an extension, is simply ignorant. Because the closure of Boat Harbour is premature of this lease agreement that the Province agreed to without PLFN consent, Premier McNeil has been quoted saying that the monies our government will be giving Northern Pulp are not to directly pay for the estimated $130 million 15.5 km pipe and new treatment facility, but in lieu of the lease agreements early closureâ?¦. Obviously, this $130 million could be better spent on converting the mill to a mechanical, closed loop system. The mill has no interest and has continually stated, no pipe = no mill. If all you are thinking about is profits, you canâ?Tt blame them. This company, Asia Pulp and Paper, subsidiary, Paper Excellence, buys up mothballed pulp mills for peanuts in comparison to todayâ?Ts cost, that would be upwards of 2 billion dollars, spends next to nothing on upgrades, rakes in government subsidies and hand-outsâ?¦ and in the case of our mill, is not responsible for any environmental damage. What a deal! The mill with one of the worst environmental records in the country, suffers no consequences for environmental damage â?" a coincidence? Think about that, why would you improve your discharges, air and water, if there are no consequences? No, you canâ?Tt blame them for not wanting to convert the mill. There would be downtime and they couldnâ?Tt sue our government for it â?" and they will be suing for any â?~downtimeâ?T when Boat Harbour closes, you can count on that. They have a sweetest of deals right now and the fishing and forestry industries are both paying for it! The thing is, our government, the people, have allowed this to happen. The question is, will we continue to? This mill is not worried about our marine environment and really, other than from a profits perspective, they are not worried about the longevity of our forest industry either. I donâ?Tt suspect anyone in the forest industry would want any harm to the fishing industry and I know the reverse is the same we in the fishing industry want the forest industry to thrive, but simply not at our expense. There is a solution and the extension of Boat Harbour is not the solution. The solution is to convert the mill this is what the forest industry should be promoting to Northern Pulp. Name:

Project: replacement_effluent_treatment_facility_project Comments: There are so many reasons the people of this province and beyond will NOT accept anything less than a federal assessment. This plan was declined twice already in the past by federal level so Im unsure how this is acceptable in 2019. It should also be noted this plan makes NO mention to ice scours that would damage the pipe at the caribou location. The people have continually stated we will not accept a pipe. We know this would destroy our waters. The Supreme court has already ruled any future construction must be worked on with Pictou Landing first Nations. We the people are standing FIRM with this group. We believe many land demonstrations would occur and escalating incidents would happen. We do NOT WISH THIS. As a long time resident of Pictou County, I am ashamed at the true blatant corruption that has taken place since 1967 regarding this mill. It is far too old to continue. CLOSED LOOP should be be the target. Our many reasons can be found here as well, why we a re demanding a federal assessment. For your health: The composition of the toxic effluent will contain dioxins, furans, metals, solids and other contaminates at a rate of 90,000,000 Litres per day. Dioxins and furans can cause very serious health issues to humans and our food sources. Shellfish absorb dioxins and furans at 25,000-50,000 times the concentration in the water. The Northern Pulp treatment system proposal includes a plan to burn the waste sludge. The waste sludge contains toxins which would be released through the stacks of the millâ?Ts power boiler. The proposal is to â? odewater the sludge prior to mixing it with bark and other wood waste for combustion in the millâ?Ts power boiler.â? This is the same power boiler that is currently and repeatedly failing stack emissions tests. Problems with air quality from mill emissions have been documented for years. Lack of appropriate monitoring and enforcement already puts area residents at risk. Now, Northern Pulp is considering adding sludge containing toxins to the combustion mix, increasing health risks from NPâ?Ts air emissions. It is also important to note, the route of this effluent pipe goes through the source water supply for the town of Pictou and community of Caribou and surrounding area. See also: Maineâ?Ts dioxin problem What you should know about Northern Pulpâ?Ts proposed new treatment facility 2. For the economy The proposed treatment system runs the risk of harming three lifelong Industries worth close to $4 billion to the Nova Scotia economy. The tourism industry is worth $2.7 billion and prides itself on warm, clean water and world class sandy beaches. The commercial fisheries is worth over $1 billion and relies on sustainable wild shellfish that is shipped all across the world. The sport fishing industry is worth $56 million, and the Northumberland Strait is home to the last remaining stable Atlantic Salmon stocks on mainland Nova Scotia. See also: Nova Scotia exports top 10 Nova Scotia celebrates seafood export success at fisheries conference 3. For the environment â?" Meeting regulations does not prevent harm Nova Scotia and the Northumberland Strait are put at risk by the proposed effluent treatment process. As it stands right now, there are no CCME guidelines established for marine environments in terms of some of the chemicals and compounds that make up the pulp mill effluent. Pulp and Paper Effluent Regulations PPER in Canada cover two matters total suspended solids TSS and biochemical oxygen demand BOD. Even though total discharges of TSS and BOD in pulp and paper effluent decreased by approximately 90 and 97 respectively from 1970-2008, pulp mill effluents continue to have harmful impacts on fish, fish habitat and the environment. Information gathered through environmental effects monitoring EEM at all Canadian mills points to the disturbing conclusion that although mills are meeting regulations and passing the PPER toxicity test, 70 are having harmful effects on aquatic life and habitat, and 55 are having

harmful effects on the larger environment. This information led the federal department of Environment and Climate Change to undertake a modernization review of pulp and paper effluent regulations in 2017. â?oResults from EEM studies and the changing realities of the pulp and paper industry indicate a need to modernize the PPER to improve environmental protection,â? the department states. If meeting regulations is not enough to prevent harm, neither is passing toxicity tests. Only one toxicity test is required under Canadian pulp and paper regulations. The required LC-50 test is for acute lethality. For this test, an effluent is considered acutely lethal if the treated effluent at 100 concentration kills more than 50 of the Rainbow Trout exposed to it during a 96-hour period. Long-term effects, including impacts on reproduction or growth, cumulative impacts on fish habitat and the larger environment or accumulation of substances harmful for human consumption are not regulated under the PPER. Testing for environmental effects is required for information purposes. Only two mills in Canada test for and report impacts of effluent on the usability of fish resources by humans. Effluent from pulp and paper mills is regulated at the federal level principally by the Pulp and Paper Effluent Regulations PPER, which form part of the Fisheries Act. The standards that apply to pulp effluent today were adopted in 1992 and have remained unchanged for 25 years. Highly toxic dioxins and furans are regulated under a separate Act. 70 of pulp paper mills are having harmful effects on aquatic life and habitat despite meeting current regulations. Long term impacts on reproduction and growth are not regulated under PPER. Federal regulations cover only a few of the recognized harmful substances in pulp mill effluent. For example, there are no federal regulations for AOX compounds, a component of pulp effluent in mills that bleach with chlorine or a chlorine compound. AOX compounds are recognized as extremely toxic. They are not easily broken down by bacteria and thus bioaccumulate in the environment. Yet they are not included in PPER regulations. Neither are phenols, toluene, chloroform or chemical oxygen demand COD. For 25 yrs the regulations that apply to pulp effluent have remained unchanged. Provinces may go beyond Federal standards and adopt stricter regulations for effluent from pulp mills. British Columbia, Alberta, Ontario and Quebec have adopted stricter regulations. Nova Scotia does not have regulations, but sets limits through individual industrial approvals. The EU has more protective regulations than Canada does. See also: Preliminary Receiving Water Study for Northern Pulp Effluent Treatment Plant Replacement, Pictou Harbour, Nova Scotia 4. The new treatment facility is not better than the current one Northern Pulpâ?Ts proposed new effluent treatment facility differs from the present facility in a number of ways. In the present system untreated effluent is piped from the mill to the north settling ponds at Boat Harbour, where it remains for 12 hours for primary treatment. It then moves to an aerated stabilization basin where effluent is placed in contact with microorganisms. The effluent remains there for 8 days for secondary treatment. After 8 days, the effluent is discharged from the aeration basin at what is known as Point C, and treatment is considered finished. At point C, samples are taken for testing to determine whether the treated effluent meets regulations. Point C is also a dead zone! After point C, the effluent enters the 300-acre Boat Harbour lagoon, also known as Boat Harbour Basin. Boat Harbour Basin was initially used as a stand-alone effluent treatment facility. In 1972, settling ponds and an aerated stabilization basin were constructed to meet stricter regulations for pulp effluent treatment. Additional aeration and other upgrades were added from 1992-1996, as the federal government again adopted stricter regulations. The lagoon at Boat Harbour has not been officially part of the effluent treatment system since 1972. Official or not, treated effluent remains in the lagoon for an additional 20-30 days. Further aeration, settling, cooling, volatilization and breakdown of materials takes place during that time. This is referred to as â?opolishingâ? or tertiary treatment. Natural springs and surface run off further dilute the effluent. According to Northern Pulpâ?Ts figures, during the time in Boat Harbour Basin, total suspended solids TSS and biochemical oxygen below the proposed water

quality standard of 1.â? The Stantec Preliminary Receiving Waters Study, August 2017, illustrates the same lack of dispersion. Treated effluent has never flowed directly into the deeper waters of the Strait. From its discharge at the shoreline, after 20-30 days in Boat Harbour Basin, tides and currents further break down, dilute and settle contaminants before they reach the deeper waters of the Strait. It is misleading to imply that effluent from the proposed new system pumped directly into the fishing grounds of the Strait within 24 hour that contains almost 1000 kg of solids will have the same impact as the effluent which presently enters the Strait at the shore edge, hugs the shore and recirculates in and out of Pictou Harbour. Further to this, the same proposal was rejected in 1994 for the same concerns! See also: How pollution from a Nova Scotia pulp mill could sink Trudeau on both coasts Fifty years of pulp effluent 5. Better return for your tax dollars Nova Scotians are on the hook for the Boat Harbour clean up which is expected to be close to half a billion dollars once remediated. They also paid for the design process of the proposed effluent process at a cost of $6 million and will be expected to cover the construction, installation, labour etc for the proposed pipe estimated at $100 million. Further to that $127 million of Nova Scotia tax payers money have been given to the mill in the last several years. Meanwhile we have overworked doctors leaving our province. We have ER closures and very long wait times for treatment and care. Our education system is also at its max with constant cuts. Funding for seniors and veterans as well as many other public programs and services would benefit from these large sums of tax dollars. Project: replacement_effluent_treatment_facility_project Comments: It has been polluting our air and water long enough.If it cannot clean up its pollution ,it should be closed.Nova Scotians will adjust. The pulp mill in Liverpool closed and new businesses have started.We should not be paying for the clean-up costs, they need to be passed on to the polluter. No profits should accrue to the shareholders until this pollution cost is factored in as a cost of production. Besides, I doubt very much that stumpage fees to Nova Scotians come anywhere close to the pollution cost.The old joke where I grew up was in winter if you smelled sulfurdioxide in Truro some 50 miles away, we were in for a nasty eastern wind and snowstorm. Project: replacement_effluent_treatment_facility_project Comments: If anyone wants to know the potential impacts on Marine species in the Northumberland Strait, look no further than NPs 1700 page Environmental Assessment. We the people will NOT accept anything less than a federal assessment. We will stand strong and firm with Pictou Landing first nations. The plan to mitigate the risk is weak at best and meets regulations. Meeting regulations is not good enough when the Strait is at its max threshold for pressures. SEE BELOW FOR INFO DIRECTLY FROM THEIR PROPOSAL Impact Evaluation/Effects Assessment The potential environmental effects of the project and project activities on marine fish and fish habitat are assessed in the following section. Potential Effects Marine fish could be affected by activities and components of the project during the construction phase and operation and maintenance phase. If unmitigated, these changes have the potential to change marine fish populations and fish habitat e.g., adult fish, juveniles, eggs and larvae, invertebrates and marine plants through direct mortality or indirectly through alteration or destruction of habitat. The environmental assessment of marine fish is focused on changes in marine fish populations. For the purposes of this assessment, a change in marine fish populations includes any physical injury or mortality on fish attributable to the project, and any destruction or alteration of habitat from disturbance of the marine environment. Construction Phase During construction, marine fish may experience direct mortality or functional impairment resulting in eventual mortality. The placement of in-water infrastructure would have a direct effect on sessile or slow-moving demersal fish and invertebrates as they would be unlikely to avoid construction activities within the marine PFA and could experience mortality as a result of smothering or crushing. The construction of marine-based infrastructure may affect marine fish populations through a change in available substrate and size distribution, a change in water and sediment quality, or changes to the acoustic qualities of the marine environment. The process of installing marine pipelines has a direct effect on the benthic environment. In-water activities during the construction phase may also result in a change in sediment quality. The disturbance of marine sediments may temporarily increase the concentration of TSS in the water column. Suspended solids can reduce feeding and growth rates and can alter migration of salmon in nearshore habitats Robinson and Cuthbert 1996. Reduced feeding rates, avoidance behaviour and suffocation due to effects on gill function have been observed in herring from suspended sediments Robinson and Cuthbert 1996. There may also be indirect effects on fish through alterations within localized food web structures. The severity of the effect of suspended sediments increases as a function of sediment concentration and duration of exposure Newcombe and Jensen 1996. During the construction phase, vessel noise will be concentrated within the LAA and the majority of anthropogenic sound in the marine environment generated during construction will originate through trenching, pipe laying, and backfilling. There is also the potential for underwater sound if blasting is used during the construction phase. Some marine fish species may be affected when exposed to high intensity sounds Popper 2003. The sound emitted to the marine environment during the construction phase could therefore temporarily reduce the quality of fish habitat in the marine PFA. Operation and Maintenance Phase Potential effects on marine fish and fish habitat during pipeline operation include the discharge of treated effluent from the ETF. These potential effects could result from: an increase in temperature, nutrients nitrogen and phosphorus, or TSS a change in colour, chemical and biochemical oxygen demand, dissolved oxygen DO, or pH or a reduction in salinity from the discharge of treated freshwater effluent into the Northumberland Strait.

Lobster harvesters in the Pictou region have expressed concern about the potential effects of the discharge of treated effluent on lobsters, particularly in the larval stage. Potential effects to fish during the construction phase may also be applicable during the operation and maintenance phase if project maintenance activities require the presence and operation of project vessels or equipment, and in-water activities that include seabed disturbance e.g., for pipeline retrieval #NOPIPE #NOEXTENSION Name: Email: Address: Municipality:

Project: replacement_effluent_treatment_facility_project Comments: I do not support the proposed effluent waste proposal. Northern Pulp have listed some of the potential impacts on Marine species in the Northumberland Strait in their submission. The plan to mitigate the risk is weak at best and meets regulations. Meeting regulations is not good enough when the Strait is at its max threshold for pressures. This area is a major ecomonmic driver for the province of NS as well as PEI and NB. Further to that, this area has over 50 species of vegetation, wildlife and marine life that are listed as SAR, SOCC, Threatened and Endangered within the ETF footprint. SEE BELOW FOR INFO DIRECTLY FROM THEIR PROPOSAL Impact Evaluation/Effects Assessment The potential environmental effects of the project and project activities on marine fish and fish habitat are assessed in the following section. Potential Effects Marine fish could be affected by activities and components of the project during the construction phase and operation and maintenance phase. If unmitigated, these changes have the potential to change marine fish populations and fish habitat e.g., adult fish, juveniles, eggs and larvae, invertebrates and marine plants through direct mortality or indirectly through alteration or destruction of habitat. Project: replacement_effluent_treatment_facility_project Comments: I believe the extension to the boat harbor treatment facility MUST be extended so Northern Pulp can complete whatever is necessary to forge forward. It amazes me that the premier is taking such a hard stand on this matter which will reduce the provincial taxes paid by all those that will loose their jobs if the mill closes, whereas he is so willing to spend multi millions of taxpayer dollars on the Yarmouth ferry. How political is that! Pictou county is hard hit employment wise as it is. Closing the mill would have a dire affect on our economy. No matter what scientists say about the negligent affect the new system would have on the Northumberland Strait, the fishermans association would not believe it anyway.THE PLANT MUST STAY OPEN FOR THE GREATER BENEFIT OF ALL NORTHERN NOVA SCOTIA! Project: - Choose - Comments: As a fisherman in the northumberland Strait I am very concerned with a pipe in the strait our association has financed a hatchery for lobsters to get them past there most vulnerable people stage which has helped get our fishery to record landings. As a fisherman seance 1981 I have seen a lot of changes in the way we treat the environment. When I first started the garage went over the side of boat now everything comes ashore sorted and put in the popper garbage or recycling container witch Wes as a harbour authority pays for Oil use to go over board now we have a tank to put it in and have it cleaned out properly payed for the harbour authority. Was this all a wast of our time and money we all take care not to have oil or other contaminants in our bilge that would be pumped out into the environment. Yet the pulp mill is proposing to dump there wast into the environment and see no problem with that. In there assessment app The waters of the northumbland Stright are getting warmer all ready whitch is a threat to the fish living there. Yet the mill thinks it is all right to dump hot water there witch will heat it at a faster rate. The proposed pipe will empty on the edge of one of last large herring spanning grounds in the Stright. Right on the lobster grounds There is a lot of talk about jobs in the forest what about jobs in the fishery if the mill closes there will still be forestry jobs if this wast kills the northumbland Stright there will be no fishing jobs left. Please donâ?Tt Pass this assessment Name: Email: @gmail.com Address:

Project: replacement_effluent_treatment_facility_project Comments: The mill needs to close. PERIOD. Theyâ?Tve had more than enough time to come up with a solution to the effluent treatment issue and they havenâ?Tt. Itâ?Ts time they were held accountable after years of â?ofree passesâ? . Theyâ?Tve been given TOO MUCH leeway in the past and it has done nothing but cause more harm and delay what shouldâ?Tve happened years ago-the closure of the mill. Iâ?Tm a 21 year old native of Pictou County and Iâ?Tm ashamed to tell people thatâ?Ts where Iâ?Tm from because they all associate it with the pulp mill and how disgusting it is. As a child I was scared to swim and fish in the waters because of the pollution. I used drive by the mill and smell that sulphuric smell and plug my nose , and walk out of my high school under a sheet of pollution trying not to breathe while I ran to the bus. Now, as a university student, my professors use the Pictou mill as an example of environmental destruction, negative industrial power and mistreatment of loc al Aboriginal Communities. Itâ?Ts embarrassing. I understand the concern surrounding jobs loss and economic dependence...but at what cost are we willing to keep that mill open for a tiny percentage of the population of the county? What about the jobs of the lobster fishers from Nova Scotia and PEI? The people and businesses who could have MASSIVE potential in tourism if the mill wasnâ?Tt there? Real estate companies who might have an explosion of business on water front prosperities? The long term environmental impact to ecosystems and animals? The overall health and well-being of indigenous population and general CITIZENS of the county? The cancer, asthma and COPD rates in the county are no coincidence. I understand job loss is a scary thing but Michelin just opened new positions, as did the marijuana plant in Stellarton-the people that are currently employed at the mill WILL find jobs and the county will soon have new economic opportinities. Maybe even more if the mill closes. Itâ?Ts time that we stop putting the needs of the few above the needs of the many. This is a prime example of how industries manipulate, exploit and overpower small economically dependent communities and it needs to stop. It should stop with us. I am the next generation that will be living in that county, working there, investing there, raising a family there. Pictou County is MY HOME and companies like northern pulp have no place in it. However, as long as that mill is open, I will be packing my bags and I wonâ?Tt be going back until itâ?Ts closed. The generations to come are depending on us to make the right decision here, so letâ?Ts follow through and make them proud. Please donâ?Tt let them down. Dear Minister Miller:

Re: Reasonable apprehension of bias with respect to the environmental assessment of Northern Pulp's proposed effluent treatment facility

We write to you on behalf of our client, Friends of the Northumberland Strait ("**FONS**"). As per FONS' letter to you dated September 27, 2018, FONS is of the view that you, in your position as Minister of Environment, have a significant and direct financial interest in ensuring that the environmental assessment ("**EA**") for Northern Pulp's proposed effluent treatment facility ("**ETF**") is concluded as quickly as possible. In addition, your government has ongoing contractual relationships with Northern Pulp that could be interpreted as requiring you to favour Northern Pulp when deciding whether to approve the EA.

Given your position as a Cabinet minister committed to acting in the interest of your government,[1] these factors give rise to a reasonable apprehension of bias with respect to your role in the EA process. As a result, the current EA process, and any decision you make pursuant to s 34 of the *Environment Act*, are void.

On this basis, FONS respectfully requests that you recuse yourself from the EA and delegate your authority to an independent and unbiased body. FONS specifically requests delegation to the Canadian Environmental Assessment Agency ("**CEAA**"), as this body is familiar with the file and the public has already expressed extensive and unprecedented support for a federal-level assessment.

[1] See *Canadian Union of Public Employees v Ontario (Minister of Labour),* [2003] 1 SCR 539 at paras 114-116 [Appendix A, Tab 1].

A. Background

(1) The current EA

Northern Pulp currently uses Boat Harbour as its effluent treatment facility, and has done so since the 1960s. However, in 2015 concern about the impacts of the Boat Harbour facility on Pictou Landing First Nation led the Provincial legislature to pass the *Boat Harbour Act* ("***BHA***"). Section 3 of the *BHA* requires Northern Pulp to close the Boat Harbour facility on or before January 31, 2020.[2]

If the Mill is to continue operating past the closure date, Northern Pulp must have a replacement ETF up and running by that deadline. Unfortunately, Northern Pulp has already publically acknowledged that it will miss the closure date.[3] This raises the question of how long the Mill must remain idle after the closure date before it can begin operating its new ETF.

The Province has decided to apply a Class 1 environmental assessment to Northern Pulp's proposed ETF. This means that your task is to review the information provided by Northern Pulp and to make a determination pursuant to section 34(1) of the *Environment Act,* SNS 1994-95, c 1. Section 34(1) authorizes you to approve or reject the ETF, or to lengthen the EA process by requesting additional information, ordering a focus report or an environmental-assessment report, or referring the project to alternate dispute resolution.

Importantly, any decision that would have the effect of lengthening the EA process could potentially result in further delays in construction and could ultimately add months or even years to the Mill's closure time.

(2) Reasonable apprehension of bias: the legal framework

The widely accepted and unchallenged test for reasonable apprehension of bias originates with the Supreme Court of Canada's decision in *Committee for Justice and Liberty*.[4] That test, which has been adopted by the Nova Scotia Court of Appeal,[5] is as follows: what would an informed person, viewing the matter realistically and practically, conclude? Would he or she think that it is more likely than not that the decision-maker, whether consciously or unconsciously, would not decide fairly?

A finding of reasonable apprehension of bias is highly fact-specific and must be established via cogent evidence.[6] However, as a general principle the case law has established that a decision-maker's pecuniary interest in the outcome of a proceeding, however large or small that interest

---

[6] *Ibid,* at para 39.

may be, is grounds for automatic disqualification. This principle was affirmed by the Supreme Court in its 2003 decision in *Wewaykum Indian Band.*[7]

Where a reasonable apprehension of bias exists in a proceeding, it cannot be cured by a subsequent decision. The Supreme Court has been clear that "[t]he damage created by apprehension of bias cannot be remedied. The hearing, and any subsequent order resulting from it, is void."[8]

As will be illustrated in the following sections, because of your position as a Minister and member of Cabinet, both your government's pecuniary interest in the outcome of the EA and your government's contractual relationships with Northern Pulp give rise to a reasonable apprehension of bias in the context of the ongoing EA. As a result, your participation voids the current EA process and any decisions or orders flowing from it, and you are disqualified from participation in any future EA of Northern Pulp's proposed ETF.

(3) Reasonable apprehension of bias & the public interest

The rule against bias is essential to maintaining public confidence in the administration of justice. This fundamental principle of procedural fairness is all the more important when the decision-maker is tasked with making a decision in the public interest.[9]

You are unquestionably required to have regard for the public interest when making a decision under section 34(1) of the *Environment Act*. The *Act*'s purpose provisions illustrate its clear focus on the public interest, enumerating goals such as the following:

(a) maintaining environmental protection as essential to the integrity of ecosystems, human health and the socio-economic well-being of society;[10]
(b) maintaining the principles of sustainable development, including the principle of shared responsibility of all Nova Scotians to sustain the environment and the economy, both locally and globally, through individual and government actions;[11] and
(c) providing access to information and facilitating effective public participation in the formulation of decisions affecting the environment […].[12]

The requirement to have regard for the public interest when making your decision is further emphasized by the *Environmental Assessment Regulations*, NS Reg 26/95 ("***EA Regs***"). Section 12 of the *EA Regs* lists the factors that you must consider when formulating your decision. These include the following:

---

[7] *Wewaykum Indian Band v Canada,* 2003 SCC 45 at paras 69-70 [*Wewaykum*] [Appendix A, Tab 4].
[8] *Newfoundland Telephone Co v Newfoundland,* [1992] 1 SCR 623 at 645 [*Newfoundland Telephone*] [Appendix A, Tab 5].
[9] *Committee for Justice and Liberty, supra* note 4 at 391 [Appendix A, Tab 2].
[10] *Environment Act,* SNS 1994-95, c 1, s 2(a).
[11] *Ibid,* s 2(b)(iv).
[12] *Ibid,* s 2(h).

(a) concerns expressed by the public and aboriginal people about the adverse effects or the environmental effects of the proposed undertaking;[13]
(b) steps taken by the proponent to address environmental concerns expressed by the public and aboriginal people;[14] and
(c) potential and known adverse effects or environmental effects of the proposed undertaking […].[15]

As a result, the rule against bias must be observed to the highest possible standard in these circumstances.

(4) The current public controversy

As you are certainly aware, there has been significant public controversy over Northern Pulp's proposed ETF. As a result, our clients anticipate that the EA process, and your initial decision under section 34(1), will be heavily scrutinized. An appearance of bias in this context could result in a widespread loss of public confidence in the administration of justice in the Province.

The public controversy over the proposed ETF has been documented in numerous news stories over the past year. A sample of this extensive media coverage is attached to this submission at **Appendix B, Tab 2**.

The importance of maintaining an unbiased appearance throughout the EA process is all the more important in light of this historic public controversy.

B. The Minister of Environment has a significant and direct financial interest in the outcome of the EA

Your financial interest in the outcome of the current environmental assessment can be divided into two categories:

1. The Province's direct financial investment in the design and development of the new ETF; and
2. Significant unpaid loans from the Province to Northern Pulp.

These two categories will be examined in turn.

(1) The Province has invested directly in the proposed ETF

As documented in the Province's Public Accounts for the fiscal year ended March 31, 2018, Northern Pulp received a $6 million contribution from the Department of Transportation and Infrastructure Renewal ("**TIR**").[16] When media contacted TIR about this payment, the Department revealed that it was a "contribution towards detailed design and engineering studies

[13] *Environmental Assessment Regulations,* NS Reg 26/95, s 12(c) [*EA Regs*].
[14] *Ibid,* s 12(d).
[15] *Ibid,* s 12(e).
[16] Nova Scotia, *Public Accounts: Volume 3 – Supplement to the Public Accounts for the fiscal year ended March 31, 2018* (Halifax, NS: Communications Nova Scotia, 2018) at p 330 [Appendix B, Tab 3].

for a potential replacement effluent treatment facility."[17] In addition, TIR noted that it had contributed $144,980.00 towards design and engineering studies in 2016-2017, for a grand total of $6.146 million for the fiscal years 2016-2017 and 2017-2018.[18]

The results of various requests for information under the provincial *Freedom of Information and Protection of Privacy Act* ("***FOIPOP Act***") reveal that negotiations between Northern Pulp and TIR over funding for the design and construction of the new ETF continued throughout 2018.[19] This is further confirmed by both the Province and Northern Pulp. For example, in Justice Gabriel's decision in *Pictou Landing First Nation v Nova Scotia (Aboriginal Affairs),* he cited a brief from the Province disclosing that "[the Province] is also engaged in confidential discussions directly with Northern Pulp regarding potential crown funding that may be provided to support construction of the new ETF […]."[20]

In addition, Terri Fraser, the Mill's Technical Manager, submitted an affidavit in the context of Northern Pulp's application for an injunction against a number of fishermen. In that affidavit, she acknowledged the execution of a 2016 agreement between the Province and Northern Pulp to share the cost of "preliminary engineering studies for a replacement ETF,"[21] and a 2017 funding agreement between the same parties to "allow detailed engineering work to be done, the environmental studies to continue, and allow major equipment to be purchased."[22] Ms. Fraser also stated that the Province and Northern Pulp began negotiating "[…] how the cost of the new ETF should be shared […]" in September 2017, and that "[t]hose discussions continue today."[23]

Although the Province has not yet revealed the outcome of these funding negotiations, the final cost of the new ETF is estimated to be $130 million.[24] If your decision on the EA were to delay this project further, or even to reject the proposal, the Province could risk losing any anticipated return on its investment. Furthermore, any decision requiring redesign of the ETF, or any measures required to ensure environmental compliance (such as adding tertiary treatment or making changes to enable the mill to utilize a closed-loop effluent treatment system) could result in further significant monetary contributions from the Province. These are, and will be seen as, powerful incentives to approve the current design with no significant changes.

(2) The Province has provided significant loans to Northern Pulp, many of which remain outstanding

In 2017, the Department of Business disclosed that between 2009 and 2017 it had loaned Northern Pulp and its affiliates a total of $110.8 million (plus an additional $900,000 in "incentives").[25] $3.6 million was repaid in August 2016, leaving the remaining $107.2 m lion outstanding.[26]

Although the details of these loans have not been disclosed, it is clear that the Province has provided very substantial financing for the Mill over the past decade. Logic dictates that a lengthy or even permanent closure of the Mill resulting from the EA process could jeopardize the Province's chances of recouping these investments.

These financial connections between the Province and Northern Pulp create a significant and direct pecuniary interest on your part in the outcome of the EA process. It is clear that the Province is at risk of suffering a significant financial blow if the Mill is forced to close, even temporarily, as of January 31, 2020 – and that financial blow may worsen the longer the Mill is required to stay idle. As a member of Cabinet, you have a collective responsibility with your colleagues to pursue positive financial outcomes for your government, or at the very least to avoid devastating financial losses.[27] Although Northern Pulp has now acknowledged that it will miss the closure deadline, the decisions relating to the process and outcome of the EA will be a contributing factor in determining the length of the Mill's closure. In other words, your decision on the EA could result directly in a significant increase in the Province's financial liability.

These circumstances create an obvious bias toward approving the project as quickly as possible.

C. Extensive contractual relationships between the Province and Northern Pulp prevent the Minister from making impartial regulatory decisions impacting Northern Pulp's operations

On December 1, 1995, the Province entered into a Memorandum of Understanding ("**MOU**")[28] with Scott Maritimes Limited, a prior owner and operator of the Mill. The MOU is extensive, but for our purposes the two relevant clauses are as follows:

> 4.01(d) Nova Scotia agrees to undertake a clean-up program with respect to the [Boat Harbour] Facility prior to the commencement of the Lease with Scott […] If a

[25] Department of Business, "FOIPOP 2017-03648-BUS – Loans to Northern Pulp and Affiliates," June 2017 [Appendix B, Tab 9]; Bousquet, "Northern Pulp, Scotsburn Lumber, and U.S. tariffs," *supra* note 17 [Appendix B, Tab 4].

[26] Although we do not have updated information on outstanding loans, with the exception of the $3.6 million repaid in August 2016 all of the repayable loans disclosed by the Department of Business in 2017 were listed as having terms ending in 2023 or later.

[27] See *Canadian Union of Public Employees, supra* note 1 at paras 114-116 [Appendix A, Tab 1].

[28] Memorandum of Understanding between Her Majesty the Queen in Right of Nova Scotia and Scott Maritimes Limited, 1 December 1995 [Appendix B, Tab 10].

> pipeline and diffuser is required by any level of government during the term of the Lease it shall be installed at the sole expense of Nova Scotia.
>
> […]
>
> 4.01(l) Nova Scotia agrees to use its best efforts to assist Scott obtain [sic] all necessary permits, consents and approvals to permit the construction and operation of a replacement effluent treatment facility to replace the [Boat Harbour] Facility at the expiration of the term of the Lease.

The MOU, including the two provisions cited above, continues to operate as between the Province and Northern Pulp. On May 12, 2008, the Province signed an "Acknowledgement Agreement"[29] with Northern Pulp that states, in part, as follows:

> [T]he Province acknowledges, agrees and confirms that […] the Memorandum of Understanding between the Province and Scott dated December 1, 1995 and the Indemnity Agreement between the Province and Scott dated December 31, 1995 shall continue to apply with respect to the ongoing operation of the Effluent Treatment system, Purchaser's [sic] use of the Lands […] and Purchaser's use of Boat Harbour […].

The obligations imposed by these two provisions appear to be completely at odds with your obligation to conduct an independent, neutral and unbiased EA. In fact, these provisions suggest that a decision to reject the proposed ETF, or to lengthen the EA process by requesting further information, could result in contractual liability for the Province.

Northern Pulp is also party to a number of other long-standing agreements with the Province. These agreements include the Indemnity Agreement[30] referenced above, a Lease[31] and a License Agreement[32] both dated December 31, 1995, and a 2002 Lease Extension Agreement.[33] These agreements impose various obligations on the Province in relation to Northern Pulp's proposed ETF.

In fact, Northern Pulp has stated publicly that its various contracts with the Province should be determinative of the results of administrative approval processes. As per its 2015 appeal of the Industrial Approval issued by the Province, "[g]overnment cannot arbitrarily revoke Northern Pulp's contractual rights under the Agreements with the Province by way of an administrative

---

[33] Lease Extension Agreement between Her Majesty the Queen in Right of the Province of Nova Scotia and Kimberly-Clark Inc, 22 October 2002 [Appendix B, Tab 15].

approval process."[34] In response to this appeal, Randy Delorey, then Minister of the Environment, revoked a number of the conditions originally included in the 2015 Industrial Approval, and agreed to re-examine others[35] – suggesting that the Province is concerned about the potential contractual liability resulting from its efforts to effectively regulate Northern Pulp's operations.

Northern Pulp also refers explicitly to the Province's potential contractual liability in its Registration Document for the current EA. At section 1.0, it states as follows:

> At the date of Registration, the Province of Nova Scotia has made contributions to the cost planning and design of the project. The contributions may be off set against any future award Northern Pulp may be granted for damages against the Province in any respect due to early termination of the present [Boat Harbour Effluent Treatment Facility] lease.[36]

This statement speaks for itself, but Northern Pulp apparently contemplates a claim for damages for "early termination" of the Boat Harbour lease (which currently extends until 2030). Once again, it stands to reason that such a damages claim, and the Province's alleged liability, for early termination of the Boat Harbour lease will increase the longer the Mill stays idle.

Your position as a member of Cabinet creates a direct interest in upholding the Province's contractual obligations and/or minimizing the liability associated with any unavoidable contractual disputes and litigation. As a result, these extensive contractual relationships between the Province and Northern Pulp gives rise to a reasonable apprehension of bias in the context of the ongoing EA.

D. The Minister must recuse herself from the EA and delegate her authority to an independent and unbiased body

As a consequence of this apprehension of bias, the current EA process is void.[37] In addition, in your capacity as Minister of Environment you are disqualified from presiding over and making decisions under section 34 of the *Environment Act* in relation to the current EA. You are likewise disqualified from making decisions in relation to any future EA of Northern Pulp's proposed ETF.[38]

Accordingly, FONS respectfully requests that you recuse yourself from the EA and delegate your authority under section 34(1) of the *Environment Act* to an independent and unbiased body.

Minister of Labour for Ontario, appellant; v. Canadian Union of Public Employees and Service Employees International Union, respondents, and Canadian Bar Association and National Academy of Arbitrators (Canadian Region), interveners.

(209 paras.)

Case Summary

Appeal From:

ON APPEAL FROM THE COURT OF APPEAL FOR ONTARIO

Catchwords:

Labour relations — Hospital labour disputes — Appointment of board of arbitration — Legislation requiring disputes over collective agreements in hospitals and nursing homes to be resolved by compulsory arbitration — Minister of Labour appointing retired judges to chair arbitration boards — Whether Minister required to select arbitrators qualified by expertise and acceptance in labour relations community — Whether retired judges, as a class, biased against labour — Hospital Labour Disputes Arbitration Act, R.S.O. 1990, c. H.14, s. 6(5).

Catchwords:

Administrative law — Judicial review — Appointment of board of arbitration — Legislation requiring disputes over collective agreements in hospitals and nursing homes to be resolved by compulsory arbitration — Minister of Labour appointing retired judges to chair arbitration boards — Whether appointment process for selecting chairs of arbitration boards violates natural justice or infringes institutional independence [page540] and impartiality of arbitration boards — Whether appointment process breached legitimate expectations of unions — Whether appointments caused reasonable apprehension of bias — Whether Minister disqualified or required to delegate task of making appointments because of interest in arbitrations — Whether Minister's appointments patently unreasonable — Hospital Labour Disputes Arbitration Act, R.S.O. 1990, c. H.14, s. 6(5).

Summary:

Since 1965, Ontario's hospitals, nursing homes and their employees have been required to resolve disputes over

collective agreements by compulsory arbitration under the *Hospital Labour Disputes Arbitration Act* ("*HLDAA*"). If the parties cannot agree on a mutually acceptable arbitrator, a panel of three members is struck, two designated by the parties and the third chosen by the two designates or, if they fail to agree, appointed by the Minister of Labour. Amendments to the *Labour Relations Act* in 1979 facilitated the formation and use of a list of arbitrators with expertise acceptable to both management and the unions. A similar register of arbitrators was dropped from the *HLDAA* in 1980 but a normal practice was for senior officials of the Ministry of Labour, under delegated authority, to identify appropriate arbitrators. Following the 1995 provincial election, a reorganization of public sector institutions, including schools and hospitals, led to Bill 136. The Bill contained the proposed *Public Sector Dispute Resolution Act, 1997* which included a Dispute Resolution Commission. Organized labour opposed many aspects of the Bill, including the proposed commission. When the Minister announced a return to the sector-based system of appointing arbitrators, the unions believed the selection of *HLDAA* chairpersons would thereafter be limited to mutually agreed candidates.

In early 1998, the Minister appointed four retired judges to chair several arbitration boards. They were not appointed by mutual agreement nor were they on the "agreed" list compiled under s. 49(10) of the *Labour Relations Act, 1995*. The unions were not consulted. The President of the Ontario Federation of Labour complained to the Minister that the understanding about a return to the *status quo* had been breached without consultation. The unions objected that retired judges lack expertise, [page541] experience, tenure and independence from government. They also complained the Minister had breached procedural fairness by not delegating the task of making appointments to senior officials. The four judges initially appointed declined to act but other retired judges accepted the appointments. The unions sought declarations that the Minister's actions denied natural justice and lacked institutional independence and impartiality. The Divisional Court dismissed the application for judicial review. The Court of Appeal allowed the unions' appeal, concluding that the Minister had created a reasonable apprehension of bias and interfered with the independence and impartiality of the arbitrators, as well as defeating the legitimate expectation of the unions contrary to the requirements of natural justice. The Minister was ordered not to make any further appointments "unless such appointments are made from the long-standing and established roster of experienced labour relations arbitrators" compiled under s. 49(10) of the *Labour Relations Act, 1995*.

Held (McLachlin C.J. and Major and Bastarache JJ. dissenting): The appeal should be dismissed for reasons that differ somewhat from those of the Court of Appeal. The Minister is required, in the exercise of his power of appointment under s. 6(5) of the *HLDAA*, to be satisfied that prospective chairpersons are not only independent and impartial but possess appropriate labour relations expertise and are recognized in the labour relations community as generally acceptable to both management and labour.

Per Gonthier, Iacobucci, Binnie, Arbour, LeBel and Deschamps JJ.: The Minister, as a matter of law, was required to exercise his power of appointment in a manner consistent with the purpose and objects of the statute that conferred the power. A fundamental purpose and object of the *HLDAA* was to provide an adequate substitute for strikes and lock-outs. To achieve the statutory purpose, as the Minister himself wrote on February 2, 1998, "the parties must perceive the system as neutral and credible". This view was fully supported by the *HLDAA*'s legislative history.

The Minister was not required to proceed with the selection of chairpersons by way of "mutual agreement" or from the s. 49(10) roster. Nor were retired judges as a "class" reasonably seen as biased against labour. Nevertheless, the Minister was required by the *HLDAA*, properly interpreted, to select arbitrators from candidates [page542] who were qualified not only by their impartiality, but by their expertise and general acceptance in the labour relations community.

Section 6(5) of the *HLDAA* contemplates the appointment of "a person who is, in the opinion of the Minister, qualified to act". The Minister's discretion is constrained by the scheme and object of the Act as a whole, which is to create a "neutral and credible" substitute for the right to strike and lock-out. Labour arbitration has traditionally rested on a consensual basis, with the arbitrator chosen by the parties or being acceptable to both parties. Although the s. 6(5) power is expressed in broad terms, the Minister is nevertheless required, in the exercise of that power, to have regard to relevant labour relations expertise, independence, impartiality and general acceptability within the labour relations community. These criteria are neither vague nor uncertain. The livelihood of a significant group of professional labour arbitrators depends on their recognized ability to fulfill them. The

result is a perfectly manageable framework within which the legislature intended to give the Minister broad but not unlimited scope within which to make appointments in furtherance of the *HLDAA*'s object and purposes. The Minister, under the *HLDAA*, is not given a broad policy function. His narrow role is simply to substitute for the parties in naming a third arbitrator in case of their disagreement and, given the context, background and purpose of the Act, his rejection of labour relations expertise and general acceptability as relevant factors was patently unreasonable.

Although, as a member of Cabinet, the Minister was committed to public sector rationalization and had a perceived interest in the appointment process and the outcome of the arbitrations, the legislature specifically conferred the power of appointment on the Minister and, absent a constitutional challenge, clear and unequivocal statutory language conferring that authority prevailed over the common law rule against bias. The Minister's power to delegate the appointment process under s. 9.2(1) of the *HLDAA* was permissive only and to take away his authority to make his own choice would amount to a judicial amendment of the legislation.

The Minister satisfied any duty to consult with the unions about the change in the appointments process. [page543] There were extensive meetings during which the Minister signalled that the process was subject to reform and that retired judges were potential candidates for appointments. The unions made clear their opposition. Section 6(5) of the *HLDAA* did not impose on the Minister a procedural requirement to consult with the parties to each arbitration nor does the evidence establish a firm practice of appointing from a list or by mutual agreement. A general, ambiguous promise to continue an existing system subject to reform does not suffice under the doctrine of legitimate expectation to bind the Minister's exercise of his or her discretion.

The Court of Appeal had concluded that the Minister's approach tainted both the independence and impartiality of the *HLDAA* arbitration boards to which the retired judges had been appointed. This conclusion was not justified. The *HLDAA* commands the use of *ad hoc* arbitration boards. Such boards are not characterized by financial security or security of tenure beyond the life of the arbitration itself. The independence of arbitrators is guaranteed by training, experience and mutual acceptability. Since s. 6(5) requires the appointment of individuals qualified by training, experience and mutual acceptability, the proper exercise of the appointment power would lead to a tribunal which would satisfy reasonable concerns about institutional independence.

Impartiality raises different considerations. The Court of Appeal did not suggest that the retired judges were in fact biased or partial but concluded that they might reasonably be seen to be "inimical to the interests of labour, at least in the eyes of the appellants". The test, however, is not directed to the subjective perspective of one of the parties but to the reasonable, detached and informed observer. Retired judges as a class have no greater interest than other citizens in the outcome of the arbitrations and there are no substantial grounds to think they would do the bidding of the Minister or favour employers so as to improve the prospect of future appointments. A fully informed, reasonable person would not stigmatize retired judges, as a class, with an anti-labour bias. Allegations of individual bias must be dealt with on a case-by-case basis.

[page544]

The appropriate standard of review is patent unreasonableness. The pragmatic and functional approach applies to the judicial review of the exercise of a ministerial discretion and factors such as the existence of a privative clause, the Minister's expertise in labour relations, the nature of the question before the Minister and the wording of s. 6(5) all call for considerable deference. A patently unreasonable appointment is one whose defect is immediate, obvious and so flawed in terms of implementing the legislative intent that no amount of curial deference can justify letting it stand.

The appointments were not patently unreasonable simply because the Minister did not restrict himself to the s. 49(10) list of arbitrators. Some arbitrators on the list were unacceptable to the unions and some acceptable arbitrators were not on the list, confirming the reasonableness of the Minister's view that candidates could qualify without being on the list. However, in assessing whether the appointments were patently unreasonable, the courts are entitled to have regard to the importance of the factors the Minister altogether excluded from his consideration. In this case, the Minister expressly excluded relevant factors that went to the heart of the legislative scheme. The matters before the boards required the familiarity and expertise of a labour arbitrator. Expertise and neutrality foster general acceptability. Appointment of an inexpert and inexperienced chairperson who is not seen as generally acceptable in the labour relations community is a defect in approach that is both

immediate and obvious. Having regard to the legislative intent manifested in the *HLDAA*, the Minister's approach to the s. 6(5) appointments was patently unreasonable. The qualifications of specific appointees will have to be assessed on a case-by-case basis if challenged.

The appeal is thus dismissed on the limited ground that appointments that excluded from consideration labour relations expertise and general acceptability in the labour relations community were patently unreasonable.

Per McLachlin C.J. and Major and Bastarache JJ. (dissenting): The appropriate standard of review for the exercise of the Minister's appointment power under s. 6(5) of the *HLDAA* is patent unreasonableness. The pragmatic and functional approach focusses on the particular provision being invoked. The Minister exercised power under [page545] a single statute, his enabling legislation, and, absent a constitutional challenge, the patent unreasonableness standard need not make room for a review of statutory interpretation of enabling legislation on a correctness basis. There is no basis for dividing the Minister's decision into component questions subject to different standards of review, nor should the Minister's power be viewed as due less deference because it is circumscribed by legislation. Not every administrative action involves a distinct and identifiable exercise of statutory interpretation. Where, as here, the factors indicate that the question raised by the provision is one intended by the legislators to be left to the exclusive decision of the administrative decision maker, it simply is not one for the courts to make. The presence of a privative clause is compelling evidence that deference is due. The Minister knows more about labour relations than the courts and will be taken to have expertise. Deference is owed to expert decision makers designated by the legislature. The fact-based nature of the question before the Minister also points to deference and empowering the Minister, rather than an apolitical actor, suggests a legislative intent of political accountability.

The Minister did not make appointments that were patently unreasonable. A contextual approach to statutory interpretation of the enabling legislation is necessary for determining the criteria relevant to exercise of the discretion. In some cases, the criteria are spelled out in the legislation, regulations or guidelines or found in the specific purposes of the relevant Act. In others, the relevant factors may be unwritten and derived from the purpose and context of the statute. In this case, there are no relevant regulations, guidelines, or other instruments, and the statute does not say much. The Act stipulates that appointees must be qualified in the opinion of the Minister, expressly contemplating the importance of the Minister's opinion. Labour relations expertise, independence and impartiality, reflected in broad acceptability, are not necessarily dominant or obvious factors and should not be imposed as specific restrictions on the Minister's discretion. The Minister developed an opinion and determined that judging experience was a relevant qualification. The Act called for the Minister to reach his own opinion, not to consider a specific determining factor. Given how much work it takes to identify labour relations experience and broad acceptability as factors and to imply them into s. 6(5), weighing them less heavily than another unwritten qualification, namely judicial experience, does not vitiate the appointments as patently [page546] unreasonable. It takes significant searching or testing to find the alleged defect or even the factors said to constrain the Minister. It is therefore difficult to characterize the appointments as immediately or obviously defective, not in accordance with reason, clearly irrational, or so flawed that no amount of curial deference could justify letting them stand based on a failure to consider these factors. Recognition of the seriousness of quashing a decision as patently unreasonable is crucial to maintaining the discipline of judicial restraint and deference, and our intervention is not warranted in these circumstances.

Concerns about institutional independence and institutional impartiality do not render the Minister's appointments patently unreasonable. The Act requires that the tribunals be *ad hoc* and retired judges as a class cannot reasonably be seen as so partial that appointing them took the Minister outside the bounds of his statutory discretion. The possibility of a successful challenge to a particular board is not foreclosed but the constraints on the Minister's discretion do not permit a general inquiry into the independence and impartiality of the boards on the basis of the appointment process in the absence of a direct challenge to the boards actually appointed.

The reasons of McLachlin C.J. and Major and Bastarche JJ. were delivered by

BASTARACHE J. (dissenting)

1 I adopt Binnie J.'s recital of the facts and judicial history. In my view, however, the Minister of Labour ("Minister") did not make appointments that were patently unreasonable. In reaching that decision, I would adopt a somewhat different approach to that of Binnie J. with regard to judicial review for abuse of discretion. I also object to Binnie J.'s conclusion that the impartiality and independence of boards can be challenged on the sole basis of the appointment process without any direct attack on a board actually constituted.

2 With regard to judicial review for abuse of discretion, as I shall explain, the balance of factors in this case

labour relations community as widely acceptable to both unions and management by reason of his or her independence, neutrality and proven expertise.

112 I do not consider these criteria to be vague or uncertain. The practice of labour relations in this country has developed into a highly sophisticated business. The livelihood of a significant group of professional labour arbitrators depends on their recognized ability to fulfill these criteria. Some of them not only enjoy national reputations for their skills in resolving industrial conflicts but are retired judges. From the Minister's perspective, there exists not only a large pool of recognized candidates, but the *HLDAA* allows generous latitude to his selection (i.e., a candidate "who is, in the opinion of the Minister, qualified"). The result is a perfectly manageable framework within which the legislature intended to give the Minister broad but not unlimited scope within which to make appointments in furtherance of the *HLDAA*'s object and purposes.

[page597]

(2) Procedural Fairness

113 Under this heading, I group the challenges to the Minister's impartiality, the allegation that he violated procedural fairness by allegedly changing the "system" of appointments without prior consultation, and his alleged violation of the doctrine of legitimate expectation.

(a) *Was the Minister Impartial in the Exercise of the Power of Appointment?*

114 The unions say the Minister could not, as a member of a cost-cutting government, make the appointments impartially. He was therefore disqualified and ought to have delegated the appointments to senior officials.

115 The Minister says that he is not responsible for health costs or hospital administration. He is, however, a member of Cabinet and committed to government policy which, in 1997, included public sector "rationalization" and pay restraint. He was elected on a platform called "the Common Sense Revolution" and people would reasonably think he was committed to carrying it out.

116 The Ontario Court of Appeal concluded that the Minister had a "significant and direct interest" in the outcome of the arbitral awards (para. 21). As Austin J.A. pointed out, "[a]pproximately 75 per cent to 80 per cent of hospital budgets relate to labour costs and the government's primary method for controlling expenditures is wage control. Although nursing homes have sources of income that are not available to hospitals, they too are substantially dependent upon the government for funding" (para. 21). The Minister's response is that here, unlike in cases such as *MacBain v. Lederman*, [1985] 1 F.C. 856 (C.A.), at pp. 869-71 and 884, neither he nor his government was a party to hospital sector arbitral proceedings. In the *MacBain* case, the Canadian Human Rights Commission appointed the members of the *ad hoc* tribunal to adjudicate the very dispute between the Commission and the person complained about. The Minister argues that his interest in hospital finance [page598] is not "directly at stake" (*Canadian Pacific Ltd. v. Matsqui Indian Band*, [1995] 1 S.C.R. 3, at para. 100) and "too attenuated and remote to give rise to a reasonable apprehension of bias" (*Pearlman v. Manitoba Law Society Judicial Committee*, [1991] 2 S.C.R. 869, at p. 891). The local hospital boards could absorb higher unit labour costs by reducing services, thus keeping public funding requirements more or less constant. This approach, I think, is unrealistic. It underestimates the Minister's collective responsibility with his colleagues at a time of pitched confrontation with the unions over reductions in public sector staffing and financing. At the very least, there was an appearance that he had a significant interest in outcomes as well as process.

117 The legal answer to this branch of the unions' argument, however, is that the legislature specifically conferred the power of appointment on the Minister. Absent a constitutional challenge, a statutory regime expressed in clear and unequivocal language on this specific point prevails over common law principles of natural justice, as recently affirmed by this Court in *Ocean Port Hotel, supra*. In that case, the members of the provincial liquor licensing appeal board, who were empowered to impose penalties on liquor licences for non-compliance with the Act, were

ON APPEAL FROM THE FEDERAL COURT OF APPEAL

Case Summary

Administrative law — Judicial review — Boards and tribunals — Natural justice — Bias or apprehended bias — Application for certificate of public necessity — National Energy Board Act, R.S.C. 1970. c. N-6, s. 44

The issue in this appeal arose in connection with the organization of hearings by the National Energy Board to consider competing applications for a Mackenzie Valley pipeline, i.e. applications for a certificate of public convenience and necessity under s. 44 of the National Energy Board Act, R.S.C. 1970, c. N-6. The Board assigned Mr. Crowe, Chairman of the Board, and two other of its members to be the panel to hear the applications. The appellants were recognised by the Board as "interested persons" under s. 45 of the Act. The appellants objected to the participation of Mr. Crowe as a member of the panel because of reasonable apprehension or reasonable likelihood of bias: Mr. Crowe became Chairman and Chief Executive Officer of the National Energy Board on October, 15, 1973. Immediately prior to that date he was president of the Canada Development Corporation, having assumed the position late in 1971 after first having been a provisional director following the enactment of the Canada Development Corporation Act, 1971 (Can.), c. 49. The objects of that Corporation included assisting in business and economic development and investing in shared securities, ventures, enterprises and property to that end. As Corporation president and as its representative Mr. Crowe was associated with the Gas Arctic-Northwest Project Study Group which considered the physical and economic feasibility of a northern natural gas pipeline to bring natural gas to southern markets. The Agreement setting up the Study Group brought together two groups of companies which merged their efforts and pursuant to the agreement set up two companies of which Canadian Arctic Gas Pipeline Limited was one. Mr. Crowe was an active participant in the Study Group as a member of the Management Committee and a member and subsequently vice-chairman of its Finance, tax and accounting committee and during his period of membership

of the Management Committee he participated in the seven meetings held during that time, and joined in a unanimous decision of the Committee on June 27, 1973, respecting the ownership and routing of a Mackenzie Valley pipeline. The Canada Development Corporation remained a full participant in the Study Group until long after the applications were made for certificates of public convenience and necessity and until after the hearings had commenced, in effect to the time of the reference of the question of reasonable apprehension of bias in Mr. Crowe to the Federal Court of Appeal. Further, during the period of Mr. Crowe's association with the Study Group as the representative of the Canada Development Corporation the latter contributed $1,200,000 to the Study Group as its share of expenses. The National Energy Board referred to the Federal Court of Appeal the following question, "Would the Board err in rejecting the objection and in holding that Mr. Crowe was not disqualified from being a member of the panel on grounds of reasonable apprehension or reasonable likelihood of bias?" pursuant to the Federal Court Act, 1970-71-72 (Can.), c. 1, s. 28(4). That Court answered in the negative.

Held (Martland, Judson and de Grandpré JJ. dissenting: The appeal should be allowed.

Per Laskin C.J. and Ritchie, Spence, Pigeon and Dickson JJ.: In dealing with applications under s. 44 of the National Energy Board Act, the function of the pro Board is quasi-judicial, or, at least, is a function which the Board must discharge in accordance with the rules of natural justice: and if not necessarily the full range of such rules as would apply to a Court (though the Board is a court of record under s. 10 of the Act) certainly to a degree that would reflect integrity of its proceedings and impartiality in the conduct of those proceedings. A reasonable apprehension of bias arises where there exists a reasonable probability that the judge might not act in an entirely impartial manner. The issue in this situation was not one of actual bias. Thus the facts that Mr. Crowe had nothing to gain or lose either through his participation in the Study Group or in making decisions as chairman of the National Energy Board and that his participation in the Study Group was in a representative capacity became irrelevant. The participation of Mr. Crowe in the discussions and decisions leading to the application by Canadian Arctic Gas Pipeline Limited for a certificate did however give rise to a reasonable apprehension, which reasonably well-informed persons could properly have, of a biased appraisal and judgment of the issues to be determined. The test of probability or reasoned suspicion of bias, unintended though the bias may be, is grounded in the concern that there be no lack of public confidence in the impartiality of adjudicative agencies, and emphasis is added to this concern in this case by the fact that the Board is to have regard for the public interest.

Per Martland, Judson and de Grandpré JJ. dissenting: The proper test to be applied was correctly expressed by the Court of Appeal. The apprehension of bias must be a reasonable one, held by reasonable and right minded persons, applying themselves to the question and obtaining thereon the required information, the test of "what would an informed person, viewing the matter realistically and practically--conclude?" There is no real difference between the expression found in the decided cases "reasonable apprehension of bias", "reasonable suspicion of bias" or "real likelihood of bias" but the grounds for the apprehension must be substantial. The question of bias in a member of a court of justice cannot be examined in the same light as that in a member of an administrative tribunal entrusted with an administrative discretion. While the basic principle that natural justice must be rendered is the same its application must take into account the special circumstances of the tribunal. By its nature the National Energy Board must be staffed with persons of experience and expertise. The considerations which underlie its operations are policy oriented. The basic principle in matters of bias must be applied in the light of the circumstances of the case a bar. The Board is not a court nor is it a quasi-judicial body. In hearing the objection of interested parties and in performing its statutory function the Board has the duty to establish a balance between the administration of policies which they are duty bound to apply and the protection of the various interests spelled out in s. 44 of the Act. In reaching its decision the Board draws upon its experience, upon that of its own experts and upon that of all agencies of the Government of Canada. The Board is not and cannot be limited to deciding the matter on the sole basis of the representations made before it. In the circumstances of the case the Court of Appeal rightly concluded that no reasonable apprehension of bias by reasonable, right minded and informed persons exists.

APPEAL from a judgment of the Federal Court of Appeal [*[1976] 2 F.C. 20*] which answered in the negative a question referred to it by the National Energy Board. Appeal allowed, Martland, Judson, and de Grandpré JJ. dissenting.

LASKIN C.J.:— On March 11, 1976, this Court gave judgment in an appeal from a decision of the Federal Court of Appeal which answered in the negative a question referred to it by the National Energy Board pursuant to s. 28(4) of the Federal Court Act, 1970-71-72 (Can.), c. 1. The question so referred was as follows:

Would the Board err in rejecting the objections and in holding that Mr. [Marshall] Crowe was not disqualified from being a member of the panel on grounds of reasonable apprehension or reasonable likelihood of bias?

This Court allowed the appeal, set aside the decision of the Federal Court of Appeal and declared that the question should be answered in the affirmative. It stated in its formal judgment on March 11, 1976 that reasons of the majority and dissenting judges would be delivered later. The reasons of the majority now follow.

The issue referred to the Federal Court of Appeal and which came by leave to this Court arose in connection with the organization of hearings by the National Energy Board to consider competing applications for a Mackenzie Valley pipeline, that is, applications for a certificate of public convenience and necessity under s. 44 of the National Energy Board Act, R.S.C. 1970, c. N-6. One of the applications, filed on March 21, 1974 by Canadian Arctic Gas Pipeline Limited was in respect of a proposed natural gas pipeline and associated works to move natural gas in an area of the Northwest Territories (the Mackenzie River Delta and Beaufort Basin) to markets in southern Canada and also to move natural gas in Alaska markets in other states of the United States. This application was supplemented by other material filed on January 23, 1975, on March 10, 1975 and on May 8, 1975. The competing application, filed in March, 1975 by Foothills Pipe Lines Ltd., was for a natural gas pipeline to move natural gas only from the area in the Northwest Territories, mentioned above, to southern Canada markets and not from Alaska as well.

On April 17, 1975, the National Energy Board assigned Mr. Crowe, Chairman of the Board and two other members (of the eight members in all who then constituted the Board) to be the panel with Mr. Crowe presiding, to hear the applications, beginning on October 27, 1975. Under s. 45 of its governing statute the Board was empowered to give standing at its s. 44 hearings to "interested persons", and it was then obliged to hear the objections to the granting of a certificate of public convenience and necessity. The three appellants in this case, The Committee for Justice and Liberty Foundation, The Consumers' Association of Canada and the Canadian Arctic Resources Committee were recognized by the Board as "interested persons" as were other organizations and individuals. In all, some 88 parties were represented at the commencement of the hearings, and of these 80 indicated that they had no objection to Mr. Crowe continuing as a member and presiding over the hearings. One of the non-objectors was Canadian Arctic Gas Pipeline Limited, one of the applicants for a certificate. It was its counsel who raised on July 9, 1975 the question of reasonable apprehension of bias on Mr. Crowe's part in favour of the client by reason of Mr. Crowe's association with a Study Group out of whose deliberations and decisions the applicant was born.

When the hearings opened on October 27, 1975 as scheduled, Mr. Crowe read a statement detailing his involvement with the Study Group. Objections were then invited. In the result, the question mentioned at the beginning of the reasons was referred to the Federal Court of Appeal on October 29, 1975. I turn now to deal with the facts upon which the issue of reasonable apprehension of bias is raised.

Mr. Marshall Crowe became Chairman of the National Energy Board and its Chief Executive Officer on October 15,

hearings.

What must be kept in mind here is that we are concerned with a s. 44 application in respect of which, in my opinion, the Board's function is quasi-judicial or, at least, is a function which it must discharge in accordance with rules of natural justice, not necessarily the full range of such rules that would apply to a Court (although I note that the Board is a court of record under s. 10 of its Act) but certainly to a degree that would reflect integrity of its proceedings and impartiality in the conduct of those proceedings. This is not, however, a prescription that would govern an inquiry under ss. 14(2) and 22.

I am of the opinion that the only issue here is whether the principle of reasonable apprehension or reasonable likelihood of bias applies to the Board in respect of hearings under s. 44. If it does apply--and this was accepted by all the respondents--then, on the facts herein, I can see no answer to the position of the appellants.

Before setting out the basis of this conclusion I wish to reiterate what was said in the Federal Court of Appeal and freely conceded by the appellants, namely, that no question of personal or financial or proprietary interest, such as to give rise to an allegation of actual bias, is raised against Mr. Crowe. The Federal Court of Appeal founded its conclusion against disqualification on the following statement of principle:

It is true that all of the circumstances of the case, including the decisions in which Mr. Crowe participated as a member of the study group, might give rise in a very sensitive or scrupulous conscience to the suspicion that he might be unconsciously biased, and therefore should not serve. But that is not, we think, the test to apply in this case. It is, rather, what would an informed person, viewing the matter realistically and practically--and having thought the matter through-- conclude. Would he think that it is more likely than not that Mr. Crowe, whether consciously or unconsciously, would not decide fairly.

This was followed by an encompassing factual conclusion which was as follows:

On the totality of the facts, which have been described only in skeletal form, we are all of the opinion that they should not cause reasonable and right minded persons to have a reasonable apprehension of bias on the part of Mr. Crowe, either on the question of whether present or future public convenience and necessity require a pipe-line or the question of which, if any, of the several applicants should be granted a certificate.

The Federal Court of Appeal supported this factual conclusion by emphasizing that Mr. Crowe participated in the Study Group as merely a representative, that he had nothing to gain or lose by his participation or by any decision he might reach in the course of his duties as chairman of the National Energy Board in connection with the applications that were before it. I do not think that Mr. Crowe's representative capacity is a material consideration on the issue in question here, any more than representative capacity would be a material consideration if the president or chairman of one of the other participants in the Study Group had been appointed chairman of the National Energy Board and had then proceeded to sit on an application which he had a hand in fashioning, albeit he was divorced from the Study Group at the time the application was filed. Mr. Crowe was not a mere cipher, carrying messages from the board of directors of the Canada Development Corporation and having no initiative or flexibility in the manner and degree of his participation in the work of the Study Group. Nowhere in the Study Group Agreement nor in the minutes of proceedings of the Management Committee is there any indication that the representatives came to the meetings with fixed instructions from which they could not depart without a reference back. The nature of the exercise carried on under the Study Group Agreement required the representatives to apply their own judgment and their own talents to the joint project, with of course concern for the interests of the companies that they represented and subject, of course, to such directions as the companies might give. Since the representatives were all high officials of the companies, they had latitude in their participation that would not have been open to a junior employee.

Nor do I think that anything turns in this case on the fact that Mr. Crowe (according to the Federal Court of Appeal) had nothing to gain or lose either through his participation in the Study Group or in making decisions as chairman of the National Energy Board. The Federal Court of Appeal appears here to have moved over into the area of actual bias and that is not an issue.

The additional factor which underlay the Federal Court of Appeal's factual conclusion is, in its own words, as

Delaney, Disability Rights Coalition,
J. Walter Thompson, Q.C., in his capacity as
Nova Scotia Human Rights Board of Inquiry
Chair, and The Nova Scotia Human Rights Commission

Respondents

Judge:	The Honourable Mr. Justice Jamie W.S. Saunders
Appeal Heard:	November 28, 2017, in Halifax, Nova Scotia
Subject:	**Human Rights Act, R.S.N.S. 1989, c.214. Board of Inquiry. Reasonable Apprehension of Bias. Standard of Review. Prematurity. Legal Principles to be Applied Whenever Considering a Complaint of Apparent, or Actual, Bias. Costs.**
Summary:	During the course of a Board of Inquiry established to consider a complaint under the *Human Rights Act*, R.S.N.S. 1989, c. 214, it came to light that 15 years earlier the Board

Chair had written two letters concerning matters said to be similar to the issues raised in the complaint. The Attorney General of Nova Scotia moved to have the Chair recuse himself on the basis that the impugned correspondence raised a reasonable apprehension of bias.
After a hearing, the Chair ruled that the letters he had written did not give rise to a reasonable apprehension of bias, and he dismissed the motion.
The Attorney General appealed that ruling to this Court, asking that we allow the appeal and order the Chair to recuse himself from any further consideration of the complaint.

Held: Appeal dismissed. This human rights complaint actually consists of four separate complaints alleging discrimination by the Province against the complainants because of the "combined effect" of their mental disabilities and their reliance upon social assistance. They say they have been forced to live in institutions with large groups of people and been denied the opportunity to integrate and participate in supportive, community-based housing. They allege that this "prolonged detention" has caused lasting harm to their mental and physical health and socialization skills, preventing them from realizing their full potential as contributing members of society. They say that by not providing them with their preferred choice of housing in locations of their choosing, the Province has violated their rights under the *Act*. They claim entitlement to the kinds of help and professional supports available to others, in order to live in the community.
The appellant was right to bring a motion to challenge the Board's jurisdiction on the basis that a reasonable apprehension of bias existed. On this record, raising the issue was certainly justified and a thorough review of the allegation was warranted.
The Commission argued that this Court ought to decline to consider the issue, on the grounds that it is premature, and that the Board ought to be able to complete its inquiry, following which – should it be necessary – an allegation that a reasonable apprehension of bias exists, could be included as a ground of appeal, were an appeal commenced. Ordinarily, this Court is reluctant to entertain appeals from interim or interlocutory rulings in the course of a proceeding, except

2017 NSCA 24 (CanLII)

where a departure from that norm would be appropriate. This is such a case. It would be a colossal waste of time to refuse to deal with the allegation of apparent bias now, thus permitting the Board to complete its hearings and deliberations; yet at the end of all of that risking the possibility that if the Board's decision were appealed, a ground of appeal months (or years) later would likely raise the very same allegation.

After considering the record and counsels' able submissions, the appeal is dismissed. The Attorney General has failed to displace the presumption of impartiality by offering cogent evidence that would establish a reasonable apprehension of bias in this case. The Chair's earlier writings do not demonstrate that his duty to remain impartial has been compromised. Rather, the record confirms that the Chair remains open to deciding the issues impartially and upon the evidence that will be adduced at the hearing, not on any pre-determined views favoring one side or the other.

2017 NSCA 24 (CanLII)

Judges:	Bryson, Saunders and Bourgeois, JJ.A.
Appeal Heard:	November 28, 2016, in Halifax, Nova Scotia
Held:	Appeal dismissed per reasons for judgment of Saunders, J.A.; Bryson and Bourgeois, JJ.A. concurring.
Counsel:	Dorianne Mullin, for the appellant Vincent Calderhead and Charlene Moore, for the respondents, Beth MacLean, Olga Cain and Susan Lattie Dianne Pothier, Claire McNeil and Donna Franey, for the respondent, Disability Rights Coalition Jason T. Cooke and Jennifer Keliher, for the respondent, Nova Scotia Human Rights Commission

[39] First, as a matter of law, there is a strong presumption of judicial impartiality, which is not easily displaced. Second, there is a heavy burden of proof upon the person making the allegation to present cogent evidence establishing "serious grounds" sufficient to justify a finding that the decision-maker should be disqualified on account of bias. Third, whether a reasonable apprehension of bias exists is "highly fact-specific". Such an inquiry is one where the context, and the particular circumstances, are of supreme importance. The allegation can only be addressed carefully in light of the entire context. There are no shortcuts. See *Wewaykum Indian Band v. Canada*, 2003 SCC 45.

2017 NSCA 24 (CanLII)

[40] The "test" regarding what constitutes a reasonable apprehension of bias appears in the oft-quoted dissenting judgment of de Grandpré, J. in *Committee for Justice and Liberty v. National Energy Board*, [1978] 1 S.C.R. 369 at ¶40:

> …the apprehension of bias must be a reasonable one, held by reasonable and right minded persons, applying themselves to the question and obtaining thereon the required information, that test is "what would an informed person, viewing the matter realistically and practically— …conclude? Would he think that it is more likely than not that Mr. Crowe, whether consciously or unconsciously, would not decide fairly.

[41] In relation to what constitutes the "reasonable person", the qualifications are not limited to just being "reasonable". The law requires a fully *informed* "reasonable person". That is:

> …a person who approaches the question of whether there exists a reasonable apprehension of bias with a complex and contextualized understanding of the issues in the case. The reasonable person understands the impossibility of judicial neutrality, but demands judicial impartiality.

[*R. v. S.(R.D.)(R.D.S.)*, [1997] 3 S.C.R. 484]

[42] In that case, the Supreme Court of Canada explained in detail the requirement for neutrality in decision-making, and how the duty to be impartial did not oblige judges to have no sympathies or opinions at all, but rather to ensure that they were receptive to other points of view. In his reasons, Justice Cory (joined by Justice Iacobucci, said at ¶119:

> 119 The requirement for neutrality does not require judges to discount the very life experiences that may so well qualify them to preside over disputes. It has been observed that the duty to be impartial

MOTION FOR DIRECTIONS

MOTIONS TO VACATE A JUDGMENT

Courts — Judges — Impartiality — Reasonable apprehension of bias — Supreme Court judgment dismissing Indian bands' appeals — Indian bands presenting motions to set aside judgment alleging reasonable apprehension of bias arising from involvement of judge in bands' claims while serving as federal Associate Deputy Minister of Justice over 15 years prior to hearing of appeals — Whether judgment tainted by reasonable apprehension of bias — Whether judgment should be set aside.

In 1985 and 1989 respectively, the Campbell River Band and the Cape Mudge Band instituted legal proceedings against each other and the Crown, each band claiming exclusive entitlement to two reserves on Vancouver Island. In 1995, the Federal Court, Trial Division dismissed the actions and the Federal Court of Appeal upheld the decision. In December 2002, in reasons written by Binnie J. and concurred in unanimously, this Court dismissed the bands' appeals. In February 2003, the Campbell River Band made an access to information request to the federal Department of Justice seeking copies of all records to, from or which make reference to Mr. Binnie concerning the bands' claims against the Crown Mr. Binnie, when he was Associate Deputy Minister of Justice in 1982-1986, had been responsible for all litigation, except tax matters and cases in Quebec, involving the Government of Canada and had supervisory authority over thousands of cases. The Department of Justice found a number of internal memoranda which indicate that, in late 1985 and early 1986, Mr. Binnie had received some information concerning the Campbell River Band's claim and that he had attended a meeting where the claim was discussed. The Crown filed a motion in this Court seeking directions as to any steps to be taken. Binnie J. recused himself from any further proceedings in this matter and filed a statement setting out that he had no recollection of personal involvement in the case. The bands sought an order setting aside this Court's judgment. Both bands agree that actual bias is not at issue and accept Binnie J.'s statement that he had no

REQUÊTE SOLLICITANT DES DIRECTIVES

REQUÊTES EN ANNULATION DE JUGEMENT

Tribunaux — Juges — Impartialité — Crainte raisonnable de partialité — Pourvois de bandes indiennes rejetés par la Cour suprême — Présentation par les bandes indiennes de requêtes en annulation du jugement fondée sur la crainte raisonnable de partialité qui découlerait du rôle joué par un juge dans les demandes des bandes en tant que sous-ministre adjoint de la Justice plus de 15 ans avant l'audition des appels — Le jugement est-il entaché d'une crainte raisonnable de partialité? — Y a-t-il lieu d'annuler le jugement?

En 1985 et 1989 respectivement, la bande de Campbell River et la bande de Cape Mudge ont intenté une action en justice, chacune poursuivant l'autre ainsi que la Couronne et revendiquant le droit exclusif à deux réserves situées dans l'île de Vancouver. En 1995, la section de première instance de la Cour fédérale a rejeté les actions et la Cour d'appel fédérale a confirmé cette décision. En décembre 2002, notre Cour a rejeté les pourvois des bandes dans des motifs exposés par le juge Binnie, auxquels ont souscrit tous les autres juges de la Cour. En février 2003, la bande de Campbell River a présenté au ministère de la Justice une demande d'accès à l'information dans laquelle elle sollicitait des copies de tous les documents qui soit avaient été expédiées à M. Binnie, soit émanaient de ce dernier ou encore faisaient mention de lui et qui se rapportaient aux demandes présentées contre le gouvernement fédéral par les bandes. Lorsqu'il a occupé le poste de sous-ministre adjoint de la Justice, de 1982 à 1986, M. Binnie était responsable de tous les litiges auxquels était partie le gouvernement fédéral, sauf les affaires fiscales et celles se déroulant au Québec, et il supervisait des milliers de dossiers. Le ministère de la Justice a trouvé un certain nombre de notes de service internes qui indiquent que, à la fin de 1985 et au début de 1986, M. Binnie a reçu certains renseignements concernant la demande de la bande de Campbell River et a assisté à une réunion au cours de laquelle cette demande a été discutée. La Couronne a présenté à notre Cour une requête sollicitant des directives quant aux mesures qui pourraient devoir être prises. Le juge Binnie s'est

recollection of personal involvement in the case. However, they allege that Binnie J.'s involvement as federal Associate Deputy Minister of Justice in the early stages of the Campbell River Band's claim in 1985 and 1986 gives rise to a reasonable apprehension of bias.

Held: The motion for directions and the motions to vacate a judgment should be dismissed. In the circumstances of this case, no reasonable apprehension of bias is established and hence Binnie J. was not disqualified from hearing the appeals or participating in the judgment.

Public confidence in our legal system is rooted in the fundamental belief that those who adjudicate in law must always do so without bias or prejudice and must be perceived to do so. A judge's impartiality is presumed and a party arguing for disqualification must establish that the circumstances justify a finding that the judge must be disqualified. The criterion of disqualification is the reasonable apprehension of bias. The question is what would an informed, reasonable and right-minded person, viewing the matter realistically and practically, and having thought the matter through, conclude. Would he think that it is more likely than not that the judge, whether consciously or unconsciously, would not decide fairly?

It is necessary to clarify the relationship of this objective standard to two other factors: the subjective consideration of actual bias and the notion of automatic disqualification. Most arguments for disqualification are not based on actual bias. When parties say that there was no actual bias on the part of a judge, it can mean one of three things: (1) that reasonable apprehension is a surrogate for actual bias; (2) that unconscious bias can exist even where the judge acted in good faith; and (3) that looking for real bias is simply not the relevant inquiry since justice should not only be done but must be seen to be done. This third justification for the objective standard of reasonable apprehension of bias envisions the possibility that a judge may be totally impartial in circumstances which nevertheless create a reasonable apprehension of bias, requiring his disqualification. The idea that "justice must be seen to be done" cannot be severed from the

récusé à l'égard de toutes procédures ultérieures dans cette affaire et il a déposé une déclaration précisant qu'il n'avait aucun souvenir d'avoir participé personnellement à ce dossier. Les bandes ont demandé une ordonnance portant annulation du jugement de notre Cour. Les deux bandes reconnaissent qu'il ne s'agit pas d'une affaire de partialité réelle et elles acceptent la déclaration du juge Binnie selon laquelle il n'avait aucun souvenir d'avoir participé personnellement à cette affaire. Cependant, elles font valoir que le rôle joué par le juge Binnie en tant que sous-ministre adjoint de la Justice aux premiers stades de la demande de la bande de Campbell River en 1985 et 1986 fait naître une crainte raisonnable de partialité.

Arrêt : La requête sollicitant des directives et les requêtes en annulation de jugement sont rejetées. À la lumière des circonstances de l'espèce, aucune crainte raisonnable de partialité n'a été établie et le juge Binnie n'était pas inhabile à connaître des présents pourvois et à participer au jugement.

La confiance du public dans notre système juridique prend sa source dans la conviction fondamentale selon laquelle ceux qui rendent jugement doivent non seulement toujours le faire sans partialité ni préjugé, mais doivent également être perçus comme agissant ainsi. L'impartialité du juge doit être présumée et c'est à la partie qui plaide l'inhabilité qu'incombe le fardeau d'établir que les circonstances permettent de conclure que le juge doit être récusé. Le critère de récusation est la crainte raisonnable de partialité. Il consiste à se demander à quelle conclusion arriverait une personne bien renseignée qui étudierait la question en profondeur, de façon réaliste et pratique. Croirait-elle que, selon toute vraisemblance, le juge, consciemment ou non, ne rendra pas une décision juste?

Il est nécessaire de clarifier le rapport entre cette norme objective et deux autres facteurs : le facteur subjectif de la partialité réelle et la notion d'inhabilité automatique. Dans la plupart des cas où l'inhabilité du décideur est invoquée, la partie qui la soulève n'invoque pas la partialité réelle. Lorsque des parties affirment qu'il y avait absence de partialité réelle de la part du juge, cela peut signifier l'une des trois choses suivantes : (1) que la crainte raisonnable de partialité est un critère de remplacement de la partialité réelle; (2) qu'il peut y avoir partialité inconsciente, même lorsque le juge a agi de bonne foi; (3) que la présence ou l'absence de partialité réelle n'est tout simplement pas la bonne question à se poser, puisque justice doit non seulement être rendue mais elle doit également paraître être rendue. Cette troisième justification de la norme objective de la crainte raisonnable de partialité admet la possibilité qu'un juge puisse être totalement

standard of reasonable apprehension of bias. The relevant inquiry is not whether there was in fact either conscious or unconscious bias on the part of the judge, but whether a reasonable person properly informed would apprehend that there was. With respect to the notion of automatic disqualification, recent English case law suggests that automatic disqualification is justified in cases where a judge has an interest in the outcome of a proceeding. This case law is not helpful here because automatic disqualification does not extend to judges somehow involved in the litigation or linked to counsel at an earlier stage. In Canada, proof of actual bias or a reasonable apprehension of bias is required. In any event, on the facts of this case, there is no suggestion that Binnie J. had any financial interest in the appeals, or had such an interest in the subject matter of the case that he was effectively in the position of a party to the cause.

In this case, disqualification can only be based on a reasonable apprehension of bias. In light of the strong presumption of judicial impartiality, the standard refers to an apprehension based on serious grounds. Each case must be examined contextually and the inquiry is fact-specific. Where, as here, the issue of bias arises after judgment has been rendered, it is not helpful to determine whether the judge would have recused himself had the matter come to light earlier. Although the standard remains the same, an abundance of caution guides many, if not most judges, at this early stage, and judges often recuse themselves where it is not legally necessary. Lastly, this Court's dictum that judges should not preside over a case in which they played a part at any stage is but an illustration of the general principle. It does not suggest that any degree of earlier participation in a case is cause for automatic disqualification, but rather suggests that a reasonable and right-minded person would likely view unfavourably the fact that the judge acted as counsel in a case over which he is presiding, and could take this fact as the foundation of a reasonable apprehension of bias.

Here, neither Binnie J.'s past status as Associate Deputy Minister nor his long-standing interest in matters involving First Nations is by itself sufficient to justify his disqualification. The source of concern for the bands is

impartial dans des circonstances faisant néanmoins naître une crainte raisonnable de partialité requérant qu'il soit déclaré inhabile. L'idée selon laquelle « justice doit paraître être rendue » ne peut être dissociée de la norme de la crainte raisonnable de partialité. La question pertinente n'est pas de savoir si, dans les faits, le juge a fait preuve de partialité consciente ou inconsciente, mais si une personne raisonnable et bien renseignée craindrait qu'il y ait eu partialité. Relativement à la notion d'inhabilité automatique, certains arrêts britanniques récents suggèrent que l'application de cette notion est justifiée lorsque le juge a un intérêt dans l'issue de l'instance. Cette jurisprudence n'est pas utile en l'espèce, parce que la règle de l'inhabilité automatique ne s'applique pas dans les cas où le décideur a, d'une certaine façon, participé au litige ou été en contact avec les avocats aux premiers stades de l'affaire. Au Canada, il faut prouver l'existence de partialité réelle ou d'une crainte raisonnable de partialité. Quoi qu'il en soit, au vu des faits de l'espèce, rien n'indique que le juge Binnie avait quelque intérêt pécuniaire dans les pourvois ou qu'il manifestait pour l'objet de l'affaire un intérêt tel qu'il se trouvait effectivement dans la position d'une partie à la cause.

Dans la présente affaire, l'inhabilité ne peut être invoquée que sur le fondement de la crainte raisonnable de partialité. Vu la forte présomption d'impartialité dont jouissent les tribunaux, la norme exige une crainte de partialité fondée sur des motifs sérieux. Chaque affaire doit être examinée au regard du contexte et des faits qui lui sont propres. Lorsque, comme en l'espèce, la question de l'inhabilité se soulève après le prononcé du jugement et non au début de l'instance, il n'est pas utile de se demander si le juge se serait récusé si la situation avait été connue plus tôt. Quoique la norme reste la même, bon nombre de juges, sinon la plupart d'entre eux, font montre d'une prudence extrême tôt dans l'instance, et il arrive souvent qu'ils se récusent alors qu'ils ne seraient pas légalement tenus de le faire. Enfin, la remarque incidente de notre Cour selon laquelle les juges ne doivent pas siéger dans une cause à laquelle ils ont participé à quelque stade de l'affaire n'est qu'une illustration du principe général. Elle ne dit pas que toute participation dans le passé à une affaire est automatiquement cause d'inhabilité, mais elle indique plutôt qu'une personne sensée et raisonnable verrait vraisemblablement d'un mauvais oeil le fait que le juge a agi comme avocat dans une affaire dont il est saisi, et que cette personne pourrait considérer que ce fait naître une crainte raisonnable de partialité.

En l'espèce, ni le fait que le juge Binnie ait dans le passé occupé la charge de sous-ministre adjoint ni son intérêt de longue date pour les questions concernant les Premières nations ne justifient en soi de conclure

Binnie J.'s involvement in this case in the mid-1980s. The documentary record, however, does not support a reasonable apprehension of bias. Binnie J.'s involvement in the dispute was confined to a limited supervisory and administrative role. While his link to this litigation exceeded *pro forma* management of the files, he was never counsel of record and played no active role after the claim was filed, nor did he plan litigation strategy. Any views attributed to Binnie J. earlier on were offered in the context of wider implications of the negotiation process, and not in the context of litigation. Furthermore, in his capacity of Associate Deputy Minister, he was responsible for thousands of files at the relevant time and the matter on which he was involved in this file was not unique to this case but was an issue of general application to existing reserves in British Columbia. More importantly, Binnie J.'s supervisory role dates back over 15 years. This lengthy period is significant in relation to Binnie J.'s statement that he had no recollection of his involvement because it is a factor that a reasonable person would properly consider, and it makes bias or its apprehension improbable. Nor would a reasonable person, viewing the matter realistically, conclude that Binnie J.'s ability to remain impartial was unconsciously affected by a limited administrative and supervisory role dating back over 15 years.

Even if the involvement of a single judge had given rise to a reasonable apprehension of bias in this case, no reasonable person informed of the decision-making process of this Court and viewing it realistically could conclude that the eight other judges who heard the appeals were biased or tainted.

à son inhabilité. La préoccupation des bandes est la participation du juge Binnie à la présente affaire au milieu des années 1980. La preuve documentaire n'étaye toutefois pas l'existence d'une crainte raisonnable de partialité. Le juge Binnie n'a joué dans le différend en cause qu'un rôle de supervision et d'administration limité. Bien que le lien entre le juge Binnie et le présent litige ait dépassé la gestion *pro forma* des dossiers, ce dernier n'a jamais été l'avocat inscrit au dossier et il n'a pas joué de rôle actif dans le différend après le dépôt de l'action ni planifié la stratégie d'instance. Les opinions attribuées au juge Binnie ont été formulées dans le contexte des répercussions plus larges du processus de négociation plutôt que dans le contexte du litige. De plus, en sa qualité de sous-ministre adjoint, il était responsable de milliers de dossiers à l'époque pertinente et la question sur laquelle il s'est penché dans la présente affaire ne touchait pas exclusivement celle-ci mais concernait en général les réserves existantes en Colombie-Britannique. Fait plus important encore, le rôle limité de supervision qu'a joué le juge Binnie remonte à plus de 15 ans. Ce très long délai est important en ce qui concerne la déclaration du juge Binnie selon laquelle il n'avait aucun souvenir de sa participation à cette affaire, parce qu'il s'agit d'un facteur dont la personne raisonnable tiendrait à juste titre compte et qui rend improbable l'existence de partialité ou de crainte de partialité. Considérant la question de façon réaliste, cette personne ne conclurait pas non plus que le rôle limité d'administration et de supervision qu'a joué le juge Binnie dans ce dossier, il y a de cela plus de 15 ans, a inconsciemment influencé sa capacité de demeurer impartial.

Même si le rôle joué par un seul juge avait fait naître une crainte raisonnable de partialité en l'espèce, aucune personne raisonnable connaissant le processus décisionnel de notre Cour et le considérant de façon réaliste ne saurait conclure que les huit autres juges étaient partiaux ou ont été influencés.

I. Introduction

La bande indienne Wewaykum ou bande indienne de Campbell River (ci-après la « bande de

67 Of the three justifications for the objective standard of reasonable apprehension of bias, the last is the most demanding for the judicial system, because it countenances the possibility that justice might not be seen to be done, even where it is undoubtedly done — that is, it envisions the possibility that a decision-maker may be totally impartial in circumstances which nevertheless create a reasonable apprehension of bias, requiring his or her disqualification. But, even where the principle is understood in these terms, the criterion of disqualification still goes to the judge's state of mind, albeit viewed from the objective perspective of the reasonable person. The reasonable person is asked to imagine the decision-maker's state of mind, under the circumstances. In that sense, the oft-stated idea that "justice must be seen to be done", which was invoked by counsel for the bands, cannot be severed from the standard of reasonable apprehension of bias.

68 We emphasize this aspect of the criterion of disqualification in Canadian law because another strand of this area of the law in the Commonwealth suggests that some circumstances of conflict of interest may be enough to justify disqualification, whether or not, from the perspective of the reasonable person, they could have any impact on the judge's mind. As we conclude in the next section, this line of argument is not helpful to counsel for the bands in the present case.

C. *Reasonable Apprehension of Bias and Automatic Disqualification*

69 At the opposite end from claims of actual bias, it has been suggested that it is wrong to be a judge in one's own cause, whether or not one knows this to be the case. The idea has been linked to the early decision of *Dimes v. Proprietors of the Grand Junction Canal* (1852), 3 H.L.C. 759, 10 E.R. 301. More recently, in *Gough*, *supra*, at p. 661, Lord Goff stated that

> there are certain cases in which it has been considered that the circumstances are such that they must inevitably shake public confidence in the integrity of the admin-

De ces trois justifications de la norme objective de la crainte raisonnable de partialité, la dernière est la plus exigeante pour le système judiciaire, en ce qu'elle admet la possibilité que justice puisse paraître ne pas avoir été rendue, même lorsqu'elle l'a indubitablement été — c'est-à-dire qu'elle envisage qu'un décideur puisse être totalement impartial dans des circonstances faisant néanmoins naître une crainte raisonnable de partialité requérant qu'il soit déclaré inhabile. Cependant, même lorsque le principe est interprété ainsi, le critère de détermination de l'inhabilité revient toujours à l'état d'esprit du juge, quoique ce facteur soit considéré du point de vue objectif de la personne raisonnable. On demande à cette personne d'imaginer l'état d'esprit du juge, dans les circonstances pertinentes. En ce sens, l'idée maintes fois énoncée selon laquelle « justice doit paraître être rendue », qu'ont invoqué les avocats des bandes, ne peut être dissociée de la norme de la crainte raisonnable de partialité.

Nous insistons sur cet élément du critère de détermination de l'inhabilité en droit canadien parce qu'il existe, sur cet aspect du droit dans le Commonwealth, un autre courant voulant que certaines situations de conflit d'intérêts suffisent à justifier une déclaration d'inhabilité, indépendamment du fait que, du point de vue de la personne raisonnable, ces situations puissent ou non avoir une influence sur l'esprit du juge. Vu notre conclusion dans la prochaine section, cette argumentation n'est d'aucun secours aux avocats des bandes en l'espèce.

C. *Crainte raisonnable de partialité et inhabilité automatique*

Aux antipodes des demandes invoquant l'existence de partialité réelle, il a été avancé que nul ne peut être à la fois juge et partie dans une cause, et ce que la personne concernée en soit consciente ou non. On rattache cette thèse à une vieille décision, l'affaire *Dimes c. Proprietors of the Grand Junction Canal* (1852), 3 H.L.C. 759, 10 E.R. 301. Plus récemment, dans l'arrêt *Gough*, précité, p. 661, lord Goff a dit ceci :

> [TRADUCTION] . . . il existe des cas où l'on a estimé que les circonstances sont telles qu'elles ébranleraient inévitablement la confiance du public dans l'intégrité

istration of justice if the decision is to be allowed to stand. . . . These cases arise where a person sitting in a judicial capacity has a pecuniary interest in the outcome of the proceedings. . . . In such a case, . . . not only is it irrelevant that there was in fact no bias on the part of the tribunal, but there is no question of investigating, from an objective point of view, whether there was any real likelihood of bias, or any reasonable suspicion of bias, on the facts of the particular case. The nature of the interest is such that public confidence in the administration of justice requires that the decision should not stand.

de l'administration de la justice si la décision était maintenue. [. . .] Il s'agit des cas où une personne exerçant des fonctions judiciaires possède un intérêt pécuniaire dans l'issue de l'instance. [. . .] En pareils cas, [. . .] non seulement l'absence de partialité de la part du tribunal n'est-elle pas pertinente, mais il n'est pas question de se demander si, d'un point de vue objectif, il existait une probabilité réelle de partialité ou une crainte raisonnable de partialité eu égard aux faits de l'affaire en cause. La nature de l'intérêt est telle que la confiance du public dans l'administration de la justice commande que la décision ne soit pas maintenue.

This has been described as "automatic disqualification", and was recently revisited by the House of Lords in *R. v. Bow Street Metropolitan Stipendiary Magistrate, Ex parte Pinochet Ugarte (No. 2)*, [1999] 2 W.L.R. 272. There, the House of Lords dealt with a situation in which Lord Hoffmann had participated in a decision in which Amnesty International was an intervener, while sitting as a director and chairperson of a charity closely allied with Amnesty International and sharing its objects. In that context, it was found that the rule of "automatic disqualification" extended to a limited class of non-financial interests, where the judge has such a relevant interest in the subject matter of the case that he or she is effectively in the position of a party to the cause. As a result, Lord Hoffmann was disqualified, and the decision of the House of Lords was set aside, in a judgment that drew much attention around the world.

70 Ce genre de cas, qu'on a qualifié de situations d'« inhabilité automatique », a récemment été réexaminé par la Chambre des lords dans *R. c. Bow Street Metropolitan Stipendiary Magistrate, Ex parte Pinochet Ugarte (No. 2)*, [1999] 2 W.L.R. 272. Dans cet arrêt, la Chambre des lords a examiné une situation où lord Hoffmann avait participé à la décision d'une affaire dans laquelle Amnistie internationale était intervenante, alors qu'il siégeait comme administrateur et président d'un organisme de bienfaisance qui était intimement lié à Amnistie internationale et partageait les objectifs de celle-ci. Dans ce contexte, il a été jugé qu'une catégorie limitée d'intérêts non pécuniaires entraînent également l'application de la règle de l'« inhabilité automatique », par exemple lorsque le juge possède un intérêt à ce point pertinent à l'égard de l'objet de l'affaire qu'il se trouve effectivement dans la position d'une partie à la cause. Par conséquent, lord Hoffmann a été déclaré inhabile et la décision de la Chambre des lords a été annulée dans un jugement qui a suscité beaucoup d'attention à travers le monde.

A more recent decision of the English Court of Appeal suggests that this extension of the rule of automatic disqualification, beyond cases of financial interests, is likely to remain exceptional (*Locabail (U.K.)*, *supra*). Even so extended, the rule of automatic disqualification does not apply to the situation in which the decision-maker was somehow involved in the litigation or linked to counsel at an earlier stage, as is argued here.

71 Un arrêt plus récent de la Cour d'appel d'Angleterre semble indiquer que l'élargissement de l'application de la règle de l'inhabilité automatique à d'autres situations que celles mettant en jeu des intérêts pécuniaires restera vraisemblablement exceptionnel (*Locabail (U.K.)*, précité). Malgré cet élargissement, la règle de l'inhabilité automatique ne s'applique pas dans les cas où le décideur a, d'une certaine façon, participé au litige ou été en contact avec les avocats aux premiers stades de l'affaire, comme il est allégué en l'espèce.

Newfoundland Telephone Company Limited *Appellant*

v.

The Board of Commissioners of Public Utilities *Respondent*

INDEXED AS: NEWFOUNDLAND TELEPHONE CO. *v.* NEWFOUNDLAND (BOARD OF COMMISSIONERS OF PUBLIC UTILITIES)

File No.: 22060.

1991: November 7; 1992: March 5.

Present: La Forest, L'Heureux-Dubé, Sopinka, Gonthier, Cory, McLachlin and Iacobucci JJ.

ON APPEAL FROM THE COURT OF APPEAL FOR NEWFOUNDLAND

Administrative law — Apprehension of bias — Policy-making board — Board member expressing strong views as to issue board considering — Decision made after Board declined to remove member from panel — Extent to which an administrative board member may comment on matters before the board — Whether reasonable apprehension of bias — If so, whether decision void or merely voidable.

Respondent Board, whose members are appointed by cabinet subject only to the qualification that they not be employed by or have an interest in a public utility, regulates appellant. One commissioner, a former consumers' advocate playing the self-appointed role of champion of consumers' rights on the Board, made several strong statements which were reported in the press against appellant's executive pay policies before a public hearing was held by the Board into appellant's costs. When the hearing commenced, appellant objected to this commissioner's participation on the panel because of an apprehension of bias. The Board found that it had no jurisdiction to rule on its own members and decided that the panel would continue as constituted. A number of public statements relating to the issue before the Board were made by this commissioner during the hearing and before the Board released its decision which (by a majority which included the commissioner at issue) disallowed some of appellant's costs. A minority would

c.

The Board of Commissioners of Public Utilities *Intimée*

RÉPERTORIÉ: NEWFOUNDLAND TELEPHONE CO. *c.* TERRE-NEUVE (BOARD OF COMMISSIONERS OF PUBLIC UTILITIES)

N° du greffe: 22060.

1991: 7 novembre; 1992: 5 mars.

Présents: Les juges La Forest, L'Heureux-Dubé, Sopinka, Gonthier, Cory, McLachlin et Iacobucci.

EN APPEL DE LA COUR D'APPEL DE TERRE-NEUVE

Droit administratif — Crainte de partialité — Commission chargée de l'élaboration de politiques — Un membre de la Commission a exprimé des opinions bien arrêtées sur une question dont la Commission était saisie — Décision rendue après le refus de la Commission d'écarter ce membre de la formation étudiant la question — Dans quelle mesure un membre d'une commission administrative peut-il commenter des questions soumises à la commission? — Y a-t-il eu une crainte raisonnable de partialité? — Dans l'affirmative, la décision rendue était-elle nulle ou seulement susceptible d'annulation?

La Commission intimée, dont les membres sont nommés par le cabinet à la seule condition qu'ils ne soient pas employés par une entreprise de services publics et qu'ils n'aient aucun intérêt dans une telle entreprise, assure la réglementation de l'appelante. Un commissaire, ancien défenseur des droits des consommateurs qui a décidé de jouer ce même rôle au sein de la Commission, a fait, antérieurement à la tenue d'une audience publique par la Commission relativement aux frais de l'appelante, plusieurs déclarations, diffusées dans la presse, attaquant énergiquement les politiques de l'appelante en matière de rémunération de ses cadres. Au début de l'audience, l'appelante, invoquant une crainte de partialité, s'est opposée à ce que ce commissaire siège dans l'affaire. La Commission a conclu qu'elle n'avait pas compétence pour statuer sur les cas de ses membres et a décidé que la formation des commissaires resterait telle quelle. Pendant le déroulement de l'audience et avant que la Commission (à la majorité,

1992 CanLII 84 (SCC)

have allowed these costs. Appellant appealed both the order of the Board and the Board's decision to proceed with the panel as constituted to the Court of Appeal.

The Court of Appeal found that the Board had complete jurisdiction to determine its own procedures and all questions of fact and law and that it declined to exercise its jurisdiction when it refused to remove the commissioner from the panel. Although the court concluded that there was a reasonable apprehension of bias, it held that the Board's decision was merely voidable and that, given that the commissioner's mind was not closed to argument, the Board's order was valid.

The issues under consideration here were: (1) the extent to which an administrative board member may comment on matters before the board and, (2) the result which should obtain if a decision of a board is made in circumstances where a reasonable apprehension of bias is found.

Held: The appeal should be allowed.

The duty of fairness applies to all administrative bodies. The extent of that duty, however, depends on the particular tribunal's nature and function. The duty to act fairly includes the duty to provide procedural fairness to the parties. That simply cannot exist if an adjudicator is biased. Because it is impossible to determine the precise state of mind of an adjudicator who has made an administrative board decision, an unbiased appearance is an essential component of procedural fairness. The test to ensure fairness is whether a reasonably informed bystander would perceive bias on the part of an adjudicator.

There is a great diversity of administrative boards. Those that are primarily adjudicative in their functions will be expected to comply with the standard applicable to courts: there must be no reasonable apprehension of bias with regard to their decision. At the other end of the scale are boards with popularly elected members where the standard will be much more lenient. In such circumstances, a reasonable apprehension of bias occurs if a board member pre-judges the matter to such an extent

ledit commissaire étant du nombre des majoritaires) ne rende sa décision refusant certains frais de l'appelante, le commissaire en question a fait plusieurs déclarations publiques concernant la question dont la Commission était saisie. La minorité était d'avis d'admettre ces frais. L'appelante a contesté devant la Cour d'appel l'ordonnance de la Commission et la décision de celle-ci de permettre que l'audience ait lieu devant la formation telle qu'elle était constituée.

La Cour d'appel a conclu que la Commission a une compétence absolue pour décider de ses propres procédures et pour statuer sur toutes questions de fait et de droit et que son refus d'écarter le commissaire de la formation constituait un refus d'exercer sa compétence. Bien que concluant à l'existence d'une crainte raisonnable de partialité, la cour a dit que la décision de la Commission était seulement susceptible d'annulation et que, comme le commissaire n'avait pas l'esprit fermé aux arguments, l'ordonnance de la Commission était valide.

Les questions en litige en l'espèce sont celles de savoir (1) dans quelle mesure un membre d'une commission administrative peut commenter les affaires dont la commission est saisie, et (2) ce qui devrait se passer si la décision d'une commission est jugée avoir été rendue dans des circonstances où il existait une crainte raisonnable de partialité.

Arrêt: Le pourvoi est accueilli.

Tous les corps administratifs sont soumis à l'obligation d'agir équitablement. L'étendue de cette obligation tient toutefois à la nature et à la fonction du tribunal en question. L'obligation d'agir équitablement comprend celle d'assurer aux parties l'équité procédurale, qui ne peut tout simplement pas exister s'il y a partialité de la part du décideur. Vu l'impossibilité de déterminer exactement l'état d'esprit d'une personne qui a rendu une décision d'une commission administrative, l'apparence d'impartialité constitue un élément essentiel de l'équité procédurale. Le critère à appliquer pour assurer l'équité consiste à se demander si un observateur relativement bien renseigné percevrait de la partialité chez un décideur.

Il existe une grande diversité de commissions administratives. Celles qui remplissent des fonctions essentiellement juridictionnelles devront respecter la norme applicable aux cours de justice: il ne doit y avoir aucune crainte raisonnable de partialité relativement à leur décision. À l'autre extrémité se trouvent les commissions dont les membres sont élus par le public, pour lesquelles la norme est nettement moins sévère. Dans leur cas, il y a crainte raisonnable de partialité si un membre de la

1992 CanLII 84 (SCC)

that any representations to the contrary would be futile. Administrative boards that deal with matters of policy will be closely comparable to the boards composed of elected members. For those boards, a strict application of a reasonable apprehension of bias as a test might undermine the very role which has been entrusted to them by the legislature.

A member of a board which performs a policy-formation function should not be susceptible to a charge of bias simply because of the expression of strong opinions prior to the hearing. As long as those statements do not indicate a mind so closed that any submissions would be futile, they should not be subject to attack on the basis of bias. Statements manifesting a mind so closed as to make submissions futile would, however, even at the investigatory stage, constitute a basis for raising an issue of apprehended bias. Once the matter reaches the hearing stage a greater degree of discretion is required of a member.

The statements at issue here, when taken together, indicated not only a reasonable apprehension of bias but also a closed mind on the commissioner's part on the subject. Once the order directing the holding of the hearing was given, the Utility was entitled to procedural fairness. At the investigative stage, the "closed mind" test was applicable but once matters proceeded to a hearing, a higher standard had to be applied. Procedural fairness at that stage required the commission members to conduct themselves so that there could be no reasonable apprehension of bias.

A denial of a right to a fair hearing cannot be cured by the tribunal's subsequent decision. A decision of a tribunal which denied the parties a fair hearing cannot be simply voidable and rendered valid as a result of the subsequent decision of the tribunal. The damage created by apprehension of bias cannot be remedied. The hearing, and any subsequent order resulting from it, must be void. The order of the Board of Commissioners of Public Utilities was accordingly void.

commission préjuge l'affaire au point de rendre vain tout argument contraire. Les commissions administratives qui s'occupent de questions de principe sont dans une large mesure assimilables à celles composées de membres élus en ce sens que l'application stricte du critère de la crainte raisonnable de partialité risquerait de miner le rôle que leur a précisément confié le législateur.

Le membre d'une commission qui remplit une fonction d'élaboration des politiques ne devrait pas être exposé à une accusation de partialité du seul fait d'avoir exprimé avant l'audience des opinions bien arrêtées. Pourvu que ces déclarations ne témoignent pas d'un esprit à ce point fermé qu'il serait inutile de présenter des arguments contraires, on ne devrait pas pouvoir les attaquer en invoquant la partialité. Des déclarations traduisant un esprit fermé au point de rendre vain tout argument contraire justifieraient toutefois, même au stade de l'enquête, qu'on invoque la crainte de partialité. Au stade de l'audience, un membre d'une commission est tenu à une plus grande discrétion.

Prises ensemble, les déclarations en cause en l'espèce indiquent non seulement qu'il y avait une crainte raisonnable de partialité mais aussi que le commissaire avait l'esprit fermé. Une fois rendue l'ordonnance exigeant la tenue de l'audience, l'entreprise de services publics avait droit à l'équité procédurale. Si, au stade de l'enquête, c'était le critère de l'«esprit fermé» qui s'appliquait, à l'audience la norme devait être plus sévère. Aussi l'équité procédurale commandait-elle à ce stade-là que les commissaires se comportent de façon à ne susciter aucune crainte raisonnable de partialité.

Une décision subséquente du tribunal ne peut remédier à la négation du droit à une audience équitable. La décision d'un tribunal qui a refusé aux parties une audience équitable ne peut être simplement annulable et être validée ensuite par la décision subséquente du tribunal. Le préjudice résultant d'une crainte de partialité est irrémédiable. L'audience, ainsi que toute ordonnance à laquelle elle aboutit, doit être frappée de nullité. L'ordonnance de la Board of Commissioners of Public Utilities est en conséquence nulle.

The judgment of the Court was delivered by

CORY J.—Two issues are raised on this appeal. The first requires a consideration of the extent to which an administrative board member may be permitted to comment upon matters before the board. The second, raises the question as to what the result should be if a decision of a board is made in circumstances where there is found to be a reasonable apprehension of bias.

The Factual Background

Pursuant to the provisions of *The Public Utilities Act*, R.S.N. 1970, c. 322, the Board of Commissioners of Public Utilities ("the Board") is responsible for the regulation of the Newfoundland Telephone Company Limited. Commissioners of the Board are appointed by the Lieutenant-

Directeur de l'établissement Kent, [1985] 2 R.C.S. 643; **arrêts mentionnés**: *Nicholson c. Haldimand-Norfolk Regional Board of Commissioners of Police*, [1979] 1 R.C.S. 311; *Martineau c. Comité de discipline de l'Institution de Matsqui*, [1980] 1 R.C.S. 602.

Lois et règlements cités

Public Utilities Act, R.S.N. 1970, ch. 322, art. 5(1) [mod. par S.N. 1979, ch. 30, art. 1], (8), 6, 14, 15, 79, 83, 85, 86.

Doctrine citée

Janisch, Hudson N. Case Comment: *Nfld. Light & Power Co. v. P.U.C. (Bd.)* (1987), 25 Admin. L.R. 196.

POURVOI contre un arrêt de la Cour d'appel de Terre-Neuve (1990), 83 Nfld. & P.E.I.R. 257, 260 A.P.R. 257, 45 Admin. L.R. 291, qui a rejeté un appel d'une ordonnance et d'une décision de la Board of Commissioners of Public Utilities. Pourvoi accueilli.

Chesley F. Crosbie, pour l'intimée.

Version française du jugement de la Cour rendu par

LE JUGE CORY—Deux questions se posent dans le présent pourvoi. La première nécessite que la Cour examine dans quelle mesure un membre d'une commission administrative peut commenter les affaires dont la commission est saisie. Quant à la seconde, elle concerne ce qui devrait se passer si la décision d'une commission est jugée avoir été rendue dans des circonstances où il existait une crainte raisonnable de partialité.

Les faits

The Public Utilities Act, R.S.N. 1970, ch. 322, confie à la Board of Commissioners of Public Utilities («la Commission») la réglementation de la Newfoundland Telephone Company Limited. Les commissaires sont nommés par le lieutenant-gouverneur en conseil. La loi porte simplement que les

1992 CanLII 84 (SCC)

witnesses and counsel by board members. Wells' statements, however, were such, that so long as he remained a member of the Board hearing the matter, a reasonable apprehension of bias existed. It follows that the hearing proceeded unfairly and was invalid.

The Consequences of a Finding of Bias

Everyone appearing before administrative boards is entitled to be treated fairly. It is an independent and unqualified right. As I have stated, it is impossible to have a fair hearing or to have procedural fairness if a reasonable apprehension of bias has been established. If there has been a denial of a right to a fair hearing it cannot be cured by the tribunal's subsequent decision. A decision of a tribunal which denied the parties a fair hearing cannot be simply voidable and rendered valid as a result of the subsequent decision of the tribunal. Procedural fairness is an essential aspect of any hearing before a tribunal. The damage created by apprehension of bias cannot be remedied. The hearing, and any subsequent order resulting from it, is void. In *Cardinal v. Director of Kent Institution*, [1985] 2 S.C.R. 643, at p. 661, Le Dain J. speaking for the Court put his position in this way:

> . . . I find it necessary to affirm that the denial of a right to a fair hearing must always render a decision invalid, whether or not it may appear to a reviewing court that the hearing would likely have resulted in a different decision. The right to a fair hearing must be regarded as an independent, unqualified right which finds its essential justification in the sense of procedural justice which any person affected by an administrative decision is entitled to have. It is not for a court to deny that right and sense of justice on the basis of speculation as to what the result might have been had there been a hearing.

In my view, this principle is also applicable to this case. In the circumstances, there is no alternative but to declare that the Order of the Board of Commissioners of Public Utilities is void.

ment juridictionnelles. Cette norme de conduite n'empêchera évidemment pas les commissaires de soumettre à l'interrogatoire le plus rigoureux possible témoins et avocats. Compte tenu toutefois de la nature des déclarations de Wells, une crainte raisonnable de partialité subsistait tant qu'il continuait à siéger en tant que commissaire dans l'affaire. Il s'ensuit donc que l'audience s'est déroulée de façon inéquitable et était en conséquence nulle.

Les conséquences d'une conclusion à la partialité

Quiconque comparaît devant une commission administrative a droit à un traitement équitable. Ce droit est à la fois distinct et absolu. Comme je l'ai déjà mentionné, du moment que la crainte raisonnable de partialité est établie, une audience équitable ou l'équité procédurale sont impossibles. S'il y a eu négation du droit à une audience équitable, la décision subséquente du tribunal ne peut y remédier. La décision d'un tribunal qui a refusé aux parties une audience équitable ne peut être simplement annulable et être validée ensuite par la décision subséquente du tribunal. L'équité procédurale est un élément essentiel de toute audience tenue devant un tribunal. Le préjudice résultant d'une crainte de partialité est irrémédiable. L'audience, ainsi que toute ordonnance à laquelle elle aboutit, est nulle. Dans *Cardinal c. Directeur de l'établissement Kent*, [1985] 2 R.C.S. 643, à la p. 661, le juge Le Dain, au nom de la Cour, s'est exprimé ainsi:

> . . . j'estime nécessaire d'affirmer que la négation du droit à une audition équitable doit toujours rendre une décision invalide, que la cour qui exerce le contrôle considère ou non que l'audition aurait vraisemblablement amené une décision différente. Il faut considérer le droit à une audition équitable comme un droit distinct et absolu qui trouve sa justification essentielle dans le sens de la justice en matière de procédure à laquelle toute personne touchée par une décision administrative a droit. Il n'appartient pas aux tribunaux de refuser ce droit et ce sens de la justice en fonction d'hypothèses sur ce qu'aurait pu être le résultat de l'audition.

À mon avis, ce principe s'applique également en l'espèce. Dans les circonstances, nous ne pouvons que déclarer nulle l'ordonnance de la Board of Commissioners of Public Utilities.

Premier unmoved by Northern Pulp's ask for more time to close waste water facility

Pictou Landing First Nation chief not interested in extending deadline to close facility

Paul Withers · CBC News · Posted: Jan 31, 2019 10:33 AM AT | Last Updated: January 31

Premier Stephen McNeil has consistently said his government has no intention of extending the deadline contained in the Boat Harbour Act, which was passed in 2015. (CBC)

Owners of the Northern Pulp paper mill in Pictou, N.S., are seeking a one-year extension of a provincial law that aims to close the mill's waste effluent facility in January 2020.

Speaking at a Halifax news conference, Paper Excellence officials said the company is committed to righting a legacy of five decades of pollution. But the company says it needs

more time to build a new $130-million effluent treatment plant to replace the existing facility at Boat Harbour, N.S.

The Boat Harbour Act was passed in 2015 by Nova Scotia's Liberal government and requires the current facility to close by January 31, 2020 — one year from today. The move came after pressure from Pictou Landing First Nation, which is adjacent to the to the settling lagoons used to treat waste water.

The lagoons contain nearly 50 years worth of toxic waste, and it has been called one of the worst cases of environmental racism in Canada.

But Nova Scotia Premier Stephen McNeil is unmoved by the company's request.

"The deadline is the deadline," he told reporters Thursday.

The company says without an extension it will not operate the mill — but would not say it is prepared to close permanently.

"We will not operate illegally, but we do believe we will get there," Paper Excellence spokesperson Kathy Cloutier said.

McNeil seemed prepared for a shutdown of Northern Pulp for some period of time.

"The question would be for what period of time would the company be down."

A sign at Pictou Landing First Nation counts down to the date the current treatment facility is required to close under the province's Boat Harbour Act. (Michael Gorman/CBC)

McNeil says the province is looking at the worst-case scenario, in term of its liabilities, the status of financial assistance to Northern Pulp and other sawmills, worker pension plans and alternative markets for wood chips bought by Northern Pulp.

"We're working our way through that," he said.

Paper Excellence says it will begin construction on the new treatment facility as soon as it secures regulatory approval — even without an extension in place.

The mill's future and the way it treats 75 million litres of waste water each day is the subject of intense debate in northern Nova Scotia, especially in Pictou County where the mill has operated since 1967.

Come Jan. 31, 2019, the legislated deadline to shutter the Boat Harbour effluent treatment facility in Pictou County will be exactly one year away. In this week's Sound Off, Jean Laroche and Michael Gorman stand next to the portraits of premiers past at Province House and examine the history, broken promises and where all the major players stand right now. 2:28

With the closure of Boat Harbour looming, the company is proposing to build, own and operate an activated sludge treatment system next to the Northern Pulp mill with the treated effluent discharged by a diffuser pipe into the Northumberland Strait near Caribou, N.S.

Thursday's news conference coincided with Northern Pulp submitting its environmental assessment to the Nova Scotia government. The assessment will be publicly released in one week.

The proposal will be given a provincial Class 1 review, which takes about 50 days.

'The federal government is still considering a much lengthier review of its own, at the request of First Nations and the neighbouring province of Prince Edward Island,

Fishermen claim the proposed discharge pipe will harm the area's lucrative lobster fishery and have staged blockades to stop survey vessels working on a route for the pipe. Earlier this week, Northern Pulp issued a statement saying the fishermen have agreed to comply with a court injunction that prohibits them from blocking their vessels.

People gathered at Pictou Landing First Nation on Thursday participate in a round dance. The event marked the one-year countdown to the closure of the Boat Harbour treatment facility. (Michael Gorman/CBC)

The company maintains the system will meet federal standards and treated pulp mill effluent is discharged into fresh and salt water elsewhere.

Sawmill owner Robin Wilber of Elmsdale Lumber says the fate of the Nothern Pulp will affect the entire forest industry. Sawmills send bark and chips to the mill.

"No pulp mill, no saw mills, the farmer loses income from their woodlots. Its a hugely integrated industry from Yarmouth to Sydney," Wilber said

He says he understand frustration in Pictou County over pollution from the mill, but says the company deserves more time.

"Paper Excellence has only been around for a few years. There were four other previous owners who left a bad taste in everybody's mouth," he says.

"We need to give them a chance."

Durney Nicholas is a fisherman from the Pictou Landing First Nation. He attended the news conference and was not persuaded.

"The always say 'Give me more time,' but enough is enough," he said.

On Thursday, more than 500 people gathered in a gym on Pictou Landing First Nation to kick off the one-year countdown to the closure of Boat Harbour treatment facility, which it has opposed for decades.

In an emotional speech to a crowd of more than 500 people, Pictou Landing First Nation Chief Andrea Paul talked about the legacy of the Boat Harbour treatment facility and said its end would be the start of healing for the community. (Michael Gorman/CBC)

The ceremony included drumming and dancing, students read speeches and people signed declarations of support to uphold the current deadline.

"We're not moving the date. The date is the date," Chief Andrea Paul told reporters.

"We have one year left and Boat Harbour won't be used as an effluent dumping ground. We're very excited."

Paul was emotional as she addressed the crowd and talked about the legacy of Boat Harbour and what it's done to the environment.

People at the event in Pictou Landing react to a speech by Chief Andrea Paul. (Michael Gorman/CBC)

"They took away our right to fish, they took away our right to survival, they took away our health."

Acknowledging a memory wall at the back of the room, a display with the names and pictures of community members no longer alive to see this day, Paul said it would be a sacred day when the community gathers around Boat Harbour in one year to witness the stop of the effluent flow.

"What a powerful day that's going to be," she said. "Next year is going to be a beautiful day."

N.S. mill's future at risk without extension, Northern Pulp warns

Last Updated Friday, February 1, 2019 8:16AM AST

HALIFAX -- The owners of a large Nova Scotia pulp mill are suggesting the operation will be forced to shut down -- threatening 300 jobs -- unless the province extends a legislated deadline for closing the highly polluted waste water facility at Boat Harbour.

The existing deadline is one year away -- Jan. 31, 2020. The company was originally given five years to design and build another treatment facility to replace the fetid lagoons near the Pictou Landing First Nation.

The lagoons contain nearly 50 years worth of toxic waste, which former Nova Scotia environment minister Iain Rankin has called one of the worst cases of environmental racism in Canada.

Speaking at a news conference Thursday, Northern Pulp spokeswoman Kathy Cloutier said the company got bogged down in the industrial approval process and it needs about another year to get the job done.

"Some will say they have heard this before, and look where we are now. We recognize this, and relish the opportunity to be the exception rather than the rule," she said, referring to the fact that the mill's previous owners routinely made cleanup promises they did not keep.

"We want to bring about a positive legacy that addresses environmental concerns. Despite best intentions, we have not always gotten it right in the eyes of the Mik'maq or in the eyes of our stakeholders."

Cloutier said if the province rejects the request, the mill will not break the law by continuing to dump effluent into Boat Harbour past the deadline. That means the mill would almost certainly be forced to shut down, at least temporarily.

However, she said the company is moving ahead with building its new $130-million treatment facility and pipeline, even if the province fails to grant an extension.

Premier Stephen McNeil has consistently said his government has no intention of extending the deadline in the Boat Harbour Act, legislation that was drafted in 2015 after a serious effluent spill at the Pictou Landing First Nation.

McNeil confirmed Thursday he had spoken with company officials, but he said he had not changed his mind.

"The deadline is the deadline," he said after a cabinet meeting. "We gave them five years."

However, the premier also said he would be open to hearing proposals from residents of the Pictou area, including the local Tory members of the legislature. He said if a consensus was reached on amending the act, that could be debated on the floor of the legislature.

Cloutier said a temporary shutdown is not a realistic option, especially in the winter months.

The premier said the province is already looking into a Plan B, which would involve dealing with the fallout from a permanent closure.

The chief of Pictou Landing First Nation, Andrea Paul, has said the deadline must not be extended. The 600 members of the band marked the beginning of an official one-year countdown during a ceremony Thursday morning.

Paul said the company should not have held its news conference on the same day as the First Nation's event.

"Northern Pulp has just shown us what their new era of improved Indigenous relations will look like," she said in a statement released late Wednesday.

Durney Nicholas, a fisherman from Pictou Landing First Nation, said he wasn't impressed with what he heard at the news conference on Thursday.

"I'm not going to accept what they are saying," he said afterwards. "We're going to still say no. We're going to keep fighting, too ... Enough is enough."

P.E.I. Premier Wade MacLauchlan and other critics have said the project should be subjected to a more rigorous federal environmental assessment.

Cloutier said the company would welcome such scrutiny, but only if the shutdown deadline is extended.

Ronnie Heighton, president of the Northumberland Fishermen's Association, said his group has no reason to trust the company.

"As far as we're concerned, the date is the date," he said in an interview. "They just wasted time away."

The association is opposed to Northern Pulp's plan to build a pipeline that would dump more than 60-million litres of treated waste water daily into the Northumberland Strait.

The company has insisted the water will be largely unaffected within two metres of the pipeline's discharge point.

Heighton doesn't buy that.

"The stuff will still be there," said Heighton, whose group represents about 600 fishermen who fish for lobster, herring, crab, scallops and oysters. "We're talking about ... tonnes of solids per day. After about 30 years, the stuff will be on the surface."

The company confirmed Thursday it had submitted an environmental assessment application to the province for its new treatment and pipeline plan, which will include the use of a so-called Activated Sludge Treatment system.

Cloutier has said that of the 131 kraft pulp mills operating in North America, about 20 per cent use that system. The remaining 80 per cent use the lagoon system now in use at Boat Harbour. No other treatment system is used, she said.

The company has said the treated effluent it plans to pump into the Strait will meet federal regulations for emissions, but opponents say there's a lack of scientific evidence regarding how the waste will affect the long-term health of the waterway.

The 10 kilometre pipeline will travel from Abercrombie point, where the mill is located, across Pictou Harbour and then overland to the west of Pictou before extending into the Strait north of Caribou, N.S.

Built in 1967, the mill manufactures 280,000 tonnes of Northern Bleached Softwood Kraft pulp every year. Most of it is exported to make toilet paper and other paper products.

Uproar in Nova Scotia over plan to dump pulp effluent into Northumberland Strait

By Joan Baxter in Analysis, Energy, Politics | July 25th 2018

3 stories left

Pictou Landing Chief Andrea Paul addresses participants in the #NOPIPE rally on July 6, 2018 in Pictou, N.S., flanked by Mi'kmaq chiefs, fishers' group leaders and tourism operators from across three provinces. Photo by Gerard J. Halfyard

Kinder Morgan's Trans Mountain expansion may be hot in the media spotlight right now, but on the East Coast, another industrial storm is brewing.

Nova Scotia's Northern Pulp mill has proposed a 10-kilometre pipeline to transport up to 85 million litres of warm pulp effluent every day directly into the Northumberland Strait — a beautiful part of the Gulf of St. Lawrence and a lucrative fishing ground.

Public protest over this pulp pipe proposal has spawned the #NOPIPE movement, which has sown division among communities in Pictou County. #nspoli #novascotia

---

The idea of dumping treated waste from the Northern Pulp's mill in Pict

3 stories left

directly into such a rich ecosystem — without giving it an additional month to settle,

as it currently does in a lagoon before it is slowly released into the Strait — has many First Nations, fishers, citizens and local communities up in arms.

Earlier this month, Prime Minister Justin Trudeau turned his back on them as he declined to commit to a federal environmental assessment of the pipeline proposal, justifying his decision as respect for "provincial jurisdiction." In other words, the prime minister is satisfied that the Nova Scotia government can handle the assessment.

But with the province being responsible, through an indemnity agreement, for part of the project's design and cost — critics are worried that the pipeline won't receive a thorough, unbiased assessment. To boot, they add, the Northern Pulp mill's foreign corporate owners have troubling ties to illegal deforestation abroad.

Sowing division in Pictou County

The pipeline in question is for Northern Pulp's 51-year-old bleached kraft pulp mill in Pictou County on the north shore of Nova Scotia. If approved, it would be almost a metre in diameter and 10 kilometres long, carrying millions of litres of effluent and releasing it through six dispersal pipes into the Northumberland Strait.

The Northumberland Strait separates Prince Edward Island from New Brunswick and Nova Scotia in the Gulf of St. Lawrence; an extremely rich and sensitive fishing ground, on which thousands of people across the Maritimes depend for fisheries and tourism.

Critics of the project fear it would pollute coastal waters, harm crucial fish habitat and marine life, and put those vital industries at risk. As a result, the plan has sparked widespread opposition and public protest, spawning the hashtag, “#NOPIPE.” It has been condemned by fishermen, tourism operators and First Nations groups, sowing division in traditionally tight-knit communities in its wake.

The project also comes with a form of ultimatum for government regulators:

“No pipe equals no mill,” is how Kathy Cloutier, director of communications for Paper Excellence, the mill's parent company, put it to me in an email.

Paper Excellence acquired the Northern Pulp mill in 2011, and owns four other mills in Canada — three in British Columbia and one in Saskatchewan, as well as two in France. While the company has headquarters in Canada, its larger hold

3 stories left

of Paper Excellence B.V. operates as a subsidiary of Asia Pulp and Paper Group, and is based in the Netherlands.

Paper Excellence is the fifth largest foreign corporation that has owned the mill in Pictou since it opened in 1967, and has ties to a shocking history of ripping up endangered forests in Southeast Asia.

Northern Pulp's mill in Pictou County, N.S., which produces northern bleached softwood Kraft pulp, is seen in August of 2014. Photo by Gerry Farrell

A dismal overseas record

Paper Excellence is part of the corporate empire of the billionaire Widjaja family of Indonesia, which also owns Sinar Mas Group. Sinar Mas despite its denial, has ties to devastating fires and deforestation in Southeast Asia under its international trade name, Asia Pulp and Paper (APP), and the dubious distinction of being responsible for Asia's worst corporate default — US$ 13.9 billion in 2001 after a 20-per-cent plunge in global paper prices over three months.

APP pledged to clean up its act, following boycotts in 2012 of its paper products by several prominent corporate brands, as a result of its role in illegal logging in Indonesia. It adopted a “forest conservation policy,” developed with support from Greenpeace International to help it accomplish this, but in May 2018, af[illegible] emerged that APP was still responsible for destroying forests in Indone[illegible] Greenpeace ended all engagement with APP and Sinar Mas Group.

3 stories left

None of this appears to have dampened relations between the Nova Scotia government, however, and the owners of the Northern Pulp mill. As has been the pattern for the past half-century, the province seems intent on doing the mill's bidding.

How Nova Scotia was captured by a pulp mill

In 2017, Nova Scotia's Department of Environment determined that the pipe warranted a "smaller in scale" Class I environmental assessment, which takes just 50 days and leaves the final approval decision to the minister of environment. Critics say the pipe should undergo a more thorough Class II assessment, which takes 275 days and involves an environmental assessment panel.

Among those calling for the Class II assessment are Karla MacFarlane, interim leader of the Nova Scotia Progressive Conservative Party, and Tim Houston, who represents Pictou East in the legislature and is vying for the leadership of the PC party in the October convention.

Before the decision to proceed with a Class I assessment had been made however, Nova Scotia's Department of Environment had concerns about the pipe plan. According to internal emails obtained through freedom of information legislation by Linda Pannozzo for *The Halifax Examiner*, officials were worried that the mill's plan to treat effluent on-site in a new activated sludge system, and then pump it through a pipe into the Strait, had the "potential for eutrophication," meaning excess nutrients could lead to oxygen depletion.

Then, the consultants working on the pipe proposal, KSH Solutions Inc, reminded Department of Environment officials that there was a "fixed completion date" for the project, and any delays stemming from public consultations were "of concern." The new system had to be operating by July 2019, so that by January 2020, the mill's effluent would no longer flow into, and settle in Boat Harbour, as it has done since 1967.

Boat Harbour is Nova Scotia's largest environmental contaminated site and an egregious example of environmental racism.

3 stories left

Threats of expropriation

In the 1960s, when the PC government of then-premier Robert Stanfield was pushing to get the pulp mill built, it engaged two government officials to convince the Pictou Landing First Nation to sign over Boat Harbour, their precious tidal estuary, to the government for mill effluent.

In his book, *We Were Not the Savages,* Mi'kmaq scholar Daniel Paul describes the way these officials obtained control of Boat Harbour as "full of deceit and maliciousness." The officials took the chief and a councillor from Pictou Landing First Nation to a non-functioning domestic sewage facility in New Brunswick in 1965**,** and told them the water in their estuary would be just as clear and clean as the fresh, spring-fed brook at the site. They were also told, he wrote, th

3 stories left

didn't sign an agreement allowing the government to use Boat Harbour for the mill's effluent, it would be expropriated.

Deceived and under pressure, the chief and councillor agreed, signing away the tidal estuary that had provided their First Nation community with much of their food for countless generations. Boat Harbour immediately became a toxic wasteland.

To entice Scott Paper to build the mill, the provincial government had already bestowed numerous expensive gifts on the American pulp and paper giant. Among them, as detailed in the the 1965 Scott Maritimes Limited Agreement and a report for the Nova Scotia cabinet in 1965, were: a causeway linking the Town of Pictou with the mill site on Abercrombie Point; a dam across a river to provide the mill with more than 100 million litres of fresh water daily; a 50-year lease on 230,000 acres of Crown land with rock-bottom stumpage rates; and a slew of generous tax breaks.

To top it off, on Sept. 30, 1970, the government of former Progressive Conservative premier G.I. Smith signed an unprecedented agreement with Scott Paper, in which the province agreed "at its cost," to "own, operate and maintain the Effluent Treatment System and continue to accept in such system all effluent from the mill."

Pouring millions into the mill

Over the years, successive provincial governments in Nova Scotia have lavished hundreds of millions of dollars on the mill in loans and grants. The federal government has also chipped in millions of dollars for environmental improvements.

Even that's not the end of the government largesse.

In 1995, the Liberal government of former premier John Savage signed an indemnity agreement "saving harmless" anyone who worked for the mill from all responsibility for environmental problems with its effluent. It also made the government — that is, the people of Nova Scotia — responsible for effluent and reconfigurations of the mill related to its treatment and disposal, forever.

As it stands, the effluent – an average of 80 million litres daily – flows from the mill through a pipe under inner Pictou Harbour, then comes onshore at Pictou Landing. There it goes into settling ponds, then an aeration basin for a week before it flows into the 350-acre Boat Harbour lagoon. It is released through a dam into a small cove in the Northumberland Strait, following up to a month of further settling.

3 stories left

The new plan would remove that crucial last step: the effluent would be treated on-site in a new facility beside the mill and go directly into the Strait, without the settling of solids that currently happens in Boat Harbour.

In 2014, that effluent pipe ruptured, spilling 47 million litres of toxic effluent near sacred Mi'kmaq burial grounds. The people of Pictou Landing First Nation set up a blockade, joined by others concerned about the mill's air and water pollution over the years.

The mill was shut down while the pipe was replaced and the First Nation issued an ultimatum to the current Liberal government of Premier Stephen McNeil: legislate the closure of Boat Harbour.

One year later, McNeil's government, with the support of both opposition parties, passed the Boat Harbour Act, which stipulated that no effluent could flow into the lagoon after Jan. 31, 2020. After that, Boat Harbour would be remediated and restored to its former state.

For a time, there was optimism that the province would finally crack down on the mill for its poor environmental performance over the years.

Those hopes were dashed when, in late 2017, Northern Pulp announced its plan to pipe effluent directly into the Northumberland Strait, and the government decided to go with a Class I environmental assessment.

Appearing before the Public Accounts Committee of the Nova Scotia legislature in February, Deputy Environment Minister Frances Martin defended the Class I assessment as appropriate, claiming that, "while the effluent treatment plant will be a new plant and a new design, it is a modification to an existing undertaking and that is the pulp mill itself."

Northern Pulp, however, clearly states that it is designing and building a "new treatment facility."

This decision to go with the Class I assessment for the treatment facility became even more inexplicable when the Department of Environment announced that it was requiring the more extensive Class II assessment for the clean up of Boat Harbour.

Nova Scotia in a conflict of interest

3 stories left

Like Kinder Morgan's embattled Trans Mountain expansion, the proposed pulp pipe is pitting provincial governments of similar political stripes against each other – in this case, two provincial Liberal governments in Nova Scotia and P.E.I.

Prince Edward Island Premier Wade MacLaughlan wrote McNeil and federal Environment and Climate Change Minister Catherine McKenna in January this year, demanding a “more comprehensive assessment” that involves his province.

In response, a spokesperson for the Nova Scotia government said that P.E.I. would have a chance to submit its comments once the proposal had been registered for a provincial environmental assessment. Given that such commenting is the right of every citizen, this response was a firm snub of one Liberal premier by another.

As a result of the government’s indemnity agreement with the mill, Nova Scotia taxpayers appear to be on the hook not just for the new effluent and disposal facility, but also the reconfiguration of the mill to accommodate the change. To date, neither Northern Pulp nor the Nova Scotia government has divulged the cost of the new facility or who will be paying for it. However, local media cite a 2015 letter from Northern Pulp to the government saying that the cost might be in “excess of $100 million.”

Nova Scotians will also cover the costs of the Boat Harbour clean up, estimated at $133 million and counting.

In 2002, the government of former premier John Hamm passed an Order in Council extending the mill’s lease for the use of Boat Harbour until 2030. Hamm now is chair of the board of Northern Pulp, and the mill manager, Bruce Chapman, has been reminding the province of this commitment, saying that Northern Pulp will expect to be compensated by the province for the loss of the use of Boat Harbour for 10 years.

Nova Scotia citizens may also have to compensate the mill for any lost profits if it has to be idled because of a delay in getting a new effluent system up and running.

This puts the provincial government in a conflict of interest, and the impossible position of trying to regulate and assess the new effluent system, while it is responsible for its costs and any losses incurred by its delay.

More than 50 years of protest

3 stories left

Since the pipe plan was made public in late last year, thousands of citizens have mobilized against it. They have also launched a letter-writing campaign and an e-petition to convince Ottawa to undertake a federal environmental assessment.

On July 6, a land-and-sea rally to protest the pipe plan, organized by the Friends of Northumberland Strait, several fishers' associations and unions, the Pictou Landing First Nation, the Pictou Lobster Carnival, tourism operators and environmental groups, drew thousands of people to the waterfront, many on foot and others in an impressive flotilla of fishing boats.

Protesters at the rally, including First Nation chiefs from three provinces, called for a federal environmental assessment.

A few days later, McKenna told reporters she would not rule out a federal assessment, but that the decision would have to wait until the final proposal had been submitted to the province.

The same day, then-minister of fisheries and oceans Dominic LeBlanc told reporters that the responsibility for the environmental assessment lay with the province of Nova Scotia. On Trudeau's July 17 visit to northern Nova Scotia, McNeil defended the province's environmental assessment process, and the prime minister echoed this sentiment.

It was a profound disappointment to those who, like Chief Andrea Paul of Pictou Landing First Nation, had been counting on the federal government to do a thorough assessment of the pipe proposal.

Not giving up hope on Ottawa

In an email, a spokesperson for the Canadian Environmental Assessment Agency (CEAA) stated that even if a proposed project is not included in the list of activities that trigger federal assessments, it can be designated for one if the federal environment minister determines it “may cause adverse environmental effects or public concerns related to those effects."

So far, neither the mill nor the province has been able to demonstrate that the proposed pipe will not cause “adverse environmental effects” to the precious fishing areas of the Strait, suggesting that grounds for federal intervention do exist. Additionally, the federal government has “broad responsibilities for the stewardship and management” of all of Canada's oceans — including the Gulf of St. Lawrence — and by extension, the Northumberland Strait.

When Northern Pulp’s general manager and technical manager, togeth
consultant engineer in charge of the project, met with P.E.I’s Standing C

3 stories left

Agriculture and Fisheries earlier this year, they were unable to answer basic questions about the potential effect of the effluent on lobsters and the Strait.

Earlier this month, Northern Pulp admitted that its proposal to lay the pipe along the bottom of Pictou Harbour and out into the Strait, which it had planned to submit to the province in the summer, would not work — something fishers had been saying all along.

Pictou Harbour, the company determined, was too shallow, a collapsed pier and shipwreck were in the way, and an alternate route and outfall for the pipe would have to be found, pushing the registration of the proposal back to the fall of 2018.

None of this reassures people worried about the proposed pipe. For the past 51 years, the provincial government has consistently failed to protect citizens and the environment from the harmful effects the mill has had on air, water, forests and human health.

Nova Scotia's auditor general has strongly criticized the province's environmental assessment process, saying that environmental "approvals are issued without consulting inspectors who know risks," and describing the monitoring of projects as "poor."

Citizens concerned about the pipe point out that the provincial government is a party to designing the treatment facility, and can hardly be considered an "unbiased judge" of the proposal.

This is why, despite Trudeau's refusal to commit to federal involvement, many continue to sign petitions, write letters, and pin their hopes on the federal government to step in and undertake an environmental assessment.

As a new resident of Nova Scotia, this is very distressing news! Thanks for having the courage to report on the history of this issue. Let's hope we can get the federal government on board for a unbiased assessment.

David Huntley | 5 months ago

The code of ethics of Nova Scotia engineers states

“Hold paramount the safety, health and welfare of the public and the protection of the environment and promote health and safety within the workplace“

Other provinces have very similar statements in their codes.

It follows directly that no Professional Engineer should agree to work on any such project as this.

Gloria Prescott | 5 months ago

Very big conflict of interest with Nova Scotia and this pipeline for the paper mill! Federal environmental assessment is common sense. Here is hoping...

Betsy Cornwell | 5 months ago

This dismal history of the pulp industry has been repeated all over the world with greater or lesser but never benign results. It is unfortunate that Gutenberg's invention has had such a poisonous and unintended consequence - the devastation of our world's essential forests, the destruction of otherwise potable water and the life that depends on it.
It is even more dispiriting to consider that in all probability, most of what is written on it, is certainly not worth the residual costs of the paper on which it appears! Compute
was supposed to end the need for paper - instead, of course, computers and ph

Thousands of Atlantic Canada residents from three provinces protest N.S. pulp mill's effluent plan

JESSICA LEEDER › ATLANTIC BUREAU CHIEF
PICTOU, N.S.
PUBLISHED JULY 6, 2018
UPDATED JULY 9, 2018

Thousands of demonstrators gathered on the waterfront in Pictou, N.S. on Friday, to protest a proposed plan to dump treated effluent from the controversial Northern Pulp mill into the Northumberland Strait.

DARREN CALABRESE

THE GLOBE AND MAIL

SUBSCRIBE LOG IN

a sprawling tract of land directly across from Pictou's waterfront.

Locals have waged a five-decade battle with the mill's owners to keep its emissions in check. However, the ante was raised recently when the mill began holding public meetings to disclose its plans to build a pipeline in the Northumberland, the body of water separating PEI from New Brunswick and Nova Scotia. It will dispose the "treated effluent" that results from the mill's process of manufacturing bleached kraft pulp into the strait, which attracts thousands of tourists each year and also supports thousands of fishing families, not only from nearby communities, but also in Prince Edward Island and in New Brunswick, which share access to it.

Northern Pulp is in the midst of conducting an environmental assessment on its effluent pipe plan, which is due to be submitted to the provincial government later this summer, said spokesperson Kathy Cloutier. The company has tried over the past several months, through community open houses and talks with fishermen, to reassure those who are concerned that there should not be any detrimental effects from its pipe plan.

"Shouldn't is not good enough – we've got to have total assurance," said Ronnie Heighton, a life-long fisherman.

There is deeply rooted concern about the mill's plan in and around Pictou, where friction is common due to the fact that many townspeople work for Northern Pulp.

Still, hundreds of residents have taken a "no pipe" position and have posted signs declaring that sentiment, including some with skulls and crossbones; other signs are urging people to "stop and think." The signs have been hung in shop windows, on telephone polls and amid flowering gardens.

"The protection of fishing in the Northumberland Strait is paramount," Pictou Mayor Jim Ryan

THE GLOBE AND MAIL

SUBSCRIBE LOG IN

At least one fishermen's organization has applied to Ottawa to have the pipe project designated for a federal environmental assessment – currently the province has jurisdiction – under the Canadian Environmental Assessment Act. Several other advocacy groups and hundreds of individuals have joined a letter-writing campaign in support of the application.

STORY CONTINUES BELOW ADVERTISEMENT

Friday's rally was peaceful and featured a flotilla of more than 150 fishing boats loaded with supporters who clogged Pictou's harbour after conducting a sail-by of the Northern Pulp mill with air horns blaring for effect. One of the boats ferried a contingent of Mi'kmaq leaders to shore, including Pictou Landing First Nations Chief Andrea Paul.

Wearing a traditional headdress, Ms. Paul made her way to the stage where, after addressing the audience. she broke down in tears at what she said was a historic show of solidarity.

THE GLOBE AND MAIL

Stellarton Council passes motion to send letter showing support for Boat Harbour extension

Brendan Ahern (brendan.ahern@ngnews.ca)
Published: Jan 14 at 11:14 p.m.
Updated: Jan 15 at 11:53 p.m.

The Boat Harbour treatment site, located near Pictou Landing. - File

'I thought we were beyond that stage of having these conversations about us without us': Pictou Landing First Nation Chief Andrea Paul

STELLARTON, N.S. - Stellarton town council voted in favor of sending a letter to Premier Stephen McNeil in support of an extension to the Boat Harbour 2020 deadline with three in favor and two opposed.

A letter written on behalf of former and current Northern Pulp employees had been sent to town council. The letter also contains three pages of signatures in support of an extension.

The matter was added to the agenda on the night of the town council's Jan. 14 meeting.

The letter asks that Stellarton town council draft a letter to McNeil requesting an extension to the Boat Harbour closure date in order to allow the company time to complete an environmental assessment and construct a new effluent treatment plant.

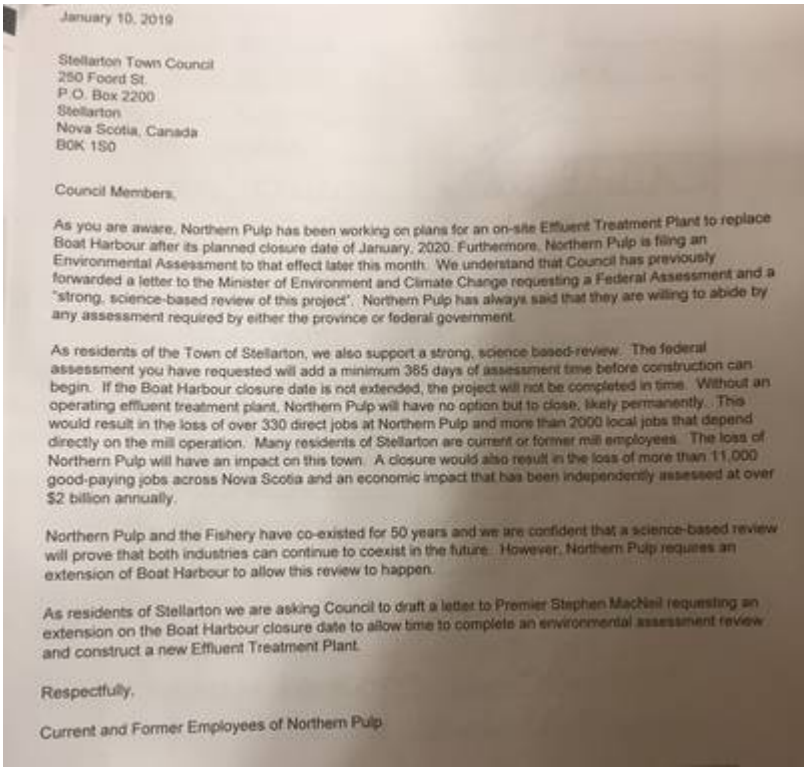
Stellarton town council has already sent a letter to the federal minister of Environment and Climate Change in support of a federal assessment for Northern Pulp's effluent treatment plan.

"I think we should send this letter in, if nothing else to stay neutral," said Deputy Mayor Bryan Knight emphasizing concerns that the Town of Stellarton could be drifting "too deep" into matter.

"My view is that we should send this letter and cut it off there and give both sides a chance to be heard," said Knight.

Common ground between the fishery and the pulp mill was the line that councillors Knight and Simon Lawand were walking when they spoke on the issue at a crowded town hall on Monday night. Former and current mill employees were in attendance at the meeting and used the open forum to speak for those in support of a Boat Harbour extension.

"What we're telling you right now is that if we don't show community support that we do want these jobs, we do want these people living in our towns, we do want to be a part of a contributing county, town, municipal unit," said Northern Pulp employee Tom Dewtie. "What can it hurt to by sending this letter to say, 'give them the time' so that both side can co-exist?"



January 10, 2019

Stellarton Town Council
250 Foord St.
P.O. Box 2200
Stellarton
Nova Scotia, Canada
B0K 1S0

Council Members,

As you are aware, Northern Pulp has been working on plans for an on-site Effluent Treatment Plant to replace Boat Harbour after its planned closure date of January, 2020. Furthermore, Northern Pulp is filing an Environmental Assessment to that effect later this month. We understand that Council has previously forwarded a letter to the Minister of Environment and Climate Change requesting a Federal Assessment and a "strong, science-based review of this project". Northern Pulp has always said that they are willing to abide by any assessment required by either the province or federal government.

As residents of the Town of Stellarton, we also support a strong, science based-review. The federal assessment you have requested will add a minimum 365 days of assessment time before construction can begin. If the Boat Harbour closure date is not extended, the project will not be completed in time. Without an operating effluent treatment plant, Northern Pulp will have no option but to close, likely permanently. This would result in the loss of over 330 direct jobs at Northern Pulp and more than 2000 local jobs that depend directly on the mill operation. Many residents of Stellarton are current or former mill employees. The loss of Northern Pulp will have an impact on this town. A closure would also result in the loss of more than 11,000 good-paying jobs across Nova Scotia and an economic impact that has been independently assessed at over $2 billion annually.

Northern Pulp and the Fishery have co-existed for 50 years and we are confident that a science-based review will prove that both industries can continue to coexist in the future. However, Northern Pulp requires an extension of Boat Harbour to allow this review to happen.

As residents of Stellarton we are asking Council to draft a letter to Premier Stephen MacNeil requesting an extension on the Boat Harbour closure date to allow time to complete an environmental assessment review and construct a new Effluent Treatment Plant.

Respectfully,

Current and Former Employees of Northern Pulp

Letter to Stellarton town council from current and former employees at Northern Pulp dated Jan 10.

Mayor Danny MacGillivray raised concerns over the fact that the letter does not mention any specific dates for how long Boat Harbour would need to remain open should the mill be given an extension.

"I'd also like to hear from Pictou Landing First Nation on what they think of the extension too before we want to have a vote on the letter," he said. "As a main stakeholder I think we should probably hear from them before making a decision."

No one from the Mi'kmaq community was present at the meeting and Pictou Landing First Nation Chief Andrea Paul said that her community had not been consulted.

"I had no knowledge whatsoever that they were doing this," said Paul in a phone interview. "I thought we were beyond that stage of having these conversations about us without us."

"It may not have changed tonight's outcome, but at least the opportunity would have been there to share our perspective."

On Jan. 9 Paul spoke at a the Municipality of Pictou County council meeting where council voted to pass a resolution honoring the Boat Harbour Act.

The letter from Northern Pulp employees to Stellarton town council was dated Jan. 10.

"When you get this close to the end and to see this type of political interference by Northern Pulp, I can honestly say I don't like it," said Paul.

Province says it's not budging on Boat Harbour deadline

Northern Pulp says it needs more time to prepare the waste treatment facility that will replace Boat Harbour

Paul Withers · CBC News · Posted: Jan 16, 2019 8:49 PM AT | Last Updated: January 16

The Boat Harbour treatment facility is owned by the provincial government, which is on the hook for cleanup costs once the facility closes. (The Canadian Press)

The Nova Scotia government will not relax its January 2020 deadline to close the Boat Harbour wastewater effluent treatment facility, even though regulatory issues have delayed the start date for the massive cleanup project by months and perhaps even a year.

The delay is significant because Northern Pulp has asked the province to keep Boat Harbour open beyond the scheduled closing in order to continue treating 75 million litres of effluent

daily from its Pictou County pulp mill.

- **Boat Harbour cleanup expected to start in 2021**
- **Premier hopes 'cooler heads prevail' as pulp mill works on assessment**

The mill says it needs more time to prepare the waste treatment facility that will replace Boat Harbour.

Kathy Cloutier, a spokesperson for parent company Paper Excellence, said the remediation delay is more evidence of the pitfalls of setting deadlines before regulatory approval.

"We have asked and have said we need an extension," she told CBC News. "So, does this help? One would have to say yes. If they aren't ready and we need to use it, then we would prefer to do that."

Province still firm on deadline

But the province seems uninterested in accommodating the mill.

The Liberal government maintains it gave Northern Pulp plenty of notice the treatment facility's days were numbered when it passed a law to close Boat Harbour four years ago.

"The province remains committed to the legislated closure date of January 31, 2020, under the Boat Harbour Act," spokesperson Marla MacInnis said late Wednesday in an e-mailed statement.

The remediation project for Boat Harbour, and its timetable, is separate from the new treatment system that is being proposed by Northern Pulp to replace Boat Harbour.

That project is facing its own regulatory and environmental challenges.

"It's a big, complex problem," said Ken Swain, the project manager for the Boat Harbour cleanup. "It's a pretty complicated solution."

Nova Scotia on the hook

Since 1967, lagoons adjacent to the Pictou Landing First Nation have received tens of millions of litres of wastewater effluent per day from the nearby pulp mill.

The Boat Harbour treatment facility is owned by the provincial government, which is on the hook for the cleanup once the facility closes. The cost is forecast at $217 million.

The Boat Harbour remediation project has been subject to a number of delays. (Nova Scotia Government)

Controversy swirls over where the mill's latest owner, Northern Pulp, plans to discharge treated effluent when Boat Harbour closes.

Swain said the remediation is proceeding on the assumption Boat Harbour will close by Jan. 31, 2020, even if the Boat Harbour cleanup is not ready to proceed.

"We're probably gonna have to push that back," Swain said.

Cleanup expected to start in 2021

Swain points to the environmental assessment process. The cleanup project will undergo a Tier II provincial environmental assessment, which includes an independent review panel and public hearings. It can last up to 275 days.

Last week, the province submitted its plans to the Canadian Environmental Assessment Agency. The agency will decide in February whether the project should undergo a federal assessment.

Procurement will follow regulatory approval and take months longer.

"So what we would probably see in that instance is not being able to have the full-scale implementation started until perhaps early 2021," Swain said.

Boat Harbour cleanup plan

The plan is to dredge up to a million cubic metres of contaminated, watery sediment and pipe it to a pad where water will be removed for treatment.

Up to 500,000 cubic metres of solids will be moved to an existing and expanded containment cell on site.

- **Northern Pulp wins injunction against fishermen's blockade**
- **Forestry minister not ready to contemplate closure of Northern Pulp just yet**

"The biggest technical challenge is effectively removing that material off the bottom of Boat Harbour," said Swain.

"We want to figure out the most efficient and effective way of getting the lens of contaminated sludge off the bottom and taking as little as possible of the clean underlying harbour bottom."

Why a key pilot project was suspended

They are still looking for the right solution.

A protester wears a sou'wester during a July 2018 protest against Northern Pulp's plan to dump millions of litres of effluent daily into the Northumberland Strait. (The Canadian Press)

Last October, dredging began to test techniques, but the pilot project was suspended in December because cold weather froze pipes.

The pilot project will resume sometime in April or May.

What's in raw mill effluent?

In May 2017, the province awarded a $6.7-million contract to GHD, an international consulting firm, to come up with the detailed plan for the cleanup.

The plan submitted to the federal government on Jan. 7 is from GHD and Nova Scotia Lands, a provincial agency charged with environmental cleanup.

GHD determined the nature and extent of contamination.

It also compared raw effluent with provincial and federal standards.

"Results indicated both PCBs and dioxins and furans were below the applicable criteria, while metals exceed the marine criteria for barium, boron, cadmium, copper, lead, mercury, and zinc. Metals parameters reported to exceed the Provincial human health criteria were sodium and vanadium," the project description stated.

The good news

The contaminated sludge is 10 per cent solids and 90 per cent water. The goal is remove between 50 to 70 per cent of the water.

The good news so far is water removed from the sludge is relatively clean.

"It will need some treatment, but not to the extent that we initially were envisioning," Swain said.

"We know we have to deal with in excess of five million cubic metres of water during the full-scale implementation of the remediation, which is several thousand Olympic-size swimming pools. So it's a large volume, a big-cost driver."

How the forecast cost has increased

In 2018, the cost of the full cleanup was estimated at $217 million.

It has risen steadily since the initial estimate of $52 million in 2015, $88 million in 2016 and $133 million in 2017.

A new forecast is expected in mid-2019 after the pilot project is completed.

The goal of the cleanup is to return Boat Harbour tidal estuary to its original condition in 1967 which means removing all the contaminated sediment.

"We'll have to be clean," said Swain.

"At the end of the day what goes out needs to be in compliance with the Fisheries Act. So we cannot release any deleterious substances into the environment so we've got to get it all."

Province in conflict of interest over Northern Pulp project, activists allege

'How can they be judge of the project, when it's their project?' asks Jill Graham-Scanlan

CBC News · Posted: Oct 04, 2018 1:48 PM AT | Last Updated: October 4, 2018

Friends of the Northumberland Strait want the Canadian Environmental Assessment Agency to take over a review of the project. (Andrew Vaughan/Canadian Press)

A group that opposes Northern Pulp's plan to dump effluent into the Northumberland Strait is calling on the Nova Scotia government to recuse itself from the controversial project's environment assessment process.

In September, Friends of the Northumberland Strait sent an eight-page letter to the provincial Environment Department and Environment and Climate Change Canada, urging the federal

government to conduct the assessment instead.

Jill Graham-Scanlan, the group's president, told CBC Radio's *Information Morning* that the province has several conflicts of interest and "is not in a position to make an unbiased determination" on whether the project should go ahead.

Demonstrators gathered in July to protest plans by Northern Pulp to run an effluent pipe into the Northumberland Strait. (Steve Lawrence/CBC)

The pulp mill in Pictou, N.S., plans to build a pipe that will send effluent far out into the Northumberland Strait. It will replace the current Boat Harbour facility that the province promised to close by 2020.

A design for the new facility hasn't been finalized yet, but once it is, it will have to go through a provincial environmental assessment.

- **Northern Pulp effluent pipe protest draws huge crowds on land and sea in Pictou**

- **Proposed Northern Pulp pipe route into ocean hits snag**

"The province needs to take a proactive approach on this," said Graham-Scanlan. "They need to recognize and acknowledge that they are in a conflict position and step back."

Paid $6M to Northern Pulp

Friends of the Northumberland Strait argues the province has a financial stake in the design and construction of the new facility, having already paid $6 million to Northern Pulp in 2017.

The government has said taxpayers will need to help pay for the new facility because the province is in a lease agreement with Northern Pulp.

"How can they be judge of the project, when it's their project?" asked Graham-Scanlan.

- **$6M in taxpayer dollars for N.S. effluent plant stinks, says opponent**
- **Fishermen worry Northern Pulp treatment plan will create 'dead zone'**

The group's letter to the federal and provincial governments also states the province "may face direct and significant financial consequences and litigation if it does not quickly approve the environmental assessment."

The group points to an indemnity agreement and memorandum of understanding the province signed in 1995 with the former owner of the mill.

In its letter, Friends of the Northumberland Strait write that “the stakes of this project are high. The Northumberland Strait is a valuable and delicate ecosystem." (Nic Meloney/CBC)

"That memorandum of understanding seems to imply that the province will do anything it can to make sure a new treatment facility is built," said Graham-Scanlan.

She said there are also concerns that a registered lobbyist for Northern Pulp now works for the government, and that the province seems to be co-operating with the company rather than providing information to concerned citizens.

Province says decision 'will be based on science'

In a statement to CBC News, the government said the environment is its first concern.

"Any decision will be based on science and the best available evidence," the Environment Department said.

"It is not the province's decision whether or not a federal environmental assessment should take place. We have determined that the Northern Pulp effluent treatment plant project requires a provincial Class 1 environmental assessment. The federal government would decide whether or not it will do its own EA as well."

If the federal government does decide to do its own assessment, that doesn't mean the province is required to bow out, but Graham-Scanlan hopes it will.

"What would compel the province to step back? Doing the right thing," she said.

Nova Scotia's forest industry faces unknown future without Northern Pulp

Sawmill operators, woodlot owners contemplate effects of a potential Northern Pulp shutdown

Michael Gorman · CBC News · Posted: Jan 22, 2019 6:00 AM AT | Last Updated: January 22

Even with a purposely light touch, 25 per cent of the harvest on this private woodlot was still pulpwood. The low-grade product was sold to Northern Pulp. (Michael Gorman/CBC)

It was a few months ago that Jeff Bishop noticed a growing unease about the future of Nova Scotia's forest industry.

Bishop, the executive director of Forest Nova Scotia, was suddenly taking more and more calls. On the other line were concerned industry members, all taking stock of what the potential loss of the Northern Pulp mill in Pictou County would mean for their livelihoods.

As the legislated closure date of the mill's Boat Harbour treatment facility looms and no replacement approved, the future of the mill — which takes between 35 and 40 per cent of the pulpwood from the provincial market — remains murky.

While there are differing opinions on the mill in terms of its history, operation and environmental footprint, there is mostly consensus on the role it plays within the forestry industry, both direct and indirect.

Officials with the Northern Pulp mill have yet to file their application for an environmental assessment for a new effluent treatment facility. (The Canadian Press)

A 2016 economic impact study found 6,100 direct forestry jobs in the province and Bishop estimates at least 2,550 of those are people connected to wood that eventually finds its way to Northern Pulp in one form or another.

The top 11 sawmills in the province, which account for 96 per cent of the lumber made here, all have ties to Northern Pulp. More than 90 per cent of sawmill chips in the province end up

there.

- **Province says it's not budging on Boat Harbour deadline**
- **Forestry minister not ready to contemplate closure of Northern Pulp just yet**

Andrew Watters, general manager for Groupe Savoie's hardwood sawmill in Westville, said they get about 30 per cent of their logs from Northern Pulp. All their chips and bark go back to the pulp mill.

"It's a pretty good part of our business plan," he said. "That sawmill waste helps pay your bills. If you don't have a market for that it's pretty hard on the equation."

There are 50 people working at the Westville sawmill, which already struggles to get supply. As a result, the mill is only running one day a week — enough to keep employees' benefits in place and make pension contributions.

If Northern Pulp were to close, Watters estimates mill production would drop to between six to eight months of the year.

Jeff Bishop is executive director of Forest Nova Scotia. (CBC)

The links don't end there, said Bishop.

"There's hundreds — if not thousands — of landowners that sell wood on the market, whether directly to Northern Pulp themselves or through another supplier that Northern Pulp may work with," he said.

Because of how thin the margins can be in the forestry industry and how integrated things are, it is difficult for there not to be significant ripples if such a major player were to exit.

"The forestry industry is greatly dependent on each other and Northern Pulp is the most important link in this relationship," an official with Wagner Forest Management N.S. wrote in a November email to Premier Stephen McNeil and Lands and Forestry Minister Iain Rankin to voice concern about the potential loss of the mill.

Logs harvested in Colchester County are stacked and arranged based on their destination. Pulpwood goes to Northern Pulp, while stud logs will go to one of two lumber mills. (Michael Gorman/CBC)

It was urgency of a different kind in 2014 that led to the creation of the Boat Harbour Act.

That summer, a pipe leading from the mill to Boat Harbour was found to be leaking effluent. An agreement between the government and the Pictou Landing First Nation ended a blockade at the site and led to the passage of legislation in 2015, which called for Boat Harbour to be closed by the end of January 2020.

The bill was born out of the government's desire to do right by a community that for decades had been lied to, saw concerns go unaddressed and was subject to environmental racism.

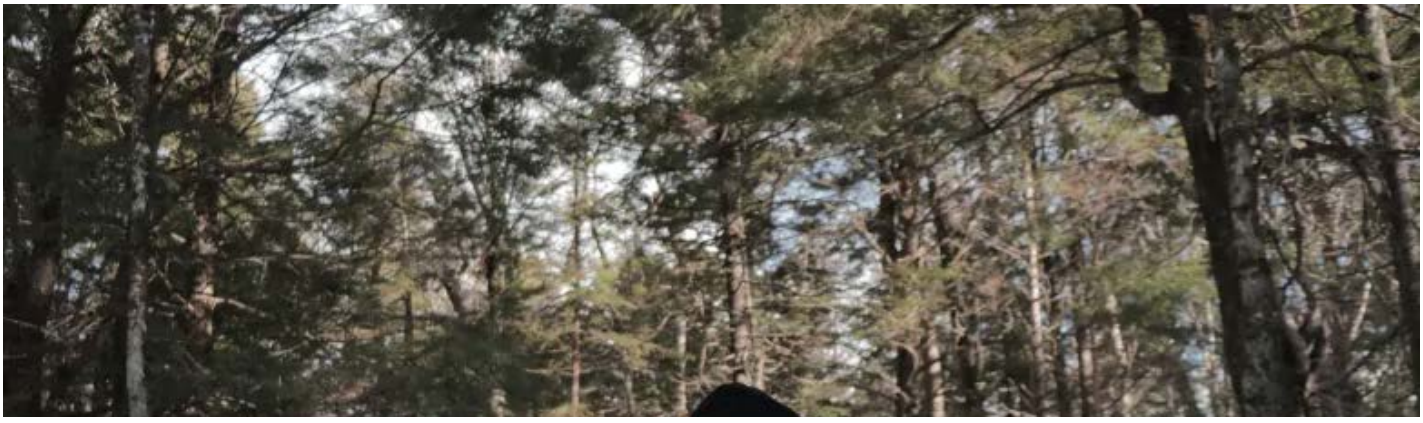
Recently, as the mill attempted to complete work for an assessment application to pump treated effluent into the Northumberland Strait, focus shifted to what the new treatment facility would mean for the fishing industry — something that's led to protests and created pitched tensions within Pictou County.

- **Tensions around Northern Pulp have local MP 'deeply concerned'**
- **Northern Pulp admits it is likely to miss 2020 effluent deadline**

Amid those tensions, and strong lobbying by the mill, McNeil has rejected calls to extend the closure deadline. The mill has had five years to prepare its plan, he's said, and he intends to keep his promise to the Pictou Landing First Nation.

People in the woods, meanwhile, wonder what it could mean for the future viability of their industry.

Last month, Rankin said the government wasn't at the point of considering a future without the mill, but people in the industry certainly are. The challenge for anyone pulling pulpwood from a block of land is there are few places for it to go.



Andy Kekacs is executive director of the Nova Scotia Woodlot Owners and Operators Association. (Michael Gorman/CBC)

"This is a phenomenal volume of wood for which there isn't much of another use," said Andy Kekacs, executive director of the Nova Scotia Woodlot Owners and Operators Association.

On this day, Kekacs is giving a tour of a recent cut on a private lot in Colchester County.

- **Northern Pulp to shut Boat Harbour waste treatment plant in 2020**

It's the very definition of soft touch forestry, with trees cut by chainsaw and lots of large trees with high-end value still standing, but with enough space between them so new trees can sprout up.

Even with this approach, 25 per cent of the wood removed was low grade and it all went to Northern Pulp. That money helps make the softer touch more economical.

Losing the mill would have a "significant disruption" on the industry, said Kekacs, one that would extend from sawmills to contractors in the woods, to people who drive trucks and the variety of businesses in rural communities sustained by the paycheques of those workers.

Greg Watson is manager of the North Nova Forest Owners Co-op. (Michael Gorman/CBC)

Greg Watson thinks about where else pulpwood could go as he watches a machine pile it high along a logging road in Denmark, Colchester County.

Watson, manager of North Nova Forest Owners Co-op, used to play in these woods as a kid. Today he's showing off what amounts to a restoration cut, a partial harvest that will help make the land and wood on it more valuable and allow for better regeneration.

Cutting wood like this isn't easy; it often takes more time and costs more money than simply knocking down a stand. But it reflects what landowners in the co-op want, said Watson.

Doing this kind of work, and the nature of Nova Scotia's forests, means crews working for the co-op pull out a lot of pulpwood. That pulpwood needs to go somewhere, and for North Nova right now that somewhere is Northern Pulp, which takes some sort of product from about half the jobs the co-op does.

"I don't think people are aware — and I'm not defending big industry or anything — but I don't know if people actually understand how much it takes," said Watson.

A harvester removes trees during a partial cut in Colchester County. (Michael Gorman/CBC)

The mill also provides North Nova with funding for silviculture work on partial harvests and planting and spacing.

Watson said anyone with ties to the mill is worried. It's the most pressure the sector has faced that he can remember. The co-op has 300 members and Watson and his team manage more than 28,000 hectares of land in Cumberland, Pictou and Colchester counties.

The ability of the team to work the woods has a direct effect on the co-op's woodlot owners, who treat their land as an investment.

Some take regular dividends in the form of firewood sales, for example, while others wait for the right time to use the proceeds of a cut to finance a major expense, such as the construction of a smaller home that keeps them in their community as they age.

"It's not just North Nova as a business," said Watson. "We help a lot of people. We've all got to live here. We've all got to find a solution here."

For many people in the forestry sector, the time to find that solution could be running out.

Nova Scotia paying millions for Northern Pulp treatment plant design

Aaron Beswick (abeswick@herald.ca)
Published: Aug 21, 2018 at 7:40 a.m.

Northern Pulp is planning to build a replacement for the Boat Harbour treatment facility next to their location in Abercrombie. The current treatment facility will close in January 2020.

The province is paying for at least part of the design of Northern Pulp's new effluent treatment facility.

Tucked into the supplementary information of the Public Accounts document is a grant of $6,001,238.13 to Northern Pulp Nova Scotia Corporation from the Department of Transportation

ADVERTISEMENT

Ad : (0:13)

and Infrastructure Renewal.

It's for designing the facility that another arm of the provincial government will conduct an environmental assessment on.

Ronnie Heighton thinks there's a problem with that.

"It's a direct conflict of interest," said the River John fisherman and spokesperson for the Northumberland Fisherman's Association.

"How can a regulator and financer be trusted to do their own environmental assessment?"

Neither the provincial government nor Prime Minister Justin Trudeau think there's a problem with that.

Both McNeil and Trudeau have maintained that the province will

do the environmental assessment.

The province never issued a news release about funding the design.

After it was discovered by the Friends of the Northumberland Strait, a group opposed to Northern Pulp's plan to pump treated effluent into the body of water, The Chronicle Herald contacted the Department of Transportation and Infrastructure Renewal.

"The contribution allows negotiations with Northern Pulp to continue and will be credited towards any future agreement," said spokeswoman Marla MacInnis.

"This cost is part of a larger discussion with Northern Pulp which is yet to be concluded."

That larger discussion is who pays to build the replacement for Boat Harbour.

A 1995 indemnity agreement and lease renewed in 2002 by premier John Hamm's government — Hamm is now chair of Northern Pulp's board of directors — puts the taxpayer on the hook for cleaning up Boat Harbor and providing a treatment facility for the mill's effluent until at least 2030.

While the province isn't saying how much a replacement will cost, a 2015 letter by Terri Fraser, technical manager at Northern Pulp, to then Environment minister Randy Delorey warned a new facility would cost over $100 million.

"We expect taxpayers to be on the hook for half a billion by the time this is all finished," said Jill Graham-Scanlan, a Pictou lawyer and spokeswoman for Friends of the Northumberland Strait.

"We are at a loss to understand why the public and the fishermen are not considered stakeholders in this game of chicken. It's our money being used to pay for this project."

She takes the money for design work as a sign the province will be on the hook for the entire construction cost of the new effluent treatment facility.

MacInnis said it was just to keep the project moving to meet the Jan. 31 deadline for the closure of the existing facility mandated by the Boat Harbour Act passed by the legislature in 2015 to get the Pictou Landing First Nation to lift a blockade of Northern Pulp.

"Detailed engineering was one of the critical items required to build a potential replacement facility in time to meet the closure deadline of January 2020 for the existing facility," said MacInnis.

"This step was required to stay within that timeline and would be reviewed as part of the environmental assessment process."

Nova Scotia fisherman says blockaders are being used as 'scapegoat' in fight with Northern Pulp

By **HALEY RYAN** StarMetro Halifax
Tues., Dec. 18, 2018

HALIFAX—A Pictou fisherman of 30 years says Northern Pulp Mill's successful injunction against those who've blocked mill survey boats is a blame tactic to hide the company's lack of proper waste plan.

Nearly 100 people from various environmental groups, Pictou Landing First Nation, Pictou area residents and other supporters rallied outside the Nova Scotia Supreme Court in Halifax amid blowing snow on Tuesday afternoon.

4/5 articles left Subscribe to The Star for just 99¢ for your first month Subscribe Now

Fishermen's supporters hold up anti-pipeline signs outside Nova Scotia Supreme Court Tuesday. Almost 100 people gathered outside the courthouse before lawyers for Northe company, Paper Excellence Canada, made arguments seeking an interim injunction to pı fishermen's blockades of survey work in the Northumberland Strait. (ZANE WOODFORI

The rally members said they were there to both support the fishermen named in the temporary injunction sought by Northern Pulp, and protest the mill's plan to pipe 62 million litres of treated waste, or effluent, each day directly into the Northumberland Strait between Nova Scotia and Prince Edward Island.

"If we allow it, our fisheries die," Pictou fisherman Donald Cheverie said in an interview, his gloved hands resting on a large sign reading 'No pipe in the strait.'

"It's poison."

Fishermen have been blocking the mill's survey boats from scouting for a potential pipe location since this spring, leading to the mill's move to file for a temporary injunction.

That was granted by Nova Scotia Supreme Court Justice Denise Boudreau on Tuesday, who

said the fishermen have the right to "lawful protest," but they don't have the legal right to block the survey vessels from doing their work.

Kathy Cloutier, a spokeswoman for Northern Pulp's parent company, Paper Excellence

4/5 articles left Subscribe to The Star for just 99¢ for your first month Subscribe Now

"Our hope was that the surveying would be allowed to occur without incident or obstruction, however actions indicated that the environmental assessment survey work would not proceed without the company seeking a court injunction," Cloutier wrote.

The proposed pipeline has been loudly contested by environmentalists, local fishermen, Hollywood actor Ellen Page of Halifax, the P.E.I. government and Indigenous residents of Pictou Landing First Nation near the Abercrombie, N.S. plant.

ADVERTISEMENT

Cheverie said local fishermen are so concerned about the pipe because the N.S. fisheries industry has "a lot at stake," while he said Northern Pulp could "walk away scot-free" since the province is left with any cleanup.

The wider Gulf of St. Lawrence fisheries region is home to lobster and crab fisheries that brought in over $1.2 billion worth of catch in 2016.

Right now, the effluent is treated in a basin system where effluent flows through a pipe from the mill to Boat Harbour and then to Boat Harbour Basin, iPolitics reported in an October piece about the mill. There, it mixes with other rivers and streams that flow in there. It is retained for up to 30 days before being discharged into the saltwater at the Pictou Landing shoreline.

shoreline.

Now that the mill is losing Boat Harbour as an effluent destination — the 2015 Boat Harbour Act set Jan. 31, 2020 as the cut-off date — it has to go somewhere, hence the debate around the possible new pipeline into the strait.

4/5 articles left Subscribe to The Star for just 99¢ for your first month Subscribe Now

In response to environmental concerns around the proposed effluent pipeline, Cloutier said in an email last week that treated effluent is "non-toxic." Since the bleached kraft pulp mill started in 1967, effluent has been flowing into the Northumberland Strait with "both our fisheries and forest industries coexisting," Cloutier wrote.

"Effluent of today is not the quality of decades past. Significant improvements have been made over the years. The proposed new form of treatment technology will be an Activated Sludge Treatment (AST) system. The new system will see no untreated effluent (wastewater) leave the mill property," Cloutier said Tuesday.

But Cheverie said the mill's position is "another lie," and any effluent that goes into the strait would be worse than what's currently coming out of Boat Harbour because there it has about 30 to 40 days to settle, and the new system would pump effluent out every day.

Donald Cheverie, a Pictou, N.S. fisherman of 30 years, rallied outside Nova Scotia Supreme Court on Dec. 18, 2018 in support of the other fishermen named in the injunction sought by Northern Pulp. (ZANE WOODFORD/STARMETRO)

The mill has already said it likely won't be able to meet the legislated Boat Harbour deadline,

and it hasn't yet submitted an environmental assessment application for a new effluent pipe into the ocean.

For Cheverie, he believes the fishermen have every right to protest the mill's actions by

4/5 articles left Subscribe to The Star for just 99¢ for your first month Subscribe Now

"They're trying to use us as a scapegoat. They had five years to do something, and they've done nothing in five years. So trying to blame it on six fishermen? It's absurd," Cheverie said.

"They have no plans on doing anything. They're after an extension to keep Boat Harbour open. If they had any intentions of doing anything with the pipe, you think they would have started four years ago?

Cheverie said Northern Pulp should take up a closed loop treatment system for their effluent if they changed their pulp process (which would keep effluent out of the ocean), but Cloutier said such a "zero effluent" plan is not an option for the mill in the proposed new effluent treatment facility.

Cloutier said a zero effluent bleached kraft mill "does not exist at this time," and that concept "is not seen as being technically nor economically achievable in the foreseeable future."

Tuesday's rally was largely peaceful, although there were some tense moments between four counter-protestors carrying signs saying 'support Northern Pulp effluent cleanup' and those who were anti-pipeline. They raised signs in each other's faces, and threw up middle fingers as they leaned around the handful of Halifax police officers who separated the groups.

One man yelled "go back to Pictou Landing" in reference to the First Nation, in the direction of a group of men which included some Indigenous protesters.

Ben Chisholm of Antigonish, N.S. is a pipefitter who does business with Northern Pulp and was one of the four counter-protestors. He said they wanted to show support for the mill to remain open, since the company provides a lot of work and income to the construction industry in the area.

Chisholm said he believes Northern Pulp will have a "properly engineered plan" for their proposed pipeline and effluent, and it will be subject to any rules set out by an environmental assessment.

"The government will be checking it all the time, so if it's not up to standard then they can step in and do something," Chisholm said.

He also added that while he's glad to see Boat Harbour will be cleaned up, the effluent that has left the basin over the past 50 years "didn't hurt the fisheries ever" and said "there was

never a fish killed.”

4/5 articles left Subscribe to The Star for just 99¢ for your first month Subscribe Now

Nicole MacKenzie of Friends of the Northumberland Strait believes the proposed plan to pump effluent into the ocean will not only physically hurt the fisheries industry, but also create a negative perception that will hurt N.S. exports. (ZANE WOODFORD/STARMETRO)

However, Nicole MacKenzie from the Friends of the Northumberland Strait group said she believes the proposed plan to pump effluent into the ocean will not only physically hurt the fisheries industry, but likely create a negative perception that will hurt N.S. exports.

MacKenzie said even if mill effluent meets regulations it can still have harmful effects on aquatic life and habitat, or could also cause the fish and lobster to move away from the area—not to mention create a harmful perception that would damage the reputation of Nova Scotia’s seafood reputation.

“You don’t have to have a dead lobster to kill the industry,” MacKenzie said.

A court hearing at a later date will consider a longer-term injunction.

Nova Scotia First Nation starts official countdown on Boat Harbour

By Staff The Canadian Press

Fishing boats pass the Northern Pulp mill as concerned residents, fishermen and Indigenous groups protest the mill's plan to dump millions of litres of effluent daily into the Northumberland Strait in Pictou, N.S., on Friday, July 6, 2018.

THE CANADIAN PRESS/Andrew Vaughan

A Nova Scotia First Nation is taking a pointedly direct approach to ensuring that a highly polluted waste water treatment facility on its land is shut down.

Under legislation passed in 2015, the provincial government has committed to closing the Boat Harbour facility by Jan. 31, 2020 – one year from this week – and the Pictou Landing First Nation plans to mark the beginning of an official countdown on Thursday.

The First Nation, which is near Pictou, N.S., has organized a “One Year Countdown” event, which is expected to include traditional drumming, dancing, prayers, smudge ceremony and speeches.

The waste water is mainly treated effluent from the Northern Pulp mill, where a proposed plan would see more than 62 million litres per day pumped directly into the Northumberland Strait once Boat Harbour is closed.

That decision has enraged local fishermen, who have staged large protests and prevented the mill’s seismic survey work on the Strait.

READ MORE: ‘Stop it at all costs’: The blockade of Northern Pulp Mill continues

On Monday, Northern Pulp issued a statement saying the fishermen have agreed to comply with a court injunction that prohibits them from blocking seismic survey vessels hired by the mill.

The mill was granted an interim injunction by a Nova Scotia Supreme Court judge in December.

Northern Pulp now says it has reached an agreement with the protesters, saying it will allow the company’s work to proceed in the Strait, Pictou Harbour and Caribou Channel.

“Northern Pulp, and owner Paper Excellence, are pleased that the legal action by Northern Pulp has been resolved to Northern Pulp’s satisfaction through an agreement and the anticipated issuance by the court of a permanent injunction,” the company said in a statement.

The company declined to comment on the latest developments.

WATCH: Thousands gather to protest pulp mill in Pictou

In a brief statement, the fishermen said they accepted the judge’s decision and the pending issuance of a permanent injunction.

Northern Pulp is expected to return to court Tuesday to seek the long-term injunction.

The company is also expected to submit an environmental approval application to the provincial Environment Department later this week.

The company has said the treated effluent it plans to pump into the Strait will meet federal regulations for emissions, but opponents say there’s a lack of scientific evidence regarding how the waste will affect the long-term health of the lucrative lobster and crab fisheries.

Northern Pulp wins injunction against fishermen's blockade

Judge says fisherman have right to lawful protest, but don't have right to block survey vessels

The Canadian Press · Posted: Dec 18, 2018 3:04 PM AT | Last Updated: December 18, 2018

People protesting the proposed Northern Pulp effluent pipe gathered Tuesday outside Nova Scotia Supreme Court in Halifax. (Preston Mulligan/CBC)

A Nova Scotia judge has granted a temporary injunction to stop fishermen from blocking survey boats hired to examine a route for a pulp mill's effluent pipeline.

Nova Scotia Supreme Court Justice Denise Boudreau decided the fishermen have the right to "lawful protest," but they don't have the legal right to block the survey vessels from doing their work.

Lawyers for the Northern Pulp mill in northern Nova Scotia argued that their project was being unlawfully held back by the fishermen's blockades.

Before the decision was handed down, about 80 people gathered outside the Halifax courthouse to protest the proposed pipeline that would pump treated waste directly into the Northumberland Strait near Abercrombie, N.S.

Kathy Cloutier, a spokesperson for Northern Pulp's parent company, Paper Excellence Canada, confirmed the mill was seeking an interim injunction to prevent blockades of the survey work in the Northumberland Strait.

A group of fishermen has stated they would block any survey boats from entering the strait.

The plan to pump treated effluent from its Abercrombie, N.S., mill into the strait has raised the ire of the fishermen, the P.E.I. government and even Hollywood actor Ellen Page, who is from Halifax.

Hundreds of boats joined a protest in July against Northern Pulp's proposed route for its effluent pipe. (Nic Meloney/CBC)

The wider Gulf of St. Lawrence fisheries region is home to lobster and crab fisheries that brought in over $1.2 billion worth of catch in 2016.

The Nova Scotia government has committed to stopping the flow of effluent to the heavily polluted Boat Harbour lagoon by Jan. 31, 2020. The lagoon is next to the Pictou Landing First Nation.

Outside the Halifax courtroom, the protesters carried signs that said "No pipe in the Strait," and they chanted "All I want for Christmas is no pipe."

- **Northern Pulp alleges death threats in legal action against fishermen**
- **McNeil plea for peace triggers protest in Pictou County**

Warren Francis, a 49-year-old fisherman and member of the Pictou Landing First Nation, said before the ruling was made that other protests would follow if an injunction is granted.

"I don't think it will stop us," he said. "My First Nation will have to step it up ... We don't want a pipeline in that strait ... I really hope it doesn't come down to violence."

Ben Chisholm, a 65-year-old business agent for the pipefitters union, said he came to the courthouse to support the mill's position because millions of dollars in economic activity could be lost if the mill closed.

"There's more support for keeping the mill open and cleaning it up than there is for closing it," he said, as the protest chants rang out nearby.

"Any time a big plant closes in an area, it's followed by poverty. There's nothing to replace this."

Northern Pulp to soon file effluent plan

Premium content

Adam MacInnis (amacinnis@ngnews.ca)

Published: Jan 04 at 8:23 p.m.
Updated: Jan 05 at 9:05 a.m.

The Northern Pulp mill is seen in Abercrombie in 2017. - The Canadian Press

Northern Pulp will register its plans for replacing the Boat Harbour treatment facility with Nova Scotia's Department of Environment by the end of January, triggering the start of the provincial environmental assessment.

Despite the fact the mill hasn't yet been able to have a survey crew complete their work, the project will be registered using existing data, says Kathy Cloutier, director of communications for Paper Excellence, which owns Northern Pulp.

2 Articles Left
$4.99/month for your first 3 months - limited time offer.

"That is a heavily surveyed area, so there is data we're able to rely on, although our preference would have been our own updated survey."

Fishermen opposed to the plans of pumping treated effluent into the Northumberland Strait repeatedly blocked the survey boat from doing work in the area. A judge issued a temporary injunction last month to prevent fishermen from stopping the survey boat from doing work.

Cloutier didn't rule out the possibility of the survey work being completed before the end of January, but said it would depend on availability of the boat, weather and safety.

The plans Northern Pulp submits will include the primarily land-based route for the pipe carrying treated effluent from Abercrombie Point, which will empty in the area off Caribou Point. Northern Pulp had considered a route that would have emptied in the area of the Northumberland Strait off of Pictou Road. But there were concerns about that, including ice scours as well as a shipwreck that made the mill look elsewhere.

The Caribou route is the mill's preferred option for various reasons, including the volume and depth of water in that location, which would improve the mixing of the treated effluent flowing out with the water in the strait, Cloutier said.

"It's a better disbursement area and a shorter in-water pipe which answers some of the concerns raised by the community and others," she said.

While the initial route would have required building between 10 kilometres and 13 kilometres of pipe underwater, this route will only have about three kilometres underwater.

According to Clouthier, one of the biggest advantages of the new treatment facility over the existing one is that no untreated effluent will leave Northern Pulp's property on Abercrombie Point. With the existing system that's been in operation since the mill opened, untreated effluent is piped from the mill at Abercrombie Point to the Boat Harbour treatment facility near Pictou Landing where it is treated before being released into Boat Harbour and then flows out to the Northumberland Strait.

The provincial government says the new treatment facility would fall into the class 1 environmental assessment category, which would take about 60 days to complete. It hasn't been determined whether a federal environmental assessment, which could take much longer, will be required.

Cloutier said the company believes the project will meet the requirements of the environmental assessment. "We are confident in the project and the science."

Engineers and design teams are currently trying to work on a feasible timeline for completion of the project, she said.

The company has already said it will not be able to meet the deadline of January 2020 to close the existing Boat Harbour facility. It is lobbying the province to extend the deadline. Cloutier said the extension is supported by those who understand the importance of the mill to the forestry industry and overall economy of the province.

"This is an extension that is necessary to provide the time to complete construction," she said.

It would be impossible to keep the mill going even under a hot idle without a treatment facility, she said.

Northern Pulp is not even considering the option of temporarily closing at this point, Cloutier said. No time of year would be optimal if they did have to shut it down, she said, but winter would particularly

be difficult. “It would be a ripple effect from suppliers to contractors to the port of Halifax almost instantly.”

CBC

Northern Pulp taking legal action to stop survey boat blockades

Some Northumberland Strait fishermen have been blocking survey boats over effluent pipe proposal

Anjuli Patil · CBC News · Posted: Dec 05, 2018 5:48 PM AT | Last Updated: December 5, 2018

Paper Excellent Canada says it had no choice but to pursue legal action. (Nic Meloney/CBC)

Northern Pulp is taking legal action to put an end to blockades that have prevented survey boats from doing work for a proposed effluent pipe in the Northumberland Strait.

On Wednesday, Paper Excellent Canada announced it has initiated legal action as a response to fishermen in the Northumberland Strait blocking the survey boats as a protest. The company said it had no choice.

"Clearly our hope was that the surveying would be allowed to occur without incident or obstruction," said Kathy Cloutier, director of corporate communications for Paper Excellence Canada.

"However actions indicated that the environmental assessment survey work would not proceed without the company seeking a court injunction."

- **Stephen McNeil hopes fishermen will end blockade of Northern Pulp survey boats**
- **'We'll block them,' fisherman says of Northern Pulp survey boat**

Cloutier said the company supports people's rights for free expression, but said the blockades have moved into "an unsafe realm in terms of obstruction and/or threats."

"Then it became necessary — unfortunately — to look at avenues such as court injunctions. These are skilled professionals who have been contracted to perform a function and should be allowed to do so," Cloutier said.

Cloutier said the court documents have been filed and said a court date is scheduled for Dec. 18.

In the meantime, Cloutier said survey boats will remain docked until the process is completed.

Darryl Bowen, a fisherman from Caribou, N.S., doesn't think an injunction will stop blockades.

"There's a lot of fishermen on this shore and unless it's an injunction against every fisherman in the Northumberland Strait, there will be somebody there blocking them if they come back," Bowen said.

Northern Pulp effluent pipe protest draws huge crowds on land and sea in Pictou

'When we sell Nova Scotia to the world, we're selling it as 'Canada's Ocean Playground,' says Pictou resident

CBC News · Posted: Jul 06, 2018 12:00 PM AT | Last Updated: July 6, 2018

Demonstrators gathered on Friday to protest plans by Northern Pulp to run an effluent pipe into the Northumberland Strait. (Steve Lawrence/CBC)

Hundreds of people from all three Maritime provinces gathered Friday in Pictou, N.S., to protest Northern Pulp's plan to put an effluent pipe into the Northumberland Strait.

Many chanted "No pipe, no way" as they marched from the local arena to the town's waterfront. Organizers estimated at least 1,000 people attended the protest.

Dozens of fishing boats and pleasure craft sailed into Pictou Harbour, some flying the Mi'kmaq Grand Council flag.

"We are the voice of this water, we are the voice of everything that lives in this water," said Andrea Paul, who was on board one of the vessels and is chief of Pictou Landing First Nation.

The pipe is supposed to replace the 140-hectare waste-water lagoon at Boat Harbour, which the government has promised to close by 2020.

The replacement would discharge about 70 million litres of treated effluent a day via a subsea pipe directly into the Northumberland Strait, several kilometres from the mill.

For 50 years, pulp mill waste water — from several mill owners — has been piped under the East River into the Boat Harbour lagoon. From there, it is aerated in settling ponds before being released about a week later into the Northumberland Strait.

Kayla Hounsell
@KaylaHounsell

One of the organizers of today's rally says it's emotional to see it all come together after months of planning. She says, "Pictou County's dirty little secret is coming out."

30 7:36 AM - Jul 6, 2018

See Kayla Hounsell's other Tweets

Jill Graham-Scanlan, president of Friends of the Northumberland Strait, told CBC's *Information Morning* that even though the effluent is being treated, it's still industrial waste.

"It'll contain all kinds of toxins — metals and other nasty substances that we in no way want flowing out into the clean, pristine waters of our Northumberland Strait and into rich fishing grounds," she said.

The plan for a new pipe hit a snag this week when recent sonar imaging showed the proposed route of the pipe and its outfall position will have to change due to a shipwreck, evidence of ice scouring, a shoal and a collapsed pier in the area.

Hundreds of people were at the waterfront in Pictou. (Nic Meloney/CBC)

The company is looking for a modification to the proposed route, not a new route, Kathy Cloutier, a Northern Pulp spokesperson, said in an email.

She said whatever Northern Pulp decides, the mill's "commitment to the community and environment will not be compromised."

The mill directly employs 330 people, and supports another 1,500 or so jobs in the forestry sector.

Mike van den Heuvel, a science professor at the University of Prince Edward Island, says it's a mistake to blame changes in the Northumberland Strait, including loss of biodiversity, solely on Northern Pulp.

There are hundreds of creeks and rivers, some carrying sediment and pesticides, flowing into the Strait, he told CBC's *Mainstreet Halifax.*

He says the portion of the mill's nutrient input into the strait is tiny, probably less than one per cent overall.

"Is there nutrients coming out of the mill? Yes. But it's not very much, when you consider it all as a whole."

Van den Heuvel, who studies the effects of agriculture and chemical use on freshwater and coastal environments, said the new treatment proposed for the effluent, based on the design, should be an improvement.

You won't be able to detect the wastewater plume more than 100 or 200 metres away from the pipeline, he said.

- **Proposed Northern Pulp pipe route into ocean hits snag**

Proposed plan puts Canada's Ocean Playground 'at risk'

Wes Surrett, general manager at the Pictou Lodge Beach Resort, said the proposed plan for the effluent pipe risks turning off tourists.

"When you're selling tourism, you're selling a brand and when we sell Nova Scotia to the world, we're selling it as 'Canada's Ocean Playground,' and here on the Northumberland Strait we sell our beautiful, sandy beaches, our warm swimmable waters and our fresh, local seafood," he told CBC's *Information Morning*.

"It is our belief that this proposed plan puts all of that at risk and once you tarnish that brand, then we're very concerned what that might do to potential tourism dollars down the road."

Some of the dozens of boats at the protest. (Nic Meloney/CBC)

Premier Stephen McNeil told reporters outside Province House on Thursday that government must find balance between what's good for the economy and what's good for the environment.

"There are those, though, that are always on opposite sides ... those that would prefer that there is no development and there's others who believe there should be development with no rules," said McNeil.

- **Environment Department official defends speedier Northern Pulp assessment**
- REPORTER'S NOTEBOOK **An 'unnerving' walk on Boat Harbour's contaminated floor**

"Our job is always to strike the balance to make sure that we protect the environment for future generations at the same time providing economic opportunity for those who are currently working in the economy of Nova Scotia."

He said how much the province will be contributing to the new treatment facility hasn't been finalized yet.

The Northern Pulp mill is shown in the background. (Nic Meloney/CBC)

More rigorous environmental assessment

Graham-Scanlan said she disagrees with the government's decision to "fast-track" the province's environmental assessment process by only requiring a Class I assessment on the replacement effluent pipe project, which she said isn't rigorous enough.

"So there's only a 30-day period for the public to view the plan and provide its comments to the environment minister. At that time, the environment minister has only 20 days to review all of the public concerns, review Northern Pulp's proposal and at the end of that 20 days the environment minister makes their decision," she said.

Some people in the area want the federal government to intervene and do a more thorough environmental assessment. (Nic Meloney/CBC)

Graham-Scanlan said she's asking the federal government to take over the environmental assessment process through the Canadian Environmental Assessment Agency.

"We believe that that process will be much more rigorous and give the due attention that this project requires," she said.

Northern Pulp confirms effluent leak at Pictou Landing

Leak reported Sunday morning, a day after annual maintenance shutdown began

Anjuli Patil · CBC News · Posted: Oct 21, 2018 4:30 PM AT | Last Updated: October 21, 2018

There was an effluent leak from Northern Pulp on Sunday. (Andrew Vaughan/Canadian Press)

Northern Pulp says it has taken immediate action to remedy an effluent leak in Pictou Landing, N.S., reported Sunday morning.

The leak was reported a day after the company began its annual maintenance shutdown Saturday, according to Kathy Cloutier, director of communications for Paper Excellence Canada.

"Northern Pulp was not in production at the time of the leak," Cloutier told CBC News in an email.

Cloutier said the company was made aware of a possible effluent leak at 9:20 a.m. The leak was confirmed about 30 minutes later and the flow was stopped.

"Northern Pulp officials instantly notified First Nations and authorities of the incident," Cloutier said.

"Representatives from Northern Pulp will continue to work with agencies throughout the coming days."

Cloutier said Northern Pulp has arranged for a third-party environmental consultant to be at the site Sunday afternoon "for assessment and development of a path forward plan."

This leak is downstream of the area where a 2014 leak occurred, Cloutier said.

Northern Pulp and fishermen agree to permanent injunction to allow survey work

N.S. mill granted interim injunction in December to stop fishermen from blocking survey vessels

The Canadian Press · Posted: Jan 28, 2019 12:01 PM AT | Last Updated: 32 minutes ago

Hundreds of boats from the three Maritime provinces joined a rally last July against Northern Pulp's plan to put an effluent pipe into the Northumberland Strait. (Nic Meloney/CBC)

A Nova Scotia First Nation is taking a pointedly direct approach to ensuring that a highly polluted waste water treatment facility on its land is shut down.

Under legislation passed in 2015, the provincial government has committed to closing the Boat Harbour facility by Jan. 31, 2020 — one year from this week — and the Pictou Landing First Nation plans to mark the beginning of an official countdown on Thursday.

The First Nation, which is near Pictou, N.S., has organized a "One Year Countdown" event, which is expected to include traditional drumming, dancing, prayers, smudge ceremony and speeches.

The waste water is mainly treated effluent from the Northern Pulp mill, where a proposed plan would see more than 62 million litres per day pumped directly into the Northumberland Strait once Boat Harbour is closed.

That decision has enraged local fishermen, who have staged large protests and prevented the mill's seismic survey work on the Strait.

On Monday, Northern Pulp issued a statement saying the fishermen have agreed to comply with a court injunction that prohibits them from blocking seismic survey vessels hired by the mill.

The mill was granted an interim injunction by a Nova Scotia Supreme Court judge in December.

Several boats flying the Grand Council Flag of the Mi'kmaq Nation preparing for a rally in the waters off Pictou in July, 2018. (Nic Meloney/CBC)

Northern Pulp now says it has reached an agreement with the protesters, saying it will allow the company's work to proceed in the Strait, Pictou Harbour and Caribou Channel.

"Northern Pulp, and owner Paper Excellence, are pleased that the legal action by Northern Pulp has been resolved to Northern Pulp's satisfaction through an agreement and the anticipated issuance by the court of a permanent injunction," the company said in a statement.

The company declined to comment on the latest developments.

In a brief statement, the fishermen said they accepted the judge's decision and the pending issuance of a permanent injunction.

Northern Pulp is expected to return to court Tuesday to seek the long-term injunction.

The company is also expected to submit an environmental approval application to the provincial Environment Department later this week.

The company has said the treated effluent it plans to pump into the Strait will meet federal regulations for emissions, but opponents say there's a lack of scientific evidence regarding how the waste will affect the long-term health of the lucrative lobster and crab fisheries.

Northern Pulp admits it is likely to miss 2020 effluent deadline

'We are at risk of missing the timelines by a few months,' Paper Excellence executive says

Paul Withers · CBC News · Posted: Nov 13, 2018 8:33 PM AT | Last Updated: November 14, 2018

Two boats joined a rally in July against a plan by Northern Pulp, shown in the background, to put an effluent pipe into the Northumberland Strait. (Nic Meloney/CBC)

The owners of a pulp and paper mill in Pictou County, N.S., say it's unlikely a new effluent treatment pipeline will be ready in time for the government-imposed deadline of January 2020.

"We are at risk of missing the timelines by a few months," said Jean-Francois Guillot, vice-president of operations at Paper Excellence, which owns Northern Pulp.

"At this point, it's risky," he said. "I don't think so. We can have effluent treatment working by January 2020, it's just the discharge point, we kind of have to do backflips to make that happen."

The deadline matters because the mill's provincial industrial approval expires Jan. 30, 2020, and a functioning effluent treatment system is required.

"If we don't have an industrial permit, we have to stop the mill," Guillot said. "What do we do at that time? What do we do with the employees? What do we do with the asset itself?

"So, yes, we are asking ourselves those questions. For us, it's not how we walk away — it's how we can make it work."

Jean-Francois Guillot, Paper Excellence's vice-president of operations, says Northern Pulp is likely to miss a January 2020 deadline for a new effluent treatment system, but wants to continue operating in Nova Scotia. (Dave Laughlin/CBC)

Guillot said the company intends to submit an environmental assessment at the end of January 2019 for a new pipeline outfall in the Northumberland Strait four kilometres outside Caribou.

That document will provide more detail on when the company believes a new system will be operational.

"We want to stay in Nova Scotia," Guillot said. "We are convinced it can be workable."

Mill fate rests on effluent treatment

The treatment and release of an estimated 70-million litres of effluent each day is key to the mill's continued operation. It has prompted protests and blockades from fishermen who object to the discharge of treated effluent anywhere in the Northumberland Strait.

The impasse is the result of legislation passed by the Nova Scotia government to close the 140-hectare treatment lagoons at Boat Harbour by January 2020.

- **McNeil plea for peace triggers protest in Pictou County**
- **Effluent pipe leak renews opposition to Northern Pulp plan for waste pipeline to Northumberland Strait**

The Indigenous community has complained for decades about the effluent flowing through its land.

The closure date was a personal commitment from Premier Stephen McNeil, who has shown no sign of budging.

Boat Harbour compensation deal reached?

Guillot also said Northern Pulp has reached a "tentative agreement on compensation" with the province over the pending closure of the existing treatment facility at Boat Harbour.

The government leases the facility to the company for waste-water treatment.

When it passed legislation to close the facility, it effectively tore up a lease agreement with the company to keep it running until 2030.

"The province and ourselves came to an agreement about, OK, how it is going to work out," Guillot said. "We talk about compensation. Both sides are OK with it. Most of the issues now are making sure to make that happen. It's not a question of money."

The province has disputed the characterization that there is arrangement in place with Northern Pulp and its parent company.

"Government has been meeting with the company to discuss what could be fair compensation given the early termination of the Boat Harbour lease, however, there is no agreement in place at this time," Marla MacInnis, communications spokesperson, said in an email response to CBC News.

First site abandoned

In December 2017, Northern Pulp announced it would build a treatment plant on its property next to the mill at Abercrombie Point and pipe it about 11 kilometres to a dispersal point outside Pictou Harbour.

But the proposed site was abandoned after surveys revealed ice scouring could destroy the six-nozzle diffuser at the discharge point — not to mention require the burying of significant sections of pipeline along the route.

Mill defends new outfall site

Guillot claims the Caribou location in deeper water offers improved mixing and dispersion.

Much is already known about water conditions, according to the company, because of dredging for the Bay Ferries run between Caribou and Wood Islands, P.E.I.

"The treated effluent, when it goes into the ocean — it's really just dissolving or disappearing," he said.

The company said the Caribou location can meet federal water quality guidelines that require temperature and salinity to return to background levels within 100 metres of the outfall.

It has not yet provided modelling data for the proposed location.

Modelling animation of dispersal at Boat Harbour, based on a 30-day tide cycle in July 2016, shows effluent dispersal largely hugs the coast with fingers of effluent extending into the Northumberland Strait.

Guillot said the company is in discussion with the provincial government about obtaining a right-of-way to use the Pictou Causeway as a pipeline route toward Caribou.

"Nobody has closed the door at this point."

50 years of broken pipes and promises

The company is unlikely to win over local fishermen in the Strait who have boiled down their fight down to No Pipe in the Strait.

Groups representing fishermen say they aren't surprised that Northern Pulp will miss the deadline.

Fishing boats gathered to block survey boats hired by Northern Pulp earlier this month. (Submitted)

"To say that they will only miss the deadline by a few months seems wildly optimistic. It doesn't even reflect the advice of their own consultants," Allan McCarthy of the Northumberland Fishermen's Association said in a news release.

"It is the position of our working group, representing over 3,000 fishermen from Nova Scotia, Pictou Landing First Nation, P.E.I., and New Brunswick, that Boat Harbour must close on schedule. All parties in the ... legislature voted in favour of the Boat Harbour Act in 2015. We call on all parties to honour that act now," he said.

"If you think tensions are high now, you don't want to think about what could happen if MLAs do not honour the Boat Harbour Act."

Pictou Landing First Nation won't consider extending the deadline, said Chief Andrea Paul.

"Our community has lived with polluted air and water, broken promises and broken pipes for over 50 years. Boat Harbour is closing on schedule and we expect nothing less. We have also made it clear that we oppose dumping treated pulp effluent anywhere in the Northumberland Strait."

'Collateral damage'

Guillot said the division between the two sides could have long-term effects.

"The scare tactics, I'm OK with that. It's a free country but people have to realize what is the collateral damage that goes with that," he said.

It was the only explicit reference he made to the economic consequences of a mill closure.

"If people are prepared to live with the conditions of having no mill, there is nothing I can do. That's not the outcome we are looking for."

'No pipe' protest forging new alliances along Northumberland Strait

Aaron Beswick (abeswick@herald.ca)

Updated: Jul 06, 2018 at 9:16 a.m.

Capt. Beverley Denny is one of the Pictou Landing First Nation fishers who will take a boat to protest the proposed Northern Pulp effluent pipe. - Aaron Beswick

First Nations no longer alone in battle over effluent

“There is an irony here,” says Mi’kmaq historian Daniel Paul as he talks about rallies to stop Northern Pulp from pumping its treated effluent into the Northumberland Strait.

“If they all care so much now, why didn’t they come forward 50 years ago.”

A broad spectrum of fishermens’ groups, environmental activists and concerned citizens have joined together under the NOPIPE banner to force the federal government to step in and order a larger scientific review of the pulp mill’s plan. For many though, the only choice is to stop it.

But decades ago, there were only the voices of the First Nations community that could be heard in opposition.

Back in 1981 Chief Raymond Francis walked into Daniel Paul's office and said he wanted to sue the province.

Francis was chief of the Pictou Landing First Nation that had watched the saltwater lagoon behind the community poisoned by the effluent piped into it from the kraft pulp mill at Abercrombie Point.

Paul was the district superintendent for the then Department of Indian and Northern Affairs.

"I told him you are going after the wrong people because the title of reserve lands is vested in the federal crown," recalled Paul.

In effect, Paul told the chief to sue his own boss – the federal government.

Ultimately, along with a $35-million settlement the federal government accepted that it had failed in its fiduciary responsibility to protect the Pictou Landing First Nation from a broad based campaign by provincial and municipal officials to get it to accept the effluent from the kraft pulp mill built at Abercrombie Point.

As part of the discovery process the court case heard from the community elders who told of how they feared reprisals from the broader white community if they stood against a project that would bring jobs to Pictou County.

"Just imagine what the public reaction would have been against these already racially oppressed people if they had said no, thus preventing the establishment of an industry which had the potential to employ, either directly or indirectly, thousands of non-Indians," wrote Paul in his history book We Were Not the Savages.

It wasn't until the pipe carrying untreated effluent to Boat Harbour ruptured in June 2014 and the band blockaded the site that the provincial government was forced to negotiate a closure of the treatment site.

Now work was underway cleaning up the Boat Harbour treatment site, which is owned by the province and leased to the mill, in anticipation of the 2020 closure date enshrined in legislation as part of the deal that saw the band lift its blockade.

"Right smack in the middle of where we fish lobster," said fisheries director Wayne Denny of where Northern Pulp's new proposed pipe will 'diffuse' its treated effluent into the Northumberland Strait.

"They killed everything behind us and now they're going to kill everything in front of us," said Denny.

- **Northern Pulp must find new route for treated effluent pipe**
- **Northumberland Strait fishermen not willing to gamble on pipe**
- **Northern Pulp employees putting their faith in science and company owners**
- **Pictou County residents and business owners share common concerns about proposed effluent pipe**

The irony for Pictou Landing, which owns 22 lobster licences and 420,000 pounds of crab quota, is the deal that will see Boat Harbour remediated will now see the effluent treated on shore and pumped

into the strait.

And there's not a lot of trust for the promises from the mill that the new pipe won't harm a fishery that directly employs 70 community members seasonally and brings in about $4 million in gross revenues.

Those numbers don't include the six lobster licenses privately held by community members.

Denny doesn't take reassurance from the requirement that Northern Pulp get an environmental assessment for the proposed replacement effluent treatment plant.

And Paul doesn't expect him or anyone in Pictou Landing to have much trust in the processes established by the federal and provincial governments that are supposed to see science, rather than political pressure, be the primary arbiter of whether projects continue.

"They were told they were going to be able to use Boat Harbour for recreation and swimming and fresh water fishing before they started pumping that effluent in there 50 years ago," said Paul.

"Now you're back there telling these people 'we're going to pump the water out into the strait and there's not going to be negative effects'. It's rather hard to get people to believe you when they have been grossly and viciously lied to over and over."

On Friday, July 6, the lion's share of Pictou Landing's fleet will be joining the flotilla in Pictou Harbour.

Watch online Friday for #No Pipe rally coverage

Many other residents plan on joining the land-based march.

Though his community fought largely alone for so long, Denny now welcomes the support of the broader non-aboriginal community.

"Now it's going to affect them too," said Denny.

"It's everybody's livelihood now."

Photo: Friends of The Northumberland Strait logo (Facebook)

A number of people are planning to rally outside a Halifax courthouse Tuesday afternoon to show their support for fishermen named in legal action against them by Northern Pulp.

The mill is seeking an interim injunction to prevent blockades or obstructions of survey work in the Northumberland Strait as it works on a route for an effluent pipe.

Friends of The Northumberland Strait, the group behind the rally, says Northern Pulp has also filed for a claim of damages against the fishermen.

The plan to dump treated effluent from the Abercrombie mill into the Strait has raised the ire of local fishermen, the Pictou Landing First Nation, the P.E.I. government and even Hollywood actor Ellen Page, who is from Halifax.

The wider Gulf of St. Lawrence fisheries region is home to lobster and crab fisheries that brought in over $1.2 billion worth of catch in 2016.

Tuesday's rally outside of the Nova Scotia Supreme Court on Upper Water St. is scheduled for 1 p.m.

N.S. pulp mill expected to miss 2020 deadline to close Boat Harbour

The Northern Pulp mill is seen in Abercrombie, N.S. on Wednesday, Oct. 11, 2017. (THE CANADIAN PRESS/Andrew Vaughan)

THE CANADIAN PRESS
Published Wednesday, November 14, 2018 6:23PM AST

ABERCROMBIE POINT, N.S. -- A controversial pulp mill in northern Nova Scotia is facing delays with its new wastewater system, making it likely to miss the provincial deadline of January 2020 to stop using a polluted lagoon.

The Northern Pulp mill has been sending untreated effluent to a First Nation reserve for more than half a century, something the province's former environment minister called one of the worst cases of environmental racism in Canada.

Under provincial legislation, the kraft pulp mill has less than 15 months to overhaul how it processes wastewater.

Kathy Cloutier, a spokeswoman for Paper Excellence Canada, which owns the Abercrombie Point mill, says the setback is due to a delay with a pipeline.

She says the new wastewater treatment facility will meet the deadline, but that a new outfall discharge pipe will take longer.

Despite the delays, Cloutier says once the new treatment plant is operational, untreated effluent will no longer leave the mill.

"Currently (since 1967) untreated effluent travels through a pipe to the Boat Harbour Treatment Facility where it receives treatment and is then discharged as treated effluent into the Northumberland Strait," she said in an email.

"The new system will see effluent treated at the facility on mill property. No untreated effluent will flow through any pipe as is the case today."

Northern Pulp Mill behind schedule installing anti-emissions technology

Northern Pulp's new proposal comes one day after effluent leak

The new system is slated to replace Boat Harbour, a toxic wastewater lagoon on the edge of Pictou Landing First Nation.

The delay was met with consternation among local community groups, fishermen and an Indigenous leader, who called on the mill to close Boat Harbour on schedule.

"Our community has lived with polluted air and water, broken promises and broken pipes for over 50 years," Chief Andrea Paul of Pictou Landing First Nation said in a statement.

"Boat Harbour is closing on schedule and we expect nothing less. We have also made it clear that we oppose dumping treated pulp effluent anywhere in the Northumberland Strait."

Allan McCarthy of the Northumberland Fisherman's Association said it's not a surprise that Northern Pulp will miss the deadline.

He said it seems "wildly optimistic" to say they are only a few months behind schedule.

McCarthy, who represents more than 3,000 fishermen from across the Maritimes, suggested the delay could cause increased strain between fishermen, the government and the mill.

"If you think tensions are high now, you don't want to think about what could happen if MLAs do not honour the Boat Harbour Act," he said.

A group of Northumberland Strait fishermen have said they will block any survey boats from entering the strait. Earlier this month, Premier Stephen McNeil encouraged fishermen to end the blockade of survey boats hired to examine a route for an undersea effluent pipe.

Although the mill initially suggested the effluent would be carried by polyethelyne pipe across Pictou Harbour and released through six dispersal pipes into the ocean, it's now examining an alternate route.

Cloutier said Northern Pulp is studying a primarily land-based route with an outfall point at Caribou.

"We are taking the time required to complete studies with regard to the alternate option as initial findings show that Caribou offers improved mixing/dispersion" compared to the original route proposed, she said.

The fishermen's group questioned the new route, saying Northern Pulp does not have answers to essential questions and the required reports and tests have not been completed.

The group said the new route would travel along the Pictou causeway, through a traffic rotary, pass through two watersheds and enter the Northumberland Strait at Caribou.

"We have seen that after mistakes are made, it can take a very long time to correct them," McCarthy said.

"Harming an ecosystem has long term effects."

N.S. paper mill asks for public help as protests mount, Ellen Page criticizes

The Northern Pulp Nova Scotia Corporation mill is seen in Abercrombie, N.S. on Wednesday, Oct. 11, 2017. The CANADIAN PRESS/Andrew Vaughan

Michael Tutton , The Canadian Press
Published Friday, November 16, 2018 1:34PM EST
Last Updated Friday, November 16, 2018 4:20PM EST

PICTOU, N.S. -- A Nova Scotia pulp mill is asking for public support for more time to build an effluent pipeline to the ocean, even as one of the province's best-known Hollywood actors steps up her criticism of the plant.

Kathy Cloutier, a spokeswoman for parent company Paper Excellence, said the Northern Pulp mill is hoping people and groups in the province's forestry industry will issue public declarations in support of an extension for the effluent pipe project.

She said people who work in forestry realize the major impact it would have on the sector if the 330-employee mill can't operate because it can't discharge its treated waste into the Northumberland Strait.

Directive issued to Northern Pulp after ash leak earlier this month

The growing impatience of an industry town: 'This has really created tension'

N.S. effluent pipeline into Northumberland Strait will need fresh route

Fishing boats converge on Nova Scotia harbour as part of effluent pipe protest

N.S. fishermen to block mill's survey vessel from entering Northumberland Strait

"It will need to be vocal so that the premier feels that extending the deadline is something the community, the industry and politicians would support," said the spokeswoman.

Her appeal came as the province's lands and forestry minister, Iain Rankin, made it clear his government won't change the Jan. 30, 2020, deadline to shut down the Boat Harbour treatment lagoon at the Pictou Landing First Nation.

"We made a commitment to that community. The act passed with all party support. It gave the mill five years to switch to a different effluent treatment facility so Boat Harbour could cease to operate. And we continue to expect that," said Rankin.

Meanwhile, Ellen Page, a Halifax-born actor who played roles in "Inception," "Juno," "X-Men" and numerous other films, tweeted this week in support of Joan Baxter's book "The Mill: Fifty Years of Pulp and Protest."

Baxter's book traces 50 years of citizen criticism of the mill's environmental impact and efforts to have government do more to protect human and environmental health. It also examines the tactics the province originally used to convince the Pictou Landing First Nation to sign off on the deal allowing pollution to flow to Boat Harbour.

Page refers to Baxter's work as a "must read," and she retweeted comments by a few of her 1.2 million Twitter followers who are critical of the impact of the plant's emissions.

"Did it make me sad and angry? Yes. Did it also inspire me greatly? Yes," Page tweeted of the book.

After reading Cloutier's comments to The Canadian Press, Page again tweeted Friday, writing: "The ... statements in this article are classic tactics used for decades to avoid taking responsibility for the horrific effect on the environment and claiming the effluent is safe when it's not." She again urged her followers to read Baxter's book.

Cloutier said the company has been making environmental improvements over the past decade.

Earlier this year, the firm completed the $36.9-million replacement project for the stack known as a precipitator. It uses static electricity to remove solid chemical particles from air emissions, and critics acknowledge the work has led to a significant improvement in air quality.

She said the company "acknowledges the history," but believes the new treatment plant project represents an opportunity.

Cloutier also said the bleached kraft mill is the backbone of the province's forestry industry because there is a close relationship between sawmills, pulp mills and paper factories.

"Removing that would have catastrophic effects. It's not a scare tactic. It's an actual fact," she said.

The spokeswoman notes the factory purchases 95 per cent of wood chips produced by the province's saw mills.

"Traditionally those chips and bark are often the difference between breaking even, a loss and having a revenue," she said, adding that Northern Pulp's closure would have a "widespread impact."

Fishermen have said they object to the distribution of treated effluent in their traditional fishing grounds due to uncertainty over the impact.

The company's public presentation says effluent emissions include organic halides, which encompass compounds ranging from chloroform to complex organic molecules such as dioxins and furans, but it says it's "well below World Bank guideline(s) for pulp mills."

It also notes the effluent emissions result in suspended solids -- ranging from clay, sand, silt, organic matter and particulates -- but says the levels will meet Canadian Council of the Ministers of Environment guidelines for aquatic marine life.

In an interview via texts, Baxter criticized the environmental review process the province has set up for the effluent pipeline, arguing the province is in a conflict of interest and there is a lack of independent oversight in the process.

She said the province -- which owns the Boat Harbour facility and leases it to Paper Excellence -- has a legal indemnity agreement that may require it to pay the company for lost profits if it can't operate due to a change in the status of the Boat Harbour facility.

"I think it (the pipeline) should go for a federal assessment," she wrote.

"I agree with the fishermen and the Friends of Northumberland Strait (a citizen group opposed to the pipeline proposal) that the province is in a conflict of interest because of the indemnity agreement."

Rankin said he's aware of the legal agreement, but he again pointed to the Boat Harbour Act, "which does state that the effluent treatment facility can no longer be discharged into the harbour."

Asked if the legislation would trump the contract, he said he didn't want to speculate on "what could happen 14 months from now" -- and added he still expects the company to meet the existing deadline.

Karla MacFarlane, a local Progressive Conservative member of the legislature, said in an interview that her party agrees with the Liberals that no further delays in ending the flow of effluent into Boat Harbour are acceptable.

"The Progressive Conservative Party agrees and honours that the deadline is 2020," she said.

N.S. fishermen to block Northern Pulp's survey vessel from entering Northumberland Strait

By Michael Tutton The Canadian Press

Fishing boats pass the Northern Pulp mill as concerned residents, fishermen and Indigenous groups protest the mill's plan to dump millions of litres of effluent daily into the Northumberland Strait in Pictou, N.S., on Friday, July 6, 2018. A group of fishermen from several ports along the Northumberland Strait say they will block a survey boat hired by Northern Pulp from entering the strait to do work on a proposed new route for an effluent pipe. THE CANADIAN PRESS/Andrew Vaughan

A group of Northumberland Strait fishermen say they will block a survey boat hired by the Northern Pulp mill from entering the strait to do work on a proposed new route for an effluent pipe.

Darryl Bowen, a fisherman from Caribou, N.S., said in a telephone interview on Monday he will make sure his boat or another fishing vessel is placed in front of the survey vessel if it attempts to leave Pictou's harbour in northeastern Nova Scotia.

READ: Northern Pulp mill confirms effluent leak near Pictou Landing

The 48-year-old fisherman says his group has a number of fishing boats available to move quickly to block the survey vessel if it attempts to leave.

"If they try to get out, we're just going to keep getting in front of them so that they can't get by us," he said, adding there were six or seven boats in the one-kilometre long harbour mouth.

"They won't get by … We'll block them," said Bowen.

However, a spokeswoman for Northern Pulp said the survey vessel isn't currently in the water, and that the company doesn't plan on doing anything that will jeopardize the safety of its contractor's employees.

Kathy Cloutier, director of communications at the mill's parent company, Paper Excellence Canada, said in an email that, "Safety within Paper Excellence Canada and its facilities is paramount."

"When situations occur, we will seek guidance and work with authorities to ensure the safety of all involved."

She said there have been discussions over the past week between Northern Pulp, contract survey crew and leadership of fisheries groups, and she added, "the information survey crew members are seeking to obtain is data that may be of benefit to various interested parties."

WATCH: Thousands gather to protest pulp mill in Pictou

Bowen said the protest by fishermen from several ports started Monday but will continue as long as necessary to prevent the survey from taking place.

He said the view of the fishermen is that it's safer to prevent the surveyors from entering the strait than having the vessel go out on open water and be confronted by hostile fishing boats, as occurred recently.

"The last time they got out there, we went up (to them) and it didn't take long for them to run back to shore," said Bowen, who fishes lobster, crab and scallops.

Though the Northern Pulp mill near Pictou provides key jobs for the town of about 3,000 residents, its pipeline plan has raised concerns about the impact on the lobster fishery, other seafood businesses and protected areas along the coast.

Under provincial legislation, the mill has until 2020 to replace its current wastewater treatment plant in Boat Harbour, and Premier Stephen McNeil has confirmed he is sticking with that deadline.

After years of pumping 70 million litres of treated waste daily into lagoons on the edge of the nearby Pictou Landing First Nation reserve, Northern Pulp wants to pipe it directly into the strait that separates Nova Scotia from P.E.I.

The lagoons contain nearly 50 years worth of toxic waste, which former Nova Scotia environment minister Iain Rankin has called one of the worst cases of environmental racism in Canada.

Paper Excellence, of Richmond, B.C., has said the mill and its 300 employees will be out of work unless it can build a pipeline to the strait.

McNeil plea for peace triggers protest in Pictou County

'We haven't done anything really unlawful,' says lobster fisherman

Paul Withers · CBC News · Posted: Nov 09, 2018 12:48 PM AT | Last Updated: November 9, 2018

Fishing boats gathered to block survey boats hired by Northern Pulp on Friday. (Submitted)

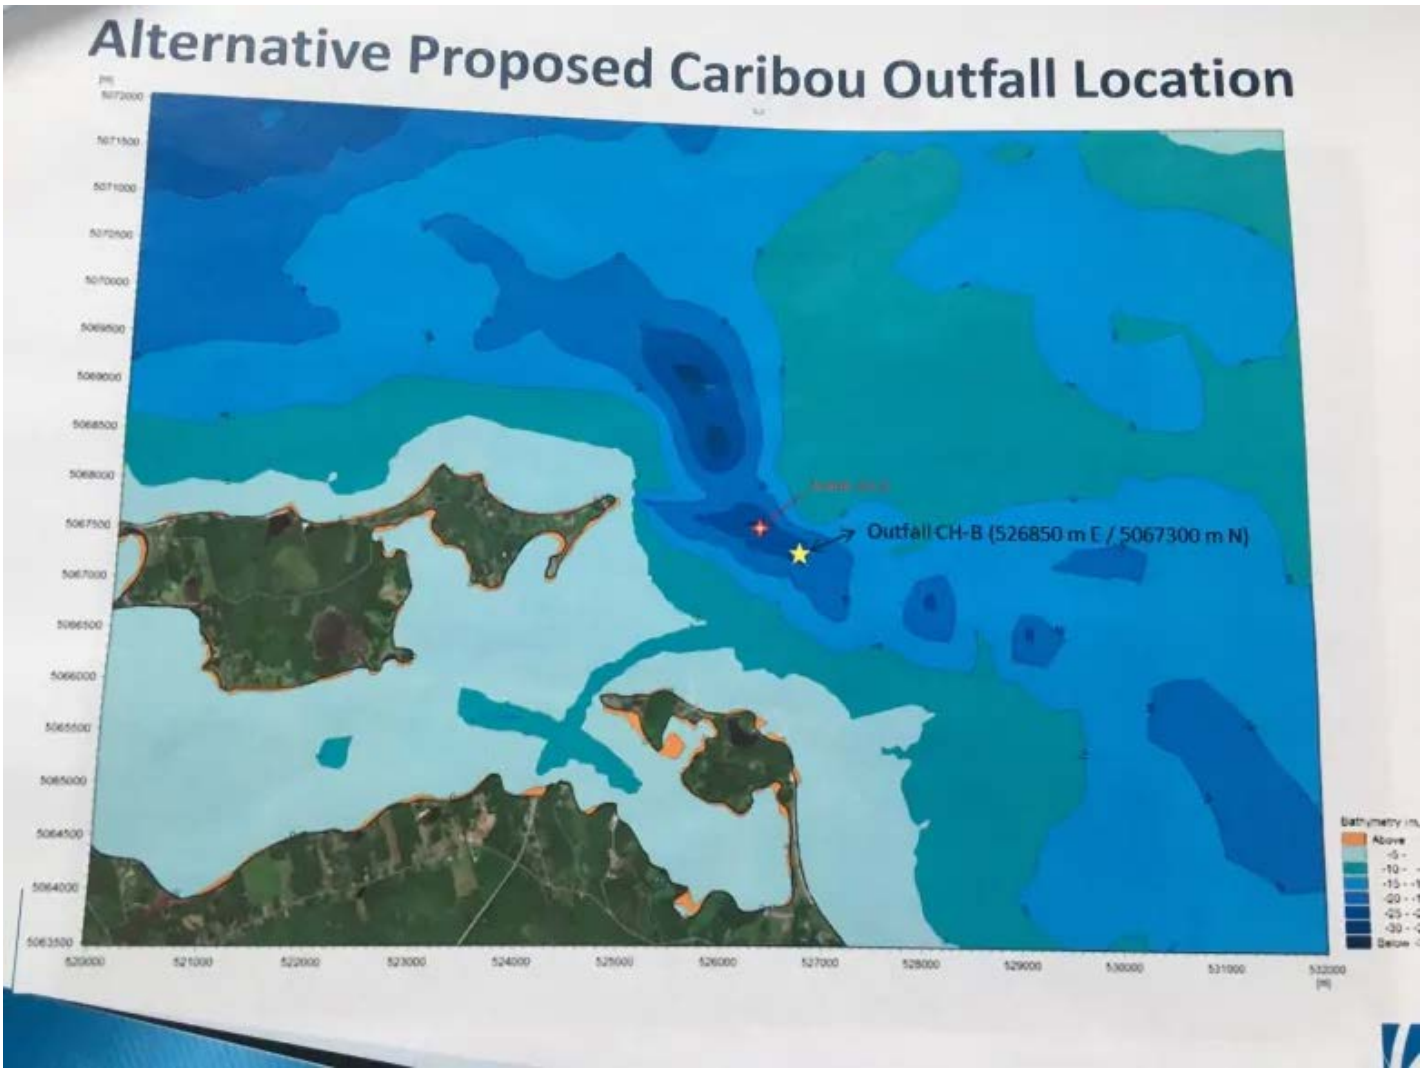
Fishermen in Pictou County sent a message to Nova Scotia Premier Stephen McNeil Friday morning.

Dozens took to the water after McNeil suggested they end a blockade of a survey boat hired to find an undersea route for a pulp mill effluent pipe.

"Premier McNeil's comments kind of struck a nerve with the fleet," said Caribou fisherman Darryl Bowen, who took part in the sunrise demonstration.

"There was probably 40 boats showed up in Pictou Harbour to send a message. We're not backing down and that's that."

Northern Pulp wants to release treated effluent into the Northumberland Strait after its current wastewater treatment system at Boat Harbour closes in 2020.



A map, showing the outfall of the proposed undersea effluent pipeline, which fishermen say they were provided by the owner of Northern Pulp during a meeting at the end of October. (Submitted)

This week, fishermen have headed off the vessel hired to find a route.

"When you have people out there trying to do lawful business that people are preventing them from doing it, its always a concern," McNeil said Thursday.

Lobster fisherman Ben Anderson, who fishes in nearby Pugwash, makes no apologies.

"We haven't done anything really unlawful," said Anderson, who called the action a peaceful demonstration.

- **Effluent pipe leak renews opposition to Northern Pulp plan for waste pipeline to Northumberland Strait**

Fishermen said they are watching the harbour around the clock for any move by the survey boat.

There is no intention to call off any blockade.

"We told them last year there's going to be no pipe in the Strait and we're not backing down," Bowen said. "We have to protect our industry at all costs. We are prepared to do that."

Fishermen say the survey boat has stayed off the water in recent days.

A spokesperson for Paper Excellence Canada, the owner of Northern Pulp, said in a statement to CBC News that safety is paramount.

"When situations occur, we will seek guidance and work with authorities to ensure the safety of all involved," Kathy Cloutier said.

Lack of public consultation ahead of Northern Pulp's submission of Environmental assessment sparks backlash

Brendan Ahern (brendan.ahern@ngnews.ca)

Pictou

Northern Pulp's decision not to hold public consultations before filing its environmental assessment has received blowback from groups representing Northumberland fishermen.

In a statement issued from Friends of the Northumberland Strait, the group decries the company's decision, stating that, "Concerned citizens and fishermen say they are appalled that Northern Pulp

does not plan to hold any open houses or public consultation before filing for environmental assessment."

The statement emphasizes Northern Pulp's past promise to hold further open house events designed to keep the public up to date on the company's plan.

"We were told Northern Pulp were wanting to be transparent during this process," said Friends of the Northumberland Strait president Jill Graham-Scalan in an interview. "They had promised us during that time that as the studies they were conducting on the route and the receiving waters were completed that they would be making those studies available to the public."

An addendum to Northern Pulp's water receiving study was posted after the press release, but Graham-Scalan says that this is not the level of transparency that was promised form the company back in December 2017.

With the company's environmental assessment being submitted at the end of January, Graham-Scalan says that it could be difficult to properly analyze the information and provide feedback.

"Not only do we have to read it, we have to absorb and reply to it," she said. "That 30-day period is the only period of time that the public has to come up to speed on the proposal and respond to the province in a way that is complete."

Northern Pulp has cited 'significant' delays and a need to move forward under an impending deadline as it's reason for filing the assessment without holding the open houses.

"We've experienced a significant number of delays through the fall in attempting to get some of the information compiled," said Northern Pulp director of communications, Kathy Cloutier. "We're at a point now where we want the project to move forward."

Cloutier added that the blockades Pictou Harbour by strait fishermen of the company's survey boat was a major factor in the need to push ahead to make up for the lost time.

When asked if the incomplete survey of the sea-floor will impact the quality of environmental data submitted to the province, Cloutier said that the only gaps will have to do with the pipe's construction.

"There may be some constructability gaps, but the environmental assessment will be a complete document."

"Another major factor to delays is the number of studies and expanded studies that were done," said Cloutier. "When the process began there were seven studies that we were aware that we'd need to submit for an environmental assessment. Since then we've moved from seven to 17, to 20, we're now at 28."

The validity of that data revealed in those studies will then be determined by the provincial assessment.

After Jan 31. Cloutier says that that information will be in the hands of the public and the provincial government.

"I can't speak to a government process, but what I can say is that there will be time for people to submit comment, and that will help the minister."

The statement issued by Friends of the Northumberland Strait remains skeptical that Northern Pulp's assessment will accurately measure the outfall's effect on marine life in the strait.

"Knowing the composition of the treated effluent they plan to release is critical," wrote president of the Northumberland Fishing association Carl Allen. "We've asked for this information for almost a year, and have never received it. If the effluent is as harmless as Northern Pulp tells the public, why haven't they provided the information?"

Independent senators tell Trudeau to act on 'dangerous' Northern Pulp plan

Mike Duffy leads call for federal environmental study on project to pour effluent into Northumberland Strait

Paul Withers · CBC News · Posted: Nov 27, 2018 6:00 AM AT | Last Updated: November 27, 2018

The Northern Pulp mill manufactures 280,000 tonnes of kraft pulp annually and supplies pulp to manufacture common household products such as tissue, towel and toilet paper, writing and photo copy paper. (The Canadian Press)

Mike Duffy is among four independent senators from Nova Scotia and Prince Edward Island demanding a full federal environmental assessment of the plan to release treated pulp mill effluent into the Northumberland Strait.

The senators say Northern Pulp's "dangerous project" could damage the fishery in the Maritime provinces and Quebec's Magdalen Islands.

"Ottawa has no choice but to step in immediately and do a complete environmental impact study," Duffy said in a statement delivered in the senate chamber Monday.

He was speaking on behalf of Nova Scotia independent Senator Dan Christmas and two other independents from P.E.I.: Brian Francis and Diane Griffin.

Paper Excellence must change mill

Paper Excellence, owner of the Northern Pulp mill in Pictou County, N.S., wants to discharge about 70 million litres of treated effluent a day into the strait at a spot several kilometres from shore at Caribou.

The company was forced to come up with a new treatment plan after Nova Scotia ordered the shutdown of its current treatment facility, which has been running for 50 years next to the Pictou Landing First Nation.

Last week in an interview with CBC News, the company admitted it will not meet the province's 2020 shutdown deadline.

Paper Excellence now says it will need an extension to the Boat Harbour Act to get its project through a provincial review, construction and commissioning.

Griffin said with the fishery and tourism industry potentially at risk in several provinces, the environmental review should not to be left to Nova Scotia alone.

About more than jobs

"It would seem really strange that one province should have a say," the senator said.

"There's more than the livelihood of the pulp workers here. It's not that we are against the pulp workers. I really think there needs to be a more serious look at an inland resolution for the effluent. Not to simply say take the cheapest route, which is to shove the pipe out into the strait."

A protester wears a Sou'wester in July as concerned residents, fishermen and Indigenous groups protest Northern Pulp's plan to dump millions of litres of effluent daily into the Northumberland Strait. (The Canadian Press)

The senators stepped in after meeting a group of fishermen in Ottawa last Thursday, including Gordon Beaton from Nova Scotia.

He's happy to see them flex their muscles. "They were all independent senators and they wore that kind of proudly. They really felt they could take this on as just something in the national interest, in a non-partisan way."

For Beaton, it's more evidence that the "No Pipe" campaign led by fishermen and the Pictou Landing First Nation is working.

"It's really found traction. The community is behind it and you see support building from other provinces obviously. Even these senators are interested in not allowing some sort of environmental disaster in the Northumberland Strait," Beaton said.

Northern Pulp defends plan

Griffin said weighing in on this project fits the role of Canadian senators to represent their region, offer sober second thought, and a protect minority interests.

"This is a case where on all three of those roles we have every right, in fact a duty, to speak up," the senator said.

But Northern Pulp said its plan to treat wastewater on site is a "significant improvement" over the existing system at Boat Harbour. It gets untreated wastewater that is carried several kilometres through an underwater pipe before it filters through a series of aeration and settling lagoons and the effluent flows through the reserve into the Northumberland Strait.

"The new system will see no untreated effluent [wastewater] leave the property. Effluent will be fully treated prior to leaving the site. That is a significant improvement," Paper Excellence spokesperson Kathy Cloutier said in an e-mailed response to Duffy's statement.

Paper Excellence says there are 131 similar kraft mills operating in North America. Of those, 20 percent use the system it is proposing and 80 percent use a system similar to the one in use at Boat Harbour.

"No other treatment process is used to treat kraft mill effluent," Cloutier said. "Northern Pulp has thoroughly investigated treatment options available to bleached kraft mills. Technical options available must include an outfall discharge in order for Northern Pulp to operate. It is not a question of cost — it is one of available technology."

The company says what emerges from the pipe is non-toxic and meets federal environmental standards.

In Nova Scotia, a dispute between fishermen and a pulp mill escalates with a stand-off at sea

By **ANTONIA NOORI FARZAN** The Washington Post
Thu., Oct. 25, 2018

Across from the fishing pier in Pictou, Nova Scotia, smokestacks pump out billowing clouds of white smoke that drift over the choppy water. The Northern Pulp mill sits on one side of the harbor, churning out pulp that's used to make toilet paper and paper towels. On the other, fishermen who make a living catching lobster, crab, herring, and mackerel tie up their boats.

The fishing piers and the pulp mill represent two of the area's major industries. But recently, they've been embroiled in conflict. Late last year, Northern Pulp announced plans to pipe chemically-treated wastewater into the Northumberland Strait. Fishermen have argued that doing so would effectively destroy their livelihood, while the company has said that its pipe is designed to minimize the impact on fishing areas.

On Tuesday, a showdown took place after fishermen spotted a boat that they believed was doing preliminary survey work on behalf of the pulp mill.

A fleet of fishermen met the vessel about two miles offshore and confronted the crew, then escorted them back to its dock, the Canadian Broadcasting Corp. reported.

Allan MacCarthy, a fisherman who has been an outspoken opponent of the planned effluent pipe, was the first to reach the survey boat.

"I said to them, 'You better get out of here because the ones that are following me aren't going to be as nice as I am,'" he told the CBC. "I just told the guys in the boat, 'Your job is not worth this. Get out of here. Get that boat back to Pictou.'"

Northern Pulp confirms leak, immediate response at Pictou mill

Fishing together on Nova Scotia's north coast to protest pulp mill's plan to dump effluent

3/5 articles left Subscribe to The Star for just 99¢ for your first month Subscribe Now

MacCarthy told the CBC five other fishing boats joined him to escort the boat back to the harbor while another 20 stood by, ready to get involved if necessary.

When he reached the survey boat, "there was a little foolish talk back and forth," he told the Chronicle Herald. "But when the other boats started coming out of Caribou, they left the area."

Northern Pulp told the CBC, "At all times, the safety of employees, contractors and their employees is our first priority. When situations occur, we will seek guidance and work with authorities to ensure the safety of all involved."

Though the Northern Pulp mill near picturesque Pictou, N.S., provides much-needed jobs for the town of about 3,000 residents, its plan to dump millions of litres of effluent daily into the Northumberland Strait has raised concerns about the impact on the lobster fishery, other seafood businesses and protected areas along the strait. (ANDREW VAUGHAN/THE CANADIAN PRESS)

A spokesperson for the Royal Canadian Mounted Police told the CBC that officers had been called to the pier due to a "potential for conflict," but that no offenses had been committed.

By the afternoon, the boat had been hauled out of the water, locals noted on Facebook.

3/5 articles left Subscribe to The Star for just 99¢ for your first month Subscribe Now

"I don't want to see anybody get hurt," MacCarthy told the CBC. "I didn't want to see anybody go to jail for Northern Pulp. But that's the way fishermen are talking, that this is not going to end well."

Federation of Nova Scotia Woodland Owners throws support behind Northern Pulp

The News
Published: Dec 08, 2018 at 11:08 a.m.

File Photo

The Federation of Nova Scotia Woodland Owners, a province-wide organization whose purpose is to champion the interests of private woodlot owners, has issued a release to express its support for the continued operation of the Northern Pulp mill at Abercrombie Point.

In a release the federation stated that the mill provides vital jobs for the rural economy of the province, jobs in harvesting and silviculture, in trucking, and in the equipment and other industries. "The mill buys sawdust, bark, and other byproducts from the province's sawmills, and this revenue in some cases provides enough income for the sawmill to survive," it states.

The release also notes that Northern Pulp, in turn, is the largest supplier of logs to the sawmills and warns that if that source vanishes, the sawmills – and the jobs and income they provide – will likely perish as well.

“This would essentially spell the end of the forest industry west of the Canso Causeway.”

The Federation stated that it is fully aware of the need to operate the mill in a responsible fashion in relation to the environment.

“When the mill was put into operation half a century ago, anti-pollution measures were inadequate; this was characteristic of most or all industrial operations of that era.”

But it stated that over the years, a series of increasingly stringent regulations have been placed upon the mill, and that process continues.

“The Federation supports the efforts of the owner and staff of Northern Pulp, and the government agencies involved, to bring the mill into environmental compliance, and we hope that all parties will exercise the necessary patience and tolerance to see it through.”

Environment minister still waiting on Northern Pulp's plans regarding Boat Harbour

Jan 11, 2019 5:18 AM by: Matthew Moore

The Northern Pulp Nova Scotia Corporation mill is seen in Abercrombie, N.S. on Wednesday, Oct. 11, 2017. THE CANADIAN PRESS/Andrew Vaughan

HALIFAX - The province's environment minister is still awaiting to hear from Northern Pulp regarding their plans for Boat Harbour, as the company has one year until its closure.

Environment minister Margaret Miller said she is expecting to get a submission by months end.

"I know staff has been working with them and we're expecting something at the end of the month but we haven't received anything yet or any clear indication of what exactly is coming in," she said.

In an emailed statement, Northern Pulp indicated the mill will register the project with the province this month.

NDP leader Gary Burrill said Northern Pulp continues to let down residents of the province.

"If you were to write a text about bad corporate citizenship, Northern Pulp would probably be chapter one."

Ken Burrows Jan 11, 2019 2:03 PM

The Northern Pulp mill must be shut down no matter what the economic cost is to the province. The harm that mill has caused to people, wildlife and the environment is beyond calculation. The government must not allow that toxic poisonous mill to continue.

MG

Morris Givner Jan 11, 2019 8:21 PM

It is of paramount importance that the Nova Scotia Government mandates that the Northern Pulp Mill and all others must not pollute the Northumberland Strait and all waters around all industrial plants .The reason: all life is harmed by the chemical pollutants from pulp mills. Once sea life is decimated by man-made chemicals,over fishing or turbines,it will never recover. We should learn from the Federal Government's decision making and stupidity which ruined the Newfoundland Cod industry. Currently,B.C. Salmon is threatened because of human- made pollution and inroads into the essential waters required for salmon reproduction and growth.

Ellen Page steps up attack on Nova Scotia pulp mill's effluent pipeline

Alex Cooke, The Canadian Press
Published Monday, December 10, 2018 7:52AM EST
Last Updated Monday, December 10, 2018 9:57AM EST

HALIFAX -- Hollywood actor Ellen Page is doubling down on her criticism of a Nova Scotia pulp mill, rallying her 1.4 million Twitter followers against its plan to build an effluent pipeline into the ocean.

"Nova Scotia government MUST stop its corporate welfare for company that is literally destroying the province," the Halifax-born movie star tweeted Monday about the Northern Pulp mill.

"Enough is enough."

N.S. fishermen to block mill's survey vessel from entering Northumberland Strait

Fishing boats converge on Nova Scotia harbour as part of effluent pipe protest

PHOTOS

Fishing boats pass the Northern Pulp mill as concerned residents, fishermen and Indigenous groups protest the mill's plan to dump millions of litres of effluent daily into the Northumberland Strait in Pictou, N.S., on Friday, July 6, 2018. (THE CANADIAN PRESS / Andrew Vaughan)

The plan to dump treated effluent from the company's Abercrombie, N.S., mill into the Northumberland Strait has raised the ire of fishermen, environmentalists and the P.E.I. government.

Page has been waging a Twitter campaign against Northern Pulp for weeks, often retweeting criticism of the mill.

Last month, Page, who starred in "Inception," "Juno," "X-Men" and numerous other films, tweeted in support of author Joan Baxter's book "The Mill: Fifty Years of Pulp and Protest," which traces decades of criticism of the mill's environmental impact.

It also examines the tactics originally used to convince the Pictou Landing First Nation to sign off on the deal allowing pollution to flow to Boat Harbour.

"Did it make me sad and angry? Yes. Did it also inspire me greatly? Yes," Page tweeted of the book.

A Nova Scotia Supreme Court judge ruled last week the province must consult with the Pictou Landing First Nation on any funding of Northern Pulp's effluent treatment facility.

Justice Timothy Gabriel said if the province becomes a financial backer of the treatment plant, that raises questions on whether the level of funding will mean "upgraded safeguards" in light of what the Mi'kmaq community has endured.

He said if the government consults on environmental aspects of the plant's construction, it should take a "holistic" approach and also consult on the financing it is willing to provide.

Premier Stephen McNeil has hinted that his government will appeal the ruling, saying he would "have more to say" on the matter.

Also last week, Northern Pulp said it's taking legal action after fishermen blocked survey boats hired to examine a route for the proposed pipeline.

Kathy Cloutier, a spokeswoman for Northern Pulp's parent company Paper Excellence Canada, said the mill has initiated action seeking an interim injunction to prevent blockades or obstructions of the survey work in the Northumberland Strait.

"Our hope was that the surveying would be allowed to occur without incident or obstruction, however actions indicated that the environmental assessment survey work would not proceed without the company seeking a court injunction," Cloutier said in an email.

But Allan MacCarthy of the Northumberland Fishermen's Association called the legal action "frivolous," saying: "The fishermen have stated all along there will be no pipe in the Northumberland Strait. We are not backing down from that."

The wider Gulf of St. Lawrence fisheries region is home to lobster and crab fisheries that brought in over $1.2 billion worth of catch in 2016.

2. St. Mary’s River

Photo: Joan Baxter

“For many years, when the St. Mary’s River Association (or SMRA) held meetings in Sherbrooke on Nova Scotia’s Eastern Shore, the group members’ purpose was primarily to report on the headway they were making in their efforts to achieve their vision of ‘Health for our river, the Atlantic salmon and our community,'” reports Joan Baxter:

> For many years, when the St. Mary’s River Association (or SMRA) held meetings in Sherbrooke on Nova Scotia’s Eastern Shore, the group members’ purpose was primarily to report on the headway they were making in their efforts to achieve their vision of “Health for our river, the Atlantic salmon and our community.”
>
> Members would gather in the St. Mary’s Education and Interpretive Centre, which volunteers from the community built in 2001 with financial help from supporters of their cause.
>
> The interpretive centre, which doubles as a salmon museum, is a testament to the storied history of the river. It is filled with exhibits of fly-fishing gear through the ages, photos of species at risk such as wood turtles, and of huge Atlantic salmon specimens that could once

be caught in the river. There is also a display devoted to famous anglers who have fished in the river over the decades, including the legendary American baseball player, Babe Ruth.

St. Marys Centre fly-fishing exhibit. Photo: Joan Baxter

Since it was formed in 1979, SMRA volunteers have worked on countless projects to try to improve the health of the river and the local economy that revolves around it. The aim, according to SMRA president Scott Beaver, is to restore the river and the salmon population to a state that will permit a catch-and-release fishing season in the river.

In 2017, 60,000 salmon fry and 21,000 sea trout fry were released into the St. Mary's River, and SMRA also promoted recreational and tourism opportunities in and around the river.

In recent years, with financial support from the Department of Fisheries and Oceans and other sponsors, SMRA has worked on $1 million worth of restoration on almost 20 kilometres of river habitat. It is the only river in Nova Scotia with a salmon recovery plan.

SMRA members stocking river. Photo: SMRA

> Past issues of SMRA's annual newsletters offer a glimpse of the astounding amounts of unpaid time, energy, and enthusiasm that people in rural communities devote to trying to make their small parts of the world better and healthier places. The tone of the newsletter is always upbeat, the reports brimming with optimism and positivity.
>
> The SMRA meeting held this week was not.

Baxter goes on to relate that SMRA fears the proposed Cochrane Hill gold mine will poison the river and destroy the recovering salmon fishery, and so the group and others river friends have organized a "No Open Pit Excavation" (NOPE) campaign in opposition to the mine.

Click here to read "Friends of St. Mary's River say 'NOPE' to Atlantic Gold."

This article is not behind the paywall, but come on, subscribe anyway; it costs real money to put this stuff together.

3. Naturalists sue to protect endangered species

From the Healthy Forest Coalition via Nova Scotia Forest Notes:

> Wildlife biologist Bob Bancroft and nature organizations launch legal action for Nova Scotia's species at risk
>
> Mr. Bob Bancroft and three of Nova Scotia's naturalists' societies say it is time to ask the courts to intervene on behalf of Nova Scotia's most at-risk wildlife and plants.
>
> "The Department of Lands and Forestry has mandatory legal obligations under the Endangered Species Act that have not been fulfilled," explains retired Acadia University biology professor Dr. Soren Bondrup-Nielsen, president of Blomidon Naturalists Society, one of the parties to the legal proceedings. "We're simply asking the Court to tell our government to do what it is already required to do by law."
>
> In court documents filed today, the applicants allege that the Department of Lands and Forestry (formerly the Department of Natural Resources) has failed to meet its legal obligations with respect to 34 species, including mainland moose, wood turtle, bank swallow, and a host of other species designated at risk in Nova Scotia.

“The Department has not yet identified core habitat for our mainland moose, a requirement that is now over-due by more than a decade,” says wildlife biologist Bob Bancroft, president of the Federation of Nova Scotia Naturalists (also known as Nature Nova Scotia).

The legal documents allege that the Department of Lands and Forestry has not yet identified a single acre of core habitat of threatened and endangered species, despite the legal requirement to do so under the Endangered Species Act.

Other short-comings noted in the documents include failures to appoint recovery teams and create recovery plans within the time-frames required under the Act.

“This is a rule of law case,” notes Jamie Simpson, lawyer for the applicants. “The Act requires the Minister of Lands and Forestry to do certain things towards the recovery of species at risk in Nova Scotia. We are asking the Court to uphold the rule of law and require the Department to abide by the Act.”

The Department’s short-comings with respect to species at risk has been reported several times. In 2015, the East Coast Environmental Law Association published a report calling on the Department to address the alleged violations of the Species at Risk Act. In 2016, the Office of the Auditor General of Nova Scotia published a review of the Department’s track-record on species at risk, noting the alleged failure to fulfill mandatory requirements under the Act.

4. Boat Harbour

The aeration pond at Boat Harbour. Photo: Joan Baxter

The Executive Committee of the Nova Scotia Forest Technicians Association has sent a letter to all the groups members, urging members to lobby the government for an extension on the deadline for ending Northern Pulp's piping of mill effluent into Boat Harbour. The letter reads:

> Dear NSFTA Members,
>
> As your executive, we are graciously asking for your help in order to show a collective voice in support of Northern Pulp and an extension to the January 2020 Boat Harbour Act deadline. The extra time is necessary for Northern Pulp to complete the construction of a new, environmentally responsible onsite treatment system. Those opposed to the project have been very vocal and our government needs to hear the voices of the people who are in support of Northern Pulp and their vitally important role within the forest industry. If you would like to help, you can simply send an e-mail to your local MLA with a message urging an extension amendment to the January 2020 Boat Harbour Act Deadline (please see link below to access MLA contact information). Also, attached is an example of a letter that can be used as a message and sent directly to Premier Stephen McNeil. Without Northern Pulp our $2.1 billion forest industry is at risk and along with it the livelihood of thousands of workers including many forestry professionals.
>
> Respectively,

Your NSFTA Executive Committee

Membership in the Forest Technician Association is limited to “graduates of a school/college of Forest Technology, recognized by the NSFTA.”

All well and good; this is a free country, people can say what they want…

However.

Is it a problem that one person on the Executive Committee — Rick Andrews — is also an employee of the provincial Department of Lands and Forestry?

And although they didn’t sign the letter, along with Andrews, five other department employees — David Steeves, Derek Gilby, Jim Rudderham, Cheryl Rudderham, and Ian Gunn — sit on NSTFA’s Board of Directors?

I’ll let others debate the ethics of government employees lobbying the political establishment on issues related to their public service careers — school teachers might have some interest in this — but however that debate falls out, this sure looks to me like “regulatory capture.” It’s long been said the regulatory regime at the old Department of Natural Resources, now Lands and Forestry, is in the pockets of the forest industry, and the Forest Technicians’ letter supports that argument.

Court rules that Nova Scotia must consult Mi'kmaq on financing of Northern Pulp effluent plant

By Staff The Canadian Press

The Northern Pulp Nova Scotia Corporation mill is seen in Abercrombie, N.S. on Wednesday, Oct. 11, 2017.

The Canadian Press/ Andrew Vaughan

A Nova Scotia Supreme Court decision says the province must consult with a Mi'kmaq community about how public money is provided to a pulp mill that has sent its effluent into an estuary near the band for five decades.

Justice Timothy Gabriel ruled Friday that if the province becomes a financial backer of Northern Pulp's effluent treatment plant, that raises questions on whether the level of funding will mean "upgraded safeguards" in light of the what the people of Pictou Landing First Nation have endured.

Gabriel said if the government consults on environmental aspects of the plant's construction, it should take a "holistic" approach and also consult on the financing it is willing to provide.

He said the two issues are linked, giving the example of how funding could be tied to a system of penalties based on whether emission and effluent discharge targets are reached by the new system.

READ MORE: Pressure mounts on Ottawa to review N.S mill's contentious effluent pipeline

The judge concluded the Crown has a duty to consult with the first nation, including on the issue of whether funding should be provided at all.

"The consultations between the parties must necessarily include … whether the province should fund the construction and design of the effluent treatment plan and pipeline, and, if so, what form that financing will take," he wrote.

Provincial legislation requires the closure of effluent flowing to a facility at the heavily polluted Boat Harbour lagoon by Jan. 31, 2020.

The commitment was made by Stephen McNeil's government in 2015 to the Pictou Landing First Nation after five decades of the waste water flowing into the estuary on the edge of the Pictou Landing First Nation.

The province has also indicated it is in discussions with Northern Pulp regarding Crown funding for the treatment facility for effluent from the bleached kraft mill at Abercrombie Point, N.S., though the amount it may contribute remains unclear.

Brian Hebert, the lawyer for the Pictou Landing First Nation, said in an interview that the court decision means the band can demand information about how the money provided by the province would extend the life of the plant – and what impact that might have in terms of potential air pollution.

A spokesman for the Office of Aboriginal Affairs says the province is reviewing the judge's decision and "considering the direction from the court as we look at next steps in the ongoing consultation with Pictou Landing First Nation."

"Justice Gabriel's decision did dismiss the First Nation's claims of procedural unfairness and noted the novel nature of the issue raised, and that both parties sought guidance from the court in good faith," wrote spokesman Gary Andrea.

Boat Harbour deadline won't move but open to legislature debate: Premier

The Northern Pulp mill is seen in Abercrombie, N.S. on Wednesday, Oct. 11, 2017. (THE CANADIAN PRESS/Andrew Vaughan)

THE CANADIAN PRESS
Published Thursday, January 24, 2019 5:35PM AST
Last Updated Thursday, January 24, 2019 6:43PM AST

HALIFAX -- Nova Scotia's premier says he has no intention of changing a legislated deadline to close the Northern Pulp mill's wastewater treatment plant in Boat Harbour -- but he is open to debating proposed changes in the legislature.

Stephen McNeil said any changes to the January 2020 deadline would have to evolve out of a community consensus in Pictou County, and would have to be brought to the floor of the legislature by the area's Opposition members.

In the meantime, McNeil said the government will keep its word to stick to the deadline.

"What I've said is if the community could come together and find some resolution and they want an adjustment, they need to put that on the floor. Other than that we're moving forward," he said following a cabinet meeting Thursday.

The heavily polluted treatment lagoon is on the edge of the Pictou Landing First Nation, and Chief Andrea Paul is on the record as being opposed to changing the date, something McNeil acknowledges.

"She's been very clear and we've been clear, said McNeil. "All I'm saying is, if people have changed their mind about what they voted on ... let's have a conversation about it. I haven't changed mine."

Progressive Conservative Leader Tim Houston said he believes the government is looking for political cover after creating a "jam" it doesn't know how to get out of.

"The government realizes that they have created a mess and they are trying to spread it around," said Houston, who added the company has also played a role in what's "become a mess."

McNeil maintains the company has had plenty of time to deal with legislation that was passed in May 2015.

Houston, who is MLA for Pictou East, said while there may be a scenario where he would bring forward an amendment to the deadline, he doesn't know what that could be at this point. He said he is willing to look at any new information that comes forward.

"As we stand here today I don't have any information that suggests the deadline should be moved."

The province is still waiting for an environmental assessment application from the mill on its plan to pump millions of litres of effluent through a system of pipe into the Northumberland Strait.

Mill officials have said in the past that no pipe would mean no mill.

In an interview earlier this week, Kathy Cloutier, a spokeswoman for Northern Pulp's parent company, Paper Excellence Canada, said it plans to submit its application with the provincial Environment Department either on or before Jan. 31.

Cloutier said the application won't include seismic testing of the proposed outfall area because ice in the Strait has likely delayed the survey work until early in the spring.

"The seismic goes more with the constructability aspect," said Cloutier. "So the environmental assessment will be filed as a complete document and then if there is some follow-up it would be around that construction aspect. The science is there for the actual location."

Environment Minister Margaret Miller said Thursday the mill's application documents will be made public within a week of being received.

A 30-day public consultation process would then kick in, to be followed by a 20-day review period by the department.

"We're going to look at the submission as it is," said Miller. "At the end of the process I have the opportunity to either deny the application, to approve it with conditions, or to send it back and ask for more information."

'Stop it at all costs': The blockade of Northern Pulp Mill continues

By Alexander Quon
Online Producer/Reporter Global News

WATCH: For the second day in a row, fishermen have successfully rebuffed a survey ship from leaving Boat Harbour in an attempt to chart a route for the planned effluent pipe. Silas Brown has the details.

The blockade of a pulp mill in Nova Scotia continued on Tuesday with fisherman from the surrounding area of Pictou, N.S., saying they'll do whatever it takes to stop a controversial waste pipe.

For the second day in a row, fishermen have successfully rebuffed a survey ship from leaving Boat Harbour in an attempt to chart a route for the planned effluent pipe, which would carry waste away from the Northern Pulp mill into the Northumberland Strait.

"We were hoping it wasn't going to come to this, but apparently it is and we're ready to do whatever we have to do," said Darryl Bowen, 48, a fisherman from Caribou, N.S., taking part in the blockade.

> "We'll stop it at all costs."

READ MORE: N.S. fishermen to block Northern Pulp's survey vessel from entering Northumberland Strait

Last month, a survey vessel was guided back to shore by Bowen and other fishermen who fear that the waste pipe will critically harm the fishery between Nova Scotia and Prince Edward Island.

"Our livelihoods are at stake here. If they destroy the ecosystem of the Northumberland Strait, we're done for generations," Bowen said.

> "They can pump Boat Harbour out, they can clean that. You can't drain the Northumberland Strait."

On Tuesday, the blockade was joined by fishermen from Pictou Landing First Nation, which borders on Boat Harbour.

Warren Francis says his band has been dealing with waste from the Northern Pulp Mill from his entire life.

The mill pumps 70 million litres of treated waste daily into lagoons on the edge of the reserve.

"Even our health issues on the reserve are pretty bad, like with breathing disorders and asthma, and I attribute that to Boat Harbour and the air quality that we're getting right from the lagoon. Now they want to take it from our backyard and move it to our front yard," Francis said.

Francis says all the fisherman in the area stand together in opposition to the pipe and are calling on the province to look after its people.

The lagoons contain nearly 50 years' worth of toxic waste, which former Nova Scotia environment minister Iain Rankin has called one of the worst cases of environmental racism in Canada.

"Who is the government looking after?" he asked.

> "Are they looking after corporations from across the world, or people from their own backyards?"

Under provincial legislation, the mill, which employs approximately 300 residents in the Pictou area, has until 2020 to replace its current wastewater treatment plant in Boat Harbour, and Premier Stephen McNeil has confirmed he is sticking with that deadline.

Paper Excellence, of Richmond, B.C., has said the mill's employees will be out of work unless it can build a pipeline to the strait.

Bowen says the blockade will continue until the harbour freezes for the winter, at which point work will be stopped.

CBC

$6M in taxpayer dollars for N.S. effluent plant stinks, says opponent

'It's a conflict of interest, a direct conflict of interest,' says fishermen's association president

CBC News · Posted: Aug 20, 2018 8:41 PM AT | Last Updated: August 20, 2018

Nova Scotia taxpayers have contributed $6 million toward early work on a new effluent treatment facility that would replace the Boat Harbour plant. (Jeorge Sadi/CBC)

Nova Scotia taxpayers have contributed $6 million toward design work and engineering studies for a new wastewater treatment plant that will handle effluent discharged from the Northern Pulp paper mill in Pictou County.

Those against the plan to dump what comes out of the facility into the Northumberland Strait are not happy the province is picking up part of the cost.

"It's a conflict of interest. A direct conflict of interest," said Ronnie Heighton, a lobster fisherman and president of the Northumberland Fishermen's Association.

- **Taxpayers won't likely shoulder full cost of Boat Harbour replacement, minister says**

Heighton said it isn't right for the Liberal government to pay for part of the treatment facility when it is also in charge of conducting an environmental assessment of the project.

Environmental impact

He and other opponents are worried over the effluent's impact on the environment.

"It's going to smother the bottom. There will be no fish living. It'll just be a dead zone in the Northumberland Strait," Heighton said.

- **Fishermen worry Northern Pulp treatment plan will create 'dead zone'**

The plant will replace the existing, government-owned Boat Harbour effluent treatment facility, which the province has promised to close by Jan. 31, 2020.

The province said it needs to contribute taxpayer money toward the new plant because it's in a lease agreement with Northern Pulp. Under the Boat Harbour Act, the existing plant must be closed 10 years before the lease ends.

Lease agreement

"The contribution allows negotiations with Northern Pulp to continue and will be credited toward any future agreement," said Marla MacInnis, a spokesperson for the provincial Department of Transportation and Infrastructure Renewal.

The $6-million figure "is part of a larger discussion with Northern Pulp which is yet to be concluded."

MacInnis said the department is working "to find a solution which ensures an environmentally friendly and economically sustainable future" for Pictou Landing First Nation, the Pictou area, Northern Pulp and others.

Ottawa's role

Heighton, however, thinks the federal government should be in charge of the environmental assessment — not the province.

- **Feds could get involved in Northern Pulp assessment**

"We can't trust the provincial government," Heighton said. "This has to go to the feds. At least they'll be somewhat independent."

A spokesperson for Northern Pulp told CBC negotiations are ongoing between the company and the province and that the final cost of the effluent treatment plant has yet to be determined.

There is also no deal on who will pay for it or own it once it's built.

Public Accounts

Volume 3 — Supplementary Information

For the fiscal year ended March 31, 2018

NOVA SCOTIA

The *Public Accounts Volume 3—Supplementary Information* is produced in accordance with the Finance Act, which requires an annual reporting of all sums paid from the Province's General Revenue Fund during the fiscal year. In this publication, payments are reflected on a cash basis and include Tangible Capital Asset Acquisitions.

Accounts Payable, Tangible Capital Assets, and other adjustments are indicated to reconcile cash payments with the accrued charges to departmental expense appropriations. The appropriations are prepared on a gross basis with no netting of General Revenue Fund revenues, recoveries, or fees and other charges.

Transfers to (or from) other Accounts indicate that a portion of the payments have been charged to other accounts/departments.

Accumulative payments to individuals and suppliers within the fiscal year are reported as follows:
Salaries – $25,000 and over;
Travel – $3,500 and over; and
All other payments – $5,000 and over.

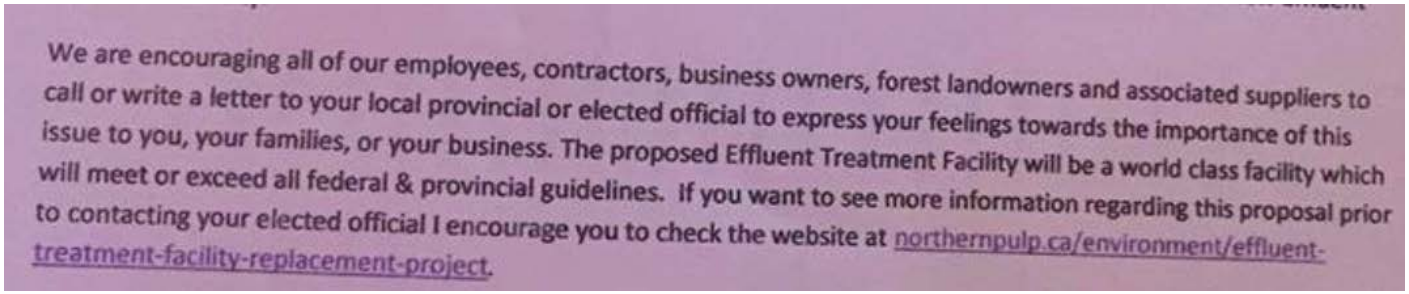
Northern Pulp, Scotsburn Lumber, and U.S. tariffs

Morning File, Tuesday, January 8, 2019

JANUARY 8, 2019 BY TIM BOUSQUET 9 COMMENTS

News

1. Northern Pulp, Scotsburn Lumber, and U.S. tariffs



We are encouraging all of our employees, contractors, business owners, forest landowners and associated suppliers to call or write a letter to your local provincial or elected official to express your feelings towards the importance of this issue to you, your families, or your business. The proposed Effluent Treatment Facility will be a world class facility which will meet or exceed all federal & provincial guidelines. If you want to see more information regarding this proposal prior to contacting your elected official I encourage you to check the website at northernpulp.ca/environment/effluent-treatment-facility-replacement-project.

Last month, Scotsburn Lumber sent out a letter encouraging “all our employers, contractors, business owners, forest landowners and associated suppliers to call or write a letter to your local or elected official” to express support for Northern Pulp Mill and its efforts to continue operating after the deadline for stopping the dumping of mill effluent into Boat Harbour.

The letter is signed by four Scotsburn execs: general manager Mark Baillie, procurement manager Donald Hume, controller Tracey Ferguson, and purchaser Scott Standen.

You can read the entire letter here.

There is of course nothing improper about people contacting government officials to express their concerns one way or another on any public matter, including the mill. But the letter caused me to wonder about the relationship between Scotsburn Lumber and Northern Pulp Mill, and so I spent considerable time over the holidays researching the history of each company, and in particular how the provincial government has financially supported the mill and perhaps, by extension, the forest industry generally.

Northern Pulp Mill. Photo: Halifax Examiner

The pulp mill has existed for many decades, but on April 28, 2009, Neenah Paper Company of Canada instructed Stewart McKelvey to incorporate Northern Pulp Nova Scotia Corporation “on our behalf.” Neenah was owned by two U.S.-based private equity firms — Blue Wolf Capital and Atlas Holdings — and the board of directors of the Northern Pulp consisted of various people from Georgia associated with the timber industry and New York financiers.

In 2011, the mill was sold to Paper Excellence, and in June 2011 the directorship of Northern Pulp Nova Scotia Corporation shifted to people associated with the timber industry in British Columbia and, importantly, the Widjaja family in Indonesia (which owns Paper Excellence). Former premier John Hamm was also a director.

The next year, the closed lumber mill in Scotsburn was resurrected. Reported CTV:

> Owners of the Northern Pulp Nova Scotia Pulp Mill in Abercrombie Point are hoping that acquiring the Ligni Bel sawmill will help to ensure a steady supply of woodchips, as the Northern Pulp mill requires a steady supply of woodchips in order to make its bleached kraft pulp.
>
> The Ligni Bel sawmill in nearby Scotsburn used to supply Northern Pulp with woodchips, but it shut down last November when over half of its wood supply was lost due to the closure of the NewPage paper mill in Point Tupper, N.S.
>
> Now, an affiliate of Northern Pulp has started the process to purchase the Ligni Bel sawmill.

I worked through the directorship history of both companies (Northern Pulp and Scotbsburn Lumber) from 2012 to the present, and found that management of the companies was intertwined. Here are two examples:

G. Wayne Gosse

• Officer and director with Scotsburn from July 17, 2012 to June 20, 2013
• Officer with Northern Pulp from September 12, 2008 to June 20, 2013
• Director of Northern Pulp from December 8, 2009 to June 20, 2013, and then again from August 29, 2013 to March 16, 2017

Andreas Kammenos

• President of Scotsburn from May 22, 2014 to July 28, 2014
• Director of Scotsburn from August 29, 2013 to July 28, 2014
• President of Northern Pulp from August 29, 2013 to April 2, 2015
• Throughout that period, Kammenos was a vice-president at Paper Excellence.

There are more connections that are harder to nail down: shared addresses and the like, but I think those two make the point.

I mean, it makes sense, right? Northern Pulp needed a steady supply of pulp, so bought the local sawmill.

Throughout, Northern Pulp was getting and continues to get considerable financial support from the provincial government — in fact, so much financial support that I'm sure I've missed a lot of it. But here's what I've been able to piece together. First, let me just list the payments to either Northern Pulp or Scotsburn as reported in Public Accounts, with payments listed by department ("G&C" means "grants and contributions"):

2009
Northern Pulp Nova Scotia Corp
DNR: (G&C): 587,559.14
DNR: 109,742.44
Total: 697,301.58

2010
Northern Pulp Nova Scotia Corp
DNR: (G&C): 180,407.00
DNR: 160,184.14
Total: 340,591.14

2011
Northern Pulp Nova Scotia Corp
DNR: (G&C) 445,395.00
DNR: 9,760.27
Total: 455,155.27

2012

Northern Pulp Nova Scotia Corp

DNR (G&C): 79,629.85

DNR: 4,541,077.27

Total: 4,620,707.12

2013

Northern Pulp Nova Scotia Corp

DNR: (G&C): 522,604.50

DNR: 196,732.00

Total: 719,336.50

2014

Northern Pulp Nova Scotia Corp

Labour: 37,500.00

DNR (G&C): 969,837.64

DNR: 733,125.66

Total: 1,740,463.30

Scotsburn Lumber Ltd

Labour: 12,500.00

DNR: 159,458.94

Total: 171,958.94

2015

Northern Pulp Nova Scotia Corp

Economic & Rural Development: 61,411.25

Labour: 42,500.00

DNR (G&C): 445,652.49

DNR: 570,066.81

Total: 1,119,630.55

Scotsburn Lumber Ltd

DNR: 100,410.89

Total 100,410.89

2016

Northern Pulp Nova Scotia Corp

Labour: 16,540.00

DNR (G&C): 602,527.17

DNR: 78,719.53

Total: 697,786.70

Scotsburn Lumber Ltd

Labour: 20,000.00

DNR: 127,772.94

Total: 147,772.94

2017

Northern Pulp Nova Scotia Corp

Labour: 14,660.00

DNR (G&C): 457,143.68

DNR: 399,498.03

TIR: (G&C) 144,980.00

Total: 1,016,281.71

Scotsburn Lumber Ltd

Labour: 12,500.00

DNR (G&C): 160,742.26
Total: 173,242.26

2018
Northern Pulp Nova Scotia Corp
Labour: 29,076.50
DNR (G&C): 464,481.45
DNR: 31,353.38
TIR (G&C): 6,001,238.13
Total: 6,526,149.46

Scotsburn Lumber Ltd
Labour: 5,000.00
DNR: (G&C) 141,394.13
Total: 146,394.13

That's somewhat more than $18 million in public money paid to Northern Pulp and about three-quarters of a million paid to Scotsburn Lumber since 2009.

I asked each department about the expenditures. Department of Labour spokesperson Shannon Kerr got back to me the very next day, with this chart:

Fiscal Year Public Accounts		Program	Division	Northern Pulp	Scotsburn Lumber	Grand Total
	2014	START	ENS	(37,500)	(12,500)	(50,000)
Total April 1 2013 - March 31 2014				**(37,500)**	**(12,500)**	**(50,000)**
	2015	Apprenticeship START	Apprenticeship	(5,000)		(5,000)
	2015	START	ENS	(37,500)		(37,500)
Total April 1 2014 - March 31 2015				**(42,500)**	**-**	**(42,500)**
	2016	CO-OP	Youth Initiatives	(6,540)		(6,540)
	2016	START	ENS	(10,000)	(20,000)	(30,000)
Total April 1 2015 - March 31 2016				**(16,540)**	**(20,000)**	**(36,540)**
	2017	Apprenticeship START	Apprenticeship	(5,000)	(12,500)	(17,500)
	2017	CO-OP		(9,660)		(9,660)
Total April 1 2016 - March 31 2017				**(14,660)**	**(12,500)**	**(27,160)**
	2018	Apprenticeship START	Apprenticeship	(17,500)	(5,000)	(22,500)
	2018	CO-OP	Youth Initiatives	(11,577)		(11,577)
Total April 1 2017- March 31 2018				**(29,077)**	**(5,000)**	**(34,077)**
				(140,277)	**(50,000)**	**(190,277)**

I assume most large companies (and a lot of small ones) are taking advantage of these worker development programs.

Likewise, Transportation and Infrastructure Renewal spokesperson Marla MacInnis got back to me lickety-split, in just two hours, about the very large TIR payments to Northern Pulp. She wrote:

> This is a contribution towards detailed design and engineering studies for a potential replacement effluent treatment facility.
>
> The amount was determined based on estimates by design consultants. The overall total for design and engineering studies is $6.146 million. $6,001,238.13 flowed in fiscal 2017-2018, while $144,980.00 began this work in 2016-2017 and can be found on page 326 of Public Accounts.
>
> The contribution allows negotiations with Northern Pulp to continue and will be credited towards any future agreement. This cost is part of a larger discussion with Northern Pulp which is yet to be concluded.

The payments were never announced publicly, but the CBC found them tucked into Public Accounts. Wrote John Laroche:

> Nova Scotia Premier Stephen McNeil insisted Thursday there was no attempt to hide a $6-million payment last year to Northern Pulp, despite the fact his government only disclosed the information as a single-line item in a 351-page document on July 26.
>
> The payment is contained in volume three of the supplementary estimates filed to officially close the books on the 2017-18 fiscal year.

I appreciate the work of government spokespeople — we reporters can be demanding with our requests, and for the most part the spokespeople respond quickly and professionally. So I thank Kerr and MacInnis for their help.

Alas, I had less luck with Department of Natural Resources spokesperson Bruce Nunn. I emailed Nunn on December 17, asking "Can you tell me what those [DNR] payments were for? I'm guessing that that information will be self-explanatory in terms of the difference between 'grants and contributions' and 'other,' but if not, could you elaborate?"

It's been 22 days, and I've had no response from Nunn. So your guess is as good as mine as to why DNR has paid Northern Pulp $10 million or so.

But wait… that list of *payments* to Northern Pulp doesn't include provincial *loans* to the company. Joan Baxter has provided me with the results of a Freedom of Information request she made related to the loans, for which she was provided this chart:

FOIPOP 2017-03648-BUS – Loans to Northern Pulp and Affiliates

12(1)(a)
17(1)

File #	Recipient	Authorized	Status	Interest Rate	Term	Amount Forgiven
300246	Northern Pulp NS	$15,000,000	in good standing (amended 2013)	NS 10-year borrowing rate plus [redacted] (amended to NS 10-year rate plus [redacted])	10 years commencing July 1, 2009 (amended to 10 years commencing January 1, 2013)	n/a (fully repayable loan)
300273	Northern Timber NS	$75,000,000	in good standing	NS 30-year borrowing rate plus [redacted]	30 years commencing March 12, 2010	n/a (fully repayable loan)
300338	Northern Pulp NS	$14,700,000	in good standing	NS 10-year cost of funds plus [redacted]	10 years commencing January 1, 2013	n/a (fully repayable loan)
300337	Northern Pulp NS	$2,500,000	in good standing	No interest (forgivable with conditions)	10 years commencing January 1, 2013	$0
300336	Northern Pulp NS	$3,600,000	paid in full as scheduled on August 1, 2016	NS cost of funds plus [redacted]	4 years commencing October 1, 2013	n/a (fully repayable loan)
300335	Northern Pulp NS	$900,000	incentive earned June 25, 2015	No interest (incentive earnable when conditions met)	n/a	$900,000 incentive earned

Comments Baxter:

> The total amount loaned or granted to the mill in that period, for which I had requested details (terms, payment rate, etc – all redacted), was $111.7 million.
>
> The $75 million, 30-year loan in 2010 (for the land purchase of 475,000 acres from Neenah Paper) had a hidden gift to Northern Pulp (owned by NY companies Blue Wolf Capital and Atlas Holdings at the time) of $7 million, because the province bought back as part of the same deal 55,000 acres of land at $300 per acre, whereas NP had paid only $172.63 per acre. This is detailed on page 179 in [her book, *The Mill*].
>
> There was also the $28.1 million federal grant from Peter MacKay and the Harper government in "green transformation" money in January 2011, just before the mill was acquired by Paper Excellence from two US private equity companies.
>
> I recap some of the in-kind and financial gifts over the years between pages 215 and 219 in the book.

A few million here, a few million there, pretty soon we'll be talking real money.

But of even further interest is how all this money going to Northern Pulp affects lumber exports.

This issue came up explicitly in a January 25, 2013 letter from Duff Montgomerie, then the deputy minister of Nova Scotia's Department of Natural Resources, to Pedro Chang, the deputy CEO of Northern Pulp.

Wrote Montgomerie: "Although Northern Pulp does not own and control Scotsburn Lumber, we need to ensure that any support of Northern Pulp does not indirectly support Scottsburn Lumber under the Softwood Lumber agreement." He goes on to say that the province's and Northern Pulp's lawyers have

figured out how to move forward “without putting the trade agreements at risk.” Alas, the details of that arrangement were redacted from the copy of the letter we obtained.

You can read the letter here.

This looks, well, sketchy. It appears that while *Northern Pulp* may not “own and control Scotsburn Lumber,” the Widjaja family controls both Northern Pulp and Scotsburn through different holding companies. So the legal control is one level up, but the actual management coordination is, or at least was, right there through the persons of Andreas Kammenos and G. Wayne Gosse, as I detailed above.

So, despite Montgomerie’s statement to the contrary, did the payments to Northern Pulp amount to backdoor subsidization of Scotsburn Lumber, and were the payments actually in violation of the Softwood Lumber agreement? I don’t know. I’ve asked Zoltan van Heyningen, the executive director of the U.S. Lumber Coalition, for comment, but he hasn’t responded.

The Softwood Lumber Agreement expired in 2015. In 2016, the U.S. Department of Commerce determined that the Canadian softwood lumber industry was being unfairly subsidized by Canadian governments, and therefore imposed a subsidy margin of 3.34% to 18.19% on Canadian lumber, depending on the firm. Nova Scotian firms, including Scotsburn Lumber, were excluded from the penalty tariffs.

I’ve asked Mark Baillie, the general manager at Scotsburn Lumber, for comment; as of publication time, he hasn’t responded.

Update, 2:30pm: Mark Baillie responds:

> I am not sure how or why the letter was forwarded to you, but you should also be aware that all other sawmills in the province are starting to voice their concerns about a potential mill

closure and the impacts this would have on their business and the forestry industry in general.

As for the corporate relationship, the sawmill was purchased in 2012 by Northern Pulp and was re-sold in May of 2014. Scotsburn Lumber Ltd. the same as all other sawmills in the province, have contracts to sell their by-products to Northern Pulp and other Fiber agreements.

2. Pictou council on Northern Pulp

The aeration pond at Boat Harbour. Photo: Joan Baxter

Last night, the Pictou County Municipal Council voted on a resolution supporting the Boat Harbour Act and closure of Boat Harbour by January 31, 2020.

The resolution was brought forward by Deputy Warden Wayne Murray, and reads as follows:

> RESOLUTION
>
> WHEREAS, after a leak of 47 million litres of pulp effluent onto Pictou Landing First Nation land and nearby waters in 2014, the Boat Harbour Act was passed with all party support in the Nova Scotia Legislature in May 2015, ending the use of Boat Harbour for wastewater effluent reception and treatment on January 31, 2020;
>
> WHEREAS Pictou Landing First Nation has consistently stated its desire and expectation that the Boat Harbour Act be honoured and that Boat Harbour close as scheduled on January 31, 2020;
>
> WHEREAS Pictou Landing First Nation welcomes public support for the closing of Boat Harbour as scheduled;
>
> BE IT RESOLVED by the Municipal Council for the Municipality of the County of Pictou that Council support the stated position of Pictou Landing First Nation to honour the Boat Harbour Act and that the Boat Harbour Effluent Treatment Facility close as scheduled on January 31, 2020.

Someone who attended the meeting supplied the following account:

Pictou Landing First Nation Chief Andrea Paul made an impassioned and powerful speech to the council.

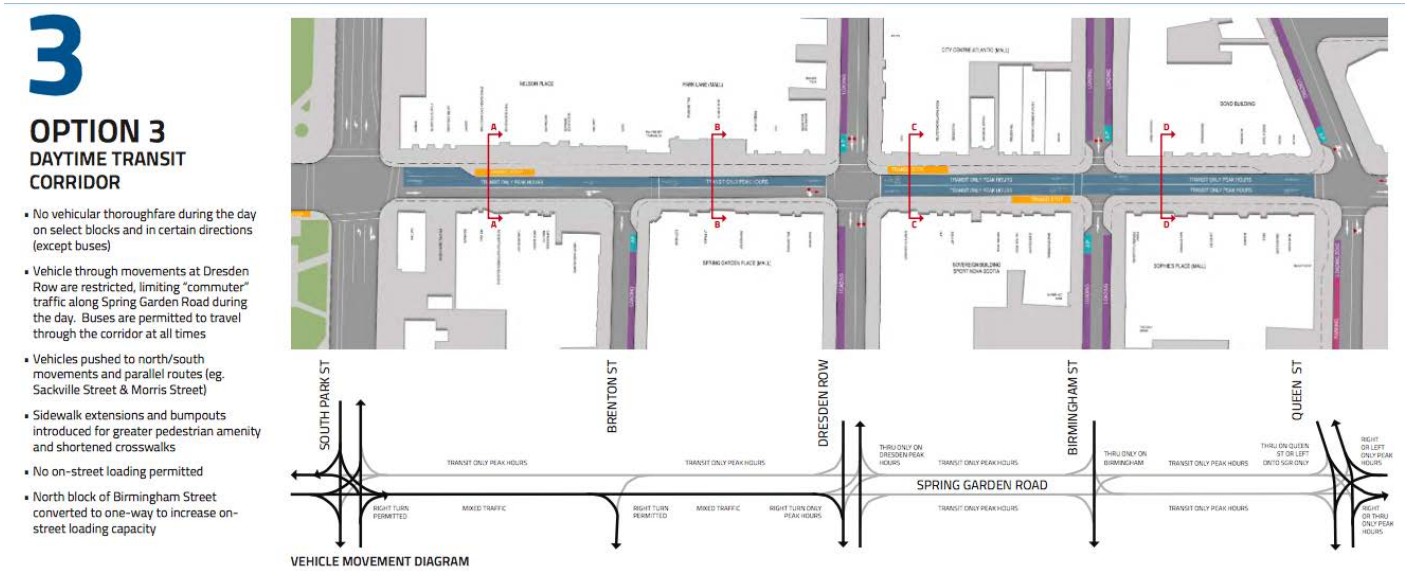
There was a lot of discussion about the resolution, and fairly widespread agreement that the mill shouldn't close, that there must be a solution somewhere, and that by supporting the Boat Harbour Act, legislation that has already been passed provincially, the council would not be voting against industry or mill jobs.

But in the end, the council voted in favour of the resolution to support the Boat Harbour Act, and the closure date of January 31, 2020.

Those who voted against the resolution were: Randy Palmer, Andy Thompson and David Parker.

Those who voted to support the resolution were: Wayne Murray (Deputy Warden who introduced the resolution), Darla MacKeil, Deborah Wadden, Ronnie Baillie, Chester Dewar, Peter Boyles and Larry Turner.

3. Spring Garden Road



The city yesterday released three proposed options for the redesign of Spring Garden Road between Barrington and Robie Streets, although the most radical potential changes are between South Park and Queen Streets, where potentially cars and trucks will be eliminated completely during the day time.

I tried to work through the document to summarize the options, but they're just too complex for me this morning. You can see the three options here (large PDF), or read Zane Woodford's summary here.

I don't have strong opinions about the proposed rebuild (anything we can do for the pedestrian experience is helpful) except to note that the entire neighbourhood around Spring Garden Road and Robie Streets is going to be an absolute mess for three or four years as the mini-Manhattan is constructed between Carleton Street and Robie Street. That construction is going to disrupt the entire peninsula, and especially the Spring Garden Road corridor. I know planners think these are different projects, that the building construction near Robie Street has nothing to do with the relatively minor construction needed to implement the changes a few blocks east, but I plead with them to consider the psychic disruption for a pedestrian walking from, say, the Central Library to the main Dalhousie campus.

4. Taxi driver charged with sexual assault

A police release from yesterday:

> Police have charged a taxi driver with sexual assault in relation to an incident that occurred in Halifax over the weekend.
>
> At approximately 5:45 a.m. on January 6 police responded to a report of a sexual assault that had occurred a short time earlier in Halifax. A taxi driver drove a female to a residence in Halifax and sexually assaulted her while she was in the vehicle.
>
> To protect the identity of the victim, we are not releasing the address where the sexual assault occurred.
>
> As a result of the investigation, officers arrested the taxi driver at a residence in Halifax without incident at approximately 3:30 that afternoon.
>
> A 36-year-old Halifax man was charged with sexual assault and was released to appear in Halifax Provincial Court at a later date.
>
> Sexual assault investigations are very complex. As part of our victim-centered, trauma-informed approach to sexualized violence, we work closely with victims to ensure they're willing to proceed with a police investigation, which includes giving a statement about the incident and providing a description of the suspect if possible. Police must also ensure the victim's privacy is upheld and well-being is fully considered; officers have been taking these measures since first speaking with the victim, and we're now in a position to report this incident to the public.

5. Violence

Yesterday's RCMP release is disturbingly detailed:

> **January 7, 2019, Yarmouth, Nova Scotia** . . . On January 4 just before 8 p.m., an injured 17-year-old female entered a convenience store in Yarmouth. She was bleeding, had several injuries to her face and hands, and was screaming. Staff at the store called 911 for assistance. Police and paramedics attended the scene and the victim was transported to hospital via EHS.
>
> The investigation has determined that the victim was picked up in blue Hyundai Tucson (small SUV) with Nova Scotia licence plate GGA 153, on Cliff St. by one female on a pretense, when the assaults began. Three people were in the back of the vehicle unbeknownst to the victim, and they started hitting her and punching her in the head.
>
> They drove to Leighton St. in Hebron where the victim was further assaulted, including being dragged out of the vehicle, thrown to the ground and kicked and punched in the head. They then went to another person's residence on Baker St. They then drove to the NSLC on Starrs Rd., and the victim went into the store with one of the suspects. They got back in the vehicle, and drove to another location on Green St. where the assaults continued and the owner of a dog tried to get it to attack her. The suspects then poured water all over her face and down her throat. She was dragged to the car by her hair. With a total of six people in the vehicle, they left that location and went to the convenience store on Hwy. 3. The victim who had been between two people in the backseat, was able to flee the vehicle, run to the store, and get help.
>
> This was a targeted incident and the victim and suspects were known to one another. One suspect was arrested that evening, and two other females were arrested on January 5 and 6. They are facing Aggravated Assault and Assault with a Weapon charges. The two remaining suspects were arrested this morning.

Government

City

Tuesday

Burnside Zoning Review – Public Open House, Case 21808 (Tuesday, 12pm and 4pm, in the building named after a bank, 259 Commodore Drive, Dartmouth) — Burnside is going to be turned into Shangri-La.

Halifax and West Community Council (Tuesday, 6pm, City Hall) — among other items, the council will consider a two-storey addition to the Delmore Buddy Daye Learning Institute at the corner of Cornwallis and Maitland Streets.

Wednesday

Audit and Finance Standing Committee (Wednesday, 10am, City Hall) — nothing terribly interesting on the agenda, but these are the sort of meetings where they add wild shit at the last minute because they think no one is watching.

North West Planning Advisory Committee (Wednesday, 7pm, Silver and Gold Room, Sackville Heights Community Centre) — here's the agenda.

Province

Tuesday

No public meetings today.

Wednesday

Public Accounts (Wednesday, 9am, Province House) — because the McNeil government doesn't want the opposition to ask untoward questions, all the committee does anymore is look at the Auditor General's reports. Ho-hum. This week, that means questions about the May 2018 report on Grant Programs.

On campus

Dalhousie

Tuesday

Trustworthy and novel dietary guidelines: Early results of systematic reviews on red and processed meat (Tuesday, 12pm, Room 409, Centre for Clinical Research) — Bradley Johnston from Dalhousie and Regina El Dib from Estadual Paulista University (Unesp), Brazil, will speak.

SURGE: Nova Scotia's newest sandbox (Tuesday, 2pm, Room 2660, Life Sciences Centre) — I wrote about this yesterday.

Wednesday

Biomolecular interactions at the cell surface: My journey from helpful hormones to the deadly plague (Wednesday, 4pm, theatre A, Tupper Medical Building) — Kyungsoo Shin, from Sanford Burnham Prebys Medical Discovery Institute, San Diego, will speak.

Mount Saint Vincent

Wednesday

Elder Albert Marshall and Cheryl Bartlett

Two-Eyed Seeing (Wednesday, 11am, Multipurpose Room, Rosaria Student Centre) — Elder Albert Marshall, Cheryl Bartlett, and other Indigenous and Non-Indigenous "Knowledge Holders" present a workshop, free to Mount faculty, students and staff, $75 for public. Includes lunch. Register here. More info here.

Transforming Teaching and Learning Through Etuaptmumk [Two-Eyed Seeing] (Wednesday, 7pm, Multipurpose Room, Rosaria Student Centre) — Info: foodsecurity@msvu.ca

Tremendous work on the money being given and loaned to Northern Pulp and Scotsburn Lumber. I look forward to more enlightenment as you get more responses to you queries.

Has Nunn taken a vow of silence?

Peter Ritchie says
January 8, 2019 at 1:55 pm

I thought Mr. Nunn billed himself as ‘Mr. Nova Scotia Know-it-all’; it would appear that while he may claim to know it all, he doesn’t seem particularly eager to share what he knows about the skulduggery at LAF (formerly DNR).

Excellent work, Tim and Joan.

Great work on the Northern Pulp racket, Tim. That is a serious amount of cash-ola being funnelled around from the province and those companies. Many people have been wondering what the stumpage fees the province has been paying Westfor, and what other 'incentives' might be coming Westfor's way for their exclusive contract to log crown land. Perhaps worth looking into if you can?

Agreed! Over 20 million$ tax dollars to these 2 companies in 10 years… So this is like the Yarmouth ferry except it pollutes more, deforests and directly employs more people? Great. Bring on the gold mines, fracking, space ports, convention centres and stadiums. The future will be bold/innovative/disruptive/collaborative/bleak.

Governments have alaways propped up employment by providing direct/indirect financial assistance/incentives to employers. I doubt it will ever change because it is mainly an argument over which industries get the assistance/subsidy.

Great to read coverage of the Council actions last night (Municipality of Pictou County). Impressed that the Examiner stated clearly the resolution and identified who supported the resolution and who did not. I attended the meeting, and, if my recollection is correct, Warden Robert Parker also supported the resolution.
Credit to the entire Council for unanimously agreeing to hear from Chief Paul- this was necessary as her name was not put on the agenda as a presenter until after the deadline for such things had gone by.
After Andrea Paul had made her presentation, she made the rounds of the Council itself and shook hands with each of the councillors, including the three that did not support the resolution pertaining to sticking to the hard date for the closure of Boat Harbour.
There is leadership at the local level that could possibly have an answer to the pulp effluent problem – an answer that might satisfy all parties.

As several councillors mentioned last night- 'Where's the leadership from the province of Nova Scotia?' The classification of this as a class one assessment was made by a deputy-minister. It was the wrong designation, yet the political leadership in the province supported it, and the existing government is simply letting things unfold as the locked-in process grinds away.

What chance does this display of local leadership have when any option other than a pipe into the Northumberland Strait has never been entertained seriously?

> - The Government of Nova Scotia is committed to the closure of the existing Boat Harbour Effluent Treatment Facility, which it owns, by Jan. 31, 2020. The Boat Harbour Act requires the closing of this facility ten years earlier than the lease between the Province and Northern Pulp.

Intended for Public Use

- We are working to find a solution which ensures an environmentally and economically sustainable future for the Pictou Landing First Nation, the Pictou area, Northern Pulp and other stakeholders.

- This has required a contribution towards detailed design and engineering studies for a potential replacement effluent treatment facility. The contribution allows negotiations with Northern Pulp to continue and will be credited towards any future agreement.

- This cost is part of a larger discussion with Northern Pulp which is yet to be concluded. Final construction costs could be north of $100 million.

- The Department of Transportation and Infrastructure Renewal is not involved in the Department of Environment's independent environmental assessment process.

[Advice to Executive Council] DRAFT

Memorandum
to the Executive Council

Number:
Dept.:
Date:

Title: Northern Pulp – Effluent treatment facility negotiation mandate

Submitted By: Honourable Lloyd Hines, Minister, Transportation and Infrastructure Renewal

Prepared By: Bonnie Rankin, Director of Policy

Reviewed By: Diane Saurette, Executive Director, Finance and Strategic Capital and Infrastructure Planning
Royden Trainor, Senior Executive Director, Policy and Planning

Deputy Minister: Paul LaFleche, Ph. D., P. Geo

SUMMARY:

[redacted] 13(1) 14(1)

CURRENT SITUATION AND PURPOSE FOR THIS REQUEST

The *Boat Harbour Act* mandates the closure of the Boat Harbour Effluent Treatment Facility (the Facility) by January 31, 2020, which will require either:

1. A new effluent treatment system to be commissioned and operating; or
2. The Northern Pulp Mill to cease operations.

There are a number agreements in place which define the current relationship between the Province and the Mill including (a) the *Scott Maritimes Limited Agreement Act*; (b) a Memorandum of Understanding dated December 1, 1995; (c) water supply agreement dated December 31, 1995; (d) a lease agreement dated December 1, 1995; and (e) an indemnity agreement dated December 31, 1995. In addition, by acknowledgement dated May 12, 2008 the Province provided an assurance that these agreements were in good standing and would continue to benefit the Mill.

The lease agreement between the Province (as owner) and the Mill for the use of the Boat Harbour Effluent Treatment System has a termination date of December 31, 2030, however, the enactment of the *Boat Harbour Act* in 2015 effectively shortened the period which the Mill may use the facility by ten years and eleven months.

[redacted] 13(1) 14(1)

[redacted] 13(1) 14(1)

[redacted] Treasury and Policy Board had approved cost sharing for the preliminary design of the replacement facility, now complete, including a Receiving Water study of the Outfall, and hiring a consultant to undertake an Environmental Assessment, including stakeholder consultations and Aboriginal engagement, and preparation of an Environmental Assessment Report that is necessary for the registration for a Class I Environmental Assessment [redacted]. Nova Scotia Department of Environment has announced this project as a Class I Environmental Assessment since it is a modification to an existing undertaking. [redacted] 13(1) 14(1)

[redacted] Treasury and Policy Board approved a contribution of up to $8 million for a detailed design and engineering study for a replacement effluent treatment

BACKGROUND

In the mid-1960s, the Province of Nova Scotia agreed to provide fibre and water to the Abercrombie Point Pulp Mill (currently Northern Pulp Mill, or the Mill) and to treat wastewater effluent from the Mill. This relationship was set out in the *Scott Maritimes Limited Agreement Act*.

In the 1960s, the Province situated and started operations of the Boat Harbour Effluent Treatment Facility (the Facility) when the Mill started operations. In 1995, the Mill took over the Facility operations, by lease with the Province of Nova Scotia, until December 31, 2030.

In June 2014, following a break in the effluent pipeline between Northern Pulp Mill and the Facility, the Pictou Landing First Nation (the Band) established a peaceful blockade preventing pipeline repair. As the pipeline is part of the Facility owned by Nova Scotia, an Agreement in Principle was negotiated which required the Province of Nova Scotia to agree to enact a timeline for closure of the Facility for which the Band agreed to dismantle the blockade.

The *Boat Harbour Act* was subsequently founded in the outcome of negotiations between the Band and provincial officials, which were carried out during late 2014 and early 2015. As a result of these negotiations, the date of January 31, 2020 had been determined as the date of closure of the Boat Harbour Effluent Treatment Facility for the reception and treatment of effluent from the Northern Pulp Mill. [redacted]

13(1)
14(1)

[redacted]

13(1)
14(1)

The Province has contractual commitments to provide water to Northern Pulp until March 2021 and to lease the Boat Harbour Effluent Treatment Facility to Northern Pulp until December 30, 2030. In addition, the Province entered into an MOU, Indemnity Agreement and an Acknowledgement Agreement, concerning the commitments and obligations of the parties in respect of the Mill's operations, and the liabilities of the Province in this regard.

The *Boat Harbour Act* has introduced a legislated date of January 31, 2020 after which the Boat Harbour Effluent Treatment Facility may no longer be used to receive and treat effluent from the Mill. The Act also limits claims related to the cessation of use of the Boat Harbour Effluent Treatment Facility [redacted]

Communications Plan [Template] Advice to Executive Council

Plan Title: Northern Pulp – Effluent Treatment Facility negotiation mandate
Department: Transportation and Infrastructure Renewal
Accompanying: R&R RFL X MEC
Date: May 11, 2018
Prepared by: Brett Loney

Narrative: Northern Pulp and the Province have been working to find the best available solution for a new effluent treatment facility. We are working to ensure the best environmentally-sustainable solution to ensure inclusive economic growth.

Background/Context:

13(1)
14(1)

The Province has legal commitments to provide water to Northern Pulp until March 2021 and to lease the Boat Harbour effluent treatment facility to Northern Pulp until December 30, 2030.

13(1)
14(1)

Stakeholder/Key Audience Analysis:

Stakeholder	Reaction	Analysis

13(1)
14(1)

13(1)
14(1)

[redacted]

Research: The province commissioned a telephone survey conducted by Corporate Research Associates in summer 2014. A clear majority of Nova Scotians (62%) supported the Mill's continued operation. Residents of Pictou County were slightly less likely to support Northern Pulp's continued operation, with 50% mostly or completely opposing, and were more likely to want the Mill shut down until required changes to the Mill were complete. Support for government funding of the Mill was low overall, and only if funds are invested well. Only a few Nova Scotians supported additional aid being provided while the Mill is in violation of environmental regulations. The range of funding considered reasonable varied with 31% of Nova Scotians identifying less than $5-million (19% indicated no government funding). Overall, Pictou County residents were more likely to express concerns about the Mill's operation, more likely to agree the Mill should be shut down, more likely to believe no funding should be provided to the Mill, and more aware of the Ministerial Order that was in place at the time of the survey in relation to the Mill's environmental impact and emission violations.

Overall, the issue of replacing Northern Pulp's Effluent Treatment Facility has been controversial and received moderate and ongoing media coverage, particularly in Pictou County.

SUPREME COURT OF NOVA SCOTIA

Citation: *Pictou Landing First Nation v. Nova Scotia (Aboriginal Affairs)*, 2018 NSSC 306

Date: 20181130
Docket: Hfx No. 474934
Registry: Halifax

2018 NSSC 306 (CanLII)

Between:

Pictou Landing First Nation

Applicant

v.

Her Majesty the Queen in Right of the Province of Nova Scotia as represented by the Minister of Aboriginal Affairs

Respondent

Judge: The Honourable Justice D. Timothy Gabriel

Heard: July 25, 2018, in Halifax, Nova Scotia

Counsel: Brian Hebert, for the Applicant
Sean Foreman and Diane Rowe, for the Respondent

2018 NSSC 306 (CanLII)

By the Court:

Introduction

[1] Northern Pulp Nova Scotia Corporation ("Northern Pulp") owns and operates a bleached kraft pulp mill and associated facilities located at Abercrombie Point, Pictou County. This latter has been referred to by the parties as "the mill" and I will continue to refer to it as such within the body of these reasons.

[2] Pictou Landing First Nation ("PLFN") has applied for Judicial Review of a decision of the office of Provincial Minister of Aboriginal Affairs to deny consultation with respect to the issue of whether the Province will or should fund the construction of a new effluent treatment facility at Boat Harbour, Pictou County, Nova Scotia. For the reasons which follow, the application is granted.

Background

[3] The mill presently includes an effluent treatment facility which has been operating since 1967. It is adjacent to Boat Harbour. I will refer to the presently existing facility as "the Boat Harbour treatment facility".

[4] The *Boat Harbour Act*, 2015 c. 4 ("*BHA*"), provides in part as follows:

> 3. On and after the earlier of January 31, 2020, and the date on which the Northern Pulp Nova Scotia Corporation ceases to use the facility, the use of the facility for the reception and treatment of effluent from the mill must cease.
>
> [Emphasis added]

[5] Key words contained in s. 3 are referenced in the interpretation provisions set out in s. 2:

> In this Act,
>
> (a) "effluent" has the same meaning as in the Pulp and Paper Effluent Regulations (Canada), as amended from time to time;
>
> (b) "Facility" means the Boat Harbour Effluent Treatment Facility, comprising

> (i) the effluent treatment system located at 340 and 580 Simpson Lane, Pictou Landing, in the County of Pictou, and consisting of two settling basins, an aerated stabilization basin, the former stabilization lagoon and all appurtenances thereof necessary to permit the receipt and disposal of effluent from the Mill, and
>
> (ii) the pipeline for the transmission of effluent from the Mill to the settling basins, which commences at a standpipe located at 260 Granton Abercrombie Branch Road, Abercrombie Point, in the County of Pictou, leads under the East River and discharges into the settling basins;
>
> (c) "Mill" means the Northern Pulp Mill, a bleached kraft pulp mill located at 260 Granton Abercrombie Branch Road, Abercrombie Point.

[6] As the Province indicates in its brief:

> 4. Northern Pulp is in the planning stages to formally apply for Environmental Assessment ("EA") approval pursuant to Part IV of the *Environmental Act* for the design, construction and operation of a new Effluent Treatment Facility ("ETF") to replace the existing Boat Harbour Treatment Facility, which must be closed as required by the *Act* ("the pending ETF Application").
>
> 5. The Province is currently engaged in active consultation with the PLFN regarding the Pending ETF Application. The Province has confirmed $70,000.00 in capacity funding to support PLFN's meaningful participation in that process.

[7] The Province continues:

> 7. The Province has disclosed it is also engaged in confidential discussions directly with Northern Pulp regarding potential crown funding that may be provided to support construction of the new ETF (the "Potential Crown Funding"). No such decision has yet been made.
>
> 8. PLFN takes the position that any such Potential Crown Funding to Northern Pulp by the Province is a separate "decision" that triggers an independent duty to consult with PLFN, as this decision "will have the effect of continuing the operation of the Mill beyond January 30, 2020" and therefore further impact the asserted rights and interests asserted by PLFN.
>
> 9. The Province disagrees that any decision to provide some form of Potential Crown Funding would be a "decision" or "action" that itself

2018 NSSC 306 (CanLII)

> triggers an independent duty to consult with PLFN. Simply put, Potential Crown Funding to Northern Pulp does not meet the established legal test to trigger consultation, as any such potential decision or action itself does not authorize continued operation of the Mill beyond January 30, 2020 (as claimed by PLFN) and therefore has no additional or potential adverse impact on the rights and interests asserted by PLFN.
>
> [Emphasis in original]

[8] After reminding me that the Boat Harbour Treatment Facility and the circumstances of Boat Harbour have been publicly referred to by provincial spokespersons in the past "as an example of environmental racism" (*Applicant brief, para. 7*), PLFN goes on to point out:

> 8. The Mill requires a new treatment facility if it is to continue operating. A new treatment facility, if built, will allow the Mill to be operated for many years to come and will mean the continued release of contaminants from the Mill during the pulping process during that period. Those contaminants, some of which are toxic, will find their way to Pictou Landing First Nation and will be breathed in by the men, women and children living there.
>
> 9. The Province of Nova Scotia is considering financial assistance to Northern Pulp to assist with the construction of the new treatment facility being proposed by Northern Pulp.
>
> 10. The Province is currently consulting with Pictou Landing First Nation on the pending decision of the Province to approve the effluent treatment facility under the *Environmental Act*. The consultation focuses on the physical impacts of the design, construction and operation of the new effluent treatment facility. As such it is not focused on emissions from the ongoing pulping operations at the Mill.
>
> 11. The Province has denied Pictou Landing First Nation's request to expand the present consultation to include the funding decision, suggesting that the decision cannot lead to any adverse impacts and therefore does not trigger the duty to consult.

[9] The record filed in conjunction with this matter is miniscule. It contains merely two documents. The first is a letter from Brian Hebert (counsel for PLFN) dated January 11, 2018, seeking confirmation of the scope of consultation and capacity funding for PLFN. The second consists of a letter from the Nova Scotia Office of Aboriginal Affairs ("OAA") to Brian Hebert, PLFN counsel, in response to his January 1, 2018 letter, confirming the scope of the consultation regarding the

2018 NSSC 306 (CanLII)

Northern Pulp ETF and the quantum of capacity funding for consultation ($70,000.00). This second letter is dated February 26, 2018.

[10] The second letter was written by Beth Lewis, OAA's consultation advisor. Although OAA agreed to provide funding to accommodate consultation upon potential physical impacts to Treaty Rights in relation to the design, construction and operation of the ETF, they would not commit to do so with respect to whether the Province will finance the actual construction of it.

[11] As Ms. Lewis puts it (*Record, tab. 2*):

> The current act of consultation is focussed upon potential physical impacts to Aboriginal and Treaty Rights associated with the design, construction, and operation of the proposed ETF. The intent of the ETF is to mitigate or eliminate harm to the environment by the industrial operations of the mill.
>
> A decision by the Province in regards to any or partial funding of the ETF does not create a new impact on Aboriginal or Treaty. The Province may provide information to PFLN [sic] in the event that any decision regarding funding is made, in keeping with the spirit of maintaining transparent communication on the project. (*letter, Beth Lewis, consultation advisor, Nova Scotia of Aboriginal Affairs, February 26, 2018, Record, tab 2*)
>
> [Emphasis added]

[12] An affidavit of Andrea Paul was filed by PLFN in conjunction with this application. Extrinsic evidence not before the original decision maker is not usually permitted on a judicial review application. In this case, the proffered affidavit addresses the allegations of the lack of procedural fairness extended to PLFN, and (by implication) the incompleteness of the record.

[13] Andrea Paul is Chief of the Pictou Landing First Nation. Her affidavit was filed on June 13, 2018. In both her affidavit and *viva voce* testimony, she referred to a number of matters of which she has been advised. Included was her understanding (*Paul affidavit, para. 2*) as follows:

> It is my understanding based on various discussions with representative of Northern Pulp and the Province that without provincial funding, the new treatment facility and the new pipeline will not be built.

2018 NSSC 306 (CanLII)

[14] Moreover, she goes on to indicate that she has been advised by Bruce Chapman, General Manager of Northern Pulp, to the effect that, without the new treatment facility and the new pipeline, the mill cannot operate after January 31, 2020, which is, as we have seen from the *Boat Harbour Act*, the latest date mandated for the closure of the current Boat Harbour treatment facility.

2018 NSSC 306 (CanLII)

[15] Among other things, Chief Paul refers to an article in the *Journal of Environmental Quality* indicating that certain of the airborne contaminants to which the PLFN community has been exposed since 1967 continue to pose deleterious health risks for its members. If the lifetime of the mill is extended beyond 2020 the adverse environmental effects will continue to be experienced by the community for the duration of the extension. She concludes, in paras. 10 and 11 of her affidavit:

> 10. I have also reviewed parts of an air dispersion modelling study that was prepared by Stantec Consulting Ltd. for Northern Pulp and filed with the Nova Scotia Department of Environment to satisfy condition 6 II d) and 6 III e) and f) of industrial approval number 2011-076657. I attach a true copy of this study as Exhibit "C" to this my Affidavit. This study is also a source of my belief that the Mill emits a number of pollutants and that the prevailing winds carry these pollutants toward Pictou Landing First Nation. The study was provided to Pictou Landing Fist Nation by the Nova Scotia Department of Environment.
>
> 11. I have examined the record provided by the Respondent in this matter and must say that I am disappointed that the Province took so little information into account when responding to our request for consultation on this issue. This affidavit and the exhibits attached are intended to provide a fuller background to our request and this is my belief that this information is available to the Respondent within its own records.

[16] Chief Paul alleges, among other things, that the Province did not consider the information available to it (of which the exhibits to her affidavit comprise merely examples) in determining whether to consult with PFLN on the issue of whether to not to fund the new ETF. In other words, the Province ought to have consulted these and other materials when determining whether the decision to fund, in and of itself, by extending the lifetime of the mill, might have a potential adverse impact upon PFLN lands and/or treaty rights. This is because (PLFN argues) without government funding, the ETF will not be built, and if the new ETF is not built, the mill will be forced to close. This is in accord with PLFN's best

interest, because of the adverse health effects upon the community of the airborne contaminants which the Mill will continue to churn out, even with a new ETF.

Issues

[17] The following issues are engaged:

1. Was PLFN treated in a procedurally fair manner by OAA?
2. Was the Province's determination that it has no duty to consult with PLFN (as to whether it will fund the ETF) correct?

Analysis

1. Was PLFN treated in a procedurally fair manner by OAA?

   a. *The affidavit of Andrea Paul dated June 13, 2018*

[18] Reference has previously been made to Chief Paul's affidavit. Fundamentally, the assertions made by PLFN in relation to procedural unfairness are summarized in that affidavit.

[19] First, we find in paras. 6 – 8:

> 6. The concern that our community has always had has been the quality of the air that we breathe. We have suffered odors from the Boat Harbour Treatment Facility for 50 years. This has caused constant fear about the effect of this on our health, especially our elders' and children's health. For many years we were told by various government officials that even though the sulphur compounds we smelled were very horrible smelling, they did not pose any health risks. However, according to an article by Susan Schiffman and C. M. Williams entitled, "*Science of Odor as a Potential Health Issue*" published in the *Journal of Environmental Quality* 34:129-138 (2005), exposure to foul smelling sulphur compounds can lead to adverse health impacts in communities exposed to them even though the exposure levels are below the level that could cause physical harm. I attach as Exhibit "A" to this my Affidavit a true copy of Schiffman article.
>
> 7. With the closure of the Boat Harbour Treatment Facility, one source of these sulphur compounds will be removed - and our community is thankful for that. But as we look toward the future we must also be concerned about the long-term impact of the operation of the Mill on our community, including adverse impacts from the airborne contaminants coming from the Mill itself. We have never had an opportunity to study

2018 NSSC 306 (CanLII)

> and understand these long terms impacts as we have to date been so focused on the closure of the Boat Harbour Treatment Facility.
>
> 8. However, the Province is now in the process of determining whether to fund the New Treatment Facility and New Pipeline. If it does, the Mill will be operating for many years to come. In deciding whether to fund the New Treatment Facility and New Pipeline, we believe that the Province must take into account the potential impact of its decision on Pictou Landing First Nation. It is for this reason that we asked for a formal consultation with the Province in respect of this important decision.

2018 NSSC 306 (CanLII)

[20] As we have also seen, Chief Paul refers, in other portions of her affidavit, to information that she received from the Executive Director of Corporate Initiatives at Nova Scotia Department of Transportation and Infrastructure Removal. She cites this information, and other discussions held with Bruce Chapman, General Manager for Northern Pulp, as the basis for her conclusion that without the new ETF and pipeline the mill will be forced to close after January 30, 2020. This is because, without Provincial funding, the facility will not be built.

[21] As is apparent from para. 6 (cited above) Chief Paul also references an article by Schiffman and Williams published in *The Journal of Environmental Quality* in 2005 "*Science of Odor as a Potential Health Issue*". She attaches as Exhibit "A" a copy of the Schiffman article. She also makes reference in para. 9 to a research article published by Tony Walker of Dalhousie University at the School for Resource and Environmental Studies entitled "*Pilot Study Investigating Ambient Air Toxic Emissions in Our Canadian Kraft Pulp and Paper Facility in Pictou County, Nova Scotia*" and published in *Environmental Science and Pollution Research* in 2017.

[22] Chief Paul cites both articles as the bases for her belief that the mill emits several thousand tons of pollutants annually, including "toxic volatile organic chemicals" and that they are carried on prevailing winds to other places in Pictou County, including Pictou Landing First Nation. This article is also attached as an exhibit to her affidavit.

[23] Chief Paul cites the fact that this article was based upon data collected by the Nova Scotia Department of Environment at the Granton, Nova Scotia air monitoring site, which is operated by that Department. She draws attention to "parts of an air dispersion modelling study that was prepared by Stantec Consulting for Northern Pulp and filed with the Nova Scotia Department of Environment to satisfy conditions 6(ii)(d) and 6(iii)(f) of the Industrial Approval

2011-076657". She adds that the study was provided to PLFN by the Nova Scotia Department of the Environment itself. (*Paul affidavit, para. 10*)

2018 NSSC 306 (CanLII)

[24] In para. 11 she concludes:

> 11. I have examined the record provided by the Respondent in this matter and must say that I am disappointed that the Province took so little information into account when responding to our request for consultation on this issue. This affidavit and the exhibits attached are intended to provide a fuller background to our request and it is my belief that this information is available to the Respondent within its own records.

[25] The Applicant extrapolates from this that the Band was denied procedural fairness by the failure of the Province to consider all relevant information before making its decision. Information readily available to the Province, some of which was included in Chief Paul's affidavit, was not considered, the Applicant contends.

[26] As the Applicant puts it:

> 58. Whatever else procedural fairness entails, fairness requires the Minister to consider all relevant information before making a decision. The affidavit evidence establishes that information within the control of the Province establishes that the Mill does emit toxic and carcinogenic pollutants and that the prevailing winds carry these pollutants to the Pictou Landing First Nation. <u>While these adverse impacts have been occurring for many years, the decision of the Province to fund the new treatment facility will mean that these effects will continue to occur beyond January 30, 2020</u>. As discussed above, the adverse impacts beyond that date will be causally connected to the Province's decision to fund the new treatment facility and pipeline, if it decided to do so.
>
> 59. These are serious consequences and the concerns of Pictou Landing First Nation appear on the affidavit evidence to be justified. The First Nation deserves a fuller review by the Minister before dismissing the request for consultation out of hand.
>
> [Emphasis added]
> (*Applicant's brief*)

[27] The Applicant refers to the court statement in *Haida Nation* (*Haida Nation v. British Columbia (Minister of Forests)*, (2004) SCC 73) that "the foundation of the duty to consult is found in the Crown's honour. The goal of reconciliation,

suggests that the duty arises when the Crown has knowledge, real or constructive, of the potential existence of the Aboriginal right or title and contemplates conduct that might adversely affect it". (*Haida Nation, para. 35*)

[28] According to the Applicant, "it follows from this that the Province is required to consider all of the information that bears on the question that is in its possession or available to it". (*Applicant's reply brief, para. 27)*

[29] The Applicant further submits that it may be impractical or impossible for a First Nation to access the information available to the government, such as any representations Northern Pulp may have made to the Province by way of an economic case. Therefore, the Applicant argues, the honour of the Crown would suggest that the Crown should consider all extraneous information available to it (some examples of which Chief Paul has provided) before deciding whether a duty to consult as to potential funding exists. (*Applicant's reply brief, paras. 29 and 30)* By necessary implication, that additional information should form part of the record because it was available to the Province before it made its decision.

[30] With respect, I am unable to accept the Applicant's contentions in this regard. First, I have serious reservations with respect to many portions of Chief Paul's affidavit. It is replete with references to conversations that she has had with various named and unnamed individuals, and contains further submissions as to conclusions that she has drawn on the basis of those conversations with respect to the potential adverse effects of the emissions of the mill (and, by extension, the potential for adverse effects as a result of the new mill with the ETF under discussion), and also the <u>impossibility</u> of the new ETF being built without government funding.

[31] We are not dealing here with evidence concerning ancient practices, customs and traditions of Mi'kmaq people before written records existed. There is, therefore, no basis for a departure from the "…evidentiary standards that would be applied, for example, in a private law torts case…" (*R. v. Van der Peet*, [1996] 2 SCR 507 – para.68).

[32] Second, it does not appear to me that the Province is denying the potential physical impacts to Treaty Rights of the mill (even with a new ETF) in any event. What it appears to be saying is that these potential airborne physical impacts are part of the <u>present</u> operation of the mill – funding of a new ETF will not result in any new impact in that respect.

2018 NSSC 306 (CanLII)

[33] Moreover, the Province has implicitly conceded that an improper design or construction of the "new" ETF could have a potential physical impact (albeit, as a result of the discharge of effluent, rather than airborne pollution). It acknowledges that PLFN has a legitimate interest in the specifications to which the new ETF is to be subject. In fact, it reminds the court repeatedly that these are the very things that it is prepared to consult about, and for which it has put up $70,000.00 in capacity funding. This will, it argues, enable the PFLN to meaningfully consult with respect to these very concerns.

[34] The Province's argument, in a nutshell, is to the effect that there are no "new" physical impacts to Treaty Rights which could even potentially arise merely out of the decision as to whether it should fund the project or not.

[35] Finally, there is no indication in the record (specifically, in the letter written at the outset by counsel for PLFN (Tab 1)) to any of the specific material cited by Chief Paul, in her affidavit.

[36] As a result, PLFN's claim that there was a denial of procedural fairness, or that the record is incomplete, is somewhat inchoate under the circumstances. The Applicant has provided no authority – beyond general references to the honour of the Crown – to support the position that the Crown had a duty in this situation to bring forward any and all information in its possession bearing upon the operation of the mill. The Province's reply was responsive to the letter from the Applicant's counsel. It is not clear what the principal basis would be to find a breach of procedural fairness in these circumstances.

[37] As a consequence, I conclude that there is no substance to the Applicant's assertion of procedural unfairness in relation to this matter.

[38] That being said, although I cannot conclude on the basis of the evidence before me that a new ETF will not be built without Provincial funding, I can conclude, upon the facts:

> a) that the current Boat Harbour Treatment Facility is an integral part of the current operation of the mill as a whole (*BHA*, s. 2(b));
>
> b) that the current Boat Harbour Treatment Facility must close no later than January 31, 2020 (*BHA*, s. 3);
>
> c) that the new ETF which will replace the existing facility will be integral to the continued operation of the mill, beyond January 31, 2020

2018 NSSC 306 (CanLII)

> (it must replace those functions discharged by the current Boat Harbour Treatment Facility (described in *BHA*, s. 2(b));
>
> d) each additional potential source of funding that is available for the project makes it incrementally more likely that the new ETF project will come to fruition; and
>
> e) that as a consequence, a Provincial decision to fund the project, even if it is not the only potential source of funding, would make it incrementally more likely that the mill will remain open and be able to continue operations past 2020.

2. Was the Province's determination that it had no duty to consult with PLFN (as to whether it will fund the new ETF) correct?

a. *The scope of the duty*

[39] The Supreme Court of Canada has described the duty to consult in many cases. We may begin with *Delgamuukw v. British Columbia*, [1997] 3 S.C.R. 1010. Therein, Chief Justice Lamer, speaking for the court, said that:

> …Aboriginal title encompasses within it a right to choose to what ends a piece of land can be put … This aspect of aboriginal title suggests that the fiduciary relationship between the Crown and aboriginal peoples may be satisfied by the involvement of aboriginal peoples in decisions taken with respect to their lands. There is always a duty of consultation. Whether the aboriginal group has been consulted is relevant to determining whether the infringement of aboriginal title is justified, in the same way that the Crown's failure to consult an aboriginal group with respect to the terms by which reserve land is leased may breach its fiduciary duty at common law … The nature and scope of the duty of consultation will vary with the circumstances. In occasional cases, when the breach is less serious or relatively minor, it will be no more than a duty to discuss important decisions that will be taken with respect to lands held pursuant to aboriginal title. Of course, even in these rare cases when the minimum acceptable standard is consultation, this consultation must be in good faith, and with the intention of substantially addressing the concerns of the aboriginal peoples whose lands are at issue. In most cases, it will be significantly deeper than mere consultation. Some cases may even require the full consent of an aboriginal nation, particularly when provinces enact hunting and fishing regulations in relation to aboriginal lands.

[40] This duty to consult has been expansively discussed by the court in subsequent decisions. Although this is a non-exhaustive list, some of these cases

2018 NSSC 306 (CanLII)

include *Taku River Tlingit First Nation v. British Columbia (Project Assessment Director),* 2004 SCC 74, *Clyde River (Hamlet) v. Petroleum Geo-Services Inc.*, 2017 SCC 40, and *Mikisew Cree First Nation v. Canada (Minister of Canadian Heritage*), 2005 SCC 69 ("*Mikisew Cree 2005*")

[41] In "*Mikisew Cree 2005*", Justice Binnie, writing for the court, incorporated earlier remarks by Chief Justice Beverly McLachlin in *Haida Nation*:

> … The content of the process is dictated by the duty of the Crown to act honourably. Although *Haida Nation* was not a treaty case, McLachlin C.J. pointed out, at paras. 19 and 35:
>
> > 19. The honour of the Crown also infuses the processes of treaty making and treaty interpretation. In making and applying treaties, the Crown must act with honour and integrity, avoiding even the appearance of "sharp dealing" (Badger, at para. 41). Thus in Marshall, supra, at para. 4, the majority of this Court supported its interpretation of a treaty by stating that "nothing less would uphold the honour and integrity of the Crown in its dealings with the Mi'kmaq people to secure their peace and friendship".
> >
> > ...
> >
> > 35. But, when precisely does a duty to consult arise? The foundation of the duty in the Crown's honour and the goal of reconciliation suggest that the duty arises when the Crown has knowledge, real or constructive, of the potential existence of the Aboriginal right or title and contemplates conduct that might adversely affect it.
>
> [Emphasis added]

[42] Justice Binnie went on to point out (at para. 55 of *Mikisew Cree 2005*) that the duty to consult is "triggered at a low threshold, but adverse impact is a matter of degree, as is the extent of the Crown's duty".

[43] In the recently decided *Mikisew Cree First Nation v. Canada (Governor General in Council)* 2018 SCC 40 ("*Mikisew Cree 2018"*), many of the Justices had opportunity to further elaborate upon the concepts of the "honour of the Crown" and the "duty to consult". For example, Justice Karakatsansis wrote with respect to the former:

2018 NSSC 306 (CanLII)

> 23. The honour of the Crown is always at stake in its dealings with Aboriginal peoples (*R. v. Badger*, [1996] 1 S.C.R. 771, at para. 41; Manitoba Metis, at paras. 68-72). As it emerges from the Crown's assertion of sovereignty, it binds the Crown qua sovereign. Indeed, it has been found to apply when the Crown acts either through legislation or executive conduct (see *R. v. Sparrow*, [1990] 1 S.C.R. 1075, at pp. 1110 and 1114; *R. v. Van der Peet*, [1996] 2 S.C.R. 507, at para. 231, per McLachlin J., as she then was, dissenting; Haida Nation; Manitoba Metis, at para. 69).
>
> 24. As this Court stated in Haida Nation, the honour of the Crown "is not a mere incantation, but rather a core precept that finds its application in concrete practices" and "gives rise to different duties in different circumstances" (paras. 16 and 18). When engaged, it imposes "a heavy obligation" on the Crown (*Manitoba Metis*, at para. 68). Indeed, because of the close relationship between the honour of the Crown and s. 35, the honour of the Crown has been described as a "constitutional principle" (*Beckman v. Little Salmon/Carmacks First Nation*, 2010 SCC 53, [2010] 3 S.C.R. 103, at para. 42). That said, this Court has made clear that the duties that flow from the honour of the Crown will vary with the situations in which it is engaged (*Manitoba Metis,* at para. 74). Determining what constitutes honourable dealing, and what specific obligations are imposed by the honour of the Crown, depends heavily on the circumstances (*Haida Nation*, at para. 38; *Taku River*, at para. 25; *Rio Tinto Alcan Inc. v. Carrier Sekani Tribal Council*, 2010 SCC 43, [2010] 2 S.C.R. 650, at paras. 36-37).
>
> [Emphasis added]

[44] As to the latter, she continued:

> 25. The duty to consult is one such obligation. In instances where the Crown contemplates executive action that may adversely affect s. 35 rights, the honour of the Crown has been found to give rise to a justiciable duty to consult (see e.g. *Haida Nation, Taku River, Mikisew Cree First Nation v. Canada (Minister of Canadian Heritage)*, 2005 SCC 69, [2005] 3 S.C.R. 388, and *Little Salmon*). This obligation has also been applied in the context of statutory decision-makers that -- while not part of the executive - - act on behalf of the Crown (*Clyde River (Hamlet) v. Petroleum Geo-Services Inc.*, 2017 SCC 40, [2017] 1 S.C.R. 1069, at para. 29). These cases demonstrate that, in certain circumstances, Crown conduct may not constitute an "infringement" of established s. 35 rights; however, acting unilaterally in a way that may adversely affect such rights does not reflect well on the honour of the Crown and may thus warrant intervention on judicial review.

2018 NSSC 306 (CanLII)

> 26. The duty to consult jurisprudence makes clear that the duty to consult is best understood as a "valuable adjunct" to the honour of the Crown (*Little Salmon*, at para. 44). The duty to consult ensures that the Crown acts honourably by preventing it from acting unilaterally in ways that undermine s. 35 rights. This promotes reconciliation between the Crown and Aboriginal peoples first, by providing procedural protections to s. 35 rights, and second, by encouraging negotiation and just settlements as an alternative to the cost, delay and acrimony of litigating s. 35 infringement claims (*Clyde River*, at para. 1; *Haida Nation,* at paras. 14 and 32; *Mikisew Cree*, at para. 63).
>
> 27. The duty to consult has been recognized in a variety of contexts. For example, in *Haida Nation*, this Court recognized a duty to consult when the Crown contemplated the replacement and transfer of tree farm licences that had the potential to affect asserted but unproven Aboriginal rights. In *Mikisew Cree [No. 1]*, the Court recognized that the contemplation of "taking up" lands under Treaty No. 8 could adversely affect the Mikisew's rights under the treaty and thus required consultation. Crown conduct need not have an immediate impact on lands and resources to trigger the duty to consult. This Court has recognized that "high-level management decisions or structural changes to [a] resource's management" may also trigger a consultative duty (*Carrier Sekani,* at para. 47; see also para. 44). However, to date, the duty to consult has only been applied to executive conduct and conduct taken on behalf of the executive.
>
> [Emphasis added]

[45] Next, Justice Abella:

> 60. But the honour of the Crown is not itself a cause of action. Rather, it speaks to the way in which the Crown's specific obligations must be fulfilled (*Manitoba Metis Federation*, at para. 73). These obligations vary depending on the circumstances. In negotiating and applying treaties, the Crown must act with integrity and honour, and avoid even the appearance of sharp dealing (*Haida Nation*, at para. 19; *Badger*, at para. 41; *R. v. Marshall,* [1999] 3 S.C.R. 456, at para. 4). Where the government enacts regulations that infringe on Aboriginal rights, the honour of the Crown demands that those measures be justified (*Sparrow*, at p. 1109). And when the government contemplates conduct that might adversely affect Aboriginal or treaty rights, the honour of the Crown gives rise to a duty to consult and accommodate.

2018 NSSC 306 (CanLII)

> 61. Grounded in the honour of the Crown, the duty to consult arises from the assertion of Crown sovereignty and aims to advance the process of reconciliation (*McCabe*, at p. 90; *Haida Nation*, at paras. 45 and 59). It serves an important role in the "process of fair dealing and reconciliation that begins with the assertion of sovereignty and continues beyond formal claims resolution" (*Haida Nation*, at para. 32). Where the duty arises, it requires meaningful consultation between the government and the affected group. This means a meaningful effort by the government to act in a manner that is consistent with the honour of the Crown in that particular context (Dwight G. Newman, *Revisiting the Duty to Consult Aboriginal Peoples (2014)*, at pp. 88-89). Consultation obligations can be viewed as falling on a spectrum, which accommodates the different contexts in which more or less consultation is necessary to fulfill its purpose (*Newman*, at p. 89; *Haida Nation*, at para. 43).
>
> 62. I see this duty as being more than a "means" to uphold the honour of the Crown. The obligation arises because it would not be honourable to make important decisions that have an adverse impact on Aboriginal and treaty rights without efforts to consult and, if appropriate, accommodate those interests. The Crown must act honourably in defining the rights guaranteed by s. 35 and in reconciling them with other societal rights and interests. This implies a duty to consult (*Haida Nation*, at para. 20). The question is not whether the duty to consult is appropriate in the circumstances, but whether the decision is one to which the duty to consult applies.
>
> [Emphasis added]

[46] As to the duty to consult, Justice Abella continued:

> 70. …the Court affirmed that the Crown's obligation to consult and accommodate Indigenous groups arises independently from its obligation to justify infringements of Aboriginal and treaty rights. In the duty to consult context, the controlling question is not whether the limit on rights is justified, but "what is required to maintain the honour of the Crown and to effect reconciliation between the Crown and the Aboriginal peoples with respect to the interests at stake" (*Haida Nation*, at para. 45). In this sense, the trilogy represents a shift towards mutual reconciliation between Aboriginal and Crown sovereignty, and a further step towards embracing the honour of the Crown as a limit on Crown sovereignty in relation to Indigenous peoples (Mark D. Walters, "*The Morality of Aboriginal Law*" (2006), 31 Queen's L.J. 470, at pp. 513-14).
>
> [*Haida Nation, Taku River, and Mikisew*]
> [Emphasis added]

2018 NSSC 306 (CanLII)

[47] Finally, Justice Rowe noted:

> 157. This Court stated in *Rio Tinto* that any potential for adverse impact as a result of Crown conduct will trigger the duty to consult and accommodate. The Court further stated that the duty may arise with respect to "high-level managerial or policy decisions" (para. 87). The policy decisions at issue in *Rio Tinto* were made by the executive in regards to a particular development project; in that case, the impugned decision concerned the sale of power produced from a hydroelectric dam on the Nechako River. The Court's statement needs to be understood in the context in which it was made; it does not support the proposition that a duty to consult is constitutionally mandated in the law-making process. This is reinforced by the requirement that the impugned decision would result in potential adverse impacts. This Court held that there must be a "causal relationship between the proposed government conduct or decision and a potential for adverse impacts on pending Aboriginal claims or rights" (para. 45 (emphasis added)). Counsel for the Mikisew rely heavily on the reasons given by this Court in *Rio Tinto*. But *Rio Tinto* does not support the conclusion that the duty to consult must apply to the legislative process. In fact, this Court explicitly left open the question of whether "government conduct" attracting the duty to consult includes the legislative process (para. 44).
>
> [Emphasis in original]

[48] Earlier Chief Justice McLaughlin had summarized the criteria which will engage the duty to consult in *Rio Tinto Alcan Inc. v. Carrier Sekani Tribal Council*, 2010 SCC 43. They consist of:

1. Actual or constructive knowledge by the Crown of a potential Aboriginal claim or right;
2. Contemplated Crown conduct; and that
3. The proposed conduct or decision may have an adverse impact upon Aboriginal claim or right.

[49] With respect to the first element:

> 40. To trigger the duty to consult, the Crown must have real or constructive knowledge of a claim to the resource or land to which it attaches: *Haida Nation*, at para. 35. The threshold, informed by the need to maintain the honour of the Crown, is not high. Actual knowledge arises when a claim has been filed in court or advanced in the context of negotiations, or when a treaty right may be impacted: *Mikisew Cree First Nation v. Canada (Minister of Canadian Heritage),* 2005 SCC 69, [2005]

2018 NSSC 306 (CanLII)

> 3 S.C.R. 388, para. 34. Constructive knowledge arises when lands are known or reasonably suspected to have been traditionally occupied by an Aboriginal community or an impact on rights may reasonably be anticipated. While the existence of a potential claim is essential, proof that the claim will succeed is not. What is required is a credible claim. Tenuous claims, for which a strong prima facie case is absent, may attract a mere duty of notice…
>
> 41. The claim or right must be one which actually exists and stands to be affected by the proposed government action. This flows from the fact that the purpose of consultation is to protect unproven or established rights from irreversible harm as the settlement negotiations proceed …

2018 NSSC 306 (CanLII)

[50] It is difficult to separate the second and third elements, which are centered around the need for potential impact upon Treaty right or claims by the Crown conduct in question. In addressing this point, the Chief Justice continued:

> 43. This raises the question of what government action engages the duty to consult. It has been held that such action is not confined to government exercise of statutory powers … This accords with the generous, purposive approach that must be brought to the duty to consult.
>
> 44. Further, government action is not confined to decisions or conduct which have an immediate impact on lands and resources. A potential for adverse impact suffices. Thus, the duty to consult extends to "strategic, higher level decisions" that may have an impact on Aboriginal claims and rights … Examples include the transfer of tree licences which would have permitted the cutting of old-growth forest (*Haida Nation*); the approval of a multi-year forest management plan for a large geographic area (*Klahoose First Nation v. Sunshine Coast Forest District (District Manager*), 2008 BCSC 1642, [2009] 1 C.N.L.R. 110); the establishment of a review process for a major gas pipeline (*Dene Tha' First Nation v. Canada (Minister of Environment*), 2006 FC 1354, [2007] 1 C.N.L.R. 1, aff'd 2008 FCA 20, 35 C.E.L.R. (3d) 1); and the conduct of a comprehensive inquiry to determine a province's infrastructure and capacity needs for electricity transmission (An Inquiry into British Columbia's Electricity Transmission Infrastructure & Capacity Needs for the Next 30 Years, Re, 2009 CarswellBC 3637 (B.C.U.C.)).
>
> [Emphasis added]

[51] As to “adverse effect” the court continued:

> 45. The third element of a duty to consult is the possibility that the Crown conduct may affect the Aboriginal claim or right. The claimant

must show a causal relationship between the proposed government conduct or decision and a potential for adverse impacts on pending Aboriginal claims or rights. Past wrongs, including previous breaches of the duty to consult, do not suffice.

46. Again, a generous, purposive approach to this element is in order, given that the doctrine's purpose, as stated by Newman, is "to recognize that actions affecting unproven Aboriginal title or rights or treaty rights can have irreversible effects that are not in keeping with the honour of the Crown" (p. 30, citing *Haida Nation*, at paras. 27 and 33). Mere speculative impacts, however, will not suffice. As stated in *R. v. Douglas*, 2007 BCCA 265, 278 D.L.R. (4th) 653, at para. 44, there must an "appreciable adverse effect on the First Nations' ability to exercise their aboriginal right". The adverse effect must be on the future exercise of the right itself; an adverse effect on a First Nation's future negotiating position does not suffice.

47. Adverse impacts extend to any effect that may prejudice a pending Aboriginal claim or right. Often the adverse effects are physical in nature. However, as discussed in connection with what constitutes Crown conduct, high-level management decisions or structural changes to the resource's management may also adversely affect Aboriginal claims or rights even if these decisions have no "immediate impact on lands and resources": Woodward, at p. 5-41. This is because such structural changes to the resources management may set the stage for further decisions that will have a direct adverse impact on land and resources. For example, a contract that transfers power over a resource from the Crown to a private party may remove or reduce the Crown's power to ensure that the resource is developed in a way that respects Aboriginal interests in accordance with the honour of the Crown. The Aboriginal people would thus effectively lose or find diminished their constitutional right to have their interests considered in development decisions. This is an adverse impact: see Haida Nation, at paras. 72-73.

48. An underlying or continuing breach, while remediable in other ways, is not an adverse impact for the purposes of determining whether a particular government decision gives rise to a duty to consult. The duty to consult is designed to prevent damage to Aboriginal claims and rights while claim negotiations are underway: *Haida Nation,* at para. 33. The duty arises when the Crown has knowledge, real or constructive, of the potential or actual existence of the Aboriginal right or title "and contemplates conduct that might adversely affect it": *Haida Nation*, at para. 35 (emphasis added). This test was confirmed by the Court in *Mikisew Cree* in the context of treaty rights, at paras. 33-34.

2018 NSSC 306 (CanLII)

[Emphasis added]

[52] I conclude that the duty to consult as described in the authorities (of which such as *Mikisew Cree 2005*, *Mikisew Cree 2018*, *Haida Nation* and *Carrier Sekani* are examples) is a derivative of the honour of the Crown. It confines the duty to consult to adverse effects flowing from the specified Crown action at issue – not to the larger adverse effects of the project of which it is a part. "The subject of the consultation is the impact on the claimed rights of the current decision under consideration" (see *Carrier Sekani*, para. 53 [emphasis in original]).

[53] A "generous, purposive approach" is adopted when the question of causation is considered, but merely speculative impacts will not suffice (*Carrier Sekani*, para. 46*)*. The process is grounded in the Crown's duty to act honourably. In any decision as to whether to consult or not, the Crown's honour must infuse the process. It must also be seen to be acting with such honour. Even the appearance of "sharp dealing" must be avoided (*Haida Nation*, para. 19).

[54] I am also mindful of *Chippewas of the Thames First Nation v. Enbridge Pipelines Inc.*, 2017 SCC 41, in which the court said that:

> It may be impossible to understand the seriousness of the impact of a project on s. 35 rights without considering the larger context… Cumulative effects of an ongoing project, and historical context, may therefore inform the scope of the duty to consult…(*Chippewas of the Thames,* para. 42)

b. What is the proper standard of review?

[55] The parties both begin with the assertion that an application for judicial review is the appropriate mechanism by which to seek a determination as to whether there has been a breach of the duty to consult. I agree.

[56] Indeed, the summary provided in *Pimicikamuk v. Manitoba*, 2014 MBQB 143, in my respectful view, accurately reflects the current law in this respect:

> 48. Administrative law remedies have been provided for by the Supreme Court of Canada in respect of alleged failures to comply with the duty of consultation. In other words, where a First Nation or Aboriginal community alleges a failure of the Crown to discharge its duty of consultation, the issue is normally determined pursuant to administrative law principles in the context of a judicial review.

2018 NSSC 306 (CanLII)

[57] The court in *Pimicikamuk* continues:

> 49. In *Haida*, the Supreme Court of Canada has directed the courts to review the consultation process on a standard of reasonableness. As it relates to the government's initial assessment of the existence or extent of the duty, the Supreme Court in *Haida* has directed the courts to review that assessment on the correctness standard to the extent that "the issue is one of pure law and can be isolated from issues of fact". See *Haida*, *supra*, at para. 61-63; *Rio Tinto*, *supra*, at para. 64; *Hupacasath First Nation v. British Columbia (Minister of Forests)*, 2008 BCSC 1505 at para. 187, 173 A.C.W.S. (3d) 330; *Ahousaht Indian Band v. Canada (Minister of Fisheries and Oceans)*, 2014 FC 197 at para. 34.

[58] The Applicant has argued:

> 43. Accordingly, in the present case the Applicant acknowledges that the standard of reasonable [sic] applies to the decision itself subject to the application of the higher standard of correctness where errors of law can be isolated. This is consistent with the leading case on judicial review of administrative tribunals in *Dunsmuir v. New Brunswick*, 2008 SCC 9.
>
> *(Applicant's brief, para. 43*)

[59] With respect, here the court is not being asked to review a completed process of consultation replete with an extensive activity record. If it were, this would ordinarily trigger the application of a more deferential or relaxed standard (one of reasonableness).

[60] Rather, in circumstances such as this, the extant case law frames the applicable standard of review as one of correctness. Either the duty to consult exists or it does not.

[61] This accords with the recent decision of *Mi'kmaq of Prince Edward Island v. Prince Edward Island* [2018] PESC 20, where the court stated:

> 62. There are three points at which the standard of review is to be considered. They include when a tribunal is determining the existence of a duty to consult, deciding the extent of consultation required (as per the *Haida* spectrum), and assessing the extent of consultation that occurred. While McLachlin C.J. expressed that the existence or extent of the duty to consult or accommodate is a legal question in the sense that it defines a legal duty, she immediately went on to express, in para. 61 of *Haida*, that a contextual assessment of the factual background may lead to deference being shown even with respect to deciding on the two questions of the

2018 NSSC 306 (CanLII)

> existence and extent of the duty to consult. In other words, she allowed for reasonableness to be the standard of review to apply to the determination of those questions, depending upon the circumstances of each case.
>
> 63. At the hearing of this matter, in line with the conclusion in *Ahousaht*, all counsel submitted the applicable standard of review was correctness in respect of assessing both the existence and extent of the duty to consult and accommodate, and reasonableness with respect to assessing whether the Province met their duty to consult to the extent required. I will review the decisions upon the basis of these suggested standards of review.
>
> [Emphasis added]

2018 NSSC 306 (CanLII)

[62] I conclude that the appropriate standard of review to be applied herein is one of correctness.

c. Is the Crown's decision not to consult with respect to the possibility of its funding of the new ETF correct?

[63] The Province does not deny that the first element set forth in *Carrier Sekani* "knowledge of a potential Aboriginal claim or right" exists. Rather it maintains that the central issues concern the second and third elements. These latter, taken together, raise the question of whether the contemplated conduct (which is to say, the potential funding decision) might adversely affect an Aboriginal claim or right so as to trigger a duty to consult.

[64] Among other authorities, the Province refers to *Buffalo River Dene Nation v. Saskatchewan (Minister of Energy and Resources)*, 2015 SKCA 31, wherein it was determined that the posting for sale and eventual grant of mining exploration permits with respect to Treaty lands did not suffice to trigger a duty to consult.

[65] In *River Dene*, the court concluded that the Applicant had not shown a causal link between the granting of the permit and any possible impact upon its rights. The court held that the sale of the permits, on its own, could not lead to adverse impacts. This was because more regulatory requirements had to be met before any actual entry, exploration, mineral extraction or other activity upon or involving the First Nation land could occur. It also meant that the decision was not of the "strategic, higher level" kind referred to in *Haida Nation* and *Carrier Sekani*.

[66] As to the threshold for consultation, Caldwell, J.A. stated in *River Dene*:

> 91. … The duty to consult is triggered at a low threshold, but it must remain a meaningful threshold - the applicant has to establish some sort of appreciable or discernible impact flowing from the impugned Crown conduct before a duty to consult in relation to that impact will arise. This is both logical and practical because there has to be something for the Crown and the Aboriginal group to consult about -- the duty to consult is, at core, a practical doctrine. Put another way, it makes little sense for the duty to consult to arise where, as the Chambers judge concluded here, there is nothing to consult about, i.e., nothing to reconcile.
>
> 92. What I mean by this is that, here, Buffalo River DN has not established that a foreseeable impact on Treaty 10 lands (and, consequently, on its members' hunting, trapping, and fishing rights) could possibly arise without the occurrence of a subsequent or second-stage approval from the Crown. However, once any form of surface access is contemplated, then actual impact on Treaty 10 land becomes possible. It is at this point in the process that the Permit-Holder is required to provide a plan for its proposed exploration or development of minerals lying under the surface of Treaty 10 lands. It is at this point that the Crown and Buffalo River DN would have something meaningful, in the sense of quantifiable, to consult about, to reconcile. And, indeed, the Crown seems to acknowledge that it would have a duty to consult with Buffalo River DN if this matter were to reach this point in the regulatory process.
>
> [Emphasis added]

[67] The key feature, it seems to me, upon which *River Dene* turned, was the inability of the (then) currently contemplated action, which is to say, the transfer of the permits *simpliciter*, to have any type of impact upon the area in question. In fact, such impact would simply not be possible, without something further. This "something" was the requirement for permission by the permit holder (whoever it might be at the relevant time) to submit a plan, and undergo an approval process (a "next step") with respect to its proposed exploration or exploitation of the minerals below Treaty lands.

[68] This next step was required whether the current ownership of the permit remained extant, or whether the permit was transferred, as proposed. This status quo remained whether current or new permit owner(s) took that next step – either would have to undergo the regulatory process before there was any possibility of physical impact upon Treaty lands. It was, therefore, not until this "next step" was

2018 NSSC 306 (CanLII)

taken that consultation was required. Quite literally, there was nothing to consult about when it came to the mere sale of the mining exploration permits in question.

[69] The Respondent argues that the situation in the case at bar is apposite. In essence, the Province (in paraphrase) says "Look, any new ETF which replaces the existing Boat Harbour Treatment Facility triggers a need for an Environmental Assessment approval pursuant to Part IV of the *Environment Act.* We have agreed, therefore, that the pending ETF application including its design and specifications, should be (and is) the subject of active consultation with PLFN. We have provided $70,000.00 in capacity funding so that PLFN may have meaningful participation in the process". (*see Respondent brief, para. 4 – 5*)

2018 NSSC 306 (CanLII)

[70] It is this process (the Province continues) which has the potential to impact upon Treaty Rights *a propos* potential impacts on the environment. However, the question of whether it is the Province or some other entity who actually funds the new ETF (if it is approved) cannot (in and of itself) have <u>any</u> physical impact upon Treaty Rights.

[71] This arguement misses the mark, in my respectful view, for a number of reasons. First, we know that the process of consultation does not <u>require</u> the Crown to accede to the views of the Applicant.

[72] Could the Crown proceed (after consultation) with a particular design or construction of the new ETF against the strong opposition of PLFN? It could, conceivably. But if it did so, and then also provided the very funding by which the new ETF was to become a reality, would that too, be compatible with the honour of the Crown?

[73] Where the Crown is required to consult it must do so meaningfully. Would the act of funding a project opposed by PLFN reflect on the "meaningfulness" of the antecedent efforts of the Crown to consult? "Meaningful consultation" requires a:

> "… meaningful effort by the government to act in a manner that is consistent with the honour of the Crown in that particular context".
>
> (*Mikisew Cree 2018*, para. 61 per Abella, J.)

[74] Second, does the potential involvement of the Crown in the funding of the new ETF make it more or less likely that the required *Environmental Act* approval will ultimately be granted? While (as the Respondent points out) it would be a

different "department" of the Crown involved in the approval process, it would essentially boil down to the Crown (wearing one hat) being called upon to determine whether a project which the Crown (wearing another hat) has funded, passes muster. This will do nothing to assuage whatever cynicism has been engendered in the past by the already significant environmental impact which has been visited upon Treaty lands and environs by the mill and its facilities to date.

2018 NSSC 306 (CanLII)

[75] Further, and as we have seen, the duty to consult, when is arises, flows from the Honour of the Crown. This honour "binds the Crown *qua* Soverign". (*Misikew Cree 2018*, per Karakatsansis, J., para. 23) We have seen that even the appearance of sharp dealing is to be avoided. In my view, Treaty people are entitled to treat with the Crown as though it speaks with one voice.

[76] To put it more bluntly, in the event that the Province were to become the lender financing the project, it would have a very tangible interest in Northern Pulp's success. That company's success would become directly related not only to the Province's prospect of recovering its investment, but also as to its prospect of (possibly) making a profit upon it.

[77] Related to this is the practical question of what quantity of "sunk costs" would the Province be required to invest if it funds the project, before the project is submitted for environmental approval. At a minimum, someone must draw up design specifications and plans, and undertake the work ancillary to this before approval is requested. Will the increasing extent of this sunk cost create increasing incentive for all Crown departments to keep the mill operating? While past wrongs do not create a new impact, they may certainly inform the imperative need for transparency and consultation in relation to all aspects of the present process.

[78] As we have seen from *Carrier Sekani*, the potential for adverse impact suffices to trigger a duty to consult (para. 44). It is clear that the duty extends to "strategic, higher level decisions" that may have an impact upon the claim or right (*Rio Tinto*, para. 47). The Province's interest as lender funding the new ETF will undoubtedly influence "higher level" strategic decision making.

[79] Indeed, if one accepts (as I do) that the longer the mill continues to operate the longer that treaty rights may potentially be impacted by the discharge of effluent from a improperly designed ETF or, even if properly designed, by a subsequent malfunction of same, then one accepts that the best case scenario, from the vantage of PLFN, would be the closure of the mill and the ETF in its entirety. If the Province is to become the lender, not only is it providing the means by which

the ETF will be built, but it will have an interest to insure that the mill will continue to remain in operation into the future so as to at least recover the taxpayers' investment.

[80] In addition, Part IV of the *Environment Act* (and Regulations enacted pursuant thereto) contains standards which must be achieved in order to obtain approval of the project as a whole. If the Province funds, will it fund to the extent necessary to merely achieve minimal (often less expensive) standards, or is it prepared to consult with the PLFN as to whether, in the unique circumstances of what the people in this area have endured, upgraded (more expensive) safeguards should be implemented?

[81] In *Dene Tha' First Nation v. Canada (Minister of Environment),*2006 FC 1354, aff'd 2008 FCA 20, (*Dene Tha'*) the federal government began designing a regulatory and environmental review procedure in anticipation of the MacKenzie Gas Pipeline ("MGP") project without consulting the Dene Tha'.

[82] At the Federal Court level, the Court rejected the Crown's argument that there was no duty to consult at that stage, observing that:

> 100. …conduct contemplated here is the construction of the MGP. It is not, as the Crown attempted to argue, simply activities following the Cooperation Plan and the creation of the regulatory and environmental review processes. These processes, from the Cooperation Plan onwards, were set up with the intention of facilitating the construction of the MGP. It is a distortion to understand these processes as hermetically cut off from one another. The Cooperation Plan was not merely conceptual in nature. It was not, for example, some glimmer of an idea gestating in the head of a government employee that had to be further refined before it could be exposed to the public. Rather, it was a complex agreement for a specified course of action, a road map, which intended to *do* something. It intended to set up the blue print from which all ensuing regulatory and environmental review processes would flow. It is an essential feature of the construction of MGP.
>
> …
>
> 106. The precise moment when the duty to consult was triggered is not always clear. In *Haida*, the Court found that the decision to issue a Tree Farm License (T.F.L) gave rise to a duty to consult. A T.F.L. is a license that does not itself authorize timber harvesting, but requires an additional cutting permit. The Court held that the "T.F.L. decision reflects the strategic planning for utilization of the resource" and that "[d]ecisions

2018 NSSC 306 (CanLII)

made during strategic planning may have potentially serious impacts on Aboriginal right and title". [Emphasis added. See *Haida* paragraph 76]

107. From the facts, it is clear that the Cooperation Plan, although not written in mandatory language, functioned as a blueprint for the entire project. In particular, it called for the creation of a JRP to conduct environmental assessment. The composition of the JRP was dictated by the JRP Agreement, an agreement contemplated by the Cooperation Plan. The composition of this review panel and the terms of reference adopted by the panel are of particular concern to the Dene Tha'. In particular, the Dene Tha had unique concerns arising from its unique position. Such concerns included: the question of the enforceability of the JRP's recommendations in Alberta and funding difficulties encountered by the Dene Tha' as result of its not qualifying for the "north of 60 funding programs" (a funding program apparently available only to those First Nations bands north of the 60 degrees parallel). The Dene Tha' also had other issues to discuss including effects on employment, skill levels training and requirements and other matters directly affecting the lives of its people.
108. The Cooperation Plan in my view is a form of "strategic planning". By itself it confers no rights, but it sets up the means by which a whole process will be managed. It is a process in which the rights of the Dene Tha' will be affected.

[Emphasis added]

[83] When *Dene Tha'* reached the Appellate level, the Federal Court of Appeal observed:

9. This case turns entirely on its own facts. Having regard to the evidence on the record, it was open to Justice Phelan to find as a fact that, given the unique importance of the Mackenzie Gas Pipeline, and the particular environmental and regulatory process under which the application for approval of the Mackenzie Gas Pipeline would be considered by the Joint Review Panel and the National Energy Board, the process itself had a potential impact on the rights of the Dene Tha'. It was also open to him to find as a fact that, at some point during the period from 2002 and 2004, it was sufficiently certain that there would be an application for approval of the Mackenzie Gas Pipeline that the obligation to consult was triggered. He was not required, as a matter of law, to conclude that no consultation obligation arose until the formal application for approval was filed. The test framed by the Supreme Court of Canada in the cases cited above does not dictate such a rigid or inflexible approach.

2018 NSSC 306 (CanLII)

[Emphasis added]

[84] A consideration of the above factors, and others, makes it seem very implausible that a government decision to fund a new effluent treatment facility less than fourteen months before the statutorily mandated closure of the existing facility and the expiry of the mill's industrial approval, would not carry with it a potential for further adverse effect on PLFN's right to occupy lands already polluted by the Boat Harbour Treatment Facility. The new adverse impacts would include the increased likelihood of a new ETF being built (in the short term) and of the mill remaining open (in the longer term) prompted by (at least the appearance of) the interest of the Province to either recover its investment or profit from it. Provincial involvement in funding would set the stage for further decisions that have (at the very least) the potential to impact the "strategic, higher level decisions" of the Province in precisely the manner contemplated by *Rio Tinto* (para. 47).

[85] Finally, the bifurcation of issues ("design and construction" from the "actual funding" of the ETF) artificially compartmentalizes a process which, in my view, should be treated more holistically.

[86] One (obvious) example, arises from the legitimate concern on the part of PLFN (presumably the Province as well – hence the consultation with respect to the design and construction) about the potential for deleterious effects upon the environs, which could potentially result from an inadequate design of the ETF. Separation of the potential funding issue would result in the loss of an opportunity for the two sides to discuss whether the financing (if it was to be provided by the Province) should or could be tied into a system of penalties and/or rewards for achieving and/or failing to achieve proposed emission or effluent discharge targets. This may (potentially) impact upon the likelihood that these targets would be attained.

[87] Put differently, and unlike the situation in *River Dene*, it seems clear to me that the parties have plenty to consult about with respect to the topic of the potential Provincial funding of the new ETF. Some of the discussion points have been noted herein. Beyond these earlier comments (which serve as examples only), it would not be appropriate for the court to circumscribe or exhaustively attempt to define the parameters or the topics encompassed by the Province's duty to consult in relation to this potential funding. Such discussions cannot be isolated or hermetically sealed off from the overall design and approval process, in any event, for the reasons noted above.

2018 NSSC 306 (CanLII)

Conclusion:

[88] The application is granted. The consultations between the parties must necessarily include *inter alia* whether the Province should fund the construction and design of the ETF and pipeline, and, if so, what form that financing will take.

[89] This application had some novel aspects to it. It is one in relation to which each side sought guidance from the court in good faith. I decline to award costs to either party as a result.

Gabriel, J.

Court Administration
DEC 04 2018
Halifax, N.S.

Form 39.08

2018

Hfx. No. 483516

Supreme Court of Nova Scotia

Between:

NORTHERN PULP NOVA SCOTIA CORPORATION

Plaintiff

and

EDWIN DONALD SHAW, ALLAN FRANCIS MACCARTHY, CHAD MACCARTHY, DARRYL WAYNE BOWEN, BEN ANDERSON, PAUL SCOTT MUSICK, BRADLEY ELMER MACDONALD, JANE DOE AND JOHN DOE

Defendants

AFFIDAVIT OF TERRI FRASER
SWORN ON NOVEMBER 30, 2018

I, **Terri Fraser**, of Stellarton, in the County of Pictou, make oath and say as follows:

1. **THAT** I am the Technical Manager of Northern Pulp Nova Scotia Corporation's pulp mill located at Abercrombie Point, Pictou County (the "Mill").

2. **THAT** I am the project lead for the project to design and construct a replacement effluent treatment facility at the Mill and have personal knowledge of the facts deposed to herein except where stated to be based on information and belief.

3. **THAT** a pulp mill has been in operation at the Abercrombie Point location since 1967. From 1967 to 1995 the effluent produced by the Mill was treated at the Boat Harbour Effluent Treatment Facility (the "Boat Harbour ETF") which was owned and operated by Her Majesty the Queen in right of the Province of Nova Scotia (the "Province").

4. **THAT** on December 1, 1995 the Province and Scott Maritimes Limited, a predecessor in title of the current owner of the Mill, Northern Pulp Nova Scotia ("Northern Pulp"), entered into a Memorandum of Understanding ("MOU") to "restate and restructure" their contractual relationship in relation to the Boat Harbour ETF. A copy of the MOU is attached hereto as Exhibit "A" to this my Affidavit.

5. **THAT** one of the components of the restated and restructured contractual relationship was a Lease, which is attached to this my Affidavit as Exhibit "B". Pursuant to the Lease, the Boat Harbour ETF was leased by the Province to Scott Maritimes Limited for a term of ten years.

6. **THAT** by a Lease Extension Agreement made October 22, 2002 between the Province and Scott Maritimes Limited's successor in title and interest, Kimberly-Clark Inc., the Lease Agreement was amended to extend the term for a further period of 25 years after the initial 10 year term. Consequently, the Lease would expire on December 31, 2030. A copy of the Lease Extension Agreement is attached hereto as Exhibit "C" to this my Affidavit.

7. **THAT** Northern Pulp acquired the Mill in 2008 from Neenah Paper Company of Canada, a successor in title and interest of Kimberly-Clark Inc. and Scott Maritime Limited. By an Acknowledgement Agreement dated May 12, 2008, the Province acknowledged, agreed and confirmed that all of the benefits of the MOU and the Lease, as amended by the Lease Extension Agreement, accrued to Northern Pulp. A copy of the Acknowledgement Agreement is attached as Exhibit "D" to this my Affidavit.

8. **THAT** on April 17, 2015 the bill to enact the *Boat Harbour Act* was introduced in the Legislature. The purpose of the Act was to force the closure of the Boat Harbour ETF by January 31, 2020.

9. **THAT** Northern Pulp was not consulted about the consequences of the enactment of the *Boat Harbour Act* nor the closure data specified in the Act before the bill was introduced. Northern Pulp was merely advised that the bill would be introduced on April 16, 2015.

10. **THAT** I was a member of the group of Northern Pulp representatives that appeared before the Law Amendments Committee on April 27, 2015 to present Northern Pulp's perspective on the consequences of the bill and in particular, the short period of time allowed in the bill to identify, design and construct an effluent treatment facility to replace the Boat Harbour ETF.

11. **THAT** no change was made to the closure date as set out in the bill. When the *Boat Harbour Act* received Royal Assent the date for closure remained January 31, 2020.

12. **THAT** at or about the time the bill was proceeding through the legislative process, Northern Pulp was appealing the terms and conditions proposed in the new Industrial Approval issued March 9, 2015. An Industrial Approval is required under the *Environment Act* in order to operate the Mill.

13. **THAT** among the conditions in the Industrial Approval were conditions for a new alternative effluent treatment system. I was informed by representatives of Northern Pulp's consulting engineers (KSH Solutions, Ekono, and Callan Brooks Inc.) and did, and

14. **THAT** an appeal from the Industrial Approval was initiated by Northern Pulp on April 9, 2015. After the appeal was initiated there were many discussions with representatives of Nova Scotia Environment ("NSE").

15. **THAT** the conditions of particular concern to Northern Pulp were deleted in accordance with the decision of the Minister of Environment dated February 8, 2016. Northern Pulp thereupon withdrew its appeal on March 15, 2016.

16. **THAT** in the late spring of 2016 Northern Pulp suggested to the Province that they work together to explore how best to replace the Boat Harbour ETF. The Province agreed and its officials were involved in the preparation of a request for proposal ("RFP") for the delivery of engineering studies, evaluation of the submissions and the selection of the successful proponent. The RFP was issued on September 30, 2016.

17. **THAT** on December 28, 2016 the Province and Northern Pulp entered into an agreement to share the cost of preliminary engineering studies for a replacement ETF.

18. **THAT** the studies were to be done in two phases. The first phase involved the consideration of all aspects of effluent generation at the Mill, the review of the technologies available to treat the effluent, and the identification of the optimum technical approach to the treatment of the effluent. The second phase involved the development of cost estimates for the cost to construct a new ETF.

19. **THAT** KSH Solutions was retained to perform the engineering studies. It recommended that a new ETF use Activated Sludge Treatment ("AST"). In comparison to Aerated Stabilization Basin ("ASB") technology used at the Boat Harbour ETF, AST has high-rate removal efficiencies and good process flexibility.

20. **THAT** under Phase 2, KSH Solutions produced a cost estimate for the effluent treatment facility itself that was considered to be accurate to within +/- 10 percent. The estimate for the pipeline that was to extend from the new ETF to a diffuser did not have the same degree of accuracy. The cost estimate for the pipeline and diffuser was considered to be accurate within +/- 20 or 30 percent.

21. **THAT** the estimates were received from KSH Solutions in the fall of 2017.

22. **THAT** Northern Pulp and the Province began discussing how the cost of the new ETF should be shared in September 2017. Those discussions continue today.

23. **THAT** at or about the same time, namely in the fall of 2017, Northern Pulp and the Province worked together to identify a consultant to prepare environmental assessment studies. Dillon Consulting Ltd. was retained and it began its work on October 2, 2017.

24. **THAT** by August 2017, Stantec Engineering, as a subcontractor to KSH Solutions, had completed a receiving water study for the Pictou Roads location. Pictou Roads is an area of the Northumberland Strait just outside the limits of Pictou Harbour.

25. **THAT** at public consultation meetings held in December 2017, Pictou Roads was identified as the proposed diffuser location. The proposed location at Pictou Roads of the diffuser is shown on the attached chart (Exhibit "E").

26. **THAT** Northern Pulp and the Province entered into a second Contribution Agreement on December 13, 2017. The purpose of this agreement was to allow detailed engineering work to be done, the environmental studies to continue, and allow major equipment to be purchased.

27. **THAT** Northern Pulp signed a contract with the equipment vendor, Veolia Water Technologies in March, 2018. The vendor had to be selected in order to permit detailed engineering design work to proceed.

28. **THAT** usually detailed engineering design work is completed before many of the environmental assessment studies are undertaken. However, because time until the date of closure stipulated by the *Boat Harbour Act* was very short, it was determined by Northern Pulp and the Province that the environmental assessment studies and detailed design work must proceed in parallel.

29. **THAT** in the early spring of 2018, after ice break-up, marine investigations were undertaken by Northern Pulp's subcontractor, CSR GeoSurveys Limited ("CSR"). In May those investigations revealed that there were areas of ice scour on the bottom of the Pictou Roads area of the Northumberland Strait, in the area that was originally thought suitable for the diffuser.

30. **THAT** the presence of evidence of ice scour at 11 metre depths suggested that ice could damage the diffuser. The pipeline designer recommended looking for an alternative location for the diffuser in deeper water.

31. **THAT** the diffuser is a device affixed to the end of the treated effluent pipeline that would diffuse the outflow from the pipeline in the most beneficial way.

32. **THAT** the receiving water study available in August 2017 was preliminary because it was necessary to conduct further, in-water studies before it could be finalized. The in-water studies would involve the use of sonar equipment to obtain a profile of the bottom and sub-bottom of the Strait, video of the proposed route of the pipeline for the purpose of habitat assessment and geotechnical investigations to evaluate the state of the bottom needed for the detailed design of the marine portion of the pipeline.

33. **THAT** following receipt of the recommendation from the pipeline designer, Northern Pulp directed CSR to survey alternative pipeline routes to deeper water. Three extensions of the route in the Pictou Roads location were examined.

34. **THAT** the length of the extensions were so long (several kilometres) that it became apparent that a pipeline overland route from the Mill to Caribou and from there into the Caribou Channel might be viable. This route was considered to be beneficial because it would

    (a) avoid known lobster fishing grounds;
    (b) allow for access to deeper water to mitigate the potential for ice damage to the diffuser; and
    (c) reduce the length of the pipeline to be installed in a marine environment – four kilometres as opposed to fourteen or fifteen for the extended Pictou Road route.

35. **THAT** receiving water studies were performed by Stantec for two locations off Caribou in the Caribou Channel. Those two locations were less than 500 metres apart. At one location the water depth was 20 metres and at the other 25 metres. It was determined that the 20 metre depth location exhibited better flow dynamics. The proposed location of the diffuser in the Caribou Channel is marked on the attached chart (Exhibit "F").

36. **THAT** at the end of September 2018, it was determined that the Caribou Channel was the preferred location for the diffuser.

37. **THAT** a number of meetings were held between December 2017 and the fall of 2018 with representatives of the Pictou Landing First Nation ("PLFN") and local fishers. The representatives advised that they "fished all over" but did not provide any specific locations for their respective fisheries.

38. **THAT** at these meetings the fishers stated that they had formed a "Fishers Working Group" which included PLFN, local fishers and fishers from Prince Edward Island. A concern was expressed that the treated effluent may contaminate lobsters and that even one contaminated lobster would harm the Canadian lobster "brand".

39. **THAT** at a meeting with the fishers on October 22, 2018, I was asked by the Fishers Working Group when the in-water work (called hereafter "survey work") would begin. I advised them that it would likely begin the following day, October 23, 2018.

40. **THAT** the survey work that was to have commenced on October 23, 2018 is necessary to finalize the pipeline routing and confirm the diffuser location, complete the receiving water study for the Caribou Channel location and allow for the continuation of the marine pipeline engineering. It is also important to provide information for Northern Pulp's environment assessment submission and to enable Fisheries and Oceans Canada ("DFO") to evaluate the effects, if any, of the construction of the marine section of the pipeline.

41. **THAT** I am informed by Colin Toole of CSR, the contractor engaged by Northern Pulp, and do verily believe that as a result of the actions of the owners or operators of fishing boats, CSR have been prevented from conducting the survey work.

42. **THAT** because the time available to design, construct and commission a new ETF is so short, it is absolutely essential that the survey work is done as soon as possible. Construction of a new ETF cannot begin until an environmental assessment approval has been received from the Nova Scotia Minister of Environment and DFO provides its view on the impact of pipeline construction on fish habitat.

43. **THAT** the survey results, in particular the video of the route, must be submitted to DFO as part of a request for review. Once the request for review is received, they determine if the construction of the pipeline may cause a significant adverse effect on fish habitat. If DFO determines that construction of the pipeline may cause a significant adverse effect on fish habitat, they would require Northern Pulp to follow a different and more time consuming process to consider avoidance, and offsetting measures.

44. **THAT** any delay in the provision of the survey data would cause the submission of a request for review to DFO to be delayed, it would also cause a delay in the detailed engineering work. These delays have severely impaired Northern Pulp's ability to have a new ETF facility constructed and commissioned in the most expeditious way possible.

45. **THAT** I believe that sufficient survey work can be done in December and January, weather conditions permitting, to enable environmental assessment submissions to be prepared and to allow detailed engineering to proceed.

SWORN TO before me at New Glasgow, Nova Scotia, this 30th day of November, 2018.

Northern Pulp mill formally registers controversial effluent treatment project

By Keith Doucette The Canadian Press

The Northern Pulp Nova Scotia Corporation mill is seen in Abercrombie, N.S. on Wednesday, Oct. 11, 2017.

THE CANADIAN PRESS/Andrew Vaughan

Northern Pulp has formally registered its project to replace the effluent treatment facility in Boat Harbour with Nova Scotia's Environment Department.

More than 1,700 pages of environmental assessment documents submitted by the mill were published Thursday on the department's website.

The mill says its proposal will have no significant environmental impact.

Help us **improve** GlobalNews.ca

Take the survey now!

READ MORE: N.S. group seeks data on October effluent leak from Northern Pulp pipeline

The formal move kicked off the 30-day public comment period for the controversial project that includes a new, 15.5-kilometre-long pipeline that will carry millions of litres of treated wastewater to the Northumberland Strait.

Northern Pulp called the registration a “significant milestone” for a project it says is “vital to the continued operation of Northern Pulp, anchor to Nova Scotia’s forest industry.”

> “We all have the same goal which is to see Boat Harbour returned to its natural state,” said Bruce Chapman the mill’s general manager.

“We simply need more time to carry out due diligence in each phase from environmental assessment, to construction and commissioning of this new facility.”

However, Premier Stephen McNeil has said he has no intention of changing a legislated deadline to close Boat Harbour by Jan. 31, 2020.

McNeil has also said that he would debate changes to the deadline in the legislature if they evolve out of a community consensus in Pictou County and are brought forward by the area’s Opposition members.

Boat Harbour's current heavily polluted treatment lagoon is on the edge of the Pictou Landing First Nation.

Despite the province's stated position on the deadline, the company has set out a construction schedule it estimates will take 21 months from the time it gets the required permits and approvals that would allow construction to begin this spring.

It says the effluent treatment facility, pipeline and marine outfall for the effluent would all be fully operational during the "fourth quarter of 2020."

The plan calls for a biological activated sludge treatment facility to be purchased from Paris-based Veolia Water Technologies, to be located on company property not far from the existing plant.

The documents say the effluent pipeline would be constructed within the right of way and "predominately within the existing road shoulder" of Highway 106 for about 11.4 kilometres, then enter waters near the Northumberland Ferries terminal.

The pipe would continue for about 4.1 kilometres through Caribou Harbour to the Northumberland Strait, where the effluent would be discharged through an engineered diffuser.

At a diameter of 900 millimetres, the high density polyethylene pipe will be buried for the majority of the route. It will be above ground to cross the spillway of the Pictou Causeway, where it will be suspended and attached to the exterior of the bridge.

It will be buried adjacent to the navigation channel for the Northumberland Ferries and be weighted down using concrete collars. The company says it's anticipated the marine portion of pipe will be placed in a three-metre deep open-cut trench which will be backfilled with existing material.

The end of the effluent pipe consists of an outfall with a three-port diffuser at a depth of 20 metres. The diffuser pipe will be approximately 50 metres long, with three outlets spaced 25 metres apart.

READ MORE: Permanent injunction stops Nova Scotia fishermen's blockade of Northern Pulp

The outfall will be capable of discharging up to 85 million litres of effluent per day.

The company says the treated effluent it plans to pump into the Strait will meet federal regulations for emissions, but opponents including local fishermen contend there's a lack of scientific evidence regarding how the waste will affect the long-term health of the lucrative lobster and crab fisheries.

Water quality for the diffuser will reach ambient conditions within less than two metres from the diffuser, the documents say, "in terms of total nitrogen, total phosphorus, TSS, DO, pH, and salinity." They say water colour will return to ambient conditions within five metres of the diffuser.

> "Thus, significant residual effects to water quality or sediment quality as a result of treated effluent discharge are not likely."

The company also says modelling results have indicated that there are few traces of “relatively high diluted effluent” after 30 days.

“Based on the results of this assessment, with planned mitigation and using best practices to avoid or minimize adverse effects, the wastewater treatment facility’s effect on the environment during all phases is rated as not significant,” the company said in its news release.

The public has until March 9 to submit comments by mail or via an online forum. Environment Minister Margaret Miller is to decide whether the project can be granted conditional environmental assessment approval by March 29.

The Advocate PICTOU COUNTY'S WEEKLY SINCE 1893

Northern Pulp Seeks Extension

Community Featured

February 6, 2019 Chris Muise

Facebook Twitter Google+ Pinterest

The clock is ticking for the Boat Harbour wastewater treatment facility in Pictou Landing. The Boat Harbour Act passed in 2015 stipulates that the facility must be closed by the end of January next year.

Northern Pulp, however, is seeking an extension.

The company, alongside the Paper Excellence Group, held a press conference in Halifax on Jan. 31 — exactly one year before the deadline stipulated in the Boat Harbour Act — announcing it is seeking a change in the legislation to allow for the time needed to open a new, state-of-the-art wastewater treatment facility.

"We all have the same goal, and that is to see Boat Harbour returned to its natural state," says Kathy Cloutier, director of Corporate Communications for Paper Excellence. "We simply need a bit more time to assure the time and due diligence to carry out each phase."

Before this announcement, Cloutier — alongside Paper Excellence CEO Vice President, Operations East Jean Francois Guillot and Northern Pulp Nova Scotia Corporation General Manager Bruce Chapman — detailed the company's stated efforts since the passing of the Boat Harbour Act, as well as the pitfalls they faced, which they say included unachievable goals and resistance by the fishing community.

Also discussed were the scientific merits of the proposed $130-million treatment facility, which would use an Activated Sludge Treatment (AST) system, which mills across Canada use today. Paper Excellence says that with this system, no untreated waste water would leave the Northern Pulp site.

The question on reporters' minds was, of course, 'how much time are we talking about?'

"What we're looking at today…we're talking about a year, in the whereabouts of a year," says Guillot. Cloutier explained that this year would be to allow for the environmental assessment, construction commissioning, and in general just assuring that they've dotted their i's and crossed their t's.

While Northern Pulp and Paper Excellence seemed confident that the extension would be approved and that they will, as Cloutier said, "be the company that works with Pictou Landing First Nation" and "changes this legacy…that we have acquired," Pictou Landing First Nation member Durney Nicholas has heard it all before.

"They lied to us the first day, and probably are still lying," says Nicholas, who attended the press conference. "They've promised a lot of stuff, and none of them, didn't work."

Cloutier says that Northern Pulp and Paper Excellence are committed to working with Pictou Landing First Nation to find a compromise that works for them as rights-holders, as well as the paper mill's stakeholders.

"We respect everyone's opinions," says Cloutier. "I do believe that, with continued and ongoing conversations, we will reach a goal that everyone is comfortable with."

When asked what Northern Pulp would do if the bid for an extension fails and the January 2020 deadline is maintained, Cloutier said the company would respect the law.

"We will not operate illegally," Cloutier says, while not clarifying for questioning reporters if that would mean the loss of jobs or the closure of the paper mill. "We would not contravene that act if there's no extension."

Jeff Bishop, executive director of Forest Nova Scotia, says he appreciates that the community has been waiting 50 years for a resolution.

"I understand completely where the Pictou Landing First Nation is coming from," says Bishop. "They have been, over the years, told different things by different governments and different owners of this mill. So it's not surprising to hear, when there is a solid date in place with the Boat Harbour Act, that they would like to stick to that."

Even so, Bishop says that the forestry sector of Nova Scotia is deeply interconnected, with saw mills selling excess wood to paper mills, and the 25,000-30,000 tree lot owners selling wood to the market to make ends meet. He says that the loss of the Northern Pulp facility over failure to secure an extension would send ripples across the province.

"The successful continued operation of Northern Pulp is a large piece… of the economy of this province," says Bishop.

"Not to disregard for a second the impact that that community has felt by the operation of the facility right next door — their literal own back yard — these decisions that are to come in the coming weeks and months impact the entire economy of this province, and well-being of a number of communities. Including theirs."

Whether or not the extension is accepted, Nicholas just wants this whole affair to be over.

"Get it done as soon as possible now, I guess," he says. "It's taken a long time. I remember when it started, I was only a young fella, myself. Hopefully someday, I see clear water again over there."

Kathy Cloutier, director of Corporate Communications for Paper Excellence, speaks during the Northern Pulp press conference. (Muise photo)

[redacted]

Dear [redacted]

Re: You are entitled to part of the information you requested – 2017-03648-BUS

The Department of Business received your application for access to information under the *Freedom of Information and Protection of Privacy Act* on March 29, 2017.

In your application, you requested a copy of the following records:

> *Current status (repayment, interest rates, forgiveness requests) on loans by JobsFund / NSBI to Northern Pulp totalling $107 million from 2009 to 2013: (1) 2009, $15 million (2) 2010, $75 million (3) more than $20 million [$3.6 million + $5.2 million + $12 million of which $2.5 million forgivable.*
>
> *Clarified Mar 30, 2017 that this is to include records containing the following information:*
> - *whether the loans are being repaid and/or are they in good standing*
> - *interest rates for each loan*
> - *have any forgivable amounts been forgiven, and if so when*
> - *timelines for repayment*
> - *for any loans that have been renegotiated, the renegotiated amounts and/or timelines*

You are entitled to part of the information requested. However, we have removed some of the information from this record according to subsection 5(2) of the *Act.* The severed information is exempt from disclosure under the Act for the following reasons:

- Section 12: information which could harm intergovernmental relations or information received in confidence from another government.
- Section 17: information the release of which would have a detrimental financial or economic impact on NS.

. . . . /2

The remainder of the information is enclosed.

You have the right to ask for a review of this decision by the Information Access and Privacy Commissioner (formerly the Review Officer). You have 60 days from the date of this letter to exercise this right. If you wish to ask for a review, you may do so on Form 7, a copy of which is attached. Send the completed form to the Information Access and Privacy Commissioner, P.O. Box 181, Halifax, Nova Scotia B3J 2M4.

Please be advised that a de-identified copy of this disclosure letter and the attached response to your FOIPOP application will be made public after 14 days. The package will be posted online at: https://foipop.novascotia.ca.The letter will not include your name, address or any other personal information that you have supplied in the course of making your application under FOIPOP.

Please contact James McLean at 902-424-3773 or by e-mail at james.mclean@novascotia.ca, if you need further assistance in regards to this application.

Sincerely,

Murray Coolican
Deputy Minister

Tab 10

THIS MEMORANDUM OF UNDERSTANDING made this 1st day of December, 1995

BETWEEN:

HER MAJESTY THE QUEEN IN RIGHT OF THE PROVINCE OF NOVA SCOTIA, as represented by the Minister of Supply and Services (hereinafter referred to as "Nova Scotia")

- and -

SCOTT MARITIMES LIMITED, a body corporate under the laws of Nova Scotia (hereinafter referred to as "Scott")

RECITES/WHEREAS:

1. As an inducement to encourage the development of the pulp industry in Pictou County, Nova Scotia and to encourage the introduction and expansion of other industries therein, Nova Scotia agreed to develop and operate an effluent treatment facility at Boat Harbour, Pictou County, Nova Scotia;

2. Scott Paper Company, through a subsidiary, Scott Maritimes Pulp Limited (now Scott), constructed a kraft pulp mill at Abercrombie Point, Nova Scotia, (the "Mill") which went into production on or about the 1st day of September, 1967;

3. Nova Scotia and Scott entered into an Agreement dated the 30th day of September, 1970 (the "1970 Agreement") which sets out the terms and conditions and respective obligations of the parties with respect to the operation and use of the Boat Harbour Effluent Treatment Facility and the supply of water to the Mill;

4. Pursuant to the 1970 Agreement, Nova Scotia is obliged to operate the Boat Harbour Effluent Treatment facility and supply water to the Mill for which Scott pays a set fee;

5. The 1970 Agreement is for a term of twenty-five (25) years commencing October 1, 1970, and is renewable at the instance of either party, subject to negotiation or arbitration of certain terms;

6. Scott gave notice of renewal of the 1970 Agreement to Nova Scotia on the 24th day of February, 1995 and such renewal was acknowledged by Nova Scotia by letter dated March 30, 1995;

7. Pursuant to Section 37(2) of the *Fisheries Act* (Canada) the Minister of Fisheries and Oceans has required Nova Scotia to submit a plan for the future operation of the Boat Harbour Effluent Treatment Facility and Nova Scotia desires to submit a plan which will result in the immediate closure of part of the Facility and a definitive termination date for the remainder of the Reconfigured Facility;

8. Given existing and planned improvements to the Facility, that part of the Facility known as the Stabilization Basin is no longer required for the operation of the Facility after the upgrades are satisfactorily completed; it will at a designated date following the leasing of the Reconfigured Facility no longer form part of the effluent treatment system and it will remain in the possession and control of Nova Scotia who shall have responsibility for its Remediation;

9. Nova Scotia and Scott have agreed to restate and restructure their contractual relationship as it regards the Facility so that, after the Reconfigured Facility is no longer required for effluent treatment Nova Scotia will be in a position to close the entire Facility and the parties have further agreed that Nova Scotia shall have no operational responsibility for the Reconfigured Facility (except those incidental to its position as Landlord of the Reconfigured Facility) after December 31, 1995, and Scott shall have no obligation or liability for the Remediation of all or any part of the Facility which obligation and liability shall be assumed by Nova Scotia;

10. Nova Scotia has agreed to indemnify and hold the Indemnified Parties, as defined in Schedule 4 hereof, harmless for claims which may be made against them as a result the existence of or past operation of the Facility and all other claims which may be made against

the Indemnified Parties following Scott leasing the Reconfigured Facility, except for claims arising directly out of Scott's operation of the Reconfigured Facility after the date of transfer (as more particularly set out herein);

11. The parties have agreed to the renewal of the Water Supply portion of the 1970 Agreement on the terms set out herein.

NOW THEREFORE THIS MEMORANDUM OF UNDERSTANDING WITNESSES:

ARTICLE 1 - DEFINITIONS

1.01 In this Memorandum of Understanding, including the Recitals, the following terms have the following meanings unless the context otherwise requires:

a. "ASB" means the aerated stabilization basin forming part of the Facility as shown on the Plan attached hereto as Schedule "1";

b. "1970 Agreement" means an Agreement dated the 30th day of September, 1970, between Nova Scotia and the Company pursuant to which Nova Scotia constructed and is presently operating the Facility;

c. "Environmental Laws" means all applicable laws, statutes, ordinances, rules, by-laws, guidelines, treaties, and Regulations, and all applicable directives, rules, standards, requirements, policies, orders, judgments, injunctions, or decrees which have the force of law or which are capable of having the force of law, with respect to environmental or health matters including, without limitation, the following: the *Fisheries Act* (Canada), the *Canadian Environmental Protection Act*, the *Canadian Environmental Assessment Act*, the *Transportation of Dangerous Goods Act* (Canada), the *Navigable Waters Protection Act* (Canada), the *Environmental Act* (Nova Scotia), the *Occupational Health and Safety Act* (Nova Scotia), the *Indian Act* (Canada), and any Regulations or guidelines made pursuant to the foregoing;

d. "Facility" means the effluent treatment system which consists of a pipeline for the transmission of effluent from the Mill commencing at a standpipe located on Scott's property at Abercrombie Point, Pictou County, Nova Scotia, and leading under the East River and discharging into settling ponds at Boat Harbour, the Settling Ponds, ASB and the Stabilization Basin and all other appurtenances affixed or appended thereto, more particularly depicted on the Plan attached hereto as Schedule 1 and all related lands and facilities necessary to permit the receipt and lawful disposal of effluent from the Mill commencing at the said stand pipe;

e. "Mill" means Scott's mill as that term is defined in subsection (c) of Section 2 of Chapter 15 of the Statutes of Nova Scotia, 1965.

f. "Point C" means the effluent outfall of the Reconfigured Facility as shown on the Plan attached as Schedule 1;

g. "Reconfigured Facility" means the Effluent Treatment System which consists of a pipeline for the transmission of effluent from the Mill commencing at a standpipe located on Scott's property at Abercrombie Point, Pictou County, Nova Scotia, and leading under the East River and discharging into Settling Ponds at Boat Harbour, the Settling Ponds, and ASB and discharging into Boat Harbour at Point C (which Point C shall become the "Effluent Outfall" of the Reconfigured Facility after the upgrades contemplated herein are satisfactorily completed and the Reconfigured Facility can be operated in compliance with Environmental Laws at Point C) and all other appurtenances affixed or appended thereto, more particularly depicted on the Plan attached hereto as Schedule 2 and all lands and facilities necessary to permit the receipt and lawful disposal of effluent from the Mill, commencing at the said standpipe;

h. "Remediation" means all studies and work required or recommended to fully rectify and remedy any adverse environmental condition at the Facility or any part thereof;

i. "This Memorandum" means this Memorandum of Understanding including the Recitals and the following Schedules:

Schedule 1 - Plan of Facility
Schedule 2 - Plan of Reconfigured Facility
Schedule 3 - Work Plan
Schedule 4 - Draft Water Supply Agreement
Schedule 5 - Indemnity Wording

j. "Settling Ponds" means that area depicted as "Settling Ponds" consisting of the settling pond and the emergency spill pond on the Plan of Facility attached as Schedule 1;

k. "Stabilization Basin" means that area depicted as "Stabilization Basin" on the Plan of Facility attached as Schedule 1;

l. "Work Plan" means the list of work to be done at the Facility by Nova Scotia annexed hereto as Schedule 3.

1.02 Headings

The headings of the Sections and Articles to this Agreement are inserted for convenience of reference only and shall not affect the construction or interpretation of any provision of this Agreement.

1.03 Number and Gender

Words importing the singular shall include the plural and vice versa and words importing the masculine gender shall include the feminine and neuter and vice versa.

ARTICLE 2 - PURPOSE

2.01 Nova Scotia and Scott have negotiated in good faith and have agreed on the significant, major and substantive components of their contractual relationship which are to be translated into a series of documents including the following:

(1) Water Supply Agreement;
(2) Lease Agreement between Nova Scotia and Scott (the "Lease");
(3) Indemnity Agreement;
(4) Such other agreements, deeds or assurances as may be required to ensure the lawful operation of the Facility or Reconfigured Facility, as the case may be;

all of which documents are collectively referred to in this Memorandum of Understanding as the "Legal Documentation".

2.02 Nova Scotia and Scott acknowledge that the Legal Documentation will require finalization between the lawyers of the respective parties as to form and content but that the significant, major and substantive components have been agreed to between Scott and Nova Scotia.

2.03 This Memorandum of Understanding is entered into by the parties to confirm their respective positions, undertakings and agreements which have been reached as of the date hereof.

2.04 The parties agree that the Legal Documentation shall be so drafted to reflect and contain the significant, major and substantive components as have been agreed to by the parties.

2.05 The parties agree to instruct their respective counsel and to give such direction as is necessary to proceed as diligently and expeditiously as possible and in good faith to complete the Legal Documentation.

ARTICLE 3 - WATER SUPPLY AGREEMENT

3.01 The following constitutes the significant, major and substantive components of the agreement between the parties with respect to water supply:

(a) The water supply portions of the 1970 Agreement shall be renewed on a cost recovery basis for a term of 25 years;

(b) The rate for water shall be $18.53 per million imperial gallons for the period from October 1, 1995 until April 1, 1996;

(c) Subject to the water fee credit program (set out herein), the fee for water supplied to the Mill for a five-year term commencing on April 1, 1996 shall consist of an annual base charge of $157,124 payable in equal quarterly instalments and a commodity charge of $64.84 per million imperial gallons;

(d) The annual base charge and commodity charge will be subject to renegotiation at the end of the four-year period commencing April 1, 1996 and every five years thereafter for the duration of the 25-year term and the charges shall reflect the reasonable cost of supplying the water taking into consideration the following components:

1. wages and salaries;
2. power;
3. general supplies;
4. fuel;
5. equipment repairs;
6. building maintenance;
7. rentals;
8. short term borrowings;
9. debt servicing costs.

all in relation to the operation of the Middle River Facility.

(e) All other provisions of the 1970 Agreement relating to the Supply of Fresh Water to the Mill shall apply including, without limitation, paragraphs 1(a), 1(d), 2(c), 3 and 7;

(f) For a ten year term, Scott shall be entitled to an annual environmental improvement credit of up to 25% of the commodity charge payable under the Water Supply Agreement to an annual maximum of $100,000 provided the credited amounts are used for:

(i) in-plant improvements wholly or partly designed to improve emissions, including effluent or air quality, decrease water consumption on a per ton basis or otherwise be directed at non-regulatory environmental enhancement to approach progressive systems closure;

(ii) the planning, approval and construction of new secondary treatment to replace the Boat Harbour System; or

(iii) emission-related research.

The following criteria shall apply to the credits available under paragraph (f)(i):

- a maximum of 10% of the credit may be used for project administration;
- a maximum of 25% of the credit may be applied to project design;
- actual project undertaking measures must be at least 65% of the credit;
- all projects are subject to the prior approval of the Nova Scotia Department of Environment, which approval shall not be unreasonably withheld. Unless otherwise notified by the Department of Environment, approval shall be deemed to be given sixty (60) days after the request is made.

(g) The Water Supply Agreement shall be substantially in the form annexed hereto as Schedule 4 subject to such reasonable amendments or additions as may be agreed upon between the parties acting in good faith.

ARTICLE 4 - EFFLUENT TREATMENT AGREEMENT

4.01 The following constitutes the significant, major and substantive components of the agreement between the parties with respect to effluent treatment.

(a) The parties agree to the renewal of the 1970 Agreement as it relates to effluent treatment, on current terms for the period from September 30, 1995 until December 31, 1995.

(b) Nova Scotia agrees to lease the Reconfigured Facility to Scott as it exists on December 31, 1995 (subject to upgrades contemplated herein) for a term of ten years commencing on January 1, 1996 for a rent of One Dollar ($1.00).

(c) (i) Scott shall have no liability, responsibility or obligation whatsoever arising out of, or in any way related to the operation of the Facility up to December 31, 1995 and Nova Scotia expressly agrees to assume all liabilities, responsibilities and obligations whether known or unknown relating to or in any way arising out of the use of the Facility up to December 31, 1995, and for greater certainty, Nova Scotia agrees to provide an indemnity substantially in the form annexed hereto as Schedule 5 in favour of Scott and the Indemnified Parties (as defined therein).

(ii) Scott shall assume responsibility for the Operation of the Facility after December 31, 1995, and subject to the obligation to undertake the clean up program referred to in Article 4.01(f) Scott shall have no liability, responsibility or obligation whatsoever for Remediation of the Facility.

(d) Nova Scotia agrees to undertake a clean-up program with respect to the Facility prior to the commencement of the Lease with Scott, which clean-up program shall include the work listed on the Work Plan. If a pipeline and diffuser is required by any level of government during the term of the Lease it shall be installed at the sole expense of Nova Scotia.

(e) Nova Scotia agrees to pay the cost of installation of the necessary equipment to establish Point C as the lawful effluent outfall and the cost of upgrading the aeration capacity of the Facility up to a maximum cost of One Million Seven Hundred and Fifty Thousand Dollars ($1,750,000.00) so that the facility has reliable, installed aeration capacity of up to 1,600 hp. It is agreed that Scott or its agents will engineer, manage and complete the conversion of the effluent outfall and upgrading of the aeration capacity of the Facility. It is further agreed that Scott shall be entitled to payment from Nova Scotia of costs incurred by it in converting the outfall and upgrading the aeration capacity of the Facility upon presentation of invoices for work or material to Nova Scotia, within thirty (30) days of presentation of invoices. For the purposes of this subarticle, "upgrading the aeration capacity of the Facility" includes, without limitation, engineering studies, opinions on compliance, the purchase and installation of new aerators, the upgrading of electrical equipment, and the purchase of such other equipment or the performance of such other work as may be required, in Scott's discretion.

(f) Scott shall be required to undertake a clean-up program with respect to the Facility at the termination of the Lease, which clean-up program shall consist of the removal of sludge from the Settling Ponds and the ASB and restoration of the Reconfigured Facility to the state it was in at the commencement of the Lease, reasonable wear and tear excepted. For greater certainty, it is agreed that Scott shall have no obligation or responsibility to restore the Stabilization Basin, which restoration will be undertaken by Nova Scotia in its sole discretion;

(g) It is mutually agreed that Nova Scotia shall have no ongoing responsibility for the operation of the Reconfigured Facility following December 31, 1995 (except for those responsibilities that arise as landlord) but Nova Scotia shall remain responsible for Remediation of the Reconfigured Facility at the expiration of the term of the Lease and Nova Scotia shall remain in possession of and responsible for the Stabilization Basin and Nova Scotia agrees not

to render the Stabilization Basin a tidal estuary and waters frequented by fish until the Stabilization Basin has been remediated by it in accordance with applicable Environmental Laws;

(h) As soon as is practical, Nova Scotia agrees to reduce the water level in the Stabilization Basin to eliminate any alleged trespass of the waters therein beyond the ordinary high water mark of the former Boat Harbour. Such reduction shall be done in accordance with applicable Environmental Laws;

(i) Nova Scotia agrees that the Lease shall include all fixtures and equipment currently at the Facility and Nova Scotia agrees to grant to Scott an irrevocable option to purchase fixtures and equipment used at the Facility for its depreciated value at the end of the term of the Lease.

(j) Nova Scotia agrees to grant to Scott an option to purchase the pipeline commencing at a standpipe located on Scott's property at Abercrombie Point, Pictou County, Nova Scotia and leading under the East River to the point where the shores of Pictou Landing meet the East River or such other portion of the pipeline and appurtenant lands as may be agreed, for a purchase price of One Dollar ($1.00), which option may be exercised at any time prior to December 31, 2006.

(k) Nova Scotia agrees to obtain all required permits, consents, approvals and letters of authorization for the continued operation of the Reconfigured Facility as of the date of transfer, and Nova Scotia will assign all such permits, consents, approvals and letters of authorization and obtain such consents to assignments as may be required. Nova Scotia agrees to impose operating limits on the Facility which reflect and do not exceed or apply more stringently than the standards set out in the Pulp and Paper Effluent Regulations (Canada) and further agrees to obtain all required federal government approvals, if any, to permit the continued operation of the Reconfigured Facility as contemplated in this Agreement

(l) Nova Scotia agrees to use its best efforts to assist Scott obtain all necessary permits, consents and approvals to permit the construction and operation of a replacement effluent treatment facility to replace the Facility at the expiration of the term of the Lease.

(m) In the event that easements are required for the operation of a replacement effluent treatment facility, Nova Scotia agrees:

(i) to grant such easements as may be reasonably required over lands of Her Majesty, the Queen in right of the Province of Nova Scotia at fair market value as determined by an accredited appraiser;

(ii) to use its best efforts to assist Scott to obtain any such easements required over private lands;

(n) Nova Scotia agrees that Scott shall be entitled to use the Landfill owned by Nova Scotia adjacent to the Reconfigured Facility during the term of the Lease for ordinary maintenance of the Facility and that the Landfill has sufficient capacity for such use by Scott;

(o) Nova Scotia agrees that the Lease shall not include the Landfill (notwithstanding Scott's right of use set out above) nor shall it include any former landfill or dump sites, which sites shall remain in the possession and control of Nova Scotia;

(p) This Memorandum of Understanding and the indemnities contemplated herein shall enure to the benefit of and be binding upon the parties hereto and their respective successors and assigns.

(q) Neither party shall be held responsible for any losses resulting if the fulfillment of any terms hereunder shall be delayed or prevented by civil disorders, wars, acts of enemies, acts of God, or by any other cause which could not be reasonably forseen and prevented and which are not within control of the party whose performance is interfered with, and which by the exercise of reasonable diligence, said party is unable to prevent or eliminate.

(r) The parties hereto shall do such further acts, execute and deliver such further documents and give such further assurances as may be necessary or desirable to give full effect to this Memorandum and the indemnities contemplated herein and to ensure the continued lawful operation of the Facility or Reconfigured Facility as the case may be. Furthermore,

should the federal Pulp and Paper Effluent Regulations change during the term of the Lease either through enactment of revisions or by judicial interpretation, Nova Scotia agrees to execute and deliver such further documents, including without limitation, deeds with repurchase options, as may be reasonably required for the lawful operation of the Reconfigured Facility during the term of the Lease or should Scott become lawfully permitted to operate the Reconfigured Facility without being a tenant thereof Nova Scotia agrees to accept a surrender of lease, at Scott's option.

IN WITNESS WHEREOF the parties hereto have set their hands and affixed their seals the day and year first above written.

SIGNED, SEALED AND DELIVERED in the presence of:

HER MAJESTY THE QUEEN IN RIGHT OF THE PROVINCE OF NOVA SCOTIA, AS REPRESENTED BY THE MINISTER OF SUPPLY AND SERVICES

SCHEDULE 3 - WORK PLAN

Below are the required improvements to the Boat Harbour Effluent Treatment Facility to be undertaken by Nova Scotia:

- Removal of sludge from the Settling Ponds by December 31, 1995;
- Installation of proper inlet and outlet devices for Settling Ponds by December 31, 1995;
- Removal of sludge from ASB by September 1, 1996; *
- Completion of Cycle I of the environmental effects monitoring program required under the Pulp and Paper Effluent Regulations (Canada) in accordance with the Regulations. Scott will be responsible for the continuing environmental effects monitoring program.

* As the removal of sludge from the ASB will occur while the Reconfigured Facility is subject to the Lease to Scott it is agreed:

1. Nova Scotia will take all measures necessary to complete the removal of sludge in a manner which does not interfere with the lawful operation of the Reconfigured Facility by Scott and shall fully consult with Scott before undertaking any such work;

2. Nova Scotia will indemnify and hold harmless the Indemnified Parties against all claims, demands, charges, penalties or fines which may be made against the Indemnified Parties arising directly or indirectly out of the removal of sludge from the ASB by Nova Scotia.

Schedule 4

THIS **WATER SUPPLY AGREEMENT** made in duplicate this 30th day of June, 1995,

BETWEEN:

HER MAJESTY THE QUEEN IN RIGHT OF THE PROVINCE OF NOVA SCOTIA, as represented by the Minister of Environment as approved by Order in Council 95- dated the ____ day of _____, 1995.

(hereinafter referred to as "Nova Scotia")

- and -

SCOTT MARITIMES LIMITED, a body corporate

(hereinafter referred to as "Scott")

WITNESSES:

WHEREAS Scott operates a Mill at Abercrombie, in the County of Pictou, Province of Nova Scotia, for the purpose of manufacturing bleach kraft pulp.

AND WHEREAS by an Agreement dated the 30th day of September, 1970, (the "1970 Agreement") the parties contracted, inter alia, for the supply of water to the Mill;

AND WHEREAS pursuant to the 1970 Agreement the Province covenanted and agreed to supply water to the Mill as follows:

> "On March 31, 1967, and on each day thereafter a minimum of 25 million Imperial Gallons per day."

AND WHEREAS the 1970 Agreement may be renewed at the instance of either party upon giving notice;

AND WHEREAS on the 24th day of February, 1995, Scott gave notice to the Province of its intent to renew the Agreement;

AND WHEREAS the parties hereto have agreed to the following terms to replace the 1970 Agreement:

NOW THEREFORE IN CONSIDERATION of One Dollar ($1.00) and other good and valuable consideration the parties agree as follows:

ARTICLE I - DEFINITIONS

1.01 Definitions

In this Agreement, including the Recitals, the following terms have the following meanings unless the context otherwise requires:

(a) "Agreement" means this Agreement including the recitals and the following Schedules:

(i)

(b) "Fresh Water" means water suitable for the manufacture of bleach kraft pulp;

(c) "Water Supply System" means a reservoir for the storage of water at the mouth of the Middle River and including a dam, dam gates, fish ladders, a pump house and a water pumping system, and a pipeline for the transmission of water, and such additional or alterative facilities, including West River Reservoir, as are necessary to enable the Province to supply fresh water to the Mill as herein provided.

ARTICLE II - COVENANTS OF THE PROVINCE

2.01 The Province covenants and agrees that:

(a) It will at its cost, own, operate and maintain the Water Supply System and continue to supply up to 25 million Imperial Gallons of Fresh Water per day to the Mill, provided however that the Province shall not be responsible for the removal of sodium chloride, colour or turbidity to the extent that such or due to conditions existing in or about the Middle River as of the date hereof;

(b) It will be liable for any interruption or cessation of services to be provided by it hereunder caused by any negligent act or omission of the Province, its servants, agents, contractors or employees, but the Province will not be liable for any interruption or for the cessation of the services due to a cause beyond the control of the Province which the Province shall have exercised due diligence to prevent, eliminate or terminate to the extent that it could reasonably do so;

ARTICLE III - COVENANTS OF THE COMPANY

3.01 The Company covenants and agrees that:

(a) Until April 1, 1996, it will pay to the Province for Fresh Water Eighteen Dollars and Fifty-Three Cents ($18.53) per million Imperial Gallon or One Hundred Thousand Dollars ($100,000) per year, whichever is greater;

(b) For the term commencing April 1, 1996, and running for four (4) years, it will pay to the Province for Fresh Water a commodity charge of $65.84 per million Imperial Gallons plus an annual base rate of $157,124 and

(c) It will measure the quantities of Fresh Water consumed and will pay the Province at the aforesaid rate for the quantities of Fresh Water consumed. The Province reserves the right to verify such measurements using its own equipment.

3.02 Payments under clauses (a) and (b) of Section 3.01 shall be made quarterly not in advance from the effective date of this Agreement and any necessary adjusting payment will be made once yearly commencing one (1) year after the effective date of this Agreement.

3.03 For the purposes of this Article, years shall be deemed to commence on the 1st day of April of every year.

ARTICLE IV - WATER FEE CREDIT PROGRAM

4.01 For a ten year term, Scott shall be entitled to an annual environmental improvement credit of up to 25% of the commodity charge payable hereunder to an annual maximum of $100,000 provided the credited amounts are used for:

(a) in-plant improvements wholly or partly designed to improve emissions including effluent or air quality, decrease water consumption on a per ton basis or otherwise be directed at non-regulatory environmental enhancement to approach progressive systems closure;

(b) the planning, approval and construction of new secondary treatment to replace the Boat Harbour System; or

(c) emission-related research.

The following criteria shall apply to the credits availed under paragraph 4.0(a):

- a maximum of 10% of the credit may be used for project administration;
- a maximum of 25% of the credit may be applied to project design;
- actual project undertaking measures must be at least 65% of the credit;

- the annual maximum of $100,000 per year shall be non-cumulative.

ARTICLE V - TERM OF AGREEMENT

5.01 This Agreement shall be in force for a term commencing on the date hereof and expiring on the 31st day of March, 2021, except that the amount paid for Fresh Water shall be subject to adjustment and the parties shall negotiate the price to be paid on a cost recovery basis for Fresh Water for every five (5) year term and if they are unable to reach agreement, the dispute or difference shall be referred to a Board of Arbitration constituted and appointed in accordance with Agreement.

5.02 If the parties are unable to agree on the price to be paid for Fresh Water hereunder, either party may notify the other in writing of its desire to refer such dispute or difference to a Board of Arbitration and it shall in such notice name its representative to the Board within ten (10) days of the receipt of such notice, the other party shall notify the first party in writing of the name of its representative to the Board. The two representatives shall appoint a third arbitrator and he shall be appointed chairman of the Board. The Arbitrator shall proceed expeditiously to adjudicate the dispute. The *Arbitration Act* shall apply to this arbitration clause and in particular to the appointment of a second member and third member of the Board of Arbitration if the party required to appoint a representative of the Board fails to do so as herein provided; and if the two representatives of the parties named to the Board fail to meet and appoint a third member to be chairman as herein provided.

ARTICLE VI - MISCELLANEOUS

6.01 Notices

All notices given pursuant to this Agreement shall be in writing and given by mail, fax or personal delivery to the parties as follows:

Name of Party	Scott Maritimes Limited
Address	P.O. Box 549D New Glasgow, NS B2H 5E8
Fax No.	902-752-5404
Attention:	Mr. Gerry Byrne, President

with a copy to:

	McInnes Cooper & Robertson 1601 Lower Water Street P.O. Box 730 Halifax, NS B3J 2V1
Fax No.:	902-425-6350
Attention:	Bernard F. Miller

Name of Party:	Minister of Environment
Address:	5th Floor, 5151 Terminal Road P.O. Box 2107 Halifax, NS B3J 3B7
Fax No.:	902-424-0644
Attention:	Deputy Minister, Wayne J. Grady

or to such other address, fax number or officer of a party as that party may notify the other party from time to time.

6.02 Effective Time of Notice

Notices shall be deemed given upon the earlier of the following:

(1) If mailed, on the fifth Business Day following deposit in the mails;

(2) If given by fax, on transmission;

(3) On receipt.

6.03 Governing Law

This Agreement shall be governed by and construed in accordance with the laws of Nova Scotia and the laws of Canada applicable therein.

6.04 Assigns

This Agreement shall enure to the benefit of and be binding upon the parties hereto and their respective successors and assigns.

6.05 Amendments

This Agreement represents the entire agreement between the parties and may be amended only in writing signed by all parties affected thereby.

6.06 Further Assurances

The parties hereto shall do such further acts, execute and deliver such further documents and give such further assurances as may be necessary or desirable to give full effect to this Agreement.

IN WITNESS WHEREOF the parties hereto have set their hands and affixed their seals the day and year first above written.

SIGNED, SEALED AND DELIVERED in the presence of:

SCHEDULE 5

Indemnity by Nova Scotia in Favour of Indemnified Parties

Notwithstanding any other provision in any Agreement between the parties, Nova Scotia shall indemnify and hold Scott Maritimes Limited and Scott Paper Company and their respective officers, directors, shareholders, employees, agents, consultants, advisors and their respective heirs, successors (including successors in title), assigns and legal representatives, shareholders, and their respective officers, directors, shareholders, employees, agents, consultants and advisors (hereinafter referred to as the "Indemnified Parties") harmless from and against any and all:

(a) liabilities, losses, claims, demands, actions, causes of action, damages, (including, without limitation, lost profits, consequential damages, interest, penalties, fines and monetary sanctions) including amounts paid to settle actions, whether before or after litigation or other proceedings or activities of any nature, or to satisfy judgments, orders or directives including, without limitation, any judgment, order or directive imposing joint and several liability on the Indemnified Parties and any costs (including the cost of diverting or altering components of the Facility in response to Claims), liability or damages:

(i) arising out of the designation of the Facility or Reconfigured Facility as a contaminated site within the meaning of any Environmental Laws;

(ii) arising out of or in any way related to the existence or operation of the Facility by Nova Scotia up to the effective date of this Agreement;

(iii) arising out of any claim based in nuisance, including any claim for a permanent or temporary injunction; or

(iv) any claim arising out of the construction or location of the Facility or Reconfigured Facility, including claims based in trespass whether such claims relate to activities occurring before or after the effective date of this Agreement (hereinafter collectively referred to as "Claims").

(b) legal fees on a solicitor and client basis, consultants fees and all other out-of-pocket expenses arising because of Claims (hereinafter referred to as "Expenses")

incurred or suffered by the Indemnified Parties, whether such Claims and/or Expenses arise under statute or not, which may at any time or from time to time be paid, incurred, claimed or asserted against any of the Indemnified Parties for, with respect to, or as a direct or indirect result of the construction, location or existence of the Facility or Reconfigured Facility or the past operation of the Facility by Nova Scotia including, **without limitation**:

A. Claims made and/or Expenses arising due to the presence on or under, or the discharge, escape, seepage, leakage, spillage, emission, exhaust, or release

from the Facility into the environment or into or upon land, the atmosphere, or any water course, body of water or wetlands, of any substance, pollutant, waste, contaminant, harmful or hazardous material, fumes, steam, or odour due to or in any way related to the Facility and, without limiting the generality of the foregoing, Nova Scotia undertakes that this Indemnity shall apply to the costs of defending and/or counter-claiming or claiming over and against third parties in such manner as the Indemnified Parties in their sole discretion may determine in respect of any action, proceeding or matter raised in connection with the Facility.

B. The breach of any Environmental Laws by Nova Scotia;

C. The trespass of the Facility or any part thereof on adjacent lands or any tort or other common law claim relating to or arising out of the past, present or future use of the Facility, or arising out of the design, construction, location or configuration of the Facility, including any claim for injunction raised in any such claim;

D. Subrogation claims made by Her Majesty the Queen in Right of Canada (Canada) pursuant to a Settlement Agreement dated July 20, 1993, between Canada and The Pictou Landing Indian Band.

The Indemnified Parties shall be held harmless as contemplated herein notwithstanding the provisions of any Ministerial Order or other directive issued or made pursuant to present or future Environmental Laws.

Without restricting the generality of the foregoing, this undertaking and indemnity shall extend to all Claims made by any person or government made on their own behalf, on the public's behalf (for example in public nuisance) or on behalf of any other party (including, without limitation, claims arising by statute or by subrogation). The undertaking and indemnification set out herein shall remain in full force and effect perpetually following the transfer of responsibility for operation of the Facility from Nova Scotia to Scott Maritimes Limited.

The foregoing indemnity is intended to provide the broadest possible indemnity to the Indemnified Parties and it is hereby mutually agreed that it is not to be interpreted *contra proferentum* or restrictively but is to be given a broad and liberal interpretation in favour of the Indemnified Parties.

ACKNOWLEDGEMENT AGREEMENT dated MAY 12, 2008

To: Northern Pulp NS LP, its affiliates and Northern Pulp Nova Scotia Corporation

In connection with the proposed sale of the Pictou Pulp Mill and related assets (the "Asset Sale") by Neenah Paper Company of Canada (collectively with its affiliates, "NPCC") to its wholly-owned subsidiary, Northern Pulp Nova Scotia Corporation ("NPNS"), and the subsequent sale of the shares of NPNS (the "Share Sale", and together with the Asset Sale, the "Acquisition") to Northern Pulp NS LP (collectively with its affiliates and NPNS, the "Purchaser"), Her Majesty The Queen in the Right of the Province of Nova Scotia (the "Province") hereby acknowledges, agrees and confirms that:

(a) each of the successors and assigns of Scott Maritimes Limited ("Scott"), including Kimberly-Clark Inc. and NPCC, has had, and upon the closing of the Acquisition Purchaser will continue to have, the full benefit of and all of the rights of Scott under each of the agreements and understandings entered into between the Province and Scott in connection with the transfer of operations of the Effluent Treatment System associated with the Pictou Pulp Mill from the Province to Scott in December, 1995; and

(b) each of such agreements and understandings (including any amendments or extensions prior to the date hereof) is in good standing and, from and after the closing of the Acquisition, shall continue in full force and effect for the benefit of Purchaser notwithstanding that various circumstances anticipated by the Province and Scott at the time of execution have changed (particularly with respect to closure of the Effluent Treatment System, which has not transpired).

Without limiting the generality of the foregoing, the Province acknowledges, agrees and confirms that, from and after the closing of the Acquisition, the Memorandum of Understanding between the Province and Scott dated December 1, 1995 and the Indemnity Agreement between the Province and Scott dated December 31, 1995 shall continue to apply with respect to the ongoing operation of the Effluent Treatment System, Purchaser's use of the Lands subject to the Lease between the Province and Scott dated December 31, 1995 (extended under Lease Extension Agreement dated October 22, 2002) and Purchaser's use of Boat Harbour (pursuant to the Licence Agreement between Province and Scott dated December 31, 1995 and the letter of extension dated November 30, 2006 from the Deputy Minister of Transportation and Public Works).

The Province further acknowledges, agrees and confirms that, from and after the closing of the Acquisition, the terms identified on Schedule A hereto shall operate for the full benefit of Purchaser and its successors and assigns.

Her Majesty The Queen in the Right of the Province of Nova Scotia, as represented by the Deputy-Minister of Transportation and Infrastructure

Schedule 'A

ACKNOWLEDGED TERMS

Memorandum of Understanding. December 1. 1995

Section 10

Nova Scotia has agreed to indemnify and hold the Indemnified parties, as defined in Schedule 4 thereof, harmless for claims which may be made against them as a result the existence of or past operation of the Facility and all other claims which may be made against the Indemnified Parties following Scott leasing the Reconfigured Facility, except for claims arising directly out of Scott's operation of the Reconfigured Facility after the date of transfer (as more particularly set out herein).

Article 4.01

(c)(i) Scott shall have no liability, responsibility or obligation whatsoever arising out of, or in any way related to the operation of the Facility up to December 31, 1995 and Nova Scotia expressly agrees to assume all liabilities, responsibilities and obligations whether known or unknown relating to or in any way arising out of the use of the Facility up to December 31, 1995, and for greater certainty, Nova Scotia agrees to provide an indemnity substantially in the form annexed hereto as Schedule 5 in favour of Scott and the Indemnified Parties (as defined therein).

(c)(ii) Scott shall assume responsibility for the Operation of the Facility after December 31, 1995, and subject to the obligation to undertake the clean up program referred to in Article 4.01(f) Scott shall have no liability, responsibility or obligation whatsoever for Remediation of the Facility.

(e) Nova Scotia agrees to pay the cost of installation of the necessary equipment to establish Point C as the lawful effluent outfall and the cost of upgrading the aeration capacity of the Facility up to a maximum cost of One Million Seven Hundred and Fifty Thousand Dollars ($1,750,000.00) so that the facility has reliable, installed aeration capacity of up to 1,600 hp. It is agreed that Scott or its agents will engineer, manage and complete the conversion of the effluent outfall and upgrading of the aeration capacity of the Facility. It is further agreed that Scott shall be entitled to payment from Nova Scotia of costs incurred by it in converting the outfall and upgrading on capacity of the Facility upon presentation of invoices for work or material Nova Scotia, within (30) days of presentation of invoices. For the purposes of this subarticle, "upgrading the aeration capacity of the Facility" includes, without limitation, engineering studies, opinions on compliance, the purchase and installation of new aerators, the upgrading of electrical equipment, and the purchase of such other equipment or the performance of such other work as may be required, in Scott's discretion.

(f) Scott shall be required to undertake a clean-up program with respect to the Facility at the termination of the Lease, which clean-up program shall consist of the removal of sludge from the Settling Ponds and the ASB and restoration of the Reconfigured Facility to the state it was in at the commencement of the Lease, reasonable wear and tear excepted. For greater certainty, it is agreed that Scott shall have no obligation or responsibility to restore the Stabilization Basin, which restoration will be undertaken by Nova Scotia in its sole discretion.

(g) It is mutually agreed that Nova Scotia shall have no ongoing responsibility for the operation of the Reconfigured Facility following December 31, 1995 (except for those responsibilities that arise as landlord) but Nova Scotia shall remain responsible for Remediation of the Reconfigured Facility at the expiration of the term of the Lease and Nova Scotia shall remain in possession of and responsible for the Stabilization Basin and Nova Scotia agrees not to render the Stabilization Basin a tidal estuary and waters frequented by fish until the Stabilization Basin has been remediated by it in accordance with applicable Environmental Laws.

(h) As soon as it is practical, Nova Scotia agrees to reduce the water level in the Stabilization Basin to eliminate any alleged trespass of the waters therein beyond the ordinary high water mark of the former Boat Harbour. Such reduction shall be done in accordance with applicable Environmental Laws.

(k) Nova Scotia agrees to obtain all required permits, consents, approvals and letters of authorization for the continued operation of the Reconfigured Facility as of the date of transfer, and Nova Scotia will assign all such permits, consents, approvals and letters of authorization and obtain such consents to assignments as may be required. Nova Scotia agrees to impose operating limits on the Facility which reflect and do not exceed or apply more stringently than the standards set out in the Pulp and Paper Effluent Regulations (Canada) and further agrees to obtain all required federal government approvals, if any, to permit the continued operation of the Reconfigured Facility as contemplated in this Agreement.

(n) Nova Scotia agrees that Scott shall be entitled to use the Landfill owned by Nova Scotia adjacent to the Reconfigured Facility during the term of the Lease for ordinary maintenance of the Facility and that the Landfill has sufficient capacity for such use by Scott.

(o) Nova Scotia agrees that the Lease shall not include the Landfill (notwithstanding Scott's right of use set out above) nor shall it include any former landfill or dump sites, which sites shall remain in the possession and control of Nova Scotia.

(p) This Memorandum of Understanding and the indemnities contemplated herein shall enure to the benefit of and be binding upon the parties hereto and their respective successors and assigns.

<u>Indemnity Agreement, December 31, 1995</u>

<u>Indemnity by Nova Scotia in Favour of Indemnified Parties</u>

1.01 Notwithstanding any other provision in any Agreement between parties, Nova Scotia shall indemnify and hold Scott Maritimes Limited and Scott Paper Company and their respective officers, directors, shareholders, employees, agents, consultants, advisors and their respective heirs, successors (including successors in title), assigns and legal representatives, shareholders, and their respective officers, directors, shareholders, employees, agents, consultants and advisors (hereinafter referred to as the "Indemnified Parties") harmless from and against any and all:

(a) liabilities, losses, claims, demands, actions, causes of action, damages, (including, without limitation, lost profits, consequential damages, interest, penalties, fines and monetary sanctions) including amounts paid to settle actions, whether before or after litigation or other proceedings or activities of any nature, or to satisfy judgments, orders or directives including, without limitation, any judgment, order or directive imposing joint and several liability on the

Indemnified Parties and any costs (including the cost of diverting or altering components of the Facility in response to Claims), liability or damages:

(i) arising out of the designation of the Facility or Reconfigured Facility as a contaminated site within the meaning of any Environmental Laws;

(ii) arising out of or in any way related to the existence or operation of the Facility by Nova Scotia up to the effective date of this Agreement;

(iii) arising out of any claim based in nuisance, including any claim for a permanent or temporary injunction; or

(iv) any claim arising out of the construction or location of the Facility or Reconfigured Facility, including claims based in trespass whether such claims relate to activities occurring before or after the effective date of this Agreement (hereinafter collectively referred to as "Claims").

(b) legal fees on a solicitor and client basis, consultants fees and all other out-of-pocket expenses arising because of Claims (hereinafter referred to as "Expenses")

incurred or suffered by the Indemnified Parties, whether such Claims and/or Expenses arise under statute or not, which may at any time or from time to time be paid, incurred, claimed or asserted against any of the Indemnified Parties for, with respect to, or as a direct or indirect result of the construction, location or existence of the Facility or Reconfigured Facility or the past operation of the Facility by Nova Scotia including, without limitation:

(A) Claims made and/or Expenses arising due to the presence on or under, or the discharge, escape, seepage, leakage, spillage, emission, exhaust, or release from the Facility into the environment or into or upon land, the atmosphere, or any water course, body of water or wetlands, of any substance, pollutant, waste, contaminant, harmful or hazardous material, fumes, steam, or odour due to or in any way related to the Facility and, without limiting the generality of the foregoing, Nova Scotia undertakes that this Indemnity shall apply to the costs of defending and/or counter-claiming or claiming over and against third parties in such manner as the Indemnified Parties in their sole discretion may determine in respect of any action, proceeding or matter raised in connection with the Facility;

(B) The breach of any Environmental Laws by Nova Scotia;

(C) The trespass of the Facility or any part thereof on adjacent lands or any tort or other common law claim relating to or arising out of the past, present or future use of the Facility, or arising out of the design, construction, location or configuration of the Facility, including any claim for injunction raised in any such claim; and

(D) Subrogation claims made by Her Majesty the Queen in Right of Canada (Canada) pursuant to a Settlement Agreement dated July 20, 1993, between Canada and The Pictou Landing Indian Band.

1.02 The Indemnified Parties shall be held harmless as contemplated herein notwithstanding the provisions of any Ministerial Order or other directive issued or made pursuant to present or future Environmental Laws.

1.03 Without restricting the generality of the foregoing, this undertaking and indemnity shall extend to all Claims made by any person or government made on their own behalf, on the public's behalf (for example in public nuisance) or on behalf of any other party (including, without limitation, claims arising by statute or by subrogation). The undertaking and indemnification set out herein shall remain in full force and effect perpetually following the transfer of responsibility for operation of the Facility from Nova Scotia to Scott Maritimes Limited.

1.04 The foregoing indemnity is intended to provide the broadest possible indemnity to the Indemnified Parties and it is hereby mutually agreed that it is not to be interpreted *contra proferentum* or restrictively but is to be given a broad and liberal interpretation in favour of the Indemnified Parties and is to be construed in a manner consistent with the Memorandum of Understanding.

1.05 Nova Scotia shall not be held responsible hereunder if the fulfilment of any terms hereunder shall be delayed or prevented by civil disorders, wars, acts of enemies, acts of God, or by any other cause not within control of the party whose performance is interfered with, and which by the exercise of reasonable diligence, said party is unable to prevent or eliminate.

Tab 12

THIS INDEMNITY AGREEMENT made the 31st day of December, 1995,

BETWEEN:

HER MAJESTY THE QUEEN IN RIGHT OF THE PROVINCE OF NOVA SCOTIA, as represented by the Minister of Supply and Services

(hereinafter referred to as "Nova Scotia")

- and -

SCOTT MARITIMES LIMITED, a body corporate, under the laws of the Province of Nova Scotia

WHEREAS pursuant to an agreement (the "Memorandum of Understanding") Nova Scotia has agreed to indemnify the Indemnified Parties, as defined herein, against certain Claims and/or Expenses, as defined herein.

IN CONSIDERATION of the sum of One Dollar ($1.00) and other good and valuable consideration, the parties hereby agree as follows:

Indemnity by Nova Scotia in Favour of Indemnified Parties

1.01 Notwithstanding any other provision in any Agreement between the parties, Nova Scotia shall indemnify and hold Scott Maritimes Limited and Scott Paper Company and their respective officers, directors, shareholders, employees, agents, consultants, advisors and their respective heirs, successors (including successors in title), assigns and legal representatives, shareholders, and their respective officers, directors, shareholders, employees, agents, consultants and advisors (hereinafter referred to as the "Indemnified Parties") harmless from and against any and all:

(a) liabilities, losses, claims, demands, actions, causes of action, damages, (including, without limitation, lost profits, consequential damages, interest, penalties, fines and monetary sanctions) including amounts paid to settle actions, whether before or after litigation or other proceedings or activities of any nature, or to satisfy judgments, orders or directives including, without limitation, any judgment, order or directive imposing joint and several liability on the Indemnified Parties and any costs (including the cost of diverting or altering components of the Facility in response to Claims), liability or damages:

(i) arising out of the designation of the Facility or Reconfigured Facility as a contaminated site within the meaning of any Environmental Laws;

(ii) arising out of or in any way related to the existence or operation of the Facility by Nova Scotia up to the effective date of this Agreement;

(iii) arising out of any claim based in nuisance, including any claim for a permanent or temporary injunction; or

(iv) any claim arising out of the construction or location of the Facility or Reconfigured Facility, including claims based in trespass whether such claims relate to activities occurring before or after the effective date of this Agreement (hereinafter collectively referred to as "Claims").

(b) legal fees on a solicitor and client basis, consultants fees and all other out-of-pocket expenses arising because of Claims (hereinafter referred to as "Expenses")

incurred or suffered by the Indemnified Parties, whether such Claims and/or Expenses arise under statute or not, which may at any time or from time to time be paid, incurred, claimed or asserted against any of the Indemnified Parties for, with respect to, or as a direct or indirect result of the construction, location or existence of the Facility or Reconfigured Facility or the past operation of the Facility by Nova Scotia including, **without limitation:**

A. Claims made and/or Expenses arising due to the presence on or under, or the discharge, escape, seepage, leakage, spillage, emission, exhaust, or release from the Facility into the environment or into or upon land, the atmosphere, or any water course, body of water or wetlands, of any substance, pollutant, waste, contaminant, harmful or hazardous material, fumes, steam, or odour due to or in any way related to the Facility and, without limiting the generality of the foregoing, Nova Scotia undertakes that this Indemnity shall apply to the costs of defending and/or counter-claiming or claiming over and against third parties in such manner as the Indemnified Parties in their sole discretion may determine in respect of any action, proceeding or matter raised in connection with the Facility.

B. The breach of any Environmental Laws by Nova Scotia;

C. The trespass of the Facility or any part thereof on adjacent lands or any tort or other common law claim relating to or arising out of the past, present or future use of the Facility, or arising out of the design, construction, location or configuration of the Facility, including any claim for injunction raised in any such claim;

D. Subrogation claims made by Her Majesty the Queen in Right of Canada (Canada) pursuant to a Settlement Agreement dated July 20, 1993, between Canada and The Pictou Landing Indian Band.

1.02 The Indemnified Parties shall be held harmless as contemplated herein notwithstanding the provisions of any Ministerial Order or other directive issued or made pursuant to present or future Environmental Laws.

1.03 Without restricting the generality of the foregoing, this undertaking and indemnity shall extend to all Claims made by any person or government made on their own behalf, on the public's behalf (for example in public nuisance) or on behalf of any other party (including, without limitation, claims arising by statute or by subrogation). The undertaking and indemnification set out herein shall remain in full force and effect perpetually following the transfer of responsibility for operation of the Facility from Nova Scotia to Scott Maritimes Limited.

1.04 The foregoing indemnity is intended to provide the broadest possible indemnity to the Indemnified Parties and it is hereby mutually agreed that it is not to be interpreted *contra proferentum* or restrictively but is to be given a broad and liberal interpretation in favour of the Indemnified Parties and is to be construed in a manner consistent with the Memorandum of Understanding.

1.05 Nova Scotia shall not be held responsible hereunder if the fulfilment of any terms hereunder shall be delayed or prevented by civil disorders, wars, acts of enemies, acts of God, or by any other cause not within control of the party whose performance is interfered with, and which by the exercise of reasonable diligence, said party is unable to prevent or eliminate.

WITNESS WHEREOF Her Majesty the Queen in Right of the Province of Nova Scotia executed this Agreement as of the day and year first above written.

THIS LEASE made the 31st day of December, 1995,

BETWEEN:

HER MAJESTY THE QUEEN IN RIGHT OF THE PROVINCE OF NOVA SCOTIA, as represented by the Minister of Supply and Services

(hereinafter referred to as "Landlord")

- and -

SCOTT MARITIMES LIMITED, a body corporate under the laws of Nova Scotia (hereinafter referred to as "Scott")

(hereinafter referred to as (the "Tenant"),

WHEREAS pursuant to an agreement (the "Memorandum of Understanding") the Landlord has agreed to lease to the Tenant certain lands more particularly described in Schedule 2 hereto (the "Lands"), together with fixtures presently standing thereon, for a term of ten (10) years.

IN CONSIDERATION of the rents hereby reserved and the covenants contained on the part of the Tenant, the Landlord grants this lease to the Tenant and the parties hereby agree as follows:

1. **Definitions and Interpretation**

(a) Definitions. The following expressions, where used in this lease mean:

(i) "Memorandum of Understanding" means the agreement dated the 1st day of December, 1995, between the Landlord and the Tenant;

(ii) "Lands" means the Lands in the County of Pictou in the Province of Nova Scotia more particularly depicted as outlined in red on the Plan annexed hereto as Schedule 2;

(iii)" Reconfigured Facility" or "Facility" means the Effluent Treatment System which consists of a pipeline for the transmission of effluent from the Mill commencing at a standpipe located on Scott's property at Abercrombie Point, Pictou County, Nova Scotia, and leading under the East River and discharging into Settling Ponds at Boat Harbour, the Settling Ponds, and ASB and discharging into Boat Harbour at Point C (which Point C shall

become the "Effluent Outfall" of the Reconfigured Facility after the upgrades contemplated herein are satisfactorily completed and the Reconfigured Facility can be operated in compliance with Environmental Laws at Point C) and all other appurtenances affixed or appended thereto, more particularly depicted on the Plan attached hereto as Schedule 2 and all lands and facilities necessary to permit the receipt and lawful disposal of effluent from the Mill, commencing at the said standpipe;

(iv) "Indemnified Parties" has the meaning ascribed to it in the Indemnity Agreement bearing even date herewith;

(v) "Environmental Laws" means all applicable laws, statutes, ordinances, rules, by-laws, guidelines, treaties, and Regulations, and all applicable directives, rules, standards, requirements, policies, orders, judgments, injunctions, or decrees which have the force of law or which are capable of having the force of law, with respect to environmental or health matters including, without limitation, the following: the *Fisheries Act* (Canada), the *Canadian Environmental Protection Act*, the *Canadian Environmental Assessment Act*, the *Transportation of Dangerous Goods Act* (Canada), the *Navigable Waters Protection Act* (Canada), the *Environmental Act* (Nova Scotia), the *Occupational Health and Safety Act* (Nova Scotia), the *Indian Act* (Canada), and any Regulations or guidelines made pursuant to the foregoing;

(vi) "Term" means the term of this lease as set out in paragraph 3;

(b) Interpretation. The captions and headings in this lease are for convenience of reference only, and do not affect the scope, intent, or interpretation of any provision. This lease is governed by the laws of the Province of Nova Scotia. This lease shall be construed in accordance with and subject to the Memorandum of Understanding and does not supersede the said Memorandum of Understanding and it is confirmed that the entry into this Lease does not result in a novation of the Memorandum of Understanding.

2. **Grant**

The Landlord leases to the Tenant the Lands together with the Existing Buildings and all fixtures and improvements forming part of the Facility thereon, for the Term.

3. **Term**

Term. To hold the Lands, the Facility, and all buildings, fixtures and improvements from time to time upon or appurtenant thereto for the term of ten (10) years commencing on the 31st day of December, 1995.

4. **Rent**

The Tenant shall pay to the Landlord at the commencement term of the rent of One Dollar ($1.00) as full rental for the term, the receipt and sufficiency of which is hereby acknowledged by the Landlord.

5. **General Covenants of Landlord and Tenant**

(a) General covenant of the Tenant. The Tenant covenants with the Landlord:

(i) to pay rent; and

(ii) to observe and perform all the covenants, and provisos of this lease on the part of the Tenant to be observed and performed.

(b) General covenant of the Landlord. The Landlord covenants with the Tenant:

(i) for quiet enjoyment;

(ii) to observe and perform all the covenants, and provisos of this lease on the part of the Landlord to be observed and performed; and

(iii) to indemnify the Indemnified Parties as set out in the Indemnity Agreement bearing even date herewith.

6. **Ownership of Facility and Fixtures**

(a) Tenant's ownership of Facility and Fixtures installed during Term. The Landlord and the Tenant agree that any buildings and all fixed improvements which the Tenant may construct upon the Lands from time to time are and are intended to remain the absolute property of the Tenant upon the expiration of this lease, and are deemed as between the Landlord and the Tenant during this lease, to be the separate property of the Tenant and not the Landlord but subject to and governed by all the provisions of this lease applicable thereto. The Landlord and the Tenant further agree that during the term of the Lease the Tenant shall be considered the Owner of the Facility for all purposes.

(b) Removal of Tenant's Fixtures. The Tenant may at or immediately before the expiration of the term of this lease, remove its fixtures, chattels and other property and the Tenant may from time to time remove such fixtures in the ordinary course of its business or in the event of any reconstruction, changes and alterations to the Lands.

7. (a) **Real Estate Taxes**

Real estate taxes. The Landlord shall be responsible for all real estate taxes which may at any time during the Term be imposed, assessed or levied in respect of the Landlord's reversionary interest in the premises. The Tenant shall be responsible for all real estate taxes and occupancy taxes which may at any time during the Term be imposed, assessed or levied in respect of the Tenant's leasehold interest in the premises or its occupation of the premises.

(b) Utility charges. The Tenant shall pay or cause to be paid when due all charges for electricity, light, heat, power, telephone and other utilities and services used in or supplied to the Lands throughout the Term of this lease.

8. **Maintenance of Facility**

The Tenant shall throughout the Term at its own expense keep in good and tenantlike repair, the Facility and all structures, improvements and fixtures at any time erected upon the Lands and subject to its right to make alterations and remove fixtures, the Tenant shall, at the end of the term, give up possession of the Facility in a state similar to its state of repair at the commencement of the lease, reasonable wear and tear excepted.

9. **Changes and Alterations in Facility**

The Tenant has the right from time to time during the Term to make changes, alterations, additions, extensions or rebuildings, structural or otherwise (collectively called "Improvements") in and to the Facility as the Tenant thinks necessary, provided, however, that the Tenant shall, if requested to do so by the Landlord, restore the premises to the condition they were in at the commencement of the Lease, reasonable wear and tear excepted.

10. **Construction Liens**

The Tenant shall not permit any lien under the *Mechanics' Lien Act* or any like statute to be filed or registered against the Lands, the Facility or any fixtures or Improvements on the Lands, by reason of work, labour, services or material supplied or claimed to have been supplied to the Tenant or anyone holding any interest in any part thereof

through or under the Tenant. If any lien is at any time filed or registered the Tenant shall procure registration of its discharge within twenty days after the lien has come to its notice or knowledge; provided that if the Tenant desires to contest in good faith the amount or validity of any lien and has no notified the Landlord, and if the Tenant has deposited with the Landlord or with the trustee, or paid into court to the credit of any lien action, the amount of lien claimed plus a reasonable amount for costs, then the Tenant may defer payment of the lien claim for a period of time sufficient to enable the Tenant to contest the claim with due diligence, provided always that neither the Lands nor the Facility or any part thereof, nor the Tenant's leasehold interest therein thereby becomes liable to forfeiture or sale.

11. **Assignment and Other Dealings by Landlord**

Right of Landlord to deal with reversion. Nothing contained in this lease prohibits or restricts the Landlord or implies any prohibition or restriction from transferring or otherwise dealing with its reversionary interest in the Lands but subject always to this lease and the rights of the Tenant hereunder. The Landlord covenants not to assign its rights under the Lease without the prior written consent of the Tenant.

12. **Indemnity**

The Landlord hereby restates its indemnity obligations as set out in Schedule 5 of the Memorandum of Understanding and the Indemnity Agreement bearing even date herewith.

13. **Notices**

Any notice, election, demand or exercise of option to which a party to this lease is entitled or required to give is deemed to have been duly given to any other party if in writing and delivered personally.

14. **Compliance with Laws Generally**

In addition to complying with the requirements of the lease, the Tenant shall ensure, in its use and occupation of the Lands and Facility and other fixtures and Improvements on the Lands, and in the conduct of its business thereon, and in the maintenance and repair thereof, and as to all other matters or things pertaining to the Lands, compliance with all laws, by-laws, statutes, orders and regulations of all governmental authorities having jurisdiction and the Landlord shall provide all reasonable assistance to the Tenant to comply therewith.

15. **Binding Effect**

This lease and the covenants and agreements herein contained extend to and enure to the benefit of and are binding upon the Landlord, the Tenant, and their respective heirs, executors, successors and assigns, according to the purport and intent of their respective covenants and agreements.

16. **Force Majeure**

Neither party shall be held responsible for any losses resulting if the fulfilment of any terms hereunder shall be delayed or prevented by civil disorders, wars, acts of enemies, acts of God, or by any other cause not within control of the party whose performance is interfered with, and which by the exercise of reasonable diligence, said party is unable to prevent or eliminate.

WITNESS the parties have properly executed this Lease as of the day and year first above written.

KIMBERLY-CLARK INC., a body corporate carrying on business in Nova Scotia under the name and style Kimberly Clark Nova Scotia

(the "Tenant")

WHEREAS pursuant to a lease made the 31st day of December, 1995 (the "Lease") the Landlord leased to Scott Maritimes Limited certain lands and premises known as the Boat Harbour Effluent Treatment Facility (defined therein as the Facility), for a term of ten (10) years commencing on the 31st day of December, 1995 (the "Initial Term");

AND WHEREAS the Tenant is the lawful successor to Scott Maritimes Limited;

AND WHEREAS a Notice of Lease and License made the 6th day of May, 1996 was registered at the Registry of Deeds office at Pictou, in the County of Pictou (the "Registry") on the 6th day of May, 1996 in Book 1203 at pages 483 to 487 as Document 2281 to give notice of, *inter alia*, the Lease (The Notice incorrectly identified the tenant, Kimberly-Clark Inc. as Kimberly Clark Nova Scotia Inc.);

AND WHEREAS the parties have agreed to amend the lease to extend the term for a further twenty five (25) years after the Initial Term;

AND WHEREAS the Tenant proposes to install a pipeline to form part of the Facility and the parties have agreed to provide for the grant of an easement in connection therewith.

NOW THEREFORE in consideration of the Premises and the sum of one dollar ($1.00) now paid by the Tenant to the Landlord (the receipt and sufficiency of which is hereby acknowledged), the parties hereby agree as follows:

1. **Extension of Term of Lease**

1.01 Article 3 of the Lease is hereby deleted and replaced with the following:

"Term: to hold the Lands, the Facility, and all buildings, fixtures and improvements from time to time upon or appurtenant thereto for a term of thirty five (35) years commencing on the 31st day of December, 1995."

2. Agreement to Grant Easement for Pipeline through Boat Harbour

2.01 The Landlord agrees to grant to the Tenant an easement for the remaining term of the Lease to enable the Tenant to install and operate a pipeline for the transmission of effluent from that point designated as point C on the plan attached to the Lease to a point in the vicinity of point D as designated on the said plan. The final location of the easement will be determined when the Tenant completes its detailed engineering design of the pipeline and the Landlord hereby agrees to provide a formal easement suitable for registration at the Registry when the location of the pipeline is finally determined after the detailed engineering plans are developed.

3. General Matters

3.01 **Governing law**: This Agreement shall be governed by and construed in accordance with the laws of Nova Scotia and the laws of Canada applicable therein.

3.02 **Assignment**: This Agreement shall enure to the benefit of and be binding upon the parties hereto and their respective successors and assigns.

3.03 **Further Assurances**: The parties hereto shall do such further acts, execute and deliver such further documents and give such further assurances as may be necessary or desirable to give full effect to this Agreement and the Lease.

3.04 **Confirmation of Recitals**: The Parties hereto confirm the truth and accuracy of the recitals set out herein.

IN WITNESS WHEREOF the Parties hereto have set their hands and affixed their seals on the day and year first written above.

NOVA SCOTIA CORPORATION
A PAPER EXCELLENCE COMPANY

April 9, 2015

The Honourable Randy Delorey
Minister of Environment
Nova Scotia Environment
PO Box 442
Halifax, NS B3J 2P8

Dear Minister Delorey:

Re: Industrial Approval No. 2011-076657-A01
Appeal pursuant to Section 137 of the *Environment Act*

Northern Pulp Nova Scotia Corporation ("Northern Pulp") appeals Industrial Approval No. 2011-076657-A01 (the "Approval") issued by Jay Brenton of the Nova Scotia Department of Environment (the "Department") on March 9, 2015 for the operation of Northern Pulp's mill in Abercrombie Point, Nova Scotia (the "Mill").

Northern Pulp makes this appeal (the "Appeal") to you, the Minister of Environment, pursuant to section 137 of the *Environment Act*, SNS 1994-1995, c 1 (the "Act"). In the sections below, Northern Pulp states its reasons for this Appeal, outlines its specific objections to various provisions in the Approval and sets out its requested relief.

While Northern Pulp considers it necessary to proceed with this Appeal to protect the long term economic viability of the Mill, Northern Pulp remains open to working with the Department and the Province to achieve a long term solution with respect to the Mill.

SUMMARY OF APPEAL

In summary, Northern Pulp requests that certain provisions (identified below) of the Approval be removed or revised on the grounds that these provisions:

(i) are in breach of the Province's contractual obligations to Northern Pulp under various agreements (which agreements the Department refused to consider in issuing the Approval) and impose conditions that in essence seek to achieve indirectly what the Province is not permitted to do directly, namely, require Northern Pulp to cease using its current effluent treatment facility ("Effluent Treatment Facility");

(ii) impose conditions that are impossible to meet and/or are prohibitory rather than regulatory in nature;

(iii) impose conditions that are too vague or uncertain;

Northern Pulp Nova Scotia Corporation, a Paper Excellence Company
P.O. Box 549, Station Main, New Glasgow, NS B2H 5E8
260 Granton Abercrombie Branch Road, Abercrombie, NS B2H 5C6
T: 902.752.8461 | F: 902.752.9149 | info@northernpulp.com
www.northernpulp.com | www.paperexcellence.com

(iv) are unrealistic and otherwise unreasonable; and/or

(v) are inconsistent with the protection granted to Northern Pulp by the *Freedom of Information and Protection of Privacy Act* ("FOIPOP").

Northern Pulp respectfully requests that you exercise your powers under Section 137(4) of the Act to allow Northern Pulp's Appeal and remove or revise the provisions of the Approval as further outlined in this letter. Doing so would ensure that the Approval contains conditions that: (i) do not breach the Province's obligations under the various agreements between the Province and Northern Pulp and do not effectively require Northern Pulp to change the location of its current Effluent Treatment Facility; (ii) are not impossible to achieve and are regulatory rather than prohibitory in nature; (iii) are not vague or uncertain, (iv) are realistic and otherwise reasonable; and (v) are not inconsistent with the protection granted under FOIPOP.

GROUNDS OF APPEAL

I. Department's Refusal to Consider Province's Contractual Obligations - Section 8(2)(c) of the Act

As you are aware, Northern Pulp and the Province are parties to a number of agreements in respect of the operation of the Mill, including:

1) Memorandum of Understanding dated December 1, 1995 ("MOU");

2) Lease dated December 31, 1995 ("Lease");

3) License Agreement dated December 31, 1995;

4) Indemnity Agreement dated December 31, 1995 ("Indemnity Agreement");

5) Water Supply Agreement dated June 30, 1995 ("Water Supply Agreement");

6) Lease Extension Agreement dated October 22, 2002; and

7) Acknowledgement Agreement by the Province dated May 12, 2008 ("Acknowledgement Agreement").

(collectively, the "Agreements").

Northern Pulp wrote to you on December 18, 2014 in order to ensure that the Department reviewed the Approval in light of the Province's contractual obligations to Northern Pulp under the Agreements prior to issuing the final Approval. In addition, Northern Pulp requested a joint meeting with the Department of Environment and Department of Internal Services to discuss how a long term solution can be achieved in compliance with the terms of the Agreements and the Approval.

In a letter dated January 8, 2015, you responded: "While my department is aware of the existence of agreements between the Province and your company, the Province has maintained independence between the regulation of environmental issues and management of the various agreements with the mill." You encouraged Northern Pulp to meet with Internal Services to discuss the Agreements and any implications that may arise from the issuance of the Approval

by your Department, thereby refusing Northern Pulp's request to meet jointly with Northern Pulp and Internal Services.

Your express refusal to consider the Province's various contractual obligations in issuing the Approval and your refusal to meet jointly with Northern Pulp and Internal Services as requested by Northern Pulp is not in compliance with the mandatory requirement of Section 8(2)(c) of the Act which provides:

> 8 (2) The Minister, for the purposes of the administration and enforcement of this Act, and after engaging in such public review as the Minister considers appropriate, shall
>
> [...]
>
> (c) consult with and co-ordinate activities with other departments, Government agencies, municipalities, governments and other persons; [emphasis added]

Any provision in the Approval which is inconsistent with the provisions of the Agreements is necessarily the result of the Department's refusal to consider those Agreements when it issued the Approval. Northern Pulp submits that those provisions of the Approval are unreasonable due to the failure of the Department to comply with the process of consultation and co-ordination required by its own governing statute in issuing the Approval.

In the Acknowledgement Agreement, the Province acknowledged, agreed and confirmed that each of the Agreements and understandings between the Province and the Mill's prior owner Scott Maritimes Limited ("Scott") are in good standing and will continue in full force and effect for the benefit of Northern Pulp.

Northern Pulp's current owners acquired the shares of Northern Pulp and have continued to invest substantial amounts in the Mill on the understanding that the Province could and would comply with its obligations under the Agreements. It is not unreasonable to anticipate and expect that government will comply with the contracts which it has entered into. It is unreasonable for the Department to issue the Approval with a stated disregard for those contractual obligations. Northern Pulp does not waive any of its rights under any of the Agreements.

Northern Pulp submits that, taken together, the objectionable conditions included by the Department in the Approval that are in breach of the Province's obligations under the Agreements are an attempt by the Department to indirectly achieve the Province's stated goal of closing the Effluent Treatment Facility (see, e.g., Agreement in Principle between the Province and Pictou Landing First Nation dated June 16, 2014). These provisions would force Northern Pulp to apply for an approval for and build an alternative effluent treatment system that meets conditions that would be applicable to a substantially new Mill. This is a goal which cannot be achieved directly under the Agreements which the Province has entered into with the Mill's owners or under the Department's own regulatory jurisdiction. Government cannot do indirectly what it cannot do directly and it is unreasonable for the Department to seek to do so by imposing conditions as part of a regulatory approval process aimed at achieving that indirect goal.

These provisions of the Approval, in addition to being in breach of the Province's obligations under the Agreements, impose conditions which are unreasonable for a mill that was built in the 1960s to meet without requiring that a substantially new Mill be built. While Northern Pulp has

invested in upgrades at the Mill, such equipment modifications will not achieve the requirements of the Approval. The Approval therefore essentially prohibits Northern Pulp from operating the current Mill, and requires Northern Pulp to construct a substantially new Mill, in breach of the Agreements. The cumulative cost and uncertainty associated with the approval and construction of a new effluent treatment system jeopardize the long term economic viability of the Mill and is inconsistent with the Agreements.

Government cannot arbitrarily revoke Northern Pulp's contractual rights under the Agreements with the Province by way of an administrative approval process. Any re-negotiation of Northern Pulp's rights or the Province's obligations under the Agreements must necessarily be the result of written amendment to the Agreements. Northern Pulp approached the Department and the Province indicating that it was prepared to cooperatively work with the Province, as stated in Northern Pulp's December 18, 2014 letter to you:

> "We look forward to working with your department and Internal Services. We hereby request a meeting the first week of January with Internal Services and Nova Scotia Environment to discuss how a long term solution can be achieved in compliance with the terms of the above agreements and the Industrial Approval."

Absent any such cooperation between the Province and Northern Pulp, certain provisions of the Approval cannot reasonably stand given their clear breach of Northern Pulp's rights and the Province's obligations under the Agreements. Any provision in the Approval that is inconsistent with the Agreements must be removed or revised so that the Approval is consistent with the Agreements, including:

A. Definition of Effluent Treatment System – Clause 1(t)

The defined term "Effluent Treatment System" in Clause 1(t) of the Approval now includes the "former stabilization lagoon (known as Boat Harbour)". The defined term "Effluent Treatment System" is included as part of the definition of "Facility" and both terms are referred to throughout the Approval. Northern Pulp has never leased and has never been in control of Boat Harbour. The Mill discharges effluent into Boat Harbour at Point C in compliance with its obligations under applicable approvals and regulations, and has received a broad indemnification from the Province for claims and expenses related to Boat Harbour.

Under Section 4.01(g) of the MOU, the Province remained in possession of and responsible for the stabilization basin. The Lease definition of "Reconfigured Facility" or "Facility" makes it clear that the stabilization basin is not included as part of the Facility. Any terms in the Approval which impose responsibility on Northern Pulp for the stabilization basin known as Boat Harbour ("Boat Harbour") by virtue of:

- including the "former stabilization lagoon (known as Boat Harbour)" into the definition of Effluent Treatment System, including Clauses 5(h) and (i), 6 (h) and (i), 7(j) and (n), 12(au) and 16(b); or

- indirectly including the "former stabilization lagoon (known as Boat Harbour)" into the definition of the Facility, including Clauses 2(c), 3(a), 12(ac) and (am), 24(a) and 25(a),

are inconsistent with the terms of the Lease and Indemnity Agreement.

Northern Pulp therefore requests that the reference to the "former stabilization lagoon (known as Boat Harbour)" be removed from Clause 1(t) of the Approval.

B. Responsibility for Restoration of Stabilization Basin - Clause 7(n)

Clause 7(n) of the Approval requiring Northern Pulp to develop a plan for the long term environmental management and/or rehabilitation of Boat Harbour is expressly contrary to the Agreements. Under Sections 4.01(g) and 4.01(c)(ii) of the MOU, that responsibility falls upon the Province. Further, Section 4.01(f) of the MOU provides that Northern Pulp shall have no obligation or responsibility to restore the stabilization basin, which restoration will be undertaken by the Province. Northern Pulp is entitled to indemnification for any such costs under the broad provisions of the Indemnity Agreement.

Northern Pulp therefore requests that Clause 7(n) be removed from the Approval.

C. Spill Containment Plans – Clauses 14(m) and 14(n)

Clauses 14(m) and 14(n) require Northern Pulp to submit plans to the Department with respect to spill containment. However, Northern Pulp under the Lease is entitled to the use of the Effluent Treatment Facility until 2030 and presently uses that facility for spill containment, which use has been wholly adequate to date.

Requiring Northern Pulp to undertake a new spill containment system when Northern Pulp already has an adequate containment system available to it, which it is contractually entitled to use, provides no additional benefit to the environment and is in breach of the Province's obligations under the Agreements. As Northern Pulp's current system is adequate to protect the public and environment, Clauses 14(m) and 14(n) are inappropriate. Requiring Northern Pulp to undertake a new spill containment system would also be in breach of Northern Pulp's contractual rights under the Agreements. Northern Pulp requests that these Clauses be removed entirely.

D. Water Supply Agreement – Clauses 5(d) and 5(e)

Clause 5(d) of the Approval limits daily water consumption to a rate of 63,000 cubic meters per day by January 30, 2020. For comparison purposes, this represents an intensity of 72.2 m3/Adt. Clause 5(e) of the Approval also requires Northern Pulp to achieve certain water reduction milestones in the meantime. Clause 2.01 of the Water Supply Agreement says that the Province is obliged to continue to supply up to 25 million imperial gallons (or 113,652 m3) of fresh water per day to the Mill until 2021.

The intention of the parties in agreeing to the Water Supply Agreement is clearly contravened by the reductions required by Clauses 5(d) and 5(e) of the Approval. Northern Pulp remains willing to work cooperatively with the Department, as part of an overall negotiation with the Province with respect to the Agreements, to achieve water reductions that benefit the environment but are also practical and realistic. In the absence of such discussions, however, Northern Pulp requests that Clauses 5(d) and 5(e) be removed as they are clearly in breach of the Province's obligations under the Water Supply Agreement and are therefore unreasonable.

E. Surface Run-Off Diversion - Clause 6(c)

The AMEC Report[1] at p. 26 estimates that surface run-off accounts for 2.0 m3/ADt of effluent (rain water entering process sewers). See enclosed KSH Memo[2], at p. 6-8, where KSH has provided more extensive calculations that indicate a similar volume. As a very small fraction of the total flow (less than 1.5% of the total effluent flow for the highest month of the year, April), requiring Northern Pulp to divert surface run-off water into the Pictou Harbour is unreasonable.

Northern Pulp's current practice with respect to the surface run-off stream is to treat it with the Mill effluent, which system (as discussed above in Section I.C.) Northern Pulp is entitled to use until 2030. Clause 6(c) is improper as Northern Pulp's current system is adequate in protecting the public and environment and requiring Northern Pulp to undertake a new surface run-off water diversion program would be in breach of Northern Pulp's contractual rights under the Agreements.

Therefore, Northern Pulp requests that Clause 6(c) be removed.

F. Point D Monitoring – Clause 7(o)

Clause 7(o) requires monitoring at Point D for the parameters in Table 6 of Appendix A. As Northern Pulp's obligations cease at Point C under the Agreements, Northern Pulp cannot properly be responsible for monitoring at Point D, a location in the control of the Province. Northern Pulp therefore requests that Clause 7(o) be removed entirely.

G. Limits in Excess of Pulp & Paper Effluent Regulations – Clauses 6(e), 6(f), 8(d) and 8(f)

Section 4.01(k) of the MOU provides that the Province will impose operating limits on Northern Pulp that reflect and do not exceed or apply more stringently than the standards set out in the *Pulp and Paper Effluent Regulations* (Canada) ("PPER").

As the PPER does not contain limits on COD and TRS, the Approval under Clause 6(e), with respect to COD, and Clause 8(d), with respect to TRS, imposes more stringent operating limits on the Mill than are reflected in the PPER.

Further, to the extent that limits on COD have a limiting effect on BOD, the required reductions in COD under Clause 6(e) of the Approval result in more stringent conditions being imposed on the Mill, notwithstanding that Table 6 of the Approval indicates that limits for BOD are at the rate set by the PPER.

BOD_5 (Biochemical Oxygen Demand) is the amount of oxygen required to biologically oxidize the soluble components in an effluent sample incubated for a 5-day period. It is a measure of easily biodegradable organics that can be utilized as food by naturally occurring organisms. BOD_5 is an indirect measure of how the easily biodegradable organics in the effluent will consume dissolved oxygen in the receiving waters as natural microorganisms consume these

---

[1] The Department indicated to Northern Pulp that AMEC was consulted during the development of the Approval. The April, 2010 AMEC Report entitled "Boat Harbour Return to Tidal Re-Evaluation Final Report" ("AMEC Report") is the latest report that was made available to Northern Pulp.

[2] Memo from KSH Solutions Inc. ("KSH") dated March 31, 2015 entitled "Technical Assistance with Appeal of Final Industrial Approval" ("KSH Memo").

organics, thus potentially affecting flora and fauna due to reduced dissolved oxygen concentrations. COD (Chemical Oxygen Demand) is the amount of oxygen required to chemically oxidize the soluble components in an effluent sample. COD is a measure of all organics (lower molecular weight biodegradable and higher molecular weight non-biodegradable) as well as oxidizable inorganics.

COD will always be the greater of the two, as BOD_5 is a percentage of COD. It is generally accepted that COD and BOD share an empirically demonstrated relationship. Fairly regular relationships exist between COD and BOD_5 for any given industrial or municipal wastewater stream. Once the average COD:BOD_5 ratio for a particular wastewater stream is established, a relatively simple and quick 1-hour COD test can be used to predict BOD_5 with relative reliability. This is why COD tests are often done, but rarely reported. Kraft mill lignin and cellulose contain both low and high molecular weight organics. Therefore, any measures undertaken to reduce COD at the Mill will undoubtedly reduce BOD_5 as well, in breach of the MOU. See enclosed Klopping report at p. 3-4.[3]

As a result of the inconsistency of these provisions with the MOU, Northern Pulp submits that Clauses 6(e) and 8(d) are unreasonable and therefore requests that these provisions, as well as the related provisions at Clauses 6(f) and 8(f), be removed.

H. Precluding Use of Boat Harbour Effluent Treatment Facility – Clauses 5(h), 5(i) and 5(j) and Clauses 6(h), 6(i) and 6(j) and Table 6A

Under the Lease, as extended, Northern Pulp has the right to exclusive possession and occupation of the Effluent Treatment Facility until 2030. The provisions of the Approval that effectively preclude Northern Pulp from using the Effluent Treatment Facility for the Mill's operations are inconsistent with the provisions of the Lease, including Clauses 5(b) and Clause 14 of the Lease.

The effect of Clauses 5(h), 5(i) and 5(j) and Clauses 6(h), 6(i) and 6(j) of the Approval is to require Northern Pulp to apply for an amendment to the Approval if Northern Pulp's modeling of water use reduction projects shows that the final wastewater effluent quality will not meet the requirements of Table 6 of the Approval, without modification or addition to the Effluent Treatment System as configured as of the date of the Approval. The application for an amendment must include a plan for alternative effluent management and/or treatment designed to meet the requirements of Table 6A of the Approval.

These provisions make it clear that the Department intends to require Northern Pulp to discharge its effluent at a treatment facility at a location which has yet to be determined if it is unable to comply with the conditions imposed. By specifically not contemplating or providing a means for compliance to be achieved through modifications or additions to the current Effluent Treatment System, the Province is in breach of the Agreements with Northern Pulp that entitle Northern Pulp to use the Effluent Treatment Facility until 2030. The estimated capital cost of constructing a new effluent treatment plant is in excess of $100 million.

Northern Pulp therefore requests that any Clause in the Approval which contemplates that Northern Pulp cease using the Effluent Treatment Facility prior to 2030, including Clauses 5(h), 5(i), 5(j), 6(h), 6(i) and 6(j) and Table 6A, be removed.

---

[3] Report from Paul H. Klopping dated April 8, 2015 ("Klopping Report"). Paul Klopping has been auditing the Mill since 2005.

I. Rehabilitation Plans – Clause 24

Clause 24(a) of the Approval provides that Northern Pulp must submit a detailed closure plan to the Department one year prior to the decommissioning or closure of the Facility or any part thereof. To the extent that the definition of Facility in the Approval incorporates by reference to Effluent Treatment System the "former stabilization lagoon (known as Boat Harbour)", Northern Pulp refers to Sections I.A., I.B. and I.H. above and submits that any requirement under Clause 24 for Northern Pulp to cease using its current Effluent Treatment Facility, or submit any plan or undertake any costs or rehabilitation with respect to Boat Harbour is in breach of the Lease and the Indemnity Agreement. Northern Pulp is entitled to indemnification from the Province in respect of any cessation by Northern Pulp of the Effluent Treatment Facility and any costs for any rehabilitation of Boat Harbour imposed by the Province on Northern Pulp, under the Approval or otherwise.

Northern Pulp requests that Clause 24 be revised to acknowledge that any cessation of Northern Pulp's use of the Effluent Treatment Facility and any rehabilitation of Boat Harbour are the Province's responsibility and the plans and costs thereof will be assumed by the Province.

II. Prohibitory and/or Impossible Provisions

A. Capital Investment Required to Comply with Approval is Prohibitory - Clauses 5(i), 6(c), 6(g), 6(i), 14(m) and 14(n)

In addition to being in breach of the Agreements as discussed throughout Section I above, Northern Pulp's compliance with the Approval will require Northern Pulp to undertake significant capital expenditures estimated to be in excess of $90 million, to divert surface run-off water to the Pictou Harbour, to implement a new spill containment system, and to reduce COD. See enclosed EKONO Memo, p. 2.[4]

The estimated $90 million in capital expenditures referred to above does not include the capital expenditures to construct a new effluent treatment plant in order to comply with Clauses 5(i) and 6(i) of the Approval, estimated to be in excess of $100 million. This requirement is also in breach of Northern Pulp's rights under the Lease, as discussed in Section I. H. above

The cumulative effect of the capital cost associated with Clauses 5(i), 6(c), 6(g), 6(i), 14(m) and 14(n) of the Approval is effectively the prohibition of Northern Pulp's operation by the Department, instead of the Department's regulation of it.

With respect to COD, Clause 6(g) requires Northern Pulp to develop a plan for additional reductions to achieve a maximum effluent COD of 11,890 kg/day at Point C. This equates to a 77% reduction from the Mill's present operation.[5] Such a provision is not regulatory in nature. It is prohibitory. That is, the Approval through Clause 6(g) has the effect of prohibiting Northern Pulp's activities, rather than regulating them. As discussed further in Section II.B. below, the

---

[4] Memo from Heikki Mannisto and Eva Mannisto dated April 6, 2015 entitled "Possibility to meet COD limit of 11,890 kg/day" ("EKONO Memo").

[5] The average annual COD at Point C for the period of January 1, 2010 to December 31, 2014 is 58.8 kg/Adt. At 873 Adt/day, that equates to 51,350 kg/day at the end of the Approval if the Mill is running at current levels. 11,890 kg/day represents an intensity of 13.6 kg/Adt at Point C.

COD reduction may not even be possible and any capital investments in an attempt to achieve this requirement would be prohibitory.

With respect to surface run-off diversion under Clause 6(c), the new segregated system would require a new sewer network, retention ponds, oil and sediment traps, sample collection, alarms and a mechanism to divert this stream back to the main Mill effluent stream if contamination was detected. This new non-contact outfall will require permits from the Department as well as Environment Canada and the Department of Fisheries and Oceans. Northern Pulp has no guarantee that the Mill will receive these required approvals from these departments.

A new spill containment system under Clause 6(g) is also unreasonable in that it imposes significant cost on Northern Pulp without additional environmental or public benefit and is in breach of the Agreements.

The high capital cost of complying with any or all of Clauses 6(c), 6(g), 14(m) and 14(n) are completely disproportionate to the benefit, if any, to the public and the environment of these measures. The surface run-off diversion requirement is disproportionate given the small fraction of the flow that surface run-off represents and the fact that it is presently treated with the Mill effluent. The spill containment requirement is not only disproportionate but unnecessary because Northern Pulp already has an adequate spill containment system available to it. The Department is aware through the AMEC Report that process technologies for reducing COD to the requirement of Clause 6(g), assuming those reductions are achievable, would be prohibitory. The timelines contained in the Approval for achieving these Clauses are too short for such major construction projects to be completed. Therefore, the conditions in the Approval are impossible for Northern Pulp to meet and are prohibitory.

Through the cumulative effect of these Clauses, and the capital cost associated therewith, the Department is prohibiting the Mill from operating. Instead of regulating the existing Mill, the Department is requiring that Northern Pulp build a substantially new Mill. Provisions of regulatory approvals that prohibit rather than regulate operations are unreasonable and ultra vires. Therefore, Northern Pulp requests that Clauses 5(i), 6(c), 6(g), 6(i), 14(m) and 14(n) be removed from the Approval.

B. COD Reduction is Prohibitory and Impossible to Meet – Clause 6(g)

As noted in Section II.A. above, the proposed COD reduction of 77% under Clause 6(g) of the Approval is prohibitory not only because of the capital investments in order to attempt to achieve this requirement but also because the proposed COD reduction is unrealistic and is essentially impossible for Northern Pulp to meet.

The AMEC Report provided an assessment of the status and operation of the existing treatment facility for the Mill as well as preliminary engineering for several effluent treatment alternatives. The assessment was conducted at the time that the regulatory discharge for the Mill was located at Point D. The AMEC Report concluded that the Mill's Aerated Stabilization Basin ("ASB") was operating well. Since the regulatory discharge point was moved to Point C on July 1st, 2010, there have been no incidences of daily or monthly BOD_5 or TSS being over the limits in the PPER. In fact, all tests have shown that the Mill is well below the regulated limits.

Even though the AMEC Report was based on outdated information and therefore could not recognize the current operational attainments of the Mill, the AMEC Report itself demonstrates that it is simply not possible for the Mill to achieve this COD reduction. As such, the

requirement that the Mill achieve the reduction required by Clause 6(g) amounts to a prohibition of the Mill's operations, rather than the regulation of it, and therefore is unreasonable.

Appendix 2 of the AMEC Report contains the preliminary engineering for the effluent treatment alternatives with mass balances (annual averages and not daily limits). The most stringent case in the AMEC Report, Case 3, completely abandons the Mill's effluent treatment facility and replaces it with a new Activated Sludge Treatment ("AST") system and includes "Significant Improvements & Water Use Reduction", as outlined in section 4.2.3 of the AMEC Report. Drawing #158229-100-6-923 is the mass balance for the New Treatment Plant – Case 3. This Case assumes a 50% reduction in liquor losses will be achieved (20,400 kg/day to 11,400 kg/day). It also assumes marginal increase in production with a design capacity of 908 Adt/day. Incineration of Waste Activated Sludge would occur in the Recovery Boiler, which at present is not permitted in Northern Pulp's Approval. The predicted effluent flow is 65,151 m3/d as an annual average; the new daily limit of 67,500 m3/d required in the Approval is even more stringent than the AMEC mass balance and does not consider seasonal variations.

The predicted COD for Case 3 is 70,900 kg/day. The typical COD removal for a new AST system would be in the neighbourhood of 50 – 60%. Even at the higher end of that removal efficiency (60%), the final COD discharge would be 28,360 kg/day (70,900 kg/day x 0.4). In summary, Case 3 demonstrates that even with significant in-Mill improvements and a brand new AST treatment system, the Mill would still exceed, by more than double, the COD daily limit of 11,890 kg/day at Point C as set out in the Approval at Clause 6(g). AMEC recognizes that other process technologies that were not included in Case 3 would be economically prohibitive to the Mill. The Klopping Report, EKONO Memo and McCubbin Report[6] all agree that the requirement contained in Clause 6(g) is unrealistic and that the associated costs would be significant.

Therefore, the requirement contained in Clause 6(g) of the Approval, as a daily limit representing a 77% reduction from the Mill's current annual average for the Mill's current operations, is impossible for Northern Pulp to meet. The Department included the requirement of Clause 6(g) in the Approval knowing that the AMEC Report says that the Mill cannot achieve that requirement even if the Mill adopted the strictures of Case 3 including installing a completely new treatment system. The requirement of Clause 6(g) is completely untenable, even according to the Report on which the Approval is based. The Department therefore must be considered to have included this provision in order to prohibit the Mill's operations.

The Approval contains conditions that treat the Mill as if it is a new mill and as such the Department has imposed regulatory standards on the Mill that are prohibitory to the existing Mill operating. Provisions of regulatory approvals that prohibit instead of regulate and that are impossible to meet are unreasonable and ultra vires. Therefore, Northern Pulp requests that Clause 6(g) be removed from the Approval.

C. Modeling Deadlines are Impossible to Meet - Clauses 5(h) and 6(h)

Clauses 5(h) and 6(h) of the Approval require Northern Pulp to submit to the Department modeling for all reduction stages along with a list of planned projects required under Clauses 5(e) and 6(e) no later than October 30, 2015.

Northern Pulp's consultants have indicated that it is impossible to complete in-Mill engineering studies and then adequately complete effluent quality modeling to predict Mill wastewater

[6] Report from Neil McCubbin dated April 6, 2015 ("McCubbin Report").

changes for submission to the Department by October 30, 2015. It is not reasonable to require such a deadline considering the impossibility of meeting that deadline as well as the fact that the modeling is for reductions that are not required until 2017.

In Northern Pulp's submission, October 30, 2016 is more reasonably attainable and appropriate. Therefore, Northern Pulp requests that Clauses 5(h) and 6(h) each be revised to change the deadline for this study from October 30, 2015 to October 30, 2016.

D. Regulatory Compliance without Modification or Addition - Clauses 5(i), 6(i) and 6(j)

Northern Pulp is also precluded through Clauses 5(i) and 6(i) from achieving the requirements of the Approval through modification or addition to the effluent treatment system as configured as of the date of the Approval, and through Clause 6(j) from reduction and prevention of liquor losses entering the effluent system. In addition to being contrary to the Agreements as discussed in Section I.H. above, requirements that a proponent achieve regulatory compliance without making improvements to the existing system are prohibitory on their face, and do not serve the public or benefit the receiving environment. Northern Pulp again requests that Clauses 5(i), 6(i) and 6(j) be removed.

III. Vague and Uncertain Provisions

A. New Treatment Facility - Clauses 5(h), 5(i) and 5(j) and Clauses 6(h), 6(i) and 6(j) and Table 6A

In addition to the objection noted in Section I.H. above, the majority of parameters and discharge limits in Table 6A in the event that Northern Pulp is required to discharge its effluent at a treatment facility at a different location have yet to be determined. Those limits are specifically contemplated as being determined based on an unknown location of a new treatment facility and on results of a receiving water study yet to be completed. That receiving water study must meet the satisfaction of the Department, yet the Approval does not indicate any criteria upon which such water study will be considered satisfactory. Northern Pulp considers the requirement to apply for and obtain approval of an as-yet-unidentified discharge location to be unreasonable.

At present, there is an absence of standards and guidelines in Clauses 5(h), 5(i), and 5(j) and Clauses 6(h), 6(i) and 6(j) and Table 6A. These provisions are too vague and uncertain to be considered reasonable. The conditions contain no limitation on the Department's discretion and as a result Northern Pulp has no fair notice of the conditions it must meet. Therefore, Northern Pulp requests that these provisions be removed.

B. COD Reductions - Clause 6(e)

The provisions in Clause 6(e) requiring reductions in COD do not specify or provide a means for calculating the base point for measuring such reductions. These provisions are therefore too vague to be reasonable and therefore must be removed.

IV. Unrealistic and Otherwise Unreasonable Provisions

It is clear that many provisions of the Approval are based on the AMEC Report. However, as noted in Section II.B. above, the AMEC Report is outdated and does not represent the Mill's

current operations and its operational achievements since the date of the AMEC Report. As such, certain provisions imposed by the Department in reliance of this Report are unreasonable.

The AMEC Report ranks Northern Pulp in the 95th – 100 percentile on water usage in Canada. In 2007, the year that Northern Pulp was benchmarked in this 2010 study, the Mill's regulated effluent discharge point was Point D exiting the Boat Harbour basin. In July 2010, the regulated effluent discharge point was moved back to Point C exiting the ASB. Point D is not representative of the Mill effluent flow when compared to other mills because it is downstream of the treatment plant. Effluent flow at Point D is historically 25% higher than at Point C due to surface run-off from the large Boat Harbour basin. Surface run-off was not taken into account in the AMEC Report, and therefore comparisons are not valid. Comparison of Point C data at the end of the treatment process is appropriate for benchmarking purposes. Table I shows the decrease in effluent flow from 2010 forward:

Table I: Effluent Flow Intensity (m3/Adt) – Annual Averages

Regulated Outfall Location	2007	2008	2009	2010	2011	2012	2013	2014
Point D	112	133	129					
Point C				94	89	87	86	88

As the Approval is clearly based on a lack of appreciation for the Mill's current operations, including an outdated report from AMEC which contains conclusions that are no longer correct, the Department has no basis for many provisions contained in the Approval. It is unreasonable for the Department to impose regulatory standards based on a report that relies on almost 10-year-old data and disregards the achievements of the Mill since that time.

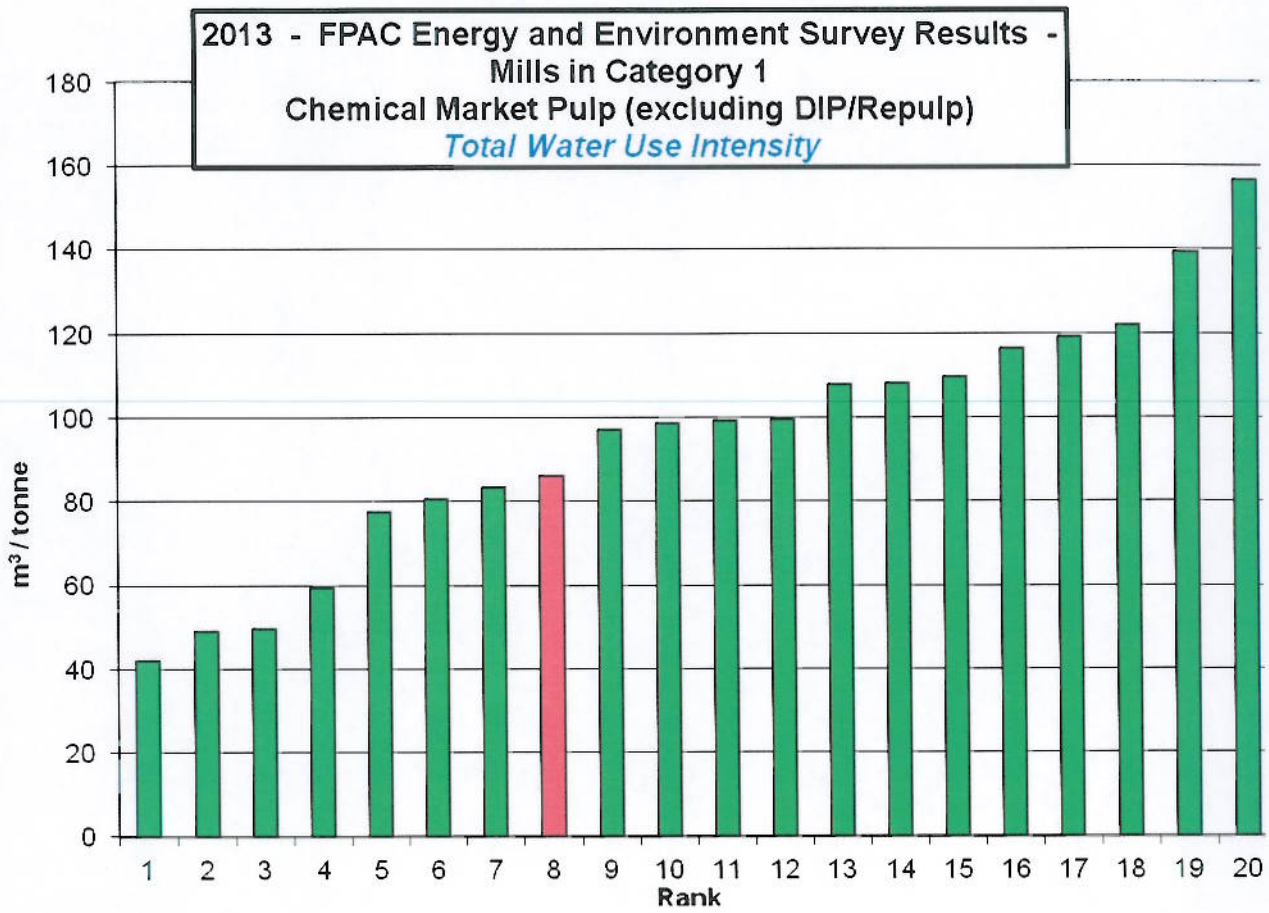
Other provisions in the Approval are unreasonable as they provide little or no additional environmental benefit but impose very significant costs on Northern Pulp and therefore are improper. As well, statements made by the Department in issuing the Approval make it clear that some provisions of the Approval are based on a misunderstanding of or lack of appreciation for the Mill's operations, which make those provisions unrealistic. Some provisions in the Approval are unreasonable as they fail to recognize industry norms or factors outside of Northern Pulp's control. Others are simply inaccurate. Those provisions must therefore be removed or revised as set out in the Sections below.

A. Water Reduction Requirement – Clauses 5(d) and 5(e)

As stated by all effluent experts (Ken Frei and Guy Martin of KSH, Paul Klopping, Neil McCubbin, and Heikki Mannisto and Eva Mannisto of EKONO), the daily limits for water intake and effluent contained in the Approval are highly unusual. Few jurisdictions place flow limits in general on intake and effluent; exceptions are generally where the mill makes up a large percentage of the waters (usually rivers) that it is drawing its water supply from or is discharging effluent into. Mills that ultimately discharge into marine environments do not typically have these restrictions: see KSH Memo, p. 4. The AMEC Report at p. 30 refers to the 2007 EKONO study which also recognizes that such limits will only be placed on mills in certain circumstances, which Northern Pulp notes are not applicable to the Mill.

The requirements related to water reductions in the Approval appear to be based on a mischaracterization of the Mill's water usage. A Departmental document accompanying the

release of the January 30, 2015 version of the Approval stated that "The Mill is a large consumer of water, especially compared to other mills." In fact, Northern Pulp's water usage is average by comparison to other Canadian mills. Enclosed is a copy of the Forest Products Association of Canada survey entitled "FPAC 2013 Energy and Environment Benchmarking Report – Pulp and Paper Sector" dated March 10th, 2015 ("FPAC Report"). The following graph is an excerpt from the FPAC Report. With 20 out of a possible 30 mills reporting, Northern Pulp ranks the 8th best in the survey for water use intensity:



Reductions of water flow of the magnitude contained in the Approval could have negative effects on the biological treatment process and ultimately the receiving water, increasing odour for residents who live in the vicinity of the effluent treatment centre.

As noted in Section I.D above, Clauses 5(d) and 5(e) should be removed from the Approval for being in breach of the Water Supply Agreement. Clauses 5(d) and 5(e) are also unreasonable as they ignore industry norms and are based on a mischaracterization of the Mill's water usage, as a result of the Department's reliance on an outdated report. Therefore, Northern Pulp repeats its requests that these Clauses be removed.

B. TRS Reduction Requirement – Clauses 8(d), 8(e) and 8(f)

The new requirement under Clause 8(d) for water-phase TRS measurements in the effluent are best described by the KSH Memo at p. 14-16. In summary, Clause 8(d) is modeled after

Ontario's new 2014 Air Pollution – Local Air Quality Regulation (which imposes certain air standards, including TRS) and the Ontario Technical Standards to Manage Air Pollution. To Northern Pulp's knowledge, Ontario is the only other province that is introducing this standard. Mills may comply with the Regulation by electing to register under the optional Technical Standard which has phased-in limits for TRS in water entering the wastewater treatment system. The Ontario Ministry of the Environment researched the relationship between TRS effluent loading and TRS in ambient air originally reported by the US EPA. Because the understanding of the relationships of TRS effluent loading and TRS in ambient air are still in their infancy and the influence of other parameters (including pH, temperature and the various types of odorous compounds present) are not well known, the Ontario government introduced this as an optional standard that mills could choose to apply for. Mills that choose to apply will, over time, provide data that will lead to improved understanding of the relationships between effluent concentrations and air quality. The optional nature of the standard gives Ontario the ability to modify the standard as is deemed necessary as information and data become available. By imposing Clause 8(d) in the Approval, the Department has applied the optional Ontario standards as a hard and fast requirement that must be abided by without regard for the outcome of the Ontario mill experiences. If the limits are deemed to be unrealistic, Ontario has allowed room for possible changes; the Department has not.

It is of particular note that Northern Pulp is regulated to fixed TRS limits, including 3-fold reductions in coming years, when the Mill does not have any baseline data. The limits in Clause 8(d) have been set by the Department before any data has been gathered and before it is known if there is even an environmental reason to impose such limits. Ontario has recognized that there is not enough known yet about the relationship between TRS effluent loading and TRS in ambient air to justify the regulation. What is an optional consideration in Ontario because the precise relationship between TRS effluent loading and TRS in ambient air has not yet been demonstrated, the Department has made a mandatory requirement of the Approval. It is unreasonable for the Department to impose a limit before knowing if there is a relationship necessitating that limit.

Northern Pulp has contacted a mill in Ontario and all of the major laboratories in Canada. It appears that no Canadian laboratories (after conferring with their satellite offices) are capable of performing the test required by Clause 8(d), NCASI Method RSC – 02.02. At this point, the closest capable lab that Northern Pulp has found is located in Simi Valley, California. This demonstrates that the Department is imposing a requirement on the Mill is entirely inconsistent with other Canadian jurisdictions.

As noted in Section I.G above, Clauses 8(d) and 8(f) should be removed from the Approval as they are in breach of the MOU. Clauses 8(d) and 8(f) should also be removed as there is no known scientific basis for the limit, which regulators elsewhere have recognized. Northern Pulp does not object to performing testing of TRS in accordance with Table 6 for the benefit of residents, as such monitoring is contemplated in Clause 8(e). However, the imposition of the regulatory requirement to achieve the TRS limits imposed in Clauses 8(e) to 8(f) is unreasonable.

Northern Pulp requests that Clauses 8(d) and 8(f) be removed entirely and that Clause 8(e) be revised to impose only a requirement that Northern Pulp test TRS in accordance with Table 6.

C. Effluent Flow Reduction Requirements – Clauses 5 and 6(a)

The reductions in Clauses 5 and 6 of the Approval are inconsistent. As water use and effluent flow are directly related in terms of the Mill's mass balance, the water use restrictions outlined in Clause 5 of the Approval effectively restrict the effluent limit contained in Clause 6(a) of the Approval to less than 67,500 m3/day or 77.3 m3/Adt. The effect of the water use restrictions in Clause 5 is to impose a greater effluent flow reduction requirement than the Department requires in Clause 6(a).

The AMEC Report (p. 25-26) indicates that consumptive water use (water taken but not returned as effluent) with the power boiler scrubber in operation is estimated at approximately 2 m3/ADt. In essence, from a mass balance perspective, Clause 5(d) is more stringent and practically translates to an effluent limit of 70.1 m3/Adt (72.2 – 2) or 61,200 m3/day. This represents a further reduction of 6,300 m3/day or an additional 9%. The McCubbin Report indicates that the net water consumption of 2 m3/Adt is very conservative and could be as high as 5 m3/Adt, which could lead to even further reduction requirements. KSH indicates that 8% of incoming water supply to the mill would be lost to evaporation. All three consultants (AMEC, Neil McCubbin and KSH) support this reduction of an additional 9-10%.

In addition to the arguments set out in Section IV.A above, the water use restrictions in Clause 5 are unreasonable because they impose conditions that are more onerous than the effluent control limits in Clause 6(a) of the Approval. Therefore, Northern Pulp requests that the water use restrictions in Clause 5 be removed.

D. COD Limits – Clauses 6(d) to 6(j)

The COD limits in Clauses 6(d) to 6(j) of the Approval are based on the outdated AMEC Report and are unreasonable.

Table II below summarizes the Mill COD data at several locations in the treatment plant.

Table II: Effluent COD Intensity (kg/Adt)

Location	2007	2008	2009	2010	2011	2012	2013	2014
Point A	154.6	124.7	103.5	123.4	99.6	92.2	82.5	87.8
Point C	**71.7**	**82.3**	**76.7**	**70.1**	**63.1**	**56.0**	**53.6**	**51.4**
Point D	74.0	78.6	71.3	65.1	62.8	56.0	55.2	50.8

The improvements in COD intensity beginning in 2011 reflected in Table II are in part the result of the Green Transformation Projects carried out by the Mill that year. Continuous improvement initiatives at the Mill have continued to provide COD reduction through to 2014.

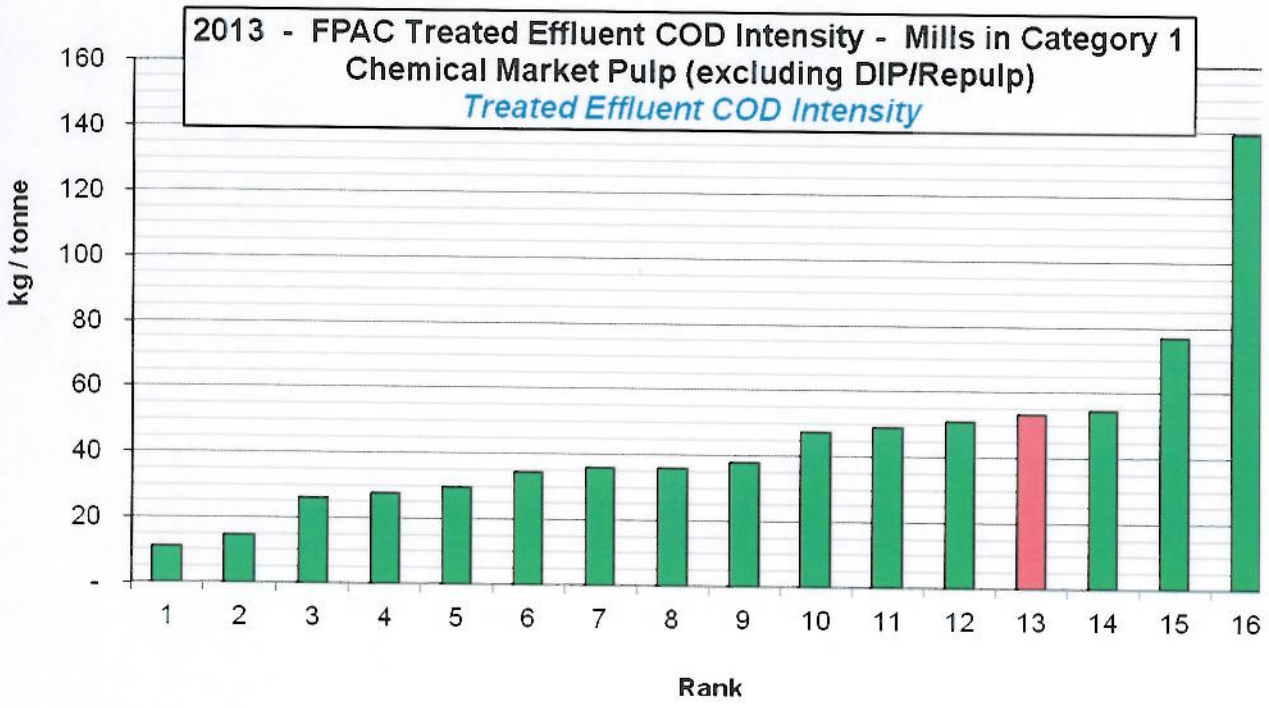
Since the AMEC Report was written, many of the proposed projects for effluent quality improvements identified in the Report have been completed, including: improvements to brown stock washing including two new washer drums and closing of the screen room with true counter-current washing, recycle of PM rejects, Stage 1 DNCG system, sludge removal plan, PB scrubber and a new emergency spill tank. A COD reduction of 30% has been achieved from the 2007 benchmark conducted in the AMEC Report.

Although not clearly stated, Northern Pulp has assumed that the COD reductions in Clause 6(e) of the Approval are based on the five year annual average COD at Point A that was reported pursuant to Clause 6(d).

Northern Pulp's average COD intensity at Point A for 2010 through 2014, as requested in Clause 6(d), is 97.1 kg/Adt. At 873 Adt/day[7], the daily discharge would be 84,800 kg/day. The 50% reduction in COD required by Clause 6(e) would mean a daily discharge of 42,400 kg/day at Point A.

There is very little published data for COD in North America, and virtually nothing from the United States. Data that is published, and all third party data presented in this Appeal, refer to "after treatment" and would be comparable to Point C in the above Table II, not point A (the inlet to treatment).

The Department has recently made statements in media interviews that Northern Pulp has four times greater COD than mills of similar size. This is clearly wrong. The following graph is an excerpt from the FPAC Report. With 16 out of a possible 30 mills in Canada reporting, this graph shows that Northern Pulp clearly does not have four times greater COD than mills of similar size, nor does it have the highest COD discharge.



The AMEC Report indicates (on p. 29) that benchmarking of effluent was done using the widely accepted EKONO study of September, 2007, which is based on 2005 data. The enclosed EKONO Memo compares COD and BOD data from Northern Pulp to the results found in the EKONO database. The EKONO benchmarking and analysis of the new COD limits concludes

[7] 310,000 Adt/year at 355 days is 873 Adt/day at the end of the Approval, assuming that the Mill is able to increase production to this limit by that time.

that the two lowest COD discharge mills are hardwood mills with oxygen delignification, modified cooking, condensate stripping, etc. and the lowest COD discharge in a Canadian bleached softwood kraft pulp mill in the database is 28-30 kg/Adt. The EKONO Memo also concludes that more than 40% of the North American bleached market kraft pulp in 2013 was produced by mills with BOD discharges higher than those at Northern Pulp's Mill. This proves once again that the Department is not working with current data and does not understand the influences of mill process equipment and wood species on COD.

It is clear that the Department was relying on outdated studies and analysis in setting the COD limits in Clause 6. This is based on outdated data and is unreasonable. Therefore, Northern Pulp requests that Clauses 6(d) to 6(j) be removed.

E. Production Limit – Clause 4(a)

Clause 4(a) of the Approval limits the maximum production rate of the Mill to 310,000 Adt/yr. Not only does this Clause prohibit the Mill's future expansion, it also offers no additional environmental benefit. The production capacity of the Mill is and should properly be limited by the existing equipment of the Mill and the other requirements of the Approval. So long as Northern Pulp is in compliance with the other requirements of the Approval, whatever the Mill's production limit happens to be when it complies with those requirements has no environmental relevance.

There is no additional environmental basis or additional public benefit for including in the Approval a provision that arbitrarily limits the production of the Mill. Northern Pulp therefore requests that Clause 4(a) be removed entirely.

F. Phenanthrene Testing – Clause 12(ag)

Clause 12(ag) requires semi-annual testing of Phenanthrene at Surface Water station SW12-3. The trend analysis requested is not warranted because the measurement was at or near the detection limit. See enclosed Dillon Consulting Memo[8]. The requirement of Clause 12(ag) therefore has no justification. It only adds cost to Northern Pulp with no corresponding additional benefit to the environment. The requirement in Clause 12(ag) is therefore unreasonable and Northern Pulp requests that it be removed.

G. Daily Limits for Water and Effluent Usage – Clauses 5(d), 5(e), 6(a) and 6(b)

The reference to water and effluent usage in the Approval in terms of daily limits is contrary to the way that effluent data is compared and benchmarked in the industry. See the AMEC Report and the enclosed EKONO Memo, FPAC Report, KSH Memo, McCubbin Report, and Klopping Report. As stated in the KSH Memo at p. 5, "Effluent flow restrictions are usually stated on an average basis, usually monthly or annually since there is no measurable risk to the environmental [sic] by one day of effluent flow above a certain amount."

The imposition of daily limits for water usage that do not consider seasonality are of particular concern to the Mill. Based on data from the last three years, the Mill's water intake has peaked at 87,000-91,000 m3/day (23-24 million gallons/day), even though the Mill's annual average water usage is 75,000 m3/day (20 million gallons/day). These peak days do not occur during the highest surface run-off months. Rather, they historically occur during the hottest days

[8] Letter from Dillon Consulting Limited dated February 11, 2015 ("Dillon Consulting Memo").

during the summer when the incoming Middle River water is at its warmest and cooling systems are most heavily loaded. Cooling towers will be an essential component of water reduction that will recycle "once-through" cooling water for re-use. Cooling towers are driven by temperature differential (water to ambient air) and relative humidity and are a very effective means of cooling. However, heat transfer during hot, humid spells can be challenging. The cooling towers offer significant water reduction on an annual basis, but daily reductions will be highly influenced by weather. It is therefore clear that the Mill will not be able to operate and comply with the daily water usage requirements of the Approval on certain days of the year. Therefore, daily limits on water usage are unreasonable as they effectively preclude the Mill from operating on a consistent basis.

There is no environmental reason to impose a daily limit in Northern Pulp's circumstances. Northern Pulp therefore requests that all water and effluent usage restrictions in the Approval, including Clauses 5(d), 5(e), 6(a) and 6(b), be revised to be based on yearly averages, not daily limits.

H. $PM_{2.5}$ Contributors – Clauses 9(a) to 9(e)

Clauses 9(a) to 9(e) of the Approval transform the voluntary objectives of the Canadian Ambient Air Quality Standards ("CAAQS") into mandatory compliance requirements without any consideration given to other local sources of $PM_{2.5}$, especially other local heavy industry, wood-burning stoves and other non-commercial sources, or the not insignificant contribution of interprovincial and international transport of $PM_{2.5}$ from other sources.

It is unreasonable to require the Mill's mandatory compliance with the limits in the CAAQS without taking into account other industrial facilities, residential sources and transportation that are also contributors to $PM_{2.5}$ in the area. See KSH Memo, p. 16-18. As the Mill's compliance with Clauses 9(a) to 9(e) is outside of the Mill's own control, such mandatory compliance requirements are unreasonable.

Northern Pulp is confident that the Mill will meet these limits as a contributor; however, imposing mandatory compliance on the Mill without taking into account other contributors is unreasonable. Northern Pulp therefore requests that Clauses 9(a) to 9(e) be revised to acknowledge that Northern Pulp is only required to demonstrate that its relative contribution to the local air quality meets the limits of the CAAQS.

I. Particulate Limit – Clause 9(h)

Clause 9(h) imposes a regulatory limit on the Recovery Boiler for particulate of 77 mg/Rm^3 @ 11% O_2. We understand, based on discussions with the Department, that this limit is based on the performance expected by the manufacturer of the new electrostatic precipitator ("ESP"). This limit does not properly take into consideration the variables that can affect actual boiler performance on a day-to-day basis, particularly in the case of a new ESP attached to an existing boiler. Contrary to North American regulatory convention, the approach taken by the Department in setting the particulate limit for the Recovery Boiler treats the installation of the new ESP as if it were a significant modification to an existing boiler and, as such, treats it as a new boiler and sets emission limits that are in line with such units: KSH Memo, p. 21-22. This is inconsistent with the approach taken in most North American jurisdictions. For example, under the U.S. Air Quality Regulations, the addition and/or replacement of pollution control equipment, such as a new ESP, is not, in itself, considered to be a modification to an existing boiler, and would not result in treating such existing boiler as if it were a new boiler for the purposes of

setting a particulate limit. As the particulate limit imposed by Clause 9(h) fails to recognize that the ESP is being connected to Northern Pulp's existing boiler system and the variables that can affect the performance of that boiler system on a day-to-day basis, Clause 9(h) is unreasonable.

The limit imposed on Quebec's existing recovery boilers of 153.5 mg/Rm^3 @ 11% O_2 represents a more reasonable and appropriate limit, as it represents state-of-the-art performance for a boiler and direct contact evaporator system of the same vintage as Northern Pulp's boiler. See KSH Memo at p. 18-22. Northern Pulp therefore requests that Clause 9(h) be revised accordingly.

J. Middle River Study – Clause 5(f)

Clause 5(f) makes Northern Pulp responsible for conducting a maximum sustainable yield study of the Middle River watershed. In the 47 years of the Mill's operation, neither the Department nor any other stakeholder has ever raised a concern about water usage impacts on the Middle River watershed. The Michelin, Granton facility also draws its fresh water supply from the Middle River and discharges its effluent back into Middle River upstream of the Mill's water supply. As well, the river is dammed to prevent salt water intrusion and the spillway dam is controlled by the Province. See KSH Memo at p. 2. No low-level warnings have ever been communicated to the Mill.

In addition, the December 15, 2015 deadline does not allow for a full year study to cover all seasons which would be normal for this type of assessment, implying that existing data must be used. The responsibility of Northern Pulp to conduct this maximum yield study of the watershed (which is usually directed towards new applicants for a water removal permit) is unreasonable, especially considering the Mill does not have access to or control of pertinent data that would be required to properly complete this study.

Northern Pulp therefore requests that Clause 5(f) be removed.

K. Waste Dangerous Goods – Clause 4(i)

Northern Pulp requests that Clause 4(i) be revised to replace the words "all wastes generated" with "all waste dangerous goods generated" in order to clarify this Clause and ensure its consistency with the preceding Clause 4(h), which deals only with waste dangerous goods.

L. TRS Reporting – Clause 7(m)(i)

The monthly reporting requirement for TRS in Clause 7(m)(i) is internally inconsistent with the reporting requirement for TRS in Table 6 of Appendix A. Clause 7(m)(i) should therefore be amended to include an exception for TRS reporting of every three months.

M. Cardlock Facility Wells – Clauses 12(a) and 12(g)

The Approval at Clause 12(a) requires Northern Pulp to maintain the Cardlock Facility Wells. The Cardlock Facility Wells are owned and operated by Parkland Fuels. Northern Pulp has permission from Parkland Fuels to sample the Wells, but the maintenance of the Wells is not under the control of Northern Pulp. Further, Clause 12(g) requires Northern Pulp to maintain records, including borehole logs, construction details and maintenance records, in respect of the Cardlock Facility Wells. This information is the property of Parkland Fuels and Parkland Fuels has no obligation to provide it to Northern Pulp.

Clauses 12(a) and 12(g) are unreasonable to the extent that these Clauses impose an obligation on Northern Pulp to maintain Wells which are not under Northern Pulp's ownership or control and require Northern Pulp to maintain with respect to those Wells records of information to which Northern Pulp is not entitled. Northern Pulp therefore requests that Clauses 12(a) and 12(g) be revised accordingly.

N. Surface Water Stations – Clause 12(ad)

Several of the Surface Water stations listed do not exist, while other new stations are not listed in Clause 12(ad). See enclosed Dillon Consulting Memo. Northern Pulp requests that this Clause be revised accordingly.

O. Stantec Report – Clause 12(au)

Clause 12(au) is inaccurate as it refers to the Stantec "Hydrogeological and Hydrological Evaluation of the Boat Harbour Treatment Facility Report" as being dated April 30, 2012. Rather, the Report is dated September 28, 2011. Northern Pulp requests that this Clause be revised accordingly.

V. Inconsistency with FOIPOP – Clause 22

The requirements in Clause 22 of the Approval that Northern Pulp provide information to the Pictou Landing First Nation ("PLFN"), including a copy of all reporting information and reports that are required to be submitted under the Approval, is inconsistent with the protection granted to Northern Pulp under FOIPOP. The public accessibility to information under the control of the Department under section 10 of the *Environment Act* is subject to the important restrictions of FOIPOP: section 10(2) of the Act.

Specifically, section 21 of FOIPOP provides that a head of a public body (such as the Minister and Administrator of the Department of Environment) must refuse to disclose information:

> (a) That would reveal
>
> (i) trade secrets of a third party, or
> (ii) commercial, financial, labour relations, scientific or technical information of a third party;
>
> (b) That is supplied, implicitly or explicitly, in confidence; and
>
> (c) The disclosure of which could reasonably be expected to
>
> (i) harm significantly the competitive position or interfere significantly with the negotiating position of the third party,
> [...]
> (iii) result in undue financial loss or gain to any person or organization, or

Much of the information required to be provided by Northern Pulp to the Department constitutes commercial, financial and technical information. That information is supplied to the Department in confidence. The disclosure of this information could reasonably be expected to harm both

Northern Pulp's competitive position as well as its negotiating position with respect to an action that has been brought by PLFN against Northern Pulp. The competitive position of Northern Pulp would be harmed because its competitors in a global market and others having interests adverse to Northern Pulp would become fully aware of the Northern Pulp's commercially sensitive information.

Requiring Northern Pulp to comply with Clause 22 of the Approval is contrary to Section 10 of the *Environment Act* and Section 21 of FOIPOP. The Department through the Approval is circumventing the due process provided for under FOIPOP and the procedural fairness afforded to Northern Pulp with respect to the release of Northern Pulp's confidential and commercially sensitive information to third parties. The Department cannot by administrative fiat overcome a legislative requirement. Clause 22 of the Approval therefore is an unreasonable and ultra vires condition imposed by the Department. Accordingly, Northern Pulp requests that Clause 22 of the Approval be removed entirely.

Northern Pulp hereby confirms that any documents submitted by Northern Pulp to the Department at any time, including but not limited to this Appeal and its enclosures, are being submitted with the expectation that the Department will observe the protections afforded to Northern Pulp by FOIPOP in respect of such documents.

CONCLUSION

In light of the above, Northern Pulp respectfully requests that you exercise your powers under Section 137(4) of the Act to allow Northern Pulp's Appeal and remove or revise the provisions of the Approval as outlined in this letter.

Yours truly,

Terri Fraser

Ms. Terri Fraser, Technical Manager
Northern Pulp Nova Scotia Corporation
PO Box 549
New Glasgow NS B2H 5E8

Dear Ms. Fraser:

Re: Notice of Appeal Form Dated April 9, 2015 and additional information filed June 12, 2015 – Industrial Approval for a Pulp Mill Operated by Northern Pulp Nova Scotia Corporation Approval No. 2011-076657-A01

I am writing regarding your Notice of Appeal Form dated April 9, 2015 respecting the decision of an Administrator to issue Approval No. 2011-076657-AOl for the operation of a bleached kraft pulp mill at 260 Granton Abercrombie Road, Abercrombie Point, Nova Scotia.

After careful review of the "grounds for appeal", the information you submitted in support of your appeal, other information held by the department, and the applicable statutory provisions, I hereby render my decision pursuant to Section 137 of the *Environment Act* and order that the following be implemented pursuant to Section 137(5) of the Act:

- Term and condition 6(g) is open to interpretation and its due date approaches the expiration date of this approval, so this term and condition shall be removed effective immediately.

- Term and conditions 5(j), 6(i), and 6(j) reference a new effluent treatment facility that would be regulated by a separate approval, so these terms and conditions shall be removed effective immediately.

- Term and condition 6(e) required additional clarity pertaining to COD concentration baseline and shall now read as follows:

    - "The Approval Holder shall undertake a study to identify all sources of COD contributing to the effluent treatment system and develop a plan, together with an implementation schedule, to achieve the following reductions, from baseline COD concentrations that shall be derived, to the satisfaction of the department, from information gathered under Condition 6(d), in COD concentrations at Point A:

        i) a 10% reduction by January 30, 2017;
        ii) a total of 20% reduction by January 30, 2018;
        iii) a total of 50% reduction by January 30, 2020."

- Term and condition 8(d) is open to interpretation, which makes it difficult to ensure compliance, thus this term and condition shall be revised to ensure clarity between Northern Pulp Nova Scotia Corporation and the Department of Environment.

- Term and condition 8(f) has language more restrictive than intended and shall now read as follows:

    - "If the Approval Holder is unable to achieve the objectives established in Condition 8(d) of this Approval, the Approval Holder shall submit a plan which meets the satisfaction of the Department, by October 30th, 2016, detailing a program to meet the objectives. This plan shall include a proposed schedule for implementation of the program."

- Term and condition 12 (ag) shall be removed effective immediately. After review of the record, I conclude that ongoing testing of phenanthrene is no longer required because the measurement was at or near detection limits.

- Term and condition 12 (ad) referenced incorrect surface water monitoring locations and therefore locations SW1, SW3, SW7, and SW8 are to be removed and replaced with locations SW12-1, SW12-2, and SW12-3. This term and condition 12(ad) shall now read as follows:

    - "The Approval Holder shall ensure the following surface water stations are analyzed for parameters listed in Table 7 and 8, in Appendix A, as well as total suspended solids (TSS), biological oxygen demand (BOD), chemical oxygen demand (COD): SW4, SW5, SW6, SW9, SW11, SW12, SW12-1, SW12-2, SW12-3 and SW13. Once annually, during the low flow period, all surface water samples shall be analyzed for mercury."

- Term and condition 22(b) is unnecessary, as the communication plan defined under Condition 22(a) provides the means for the necessary sharing of information between parties, so term and condition 22(b) shall be removed effective immediately.

- Term and condition 5 pertaining to water use reduction shall be reassessed by the Department of Environment. The information contained in the record reviewed for this appeal provides multiple and varying opinions as to the technical feasibility of the targets identified. The assessment and revisions, if any, shall establish technically feasible targets that meet desired environmental outcomes. This review must also consider changes to other terms and conditions that may be impacted by changes to water usage criteria, for example, it is necessary to ensure consistency between water usage and effluent outflow.

Terms and conditions requiring further review shall be reviewed and revised as necessary by the Department of Environment and submitted to the Minister for approval prior to inclusion in the Industrial Approval.

Pursuant to Section 138 of the *Environment Act*, you have thirty (30) days to appeal my decision to the Supreme Court.

Sincerely,

Randy Delorey, MLA
Minister of Environment

Project: replacement_effluent_treatment_facility_project Comments: I want clean air and clean water. Our earth in Pictou County already has had many leaks of chemicals from the pulp mill. Boat Harbour is dead. People there have suffered.I am for no pipe and no continuation in Boat Harbour. Enough is enough. Let forestry learn to be more sustainable, otherwise there will be no more forests at the rate we are going. Planting all spruce trees does not fertilize the soil. HArdwood leaves fertilize the soil. We need mixed forests. Forresters have been telling us this for years. Why does this whole province need to support pulp mills? Government need to look at the longevity of our forests.Our ocean will be a mess if we allow this Pipe in. Focus on sustainability of children,clean air , forests,clean water and protect our drinking water sheds around Pictou or find a government who will. Name: Email: @gmail.com Address:

Project: replacement_effluent_treatment_facility_project Comments: This is a 19th century solution to a 21st century problem. If the best you can come up with is a pipe to hide your mess offshore, then you should close the damn plant.You could do better, with some rational thought and expense. If the economics dont work , then let the wonderful free market offer its solution and close. Name: Email: @gmail.com Address:

Project: replacement_effluent_treatment_facility_project Comments: If Northern pulp will not change to an effluent free process, they should either be regulated into submission, bought out and run by the government, or expropriated for polluting the entire Northumberland Strait and likely the Gulf of St Lawrence. To bad for Northerns profits and downtime - call their bluff on no pipe = no mill. If they want the pulpwood, they can play by the rules. Legislate them into a closed system paper process or tell Northern to go elsewhere but leave the mill But the pipe into the Strait will devalue and destroy major sustainable fisheries, will be a blight on the region, and will have health consquences for the population as well. Project: replacement_effluent_treatment_facility_project Comments: THE TOP 5 REASONS TO SUPPORT #NOPIPE 1. For your HEALTH The composition of the toxic effluent will contain dioxins, furans, metals, 1000KG of solids and other contaminates at 90,000,000 Litres PER DAY. Dioxins and Furans can cause very serious health issues to humans and our food sources. Shellfish absorb dioxins and furans at 25,000-50,000 times the concentration in the water. The Northern Pulp treatment system proposal includes a plan to burn the waste sludge. The waste sludge contains toxins which would be released through the stacks of the millâ?Ts power boiler. The proposal is to dewater the sludge prior to mixing it with bark and other wood waste for combustion in the mills power boiler. This is the same power boiler that is currently and repeatedly failing stack emissions tests. Problems with air quality from mill emissions have been documented for years. Lack of appropriate monitoring and enforcement already puts area residents at risk. Now, Northern Pulp is considering adding sludge containing toxins to the combustion mix, increasing health risks from NPâ?Ts air emissions. It is also important to note, the route of this effluent pipe goes through the source water supply for the town of Pictou and community of Caribou and surrounding area. http://ec.gc.ca/inrp-npri/donnees-data/index.cfmâ?¦ https://www.nrcm.org/â?¦/cleaning-up-â?¦/maines-dioxin-problem/â?¦ https://docs.wixstatic.com/â?¦/b61814_40a0f43682ee45d99af01fbâ?¦ 2. For the overall ECONOMY The proposed treatment system runs the risk of harming three lifelong Industries worth close to $4 Billion dollars to the Nova Scotia economy. The tourism industry is worth $2.7 Billion and prides itself on warm, clean water and world class sandy beaches. The Commercial Fishing Industry is worth over $1 Billion and prides itself on sustainable wild shellfish that is shipped all across the world. The Sport Fishing industry is worth $56 Million and the Northumberland Strait is home to the last remaining stable Atlantic Salmon stocks on mainland NS. All of this is at risk due to 32,000,000,000 Liters of waste water PER YEAR that will be 37 Celsius that will contain deleterious substances harmful to Fish species and humans. https://docs.wixstatic.com/â?¦/b61814_246fdf7e04a64e239be0fbfâ?¦ https://novascotia.ca/news/release/?id=20180222001 https://docs.wixstatic.com/â?¦/b61814_f856b6a7c7b34ffb9eba165â?¦ 3. For the ENVIRONMENT â?" Meeting Regulations DOES NOT Prevent Harm Nova Scotia and the Northumberland Strait has many great resources. However, they are at risk with the proposed Effluent treatment process. As it stands right now, there are no CCME guidelines established for Marine Environments for some of the different chemicals and compounds that make up the pulp mill effluent. Pulp and Paper Effluent Regulations PPER in Canada cover two matters total suspended solids TSS and biochemical oxygen demand BOD. Even though total discharges of TSS and BOD in pulp and paper effluent decreased by approximately 90 and 97 respectively from 1970-2008, pulp mill effluents continue to have harmful impacts on fish, fish habitat and the environment. Information gathered through environmental effects monitoring EEM at all Canadian mills points to the disturbing conclusion that although mills are meeting regulations and passing the PPER toxicity test, 70 are having harmful effects on aquatic life and habitat, and 55 are having harmful effects on the larger environment. This information led the federal department of Environment and Climate Change to undertake a modernization review of pulp and paper effluent regulations in 2017. â?oResults from EEM studies and the changing realities of the pulp and paper industry indicate a need to modernize the PPER to improve environmental protection,â? the department states. If meeting regulations is not enough to prevent harm, neither is passing toxicity tests. Only one toxicity test is required under Canadian pulp and

paper regulations. The required LC-50 test is for acute lethality. For this test, an effluent is considered acutely lethal if the treated effluent at 100 concentration kills more than 50 of the Rainbow Trout exposed to it during a 96-hour period. Long-term effects, including impacts on reproduction or growth, cumulative impacts on fish habitat and the larger environment or accumulation of substances harmful for human consumption are not regulated under the PPER. Testing for environmental effects is required for information purposes. Only two mills in Canada test for and report impacts of effluent on the usability of fish resources by humans. Effluent from pulp and paper mills is regulated at the federal level principally by the Pulp and Paper Effluent Regulations PPER, which form part of the Fisheries Act. The standards that apply to pulp effluent today were adopted in 1992 and have remained unchanged for 25 years. Highly toxic dioxins and furans are regulated under a separate Act. 70 of pulp paper mills are having harmful effects on aquatic life and habitat despite meeting current regulations . Long term impacts on reproduction and growth are not regulated under PPER. Federal regulations cover only a few of the recognized harmful substances in pulp mill effluent. For example, there are no federal regulations for AOX compounds, a component of pulp effluent in mills that bleach with chlorine or a chlorine compound. AOX compounds are recognized as extremely toxic. They are not easily broken down by bacteria and thus bioaccumulate in the environment. Yet they are not included in PPER regulations. Neither are phenols, toluene, chloroform or chemical oxygen demand COD. For 25 yrs the regulations that apply to pulp effluent have remained unchanged. Provinces may go beyond Federal standards and adopt stricter regulations for effluent from pulp mills. British Columbia, Alberta, Ontario and Quebec have adopted stricter regulations. Nova Scotia does not have regulations, but sets limits through individual industrial approvals. The EU has more protective regulations than Canada does. https://drive.google.com/â?¦/1H1HltUnh9Oem_KpPHwxmye7z5â?¦/viewâ?¦ 4. New treatment Facility is NOT BETTER Northern Pulpâ?Ts proposed new effluent treatment facility differs from the present facility in a number of ways. In the present system, untreated effluent is piped from the mill to the north settling ponds at Boat Harbour, where it remains for 12 hours for primary treatment. It then moves to an aerated stabilization basin where effluent is placed in contact with micro-organisms. The effluent remains there for 8 days for secondary treatment. After 8 days, the effluent is discharged from the aeration basin at what is known as Point C, and treatment is considered finished. At point C, samples are taken for testing to determine whether the treated effluent meets regulations. POINT C is also a DEAD ZONE!! After point C, the effluent enters the 300-acre Boat Harbour lagoon, also known as Boat Harbour Basin. Boat Harbour Basin was initially used as a stand-alone effluent treatment facility. In 1972, settling ponds and an aerated stabilization basin were constructed to meet stricter regulations for pulp effluent treatment. Additional aeration and other upgrades were added from 1992-1996, as the federal government again adopted stricter regulations. The lagoon at Boat Harbour has not been officially part of the effluent treatment system since 1972. Official or not, treated effluent remains in the lagoon for an additional 20-30 days. Further aeration, settling, cooling, volatilization and breakdown of materials takes place during that time. This is referred to as â?opolishingâ? or tertiary treatment. Natural springs and surface run off further dilute the effluent. According to Northern Pulpâ?Ts figures, during the time in Boat Harbour Basin, total suspended solids TSS and biochemical oxygen below the proposed water quality standard of 1.â? The Stantec Preliminary Receiving Waters Study, August 2017, illustrates the same lack of dispersion. Treated effluent has never flowed directly into the deeper waters of the Strait. From its discharge at the shoreline, after 20-30 days in Boat Harbour Basin, tides and currents further break down, dilute and settle contaminants before they reach the deeper waters of the Strait. It is misleading to imply that effluent from the proposed new system pumped directly into the fishing grounds of the Strait within 24 hour that contains almost 1000kg of solids will have the same impact as the effluent which

presently enters the Strait at the shore edge, hugs the shore and recirculates in and out of Pictou Harbour. Further to this, the same proposal was rejected in 1994 for the same concerns!! https://thetyee.ca/â?¦/Pollution-Nova-Scotia-Pulp-Mill-Sinkâ?¦/â?¦ https://docs.wixstatic.com/â?¦/b61814_ab61cca668f1432f890d2d0â?¦ 5. Better return for your TAX DOLLARS Nova Scotians are on the hook for the Boat Harbour clean up which is expected to be close to half a billion dollars once remediated. They also paid for the design process of the proposed effluent process at a cost of $6 Million dollars and will be expected to cover the construction, installation, labour etc for the proposed pipe estimated at $100 Million dollars. Further to that $127 Million dollars of NS Tax payers dollars have been given to the mill in the last several years. Meanwhile we have doctors over worked and leaving our province. We have ER closures and very long wait times for treatment and care. Our Education system is also at its max with constant cuts. Funding for Seniors and Veterans as well as many more public programs and services would benefit from the large sums of NS tax dollars instead of it going towards Northern Pulp. https://www.halifaxexaminer.ca/â?¦/northern-pulp-scotsburn-â?¦/â?¦ https://www.halifaxexaminer.ca/â?¦/health-care-crisis-checkâ?¦/â?¦ #NOPIPE https://novascotia.ca/â?¦/Replacement_

Project: replacement_effluent_treatment_facility_project Comments: February 11, 2019 Nova Scotia Environment re: New Effluent Treatment System / re: Northern Pulp Iâ?Tve watched in amusement these past several years, as various groups have stated â?oMistruthâ?Tsâ? â?oFear Mongeringâ? to persuade residents that the Northern Pulp, Pulp Mill is the cause for every hardship health issue that they currently have. Starting with â?oAir Qualityâ? , they stated that people were â?odying in the streets in the town of Pictouâ? , that residents must wear â?oGas Masksâ? to survive. In my 54 Years living in Pictou County, never once have I witnessed people dying in the streets. And now that Northern Pulp has installed a new â?oPrecipitatorâ? , I now see the â?oPlumeâ? coming from Northern Pulp is much smaller, I suspect the system is working as it should, would suspect that this new system is meeting Nova Scotia Canadian Standards Regulations for Recovery Boiler Precipitator Emissions. Since that attempt didnâ?Tt close Northern Pulp down, now the groups are again using â?oMistruthâ?Tsâ? â?oFear Mongeringâ? to persuade the public that Northern Pulp now wants to dump â?oEffluent into the Northumberland Straitâ? , imagine!!! Suggesting that this is â?osomething newâ? and that it will ruin the water quality, beaches, property values, and Kill or damage the marine habitant. They forget to tell the public that Northern Pulpâ?Ts effluent has been discharging from Boat Harbour to the Northumberland Strait for the past 50 some years. For those past 50 years, Effluent has been mixing in with the Northumberland Strait sea water, past the various Beaches, Cottages, and the very lucrative fishing grounds, and hey, weâ?Tve been eating the fish, lobster, clams, etc., all that time. I believe these groups are doing more harm to the county province than Northern Pulp, especially when they advertise to the media those â?oMiss Truthâ?Tsâ? , which, may prevent tourists from visiting, spending their money here, or the potential new-comer, that wants to move here, but hears this groups â?overbal diarrheaâ? moves elsewhere. Nice Job Jill Matt. Northern Pulp has been purchased a couple of times in the past 15 to 20 years, they now have a new owner that wants to improve the Norther Pulp Mill, make it â?oWorld Classâ? , improve the â?oAir Effluentâ? emissions, wants to be a better business partner in the community. Itâ?Ts my understanding that the new Effluent Treatment System would be built on company property, and that once built, only treated effluent would be pumped off the property to the Northumberland Strait, thereby removing the possibility of â?oun-treated effluentâ? ever reaching salt water. Iâ?Tve seen how difficult it is when my son, son-in-law, neighbours friends have to â?oGo Westâ? for good paying jobs. Sure, most go for a couple weeks then are back home for a couple, but some of them move their families out there too, will they ever be back at some point? While their gone, theyâ?Tre no longer paying taxes here, purchasing those big items, or those everyday items. So whoâ?Ts left to pay taxes for Schools, Roads, Health Care, etc. That leaves fewer residents to pay, resulting in higher taxes!! Now is the time for someone to bring these two groups together, to discuss this matter in a civil, courteous way, and work to get along. Usually I would suggest a Premier, MLA or the like, but they all seem to be fearful for their Jobs, as this has been â?oblown out of proportionâ? . Possibly a Judge would be the answer, then both groups would have to remain quiet in the courtroom, of course when speaking to the Judge, they would have to tell the truth!! prove what they are stating is true!! To the Environment Minister, I want my support to go to Northern Pulp, for the Department of the Environment to grant the Industrial Approval, to grant an operating extension to allow time to build the New Northern Pulp Onsite Effluent Treatment System, and to get that effluent treatment system operational, provided the science behind the project

backs up the proposal, and that the system, once built is monitored operated to the Nova Scotia Canadian Pulp Mill Effluent Standards Regulations. Name: Email: @yahoo.ca Address:

Project: replacement_effluent_treatment_facility_project Comments: February 12, 2019 Margaret Miller NS Minister of Environment: To Whom It May Concern: Re: Northern Pulp and its Replacement Effluent Treatment Facility Project Save Our Seas and Shores is a non-partisan coalition of fishers, First Nations and concerned citizens who have been advocating protection of the Gulf of St Lawrence for decades. We are engaged in 5 provinces because the Gulf of St Lawrence is a fragile inland sea which shares its waters, fish and coastlines with NS, NB, PEI, QC and NL. It has counter clockwise currents that only empty into the Atlantic once a year. This vulnerable body of water is home to thousands of marine species including lobster, herring, mackerel, snow crab, ground fish, Atlantic salmon, endangered right whale, blue whale, humpback whale, Leatherback turtle and harlequin duck, to name a few. It is considered one of the most precious marine ecosystems on Earth and according to DFO, has sensitive life stages of marine organisms present year around. Because of these shared waters, it can only be legitimately studied in its entirety. This is because water and fish do not recognize provincial boundaries neither does kraft bleached pulp mill effluent which is considered to be one of the most toxic industrial pollutants ever created by humans to enter our marine environment. These toxic effluents have been bio-accumulating and assaulting our oceans and marine species for over half a century. We are writing today regarding the pipe being proposed by Northern Pulp to dump 70-90 million litres of heated kraft pulp mill effluent into the Northumberland Strait. Briefly, we would like to acknowledge that Premier Stephen McNeilâ?Ts government is the first government in 52 years to announce the pending closure of Boat Harbour in 2020â?" an atrocity that has been inflicted on Pictou Landing First Nations for over half a century. We applaud this government for taking this action. The problem is, moving Boat Harbourâ?Ts toxic effluent from Boat Harbour into the Northumberland Strait is not a feasible solution in 2019. This isnâ?Tt the same gulf that was there in 1967. Itâ?Ts the same expanse of water, but it is now highly stressed. Weâ?Tre seeing plankton levels down 50 per cent from what they were four or five years ago, and now the federal government is predicting the cod fishery will be extinct in a few years. A six-year-old fish today weighs what a four-year-old fish did 10 years ago. As it stands, this Kraft pulp mill in Abercrombie, Nova Scotia has a fifty year history of environmental negligence in Pictou County and its current plan for an effluent pipe puts the delicate ecosystem of the Gulf of St. Lawrence at major risk. Discharging 70 â?" 90 million liters of bleached Kraft pulp effluent daily into the Gulf of St. Lawrence will have a significant negative impact on the fragile and sensitive spawning, nursery and migratory habitat of lobster, herring, mackerel and many other species. This in turn, will threaten tourism and fishing industries in Nova Scotia, Prince Edward Island, New Brunswick, Newfoundland and Quebec, which support a global food supply and generate billions of dollars in economic activity. Furthermore, the economic backbone of our Maritime economy and the thousands of commercial fishers in the Northumberland Strait and the five provinces bordering the Gulf of St. Lawrence, depend on these sustainable fisheries to support their families and the hundreds of coastal communities in which they live. Compounding this matter is the inherent conflict of interest the NS Dept of Environment is in, as the owner and operator of this over entitled pulp millâ?Ts waste treatment facility. In the publicâ?Ts interest and trust, how can you possibly, in good faith and transparency, oversee and determine the viability of an environment assessment of this same waste treatment facility while you are, in fact, a business partner of this mill? It is an irreconcilable conflict, in our coalitionâ?Ts humble opinion. For the record, the Gulf of St

Lawrence is already considered one of the most rapidly de-oxygenating bodies of water on earth. In short, if we as humans are to save this extremely vulnerable body of water, we need to stop dumping our industrial waste into it. PERIOD. Therefore, we implore you: You must say NO to this reckless proposal of a pipe into the Northumberland Strait and Gulf of St Lawrence. While we applaud this governmentâ?Ts impending closure of Boat Harbour, to complete this Historic action in good faith, and in terms of real and genuine reconciliation with Pictou Landing First Nations, the only viable long term solution is this - You must STOP this effluent from entering our marine environment. NOW. Respectfully submitted,

Project: replacement_effluent_treatment_facility_project Comments: February 2019 Comment on Northern Pulp Replacement Effluent Treatment Plan Page 1 Bonny McTague ATTN: NS Environment Assessment â?oI stand firmly against Northern Pulpâ?Ts desire to pump pulp effluent into the Northumberland Strait. They are unwilling to finance a treatment which might be deemed to be safe and their new proposal most certainly will further damage our environment on an even greater scale.â? ISSUE A: TRUST The AST proposed is untried at best and would require strict adherence to management of the process and honest evaluation which this Company has never illustrated. Northern Pulp is not the environmentally friendly entity it tries to portray. We have seen this evidence of uncaring in many ways. In fact, the Public have rarely been able to trust a word they say!!! When we question or ask for clarification they donâ?Tt respond. Polite inquiries are ignored. They have even suspended their Final Public Consultation! Also, I must make mention of the Community Liaison Committee that NS Environment told them they must set up in 2011. It still operates ridiculously â?ounder coverâ? and they chose to lie that the members were selected by the Environment Dept. when in fact handpicked by NP. The push back by Northern Pulp against the Environmental Standards imposed in 2015 by the NS Government is a great example of the lack of any environmental conscience of Northern Pul p. This is proved by Bruce Chapmanâ?Ts published comments CBC regarding this issue. â?oToo expensive etc.â? This is a Company, Paper Excellence/SinarMas/Asia Pulp and Paper with a very bad record here in NS and internationally on caring for the environment. Also, a fact to know is that Asia Pulp and Paper is one of Asias largest debtors according to www.marketwatch.com As well, among Ten Top Corporate Criminals of 2018, listed by Global Exchange they are NUMBER ONE. Here in Nova Scotia they have been given millions of taxpayer dollars, an exact figure impossible to discern. The arrogant opinion that they are too big to fail pervades their bullying relationship with Government and Community. Bottom Line: It appears that proponents of Pulp Mills are willing to harm human health, species, and the environment. They choose to ignore these effects because of the economic benefits. Eventually NP may shut down when all the fiber is exhausted leaving behind a wasteland. This is a questionable goal however you spin it. This Northern Pulp Mill is rickety and old, 25 years past itsâ?T lifespan. Only one stack has an air scrubber and the high vent roof opening is also used without emission scrubbing. When their operating permit was up for renewal in 2015, they showed little regard for our environmental standards here in Nova Scotia. Pictou area and PLFN were dangerous places to be during the times toxic chemicals in the Mills air emissions were spewed out that were 80 times the allowable limit. It had to be persistent pressure by residents to force them to comply. Many people in our area suffered from Cancers as the statistics show. Breathing issues, asthma, bronchitis and COPD are off the charts. This of course ultimately is the fault of the Province but never once did the Mill owners ever speak up and acknowledge any change was needed until forced by resident pressure. The odor is still horrendous much of the time and a huge discouragement to our Tourist Industry. February 2019 Comment on Northern Pulp Replacement Effluent Treatment Plan Page 2 We live in a beautiful historic town with fabulous scenic views. Many beautiful beaches and waterfront areas once enjoyed are in ruin. Of course, the health cases all rely on anecdotal information but recently we have learned by a published peer reviewed Scientific Study by Emma Hoffman et al, 2017 in Environmental Science Pollution Research, that cancer causing VOCs have been emitted from the Northern Pulp Mill. No upgrades to emissions are presented. Their presence has caused

massive clear-cutting of trees in our beautiful wild Nova Scotian forests which in turn has destroyed birdsâ?T nests and left no places for animals to live. We have a long list of Species at Risk here in NS. They carry out Glyphosate spraying on many hectares of woodlands every year this chemical is described by the WHO as a likely carcinogen and is banned in several countries. Their entire operation threatens the serious issue of Climate Change as trees sequester carbon. FACT: Older trees and especially hardwoods sequester far more efficiently than the young replacement trees, and future forest nutrients are lost in the remnant deadwood that we burn or pulp. Over the past 66 MILLION YEARS two major extinctions ago, the Earth has never had more CO2 put into its atmosphere per year than this year [2018]. {Zeebe et al}. We must retain Carbon Sinks, not sell them out for Toilet Paper. Northern Pulp are a heavy burden on taxpayers and excepting their wages paid out and the economy of the local NS Forest Industry their profits leave Canada lining the pockets of Billionaire owners. I realize trust is not your issue to gauge but do not be taken in by their claims. Ensure our Regulatory levels are effective, up to date and prove everything. A plan on paper or modelling is not good enough for this untrustworthy company and such a high probability of disastrous environmental consequence. I am not Scientist, I did however spend 6 years with FRBHfx Fisheries and Oceans during the 70â?Ts as a Research Technician studying the effects of Methyl Mercury, PCBs and also Endocrine and Reproductive Changes on many species of Fish. This under the direction of

I cannot accept â?oon faithâ? the claims of this Company due to the trust issue and the unknown parameters they refuse to supply. In fact, there are those in the Community who believe that the Mill has no intention of ever building this treatment. Why have they waited until now to commence and rush a process we are paying for? They had over four years to develop knowing Boat Harbour would close in 2020. We also see their poor choices of Pipe Line Route. The Caribou Route passes through two watersheds and the effluent in Caribou Harbour would be adjacent to Munroeâ?Ts Island Wildlife Reserve and Caribou Park. I do not believe they will ever receive approval for this route. I have named this â?oWilful Incompetenceâ? if true. They will simply shut down, blame the hostility of the community and sue the NS Government for 10 years lost profit. As regards the ocean survey, even I was able to go on line and in a few minutes understand the depth and type of bottom from published Navigation Charts created by BIO Hydrographers. The present route is totally unacceptable: two watersheds on land, ice scour, dredging , lack of depth and disruption to Herring Spawning outside Caribou Harbour near outfall. February 2019 Comment on Northern Pulp Replacement Effluent Treatment Plan Page 3 ISSUE B Beyond the Trust Issue is the Fail Safety of this new AST System. There are only 9 Hours backup for any industrial activities that break down, then the whole untreated raw pulp effluent is dumped into the ocean. Even heavy rains may affect this ability to protect Caribou Harbour. And that figure represents 70-80 million liters of hot contaminated fresh water effluent daily containing pulp chips. In addition to Human health being impacted by the presence of toxic pulp chemicals in food fish, the other great worry is for the decline of the lucrative Fishery in the Northumberland Strait and for the health of all marine species including species of birds who prey on fish. ISSUE C is the known effect of Pulp Effluent on health to marine life. Death, suppressed reproduction, liver damage, abnormal growth and malformations can occur. Northern Pulp seem unable or unwilling to supply chemical components of final effluent So letâ?Ts speak about what we know about pulp and paper industrial waste. Following references are reports and studies I have read. Comp Biochem Physiol C Toxicol Pharmacol. 2018 Apr206-207:41-47. 10.1016/j.cbpc.2018.02.005. Epub 2018 Feb 27. Exposure to a Brazilian pulp mill effluent impacts the testis and liver in the zebra fish. Castro AJG1, Baptista IE1, deMoura KRS2, Padilha F1, Tonietto J1, de Souza AZP1, Soares CHL1, Silva FRMB1, Van Der Kraak G3 Decade of Research on the Environmental

Impacts of Pulp and Paper Mill Effluents in Canada: Field Studies and Mechanistic Research Journal of Toxicology and Environmental Health Part B 94:319-39 Â· September 2006 by McMaster, Parrott and Hewett Altered Reproduction in fish exposed to Pulp and Paper mill effluents by LM Hewitt - â?Z2008 - https://onlinelibrary.wiley.com/doi/full/10.1897/07-195.1 by LM Hewitt - â?Z2008 â?"Despite effluent improvements, effects on fish reproduction continue to be reported ... enhanced growth and enhanced condition that can be attributed to .... mill effluent BKME as evidenced by decreased gonad size, decreased circulating and gonadal production of reproductive steroids, altered expression of secondary sex characteristics, and decreased egg production. Fish Testes: Pulp effluent causes them to grow bigger but they are less able to support reproduction. Atlantic Salmon Federation Publication October 19, 2018 February 2019 Comment on Northern Pulp Replacement Effluent Treatment Plan Page 4 The effect of reproduction on fish testes: Pulp effluent causes them to grow bigger but they are less able to support reproduction. Atlantic Salmon Federation Publication October 19, 2018A Nov 2, 2018 - Summary of effects of pulp mill effluents on wild fish: Summary of studies ...from pulp and paper mills affecting ï¬ sh reproduction. Studies. An overview of recent studies on the potential of pulp mill effluents to impact reproductive function in fish Oct 1998 Kelly Roland, Munkittrick, Mark E Mcmaster, L H McCarthy, Glen Van Der Kraak. Deborah MacLatchy, a Biologist who has studied the effects of pulp mills and currently serves as president of the University of Waterloo. says the two issues around pulp mills are that if there are large amounts of nitrogen and phosphorous they can cause eutrophication, which can lead to algae blooms and invertebrates changing in numbers and size. Eutrophication happens when an influx of nutrients causes excessive plant growth that in turn sucks the oxygen out of the water so that sea creatures canâ?Tt breathe. The other issue is compounds that cause what we call endocrine disruption. â?oSo, the fish are bigger because of eutrophication but also their gonads are smaller and have less reproductive ability.â? As for the small gonads, the jury remains out on exactly which chemical compounds cause this. July 26, 2018 - Truro Daily News Speaking before the P.E.I. Legislatureâ?Ts Standing Committee on Agriculture and Fisheries Biologist Melanie Giffin, who works with the P.E.I. Fishermanâ?Ts Association, said key Atlantic herring habitats in the Northumberland Strait could be threatened by the proposed Northern Pulp pipeline in Pictou Harbor*. FisheryNation.com October 20, 2018 *same effect is expected for Caribou Harbor due to close proximity-Pictou Harbour was the original route planned. Giffin said the federal Department of Fisheries and Oceans has identified key ecologically significant areas in the Southern Gulf of St. Lawrence. Theyve actually isolated three important areas in the Southern Gulf of St. Lawrence. And those three important areas all surround the Pictou Country area, she said. There are currently few spawning beds for Atlantic Herring in the Southern Gulf. Lady crab and winter skate populations, which are unique to the Northumberland Strait, are already endangered. The white hake in St. Georgeâ?Ts Bay is also endangered. Truro Daily News July 16, 2018 Michael Van den Heuval UPEI Biologist/Researcher believes pouring between 60 to 80 million liters of treated effluent a day just outside the mouth of Pictou Harbour will have an effect. â?oYes, there is that risk. He believes however it will impact a small area. The question is, are the level of the effects acceptable to society?â? Maybe within 1000 Meters but nobody really knows. NP says effects only within 100 meters. Oddly enough however Dr seems to be the only opinion that reflects a little less concern on the environmental impacts. My comments here: It is known that Eutrophication is deadly to the ocean. This will occur due to the addition of pulp chip solids 85 or less with TSS removal to the ocean to rot and consume all the oxygen. No oxygen, nothing lives and dead zones grow. The new system effluent treatment will produce far more solids than the old method which settled most of this material in Boat Harbor, 1000 kg solids minimum per day is the least load expected to be discharged The

Construction phase of this pipeline obviously will endanger marine life. February 2019 Comment on Northern Pulp Replacement Effluent Treatment Plan Page 5
2015 Toxic Legacy project - documents gathered by Kings Journalism students to write the history of Boat Harbors treatment facility. Joan Baxterâ?Ts Book â?oThe Millâ? contains much information that has informed my opinions. It contains 900 End Notes, many are for Scientific Studies. â?oHerring Spawning Beds are within Â½ mile of the outfall, Oyster Fishery, Lobster Fishery, and Scallop Beds will all be negatively impacted. Contaminants on bottom will spread. Fish will die or migrate elsewhere. Dennis McGee NS Fleet Planning Board and Fisherman testifying to PEI Legislature Committee Feb. 8/19 created to understand deleterious effects to Fishery and demand a Federal EA of Northern Pulps New Effluent Plan. Blacklocks reports that a New Environment Canada study IDs malformed fish from pulp mill effluent. 21 May 2014 www.blacklocks.ca Fisheries and Oceans Canada. In the Maritimes, exposure to municipal wastewater or bleached kraft pulp mill effluent altered immune function in bivalvesâ? Environmental Reviews, 2008, 16NA: 19-44 by Catherine M. Couillard, Simon C. Courtenay, Robie W. Macdonald We have learned from Scientific Study in Pictou Harbor that pulp effluent has caused anemia in Blue Mussels. Detecting p-53 family proteins in haemocytic leukemia cells of Mytilus edulis from Pictou Harbor, Nova Scotia, Canada by S D St-Jean, R E Stephens, S C Courtenay, C L Reinisch Canadian Journal of Fisheries and Aquatic Sciences, 2005, 629: 2055-2066, reviewed by Aiken and Waddy, 1986a. Industrial discharges, such as bleached kraft mill effluent, potash brine, and drilling muds, have been identified as causes of reduced survival, growth, and regeneration, changes in ATPase activity, increased oxygen consumption, increased susceptibility to disease, thinning of shells, morphological abnormalities, inability to molt, and changes in behavior in Homarus americanus. A GOOGLE SEARCH OF WIKIPEDIA reveals: Wastewater discharges for a pulp and paper mill contains solids, nutrients and dissolved organic matter such as lignin. It also contains alcohols, chelating agents and inorganic materials like chlorates, also transition metal compounds and organochlorine compounds. January 14, 2018 NG News: Dr. Michelle Gray is an assistant professor at the University of New Brunswick where she teaches environment and ecosystem management. It is her opinion that â?othere is still some evidence of environmental impact.â? She explained an impact on reproduction with fish near waters impacted by pulp effluent often having smaller gonads and maturing later. Nutrient enrichment can lead to more environmental problems such as depleted oxygen levels. February 2019 Comment on Northern Pulp Replacement Effluent Treatment Plan Page 6
Prevent Cancer Now has written to request the designation of the proposed Northern Pulp Mill renovations for a Federal Regional Environmental Assessment. Although toxic air emissions are reported to have affected local residents for decades, we are writing specifically regarding the new Effluent Treatment Project proposal to close the Boat Harbour containment facility and to discharge 70-90 million liters per day of warm effluent contaminated with toxic and persistent substances via a new pipeline directly to the rich marine environment, on the bed of the Northumberland Strait. 2018 Review on Toxicity of Paper Mill Effluent on Fish Sangeeta Dey, Manabendra Dutta Choudhury and Suchismita Das* Life Science and Bioinformatics, Assam University, Silchar, India Bulletin of Environment, Pharmacology and Life Sciences Vol 2 3 2013 17 to 23 Online ISSN 2277 *email: das_aus11@yahoo.co.in corresponding author ABSTRACT . . . . . Pulp and paper mills, controversially, are one of the largest and major contributors of pollution in aquatic environments, affecting aquatic organisms in general and fishes in particular. . . . . Many chemicals have been identified in effluents which are produced at different stages of paper making. Their toxic nature is derived from the presence of several naturally occurring and xenobiotic compounds which are formed and released during various stages of paper making. The pulp and paper mills rank high in terms of water use during paper production on the other

hand they contribute to pollution loads in rivers through effluent discharges. Waste and wastewaters are generated from both of pulp and bleaching processes. The major problems of the wastewaters are high organic content, dark brown coloration, adsorbable organic halide and toxic pollutants. Toxic dyes, bleaching agents, salts, acids and alkalis are present in effluents discharged from pulp and paper industries. Heavy metals such as cadmium, copper, zinc, and chromium are present in pulp and paper mill effluent that are ultimately released into aquatic Environment. Dichloroguicol, trichloroguicol, tetrachloroguicol and chlorinated phenols are major contaminants found in the effluent released from pulp and paper mill. Another Scientific reviewer of this subject is Walden 1976. Adoli et al. 2011 reported that mean concentrations of Cd, Cu, Cr, and Zn in mosses 1 km radius of a pulp mill were significantly higher than reference stations, suggesting atmospheric emissions from pulp mills may also contribute to local metal loadings. Atmospheric deposition of metals via the mills smoke stacks may likely continue post remediation, despite installation of a precipitator in 2015 Hoffman et al.2015 My Words This may prove that AST treated effluent testing alone cannot be trusted to determine harm. Emission can contribute. As well, burning chemical laden sludge as a treatment method will prove very harmful to air quality and Northern Pulp has offered no data to assure us otherwise. Dilution is not the solution. It must not be considered a treatment approach. In the moment perhaps, but clearly common sense tells us the same amount of pollutants are expressed, only over a longer time frame. The test of fish lethality in a bucket of effluent is unreliable. February 2019 Comment on Northern Pulp Replacement Effluent Treatment Plan Page 7 Issue D Achieving a Sustainable Future: Draft Strategy Canadian Environmental Protection Act, 1999 A Federal Sustainable Development Strategy for Canada states: marine pollution means the introduction by humans, directly or indirectly, of substances or energy into the sea that results, or is likely to result, in â?¢ a hazards to human health â?¢ b harm to living resources or marine ecosystems â?¢ c damage to amenities or â?¢ d interference with other legitimate uses of the sea. I do not believe that Northern Pulp Effluent can meet these requirements. They have displayed no monitoring credibility illustrated by undetected pipeline leaks and large air emission gaffes. In fact, the Mill displays all of the above noted dangers. Their proposal is not acceptable today or into the future. Summary: It is incredulous that proven damage by this industry world wide does not inform the Residents, Government and the Scientific Community that the harm to human health and the environment cannot be overlooked because of the social or economic benefits. There must be no effluent pipe approved for Caribou Harbour, Pictou Harbour, or any part of the Northumberland Strait. It is time we begin to remediate the damage caused in the past. To know better is to do better. The onus is on the Company to demonstrate the absence of adverse effects and Northern Pulp has failed miserably in this regard with a plan only on paper, lots of paper! Finally, it seems compliance to all laws and regulations is largely reliant on self-reporting or third parties hired by the Mill bringing us back to the serious lack of trust issue. The Precautionary Principle can rule here. If there is a lack of full scientific certainty, we must err on the side of caution. ... This participant stands firmly by this principle. Bruce Hatcher, a Cape Breton University biologist, also agrees- North Shore News Nov 29th 2018. While I acknowledge the limitations of presenting data due to Northern Pulp not supplying their treatment information up front and this has made precise assessments by residents challenging, one absolute truth remains: Boat Harbour must be closed by January 2020 and the Pulp Mill by their own incompetence will not have a place for effluent to go. PLFN citizens must never be taken advantage of again. They have suffered far too long! I believe our forest Industry will re-organize and rebound. I also support a Federal Environmental Investigation being conducted on this matter. All three Maritime Provinces are impacted by environmental damage to Northumberland Strait including First Nations Fishers. Thank you for this opportunity. Project: replacement_effluent_treatment_facility_project Comments: Northern Pulpâ?Ts operation does not run at a â?osteady stateâ? . Meaning chemical composition and temperature are inconsistent with the effluent as it leaves the plant. Until there is a consistent output , no system can effectively treat this effluent. This is known to the industry and NP. This means major upgrades are required at the NP plant prior to ever discharging any effluent, so you know exactly the quality of effluent you are treating and exactly what will enter the Norhumberland Strait. By their own admission in their submission, they do not know! The submission by Northern Pulp is a pro mill propaganda piece not a report grounded in independent scientific analysis. We can not afford mistakes of the past, open this up to independent oversight presented in a public forum. There are much bigger risks than the short term effects of mill jobs, many more peopleâ?Ts jobs, health and quality of life are at stake for generations. The NP mill is old ,tired and a blight on our beautiful province. REJECT THE PROPOSAL Name: Email: @gmail.com Address:

Project: replacement_effluent_treatment_facility_project Comments: There certainly is a significant amount of information in these documents. After hearing lots about this project, it is interesting to see the complete package. I have several comments: 1. The meeting of TSS, DO, pH and salinity within 2 meters and Colour within 5 meters as well as temperature within 100 meters seems to be an excellent result. Especially considering the size of the body of water. 2. BOD being below 20 of Federal regulations and TSS being below 15 of Federal regulations indicate good performance in my mind. 3. The use of similar systems for similar operations in Scandinavia should be seen as a positive indication. 4. Even though effluent has been entering the Strait for 50 years, there appears to be a strong fishery. All evidence points to a continued strong fishery with a new treatment plant. 5. Significant study appears to have been done for all aspects of the environment, including birds, turtles, plants, etc. Studies show no significant impact. 6. There appears to be a mitigation plan for all foreseeable events during construction and operation. 7. The choice of material for the new pipe seems appropriate. 5 cm thick pipe that is not susceptible to corrosion or decay. No thermal growth and flexible. 8. A significant spill basin to collect any effluent not meeting limits. This seems like a well prepared document that should answer all reasonable questions and concerns. Based on this, I can see no reason not to proceed. Name: Email: @ns.sympatico.ca Address: Municipality: Postal-Code:

Project: replacement_effluent_treatment_facility_project Comments: Northern Pulp should be given extra time to build an effluent pond to deal with their waste water from the pulp mill. This plan should however include the no dumping of treated water in to the Northumberland Strait. This treated waste water should be so pure as to it being put into Pictous sewage plant would cause no further contamination than the treated waste water from the Pictou sewage treatment facility. There should be a full federal environmental assessment done to ensure nothing is going into the Northumberland Strait directly from Northern Pulps treatment ponds. Project: replacement_effluent_treatment_facility_project Comments: I grew up in Pictou Landing First Nation and hunted, trapped and frequented the Boat Harbour property a lot while growing up there. What I saw was horrible. I saw animals with massive lesions on them as well as missing tails that would not heal. the boat harbour fog would peel pain off houses so the community began to use vinyl siding. Many people in Pictou Landing could not go out when the fog had rolled in off of Boat Harbour because of how hard it was to breathe. When you look at the population of PLFN there is a high amount of cancer which may not be related to Boat Harbour but when you look at other communities of similar size that is not an issue like it is in PLFN. Fish kills were frequent near the release point into the Northumberland Strait not in boat harbour yet no explanation was given other than they suffocated. Fish do not suffocate in water. My family told me many stories of how they were promised that nothing would happen to our fisheries, huntin g and gathering lifestyles but the day the effluent started to pour into Boat Harbour is the day that all fish died massive fish die off occurred and so with it went our lifestyle. We now cant take anything from in or around the effluent. moving the effluent to another area without eliminating 100 of the risks to harm the fishing industry, tourist industry or the Rights of the Mikmaq to gather food for personal use, social use or ceremonial use in and around the Northumberland Strait area should be closely monitored by the federal departments of Fisheries and Oceans and the Indegenous Affairs departments. Impacting our FSC Rights should not occur because the SCC protects those Treaty Rights and if they are impacted in any way then the Federal Government should defend our Rights because they have a fiduciary right to protect the Mikmaq and the treaties we signed. Project: replacement_effluent_treatment_facility_project Comments: I feel this project is well designed and thought out. The science will prove this is the best way forward. As one of the most common type of systems used in any waste treatment plants wether it be industrial or municipal. Bad blood canâ?Tt be the way forward it must be based on fact not the fiction in the news with no merit. I believe the issues in the northumberland Strait are much deeper than one single plup mill. The province of PEI with its fertilizer run off is just as bad or far worst. Please base your findings off of facts and science not the fiction being betrayed in the mainstream media

Project: replacement_effluent_treatment_facility_project Comments: The Jobs at the Mill and the Forestry Sector are to important to have displaced, by any length of Shutdown of NP. The New Treatment Process is proven to be effective in other Mills Globally. There is absolutely no reason to change any assessment testing that had been agreed to earlier in this legislation to close Boat Harbor, so if the process of assessing is changing then the Date of Closure for Boat Harbor needs to be adjusted also. Good paying jobs matter. Get the New Effluent Treatment System Approved Now... Name: Email: @eastlink.ca Address:

Project: replacement_effluent_treatment_facility_project Comments: The content and length of this proposal are beyond my ability and presumably that of most of the public to fully review and analyze, so my comments will focus on the proposal and review process rather than the content of these documents. - With the province on the hook for an unknown amount of money related the ending the boat harbour lease, which seems to be dependant on the cost of building this new facility, there appears to be a conflict of interest / potential bias in also having the provincial government acting as the sole reviewer of the environmental assessment. The close connections between Northern Pulpâ?Ts lobbyists and the current liberal government only add to this concern. - Regardless of any pressure related to the deadline for the closure of boat harbour, the proper amount of time needs to be taken to complete reviews, and if needed, to redesign the proposal. Base on their own public engagement materials, Northern Pulp did not initiate an environmental assessment until 2 years after the Boat Harbour Act was passed. They have now submitted their last minute proposal only after already stating that they will not meet the deadline, putting increased pressure on the assessment to pass or further delay the project. Their failure to expedite the project should not allow them to bypass a thorough review. - The loss of the mill, either temporarily or permanently, would certainly have a negative effect on mill employees and the local forestry industry, but this in and of itself does not mean that the project should go forward. If this industry cannot be both environmentally and economically sustainable at the same time, it should not be one that Nova Scotia supports. If the entire forestry industry is dependant on this one mill as they have been saying, they should step up and help fund a proper treatment facility if the outcome of the assessment is that the proposal is not adequate. - I believe that a Class 2 provincial assessment and/or a federal assessment would be appropriate in this case, to ensure a complete and impartial review is conducted. And I believe this would go a long way in easing the concerns of the general public. Name: Email: Address: Municipality: Postal-Code: Phone: Fax: email_message: Privacy-Statement: agree x: 70 y: 20

Project: - Choose - Comments: I feel we need a federal environment assessment into the millâ?Ts plan to place a pipe into the Northumberland Strait. The provincial government has supported the mill and its polluting ways for over 50 years. They will support this insane proposal to dump 80 plus million litres of â?o effluentâ? per day into the strait. We live right on the strait and worry about the effect this pollution will have on our environment, beaches and our fishing industry- especially the lobster larvae. The fishermen have good reason to be worried. We are totally against the proposal of the pipe going into the strait and ask for a full federal environmental assessment. Project: replacement_effluent_treatment_facility_project Comments: This is absolutely wonderful! State of the art system will provide environmental conservation as well as protect thousands of jobs at Northern Pulp and many many other indirect jobs. Too bad other forms of waste treatment systems polluting the waterways would put this much concern and money into their waste treatments. Unfortunately there are multi thousands of pollutants polluting our environment...and until the proper technology is built in the future to eliminate this completely...shutting down ONE mill and causing major chaos is not going to achieve anything, but only create more problems. Until a complete solution is derived in the future which will not happen overnight...the best we can do is uphold all waste systems to the highest level of regulations to reduce our impact on the future, which I truly believe Northern Pulp is achieving. First Nations will get their land cleaned up...and Northumberland Straight will get the absolute least and safest TREATED was te possible globally.Boat Harbour has been running their treated waste to the straight for decades...not understanding why now the fisherman are concerned??...especially now that the waste will be of a higher quality of standards Im afraid if this one company is forced to closed, regardless of the FACT that all regulations are met, all industries with any kind of environmental waste will be heavily under the scope, including thousands of boats in the straight on a regular basis also polluting the waters. Really hoping that SOMEDAY with continued efforts we can all work and play in a world with no environmental impact. Thank you

Project: replacement_effluent_treatment_facility_project Comments: What is the maximum capacity of the new system to be installed in litres per day? It has been said that it can handle a maximum of 50000 litres per day. Where will the untreated effluent in excess of the capacity go? It has been said it will bypass the system and go right out the pipe. If unit malfunctions will untreated effluent go into directly into Northumberland Strait ? We cannot take a chance on destroying a lucrative fishing industry and tourism industry .Northern Pulp has said they cant say what will be in the treated effluent but it will be better.They say there are many other mills using this system so why cant they provide answers based on those mills ?Northern Pulp still continues to emit carcinogenic substances from the stacks into the air without care or concern for the community. Also there can be no extension on Boat Harbour facility as the PLFN have suffered from the effects of this environmental disaster and racism for far too long and have been re peatedly lied to on previous closing dates. Also they will be burning the sludge from the treatment process which will add to the toxic air and carcinogens being released into the air we breath here in Pictou County Name: Email: pictou@live.ca Address:

Project: replacement_effluent_treatment_facility_project Comments: , P.Eng @ns.sympatico.ca February 15, 2018 Environmental Assessment Branch Nova Scotia Environment P.O. Box 442 Halifax, NS, B3J 2P8 Fax: 902 424-6925 Comments submission to Nova Scotia Environment Re: Northern Pulp Replacement Effluent Treatment Facility Project Environmental Assessment Submission To Minister Iain Rankin and others whom it may concern, I appreciate and thank you for this opportunity to make comment, and trust it will be read and considered. I am an engineer with almost 40 years experience in the pulp and paper industry in Canada. Most of that time in the kraft pulp industry, including many years in the environmental side of the business. I have traveled to many mills in Canada and the United States to conduct audits and share ideas. I have been following this issue from the beginning, and given the misinformation in the public discourse, I feel it necessary to make a few important comments for your consideration. I recently took time to read Northern Pulpâ?Ts environmental assessment submission posted on your website in its entirety, including all appendices for a total of 1735 pages. It is comforting to learn that Northern Pulp has consulted many world class experts in the subject matter in the creation of this environmental assessment. This environmental assessment is as complete and comprehensive and any I have read. It is a very large and comprehensive assessment that deserves thorough evaluation by knowledgeable and skilled individuals. I expect that you will need to go outside the department for that expertise and understanding. Please donâ?Tt be guided by the incorrect and misinformed reports appearing in the public and the media when making your decision. According to the department, the environment assessment process is designed to â?oto identify the environmental impacts associated with designated development undertakings long before the proposals are implementedâ? and its purpose is to â?opromote sustainable development by protecting and conserving the environment by identifying and assessing possible adverse effects on the environment before a new undertaking begins.â? I support this process and its goals completely. I trust that decisions will be based on facts and science, and not emotion and misleading or false information. If these decisions are allowed to be made on emotion the process will fail for all. This project has had lots of press and loud public opposition, but most do not understand the kraft pulp process or the treatment of kraft mill effluent. I urge you to put the emotion and noise aside and make you decision based on the science and track record of similar projects to the one proposed. If this process would have been followed when the existing system at Boat Harbour was constructed by the provincial government, it would have been built to the best technology of the day. This includes a properly designed outfall, which would have eliminated many of the legacy issues that plagued the existing situation from its beginning. It is important to note the provincial government used promises to provide a water supply and to treat effluent as â?obaitâ? to attract industry to the area. Three companies would ultimately be attracted by this deal. These were large multinational foreign companies Scott Paper and Michelin Tire, and a few years later CIL set up operations near the mill site. The province failed to live up to their end of the agreement by cutting corners and failing to construct a facility and treat the effluent as promised. This failed the residents of Pictou County including the Pictou Landing First Nation, as well as the industries they convinced to set up in Pictou County. In doing so they created a legacy that cannot be changed no matter how well or poorly the existing system is operated. It is also important to note that since the beginning in September 1967, the government has had many opportunities to correct the situation by constructing a proper

treatment system and outfall that could have changed the course of local history. They failed to do so because of cost, political will or whatever were the issues of the day. Effluent from this facility has been going to the strait since September 1967. For the first few years, from 1967 until 1971, there was no manmade treatment. The governmentâ?Ts concept was to rely on natureâ?Ts ability to break down organics in the natural tidal estuary known as Boat Harbour to provide whatever treatment it could. The results were unacceptable to everyone in the area. The system slowly evolved through development with various levels of success and failure until 1996, when the system was leased to the mill operator to operate. Until 1996 the provincial government had full operational control. This arrangement was functionally parallel to the current situation in municipal government, where residentsâ?T homes connect to the sewage system and the municipal governments treat and release the effluent. When the mill took control of operations, a redesign was conducted and additional aeration, instrumentation and other equipment was installed so that it could operat e reliability within the federal Pulp and Paper Effluent Regulations PPER. The Northern Pulp kraft mill is typical of many kraft pulp mills around the world. The kraft process has remained much the same as it has since the first kraft mill was built in 1947. While the equipment is bigger, more sophisticated and constructed with better materials, the chemistry remains much the same. It is the most extensively used chemical pulping process in the world. It is used in first world countries where there are extensive environmental laws and in developing countries where there are few rules. Northern Pulpâ?Ts effluent treatment process is also comparable to many kraft mills. My point is the treatment process proposed is tried, true and tested. We can be very comfortable in the process selected and the equipment supplier. Veolia is a leader in the supply of effluent treatment to mills and municipalities in Canada and around the world. Treatment system designer KSH Solutions has successfully designed effluent treatment systems for many world-class mills arou nd the world. One of the most vocal opponents to improving the current situation is the lobster fishers. They are concerned the effluent will affect the lobster fishery. They seem to have forgotten that the effluent has been going to the Northumberland Strait since September 1967. If there are any issues with the lobsters caught in the area of the current outfall the fishers have kept that a secret. In fact, some have bragged about how good they are. Since the mid 1960s then the lobster catches have almost tripled in zone 26A -- the area encompassing the current system outfall into the strait. This can be confirmed by DFO. Surely any long term effects would have presented in the ensuing 52 years of continuous fishing in zone 26A, beginning with a decline in fish stocks. The PPER require that each mill maintain an Environmental Effects Monitoring EEM program. These programs study the environmental effects of the effluent on the marine environment. This is a very robust scientific program that is administered through the Environment and Climate Change Canada. They have scientists that specialize in this field. The EEM takes an iterative approach that looks for changes and studies the effects in a deeper and deeper way. The studies and reports are very scientific and undergo peer review to ensure the science is solid and accurate. Environment Canada directs the study for each cycle, drilling down on differences from the previous cycle that are discovered. No other industry in Canada goes through such an extensive critical assessment of the effects at the end of the pipe. See appendix J for the Cycle 7 results. Other EEM reports are available for those who are interested from Environment and Climate Change Canada. I was interested to understand how the millâ?Ts treatment system compares to others we generally believe to be good systems, including those we donâ?Tt hear of in the media as we do Northern Pulp. I was interested to compare the treated effluent coming from the proposed Northern Pulp facility to that of other industries in the Atlantic region. Also, in the interest of fairness, I studied a number of industries that also discharge into the marine environment. I reviewed scientific reports regarding farming, fish processing and municipal effluent and their effects on the environment in the region. Mike van den

Heuvel, director of the Canadian Rivers Institute at UPEI, is also a Canada Research Chair in Watershed Ecological Integrity. He and his counterparts have studied the Northumberland Strait extensively and recently published a study entitled â?oNitrogen Loading Criteria For Estuaries In Prince Edward Island.â? They determined that agriculture -- particularly in PEI -- is having a major impact on nitrogen loading in the Strait, and not the mill as some will claim. The millâ?Ts outfall even as it is today has very little effect on the Northumberland Strait. Said plainly, the science contradicts what is being claimed by fishers and activists in the area. I was very disappointed to learn that fish processing plants on marine environments not connected to a municipal sewage system have amazing lax regulatory requirements to treat effluent. The only requirement is that they must have a 25 mesh screen on the pipe and the pipe must not be visible during low tides. Anything and everything they want to dispose of goes down the pipe without regulation, requirement for testing, concern about effects, or question by the regulators. Truly amazing in these highly regulated times. Why arenâ?Tt the fishers interested in this? In also learned that these plants have very high suspended solids and Biological Oxygen Demand BOD loading many times more that the mill outfall. There is also no requirement to conduct any testing. The water usage is also very high given the size of these facilities. Water is used extensively for conveying the product and during cleaning. I was surprised to learn that the chemicals used in these facilities are simila r to a kraft mill. Caustic for cleaning equipment and chlorine for sterilizing. In many ways the effluent characteristics are similar. The AOX parameter in their effluent is two to three times that of a kraft pulp mill. I was also interested to compare the millâ?Ts effluent treatment system to municipal units in Nova Scotia. I selected the towns of Pictou and New Glasgow with treats sewage for Stellarton, Trenton and Westville and some surrounding areas as well as local systems for comparison. I also examined two of the three new systems constructed as part of the Halifax Harbour Cleanup Project: The Water Street Treatment Facility and the Dartmouth Mawiomi Street Treatment System. Both were constructed as part of the much-publicized Harbour Cleanup Project which for the first time stopped raw sewage from entering Halifax harbour. I used the Freedom of Information Act to obtain their operating Approvals and sample reports of the data they are required to submit as part of their operating approvals. Effluent flow from the proposed Northern Pulp mill system is significantly larger than that of the Town of Pictou, population 3186 2016 census which is not unexpected. Surprisingly, it was only 4.7 times larger than the Town of New Glasgow. When flow is compared to the Halifax plants, I was surprised to learn that the Northern Pulp facility is 5.2 times smaller than the Water Street facility and 3.4 times smaller than the Mawiomi facility. Interestingly, the press and opponents to the system would lead you to believe that Northern Pulpâ?Ts effluent volume is larger than all of the Halifaxâ?Ts 14 treatment systems. I concluded that while the Northern Pulp facility is large, it is not unusually so for Nova Scotia, contrary to what we have been lead to believe. The proposed treatment system for Northern Pulp includes a primary treatment process followed by a secondary treatment. The primary treatment consists of a coarse screen to remove the very large pieces followed by a clarifier to remove suspended solids carried in the water. The secondary treatment -- the most important step -- is a biochemical treatment process which breaks down the constituents that remain in the effluent. The process selected is an MBBR process combined with activated sludge process. This results in a highly efficient and compact design. These processes have proven very successful in treating pulp mill effluent. Activated sludge systems have been used for many years in both industry and municipal sewage treatment plants around the world. Itâ?Ts proven and reliable technology. In fact, both the New Glasgow and Pictou municipal systems are activated sludge processes and produce good results. Only one of the three systems constructed for the Halifax Harbour Clean Up project employ secondary treatment. The two largest systems -- at Water Street and Mawiomi Street -- are primary treatment only systems. They do not use biochemical

treatment. These systems do not treat for E. coli or other harmful biological elements. Both systemsâ?T operating approvals recognize this and allow for unlimited E.Coli releases except during the summer months May 1 through to October 31 when itâ?Ts limited to 5000 CFU per 100 ml of effluent. E. coli is a bacterium commonly found in the intestines of humans and other animals, some strains of which can cause severe food poisoning. This can make people severely ill with vomiting, diarrhea and potentially kidney failure. Northern Pulpâ?Ts current system has secondary treatment in the form of an Aerated Stabilization System and does not release E.coli. The proposed system is will also not release E. coli. When comparing the other primary treated effluent parameters Biological Oxygen Demand BOD and Suspended Solids, the Northern Pulp facility is designed for half the approval limits of both Halifax systems. Regarding BOD this is 25mg/l for the mill versus 50 mg/l for the Halifax systems. When comparing suspended solids the Northern Pulpâ?Ts facility is 25 mg/l versus 40 mg/l for the Halifax systems. Another very important parameter is toxicity. Local opposition groups and the media repeatedly and incorrectly report that the existing effluent released from Boat Harbour is toxic. This is incorrect. Records submitted to both provincial and federal environment departments show the effluent has consistently passed the toxicity test. Independent tests conducted by Environment Canada have confirmed this. Records obtained through Freedom of Information requests show that both the Water Street and Mawiomi Street facilities failed toxicity tests in 2007 on a number of occasions. This is a clear violation of their operating permit. Interestingly, not a word in the press or any charges laid by provincial or federal regulators. Why is Northern Pulp treated differently? The Northern Pulp treatment system is clearly less harmful to the environment. Furthermore, all municipal systems are designed to overflow, whereby untreated sewage is allowed to bypass the treatment facility and be re leased directly into the receiving waters. Indeed, all municipal systems I obtained information on had numerous occasions of such overflow. There has been much talk about high cancer rates in Pictou County and much of the blame has been placed on the Mill. In September 2018 the Nova Scotia Health Authority released their latest study entitled Nova Scotia Incident and Survival Rates September 2018 based on province wide data collected from 2011 to 2015. This documents the incidence of cancer by type and region. It is clear that Pictou county has a slightly lower that average cancer rate than the rest of the province. There are other studies that confirm this information. Please do not be misled by inaccurate information in the public domain. In closing, I encourage you to make your determination by examining the science and the merits of this project and not on the largely inaccurate information put forward by the projectâ?Ts opponents and repeated in the press. There is ample information in the EA submission to make this judgement. There are many workers and their families from across this province that depend on the jobs that this business and related businesses provides. They deserve that your give this a fair and unbiased review. This is an important project for all of Nova Scotia and I believe it should proceed.

Enviornment Assessment Branch
NS Environment
PO Box 442
Halifax NS
B3J 2P8

To Margaret Miller
NS Environment Minister.

With regards to Northern Pulps plan for pipeline

Dear Minister:

To date with lack of full scientific certainty, we have threats of serious or irreversible damage and lack of full scientific certainty the treatment plant which Northern Plup has submitted must be shut down until full assessment. In 1994 the same plan was shut down by the Tobin government to protect fish habitat from toxic effluent. The reason that pollutants that would be contrary to Fisheries Act with regard to spawning areas.

Shell fish absorb dioxins & furons a known fact. The current powerboiler is currently and repeatedly failing stack emission tests and now considering adding sludge containing toxins to mix. The route of pipeline is over Pictou, watershed and same traffic route to Northumberland Ferries Ltd. This is a entry point to PEI and this could be harmful to tourist season for the Eastside of PEI & town of Pictou

Three points :

Meeting regulations does not prevent harm

The regulations are 25 years old

70% Pulp & Paper mills are having harmful effects on aquatic life, despite meeting current regulations.

The new treatment facility is not better than current plant at Boat Harbour. This so called new plan was rejected in 1994. Why are we the tax payers paying 6 million for a rejected plan.

We have three long lived industries

Tourism, Commercial fisheries and sport fisheries all three must be worth 5 billion a year.

Citizens of Nova Scotia must have a better return of our tax dollars. We are on the hook for the clean up of Boat Harbour, which can be cleaned up, we can not say the same for Northumberland Strait. We are paying millions for the design & reconstruction of new pipe line. Why not give this money to our over worked heath care workers, Senior's and Veterans for public programs.

We are a proud house hold with one fishing fleet and a worker at Northumberland Ferries for 34 years.

We have worked hard & long hours and our way of life could be wiped out in a instant. A full stop to this project. No extension to Boat Harbour (A'se'K). No Pipe in Northumberland Strait.

Project: replacement_effluent_treatment_facility_project Comments: The waste proposal poses major risk to harming marine life , marine habitat, species at risk/endangered/threatened that include migratory and marine birds, fish, vegetation, reptiles etc. All listed in the submissions via Northern Pulp. The proposal goes through the Pictou town and Caribou water supply. 2 provincial parks and 2 nature preserves are within the effluent pipe footprint Meeting PPER doesnâ?Tt prevent harm to marine life or marine habitat per Environment Canada The characteristics of the proposed effluent is â?ounknownâ? to NP The proposal shows the plan to burn the toxic sludge in the power boiler. That we know is not working properly and air emissions are an issue today. The spill basin only holds 35 million litres of untreated effluent 10-12 hrs before it goes into the AST system. If a malfunction happens where does it go. They also list temporary and permanent closures for fishermen around the outflow area, creating a no anchor zone and possible compensation that has not been discussed for impacted fishers. The O2 delignification system is not laid out on how or when it will be constructed, maintain and operates like the AST system. It is listed in the appendix has a â?ofuture upgradeâ? . I will let you interpret that. The Waste proposal will be pumping effluent into the ocean after only processing it for 8 hours as opposed to the current waste system that takes about 30 days to process and reach the Strait Name: Email: Address: Municipality: Postal-Code: Phone: ### ### - #### Fax: ### ### - #### email_message: Privacy-Statement: agree x: 55 y: 17

Project: replacement_effluent_treatment_facility_project Comments: The more extensive Class 2 Federal Government Assessment is required for this project proposal. This statement from the submitted Environmental Assessment Registration Document clearly signifies why: At this time, effluent chemistry characteristics including the specific substances present in treated effluent and their anticipated concentrations will not be known with certainty until the project is operational. ~Certainty regarding these facts and ALL specifics must be available at this crucial proposal stage. There is simply no way to trust the science and make the correct recommendation without having this all-important information accurately presented at this highly consequential phase. Thank you for your consideration. Name: Email: @hotmail.com Address:

Project: replacement_effluent_treatment_facility_project Comments: I am writing to provide feedback to the Northern Pulps 1200 page proposal to conduct a new effluent treatment facility at its Abercrombie Point location in respect to whether or not your department should recommend a federal environmental assessment. Taken from NP proposal: The proposed project will consist of building a new effluent treatment facility ETF on NPNS property including a pipeline to transport treated effluent to Caribou Harbour. Ultimately, the effluent discharge will be into the Northumberland Strait, as has been the case since 1967 via the existing facility. The installation of a modern engineered diffuser provides an improvement in effluent dispersion. The improvement is such that as unlike the visual impact experienced today, it is anticipated that the effluent plume will not be visible when it reaches the waterâ?Ts surface. This opening statement shows exactly how the rest of the document will read. NP calls it a new effluent treatment facility which in itself should trigger the federal assessment. NP then states that the effluent discharge will be into the Northumberland Strait as has been the case since 1967 via the existing facility. We have seen what that has done to Boat Harbour and the surrounding area so why is it o.k. to continue to pollute the Strait in an area where it will not be visible to the majority of the public. How many people other than fishers will be in boats 4 miles off the coastline? Does this make it o.k. to pump the effluent into the Strait because no one can see it happening or because it has been happening for the last 50 years as the proposal states? Just because the new diffuser will supposedly provide an improvement in effluent dispersion doesnt mean that it is better see comments below . What about the temperature difference of the effluent? According to NP the area affected will only be 100m from the discharge site. This is based on supposition not scientific fact and will have severe consequences to the fisheries food over pulp please for years to come. Potential environmental effects are identified and predicted for both the construction and the operation and maintenance phases of the project. The residual environmental effects of each project phase are evaluated as either not significant â?oNSâ?, significant â?oSâ?, with the likelihood of occurrence identified in such cases, or positive â?oPâ?. The environmental effects of accidents, malfunctions and unplanned events as well as cumulative environmental effects of the project in combination with other past, present, or reasonably foreseeable future projects or activities are also assessed. The table that is listed on page xxiv of the proposal summarized the studies, and the effect of the project for the significance of the project related residual environmental effects of the project. I was amazed to see that all categories were predicted as NS - No Significant Residual Environmental Effects Predicted. However, in reading further into the proposal I have discovered many other areas of concern. Detailed design has not been completed for the construction of the marine outfall and pipeline. The preferred method for trenching the marine pipeline will likely be by side-cast excavation methods with re-use of bottom materials without bringing to surface. And comments such as The treated effluent is anticipated to meet complianceetc. are littered throughout the document. The whole document is written with not been completed or â?oto be determinedâ?. On numerous items the proposal states that it is not possible to know or needs more assessment due to the pipeline being defined in the fall of 2018. Again another reason for a federal assessment. Although NP has had 5 years to adjust to the new reality that Boat Harbour was closing, they have submitted a half-baked proposal, at the 11 hour with lots of what if and projections without any scientific data to back them up. This is not the fault of the population of Nova Scotia but we will have to suffer the costs both in air and water quality for NP dragging their feet and now trying to ram

their proposal through. As one writer to the Herald stated â?oIf one lobster from the Northumberland Strait is found to be tainted with chemicals, it will not be recorded as a Northumberland Strait lobster, but a Maritime lobster. The whole Maritime fishing industry is at stake. I understand that jobs are at stake here but there is more to consider than the economic benefit from one mill. There are other industries that are affected by NP destruction of the environment, notably the fisheries 1 Billion and tourism 2.7 billion. Together these two industries outstrip the benefits of NP. The health reasons of dumping 85,000 litres per day of a noxious mixture of dioxins, furans, metals and solids and other contaminates into a water source is inconceivable to me in this day and age of knowledge. Coupled with that, the mill wants to burn the sludge in the power boiler. This is the same boiler that has failed stack emissions tests Northern Pulps failed stack test happened the week of June 6 at a reading of 224, 50 over allowable levels although I understand from NP proposal that A frequent exceedance is defined as one that occurs more than 1 of the time. On page 140 under section 8.1.2.2 the proposal states that there have been no exceedances of maximum allowances. This is based on their own assessment. In the proposal NP quotes a recent paper by Hoffman et al. 2017 who evaluated ambient air levels of seven volatile organic compounds VOCs, based on ambient monitoring data reported from the National Air Pollution Surveillance Network NAPS. There are two NAPS monitoring stations near the NPNS mill that have historically monitored for VOCs. This paper focused on ambient monitoring data for the following VOCs: chloroform 1,3-butadiene vinyl chloride benzene carbon tetrachloride trichloroethylene and, perchloroethylene. The paper reported that results of the conducted temporal and spatial statistical analyses indicated that 1,3-butadiene, benzene, and carbon tetrachloride air concentrations routinely exceeded EPA air toxics-associated cancer risk thresholds, and that 1,3-butadiene and perchloroethylene levels in air were signifi cantly higher when the prevailing wind direction blew from the northeast and the NPNS mill towards the Granton NAPS site. Conversely, when prevailing winds originated from the southwest towards the mill, higher median VOC air toxics concentrations at the NAPS site, except carbon tetrachloride, were not observed. These outcomes have not been corroborated by regulatory agencies or other parties at this time. While this study was quick to attribute elevated ambient VOC concentrations to the NPNS mill based on a spatial and temporal evaluation only i.e., a statistical evaluation of ambient data in correlation with wind direction, without further site specific investigation, it did not attempt to rule out contributions from other potential sources of VOCs in the area e.g., transportation sources, or other industrial sources like the Michelin tire plant or the Trenton coal-fired power plant, presumably all sources of VOC emissions to some degree. So NP refuses to believe that they could be the source of air pollution but would prefer to blame it on other industries in the area. As far as the total environment foot print, meeting current PPE regulations does not mean that harm is not happening. Regulations for pulp mills were updated in 1992 and are concerned with biochemical demand and suspended solids. As it stands now, there are no CCME guidelines established for some of the different chemicals and compounds that make up the pulp mill effluent. It is not acceptable to follow 27 year old legislation so once again, a federal assessment should be considered. The new treatment facility is being touted as better than the old. I have several concerns and comments on this. It is my understanding that the current set up has the discharge going into the Northumberland Strait after a 12 hour primary treatment in the settling ponds, then moves to an aeration basin where effluent is placed in contact with micro-organisms and sits there for 8 days after which the effluent is discharged into Boat Harbour lagoon basin where it remains for an additional 20-30 days. Further aeration, settling, cooling, volatilization and breakdown of materials take place during that time. In the proposed new Activated Sludge Treatment AST system on the mill site, effluent will move through a primary clarifier to an aeration basin using micro-organisms to break down pollutants, and then to a secondary clarifier. The

process will take less than 24 hours. Northern Pulp states that effluent from the new system, including an added oxygen delignification system, will be similar to treated effluent leaving the present system at point C, with some unspecified reduction in biochemical oxygen demand BOD. However, the effluent being released from the proposed new system directly into the deep waters of the Strait will not benefit from the considerable reduction in BOD, Total Suspended Solids TSS and other contaminants including heavy metals which takes place during the 20-30 days that effluent presently remains in the Boat Harbour Basin stabilization lagoon. Northern Pulp has not provided a detailed comparison between the effluent which presently reaches the edge of the Strait and the effluent they propose to release into the fishing grounds with the new system. The present effluent outfall location at the shore edge does not disperse effluent in the Strait in the same way that the proposed new outfall site would. With the proposed new system, 70million litres of treated effluent would be pumped directly and continuously into the prime fishing areas of the Strait every day. Ocean environments are increasingly stressed. The Northumberland Strait Ecosystem Overview Report, prepared for DFO in 2007, documents increasing stresses on the Strait. To state that there are other industries producing stresses does not make it alright for NP to increase this toxicity and to think otherwise is just plain insanity. In terms of toxicity, my understanding is that there is only one test required to meet federal regulations. This test measures acute toxicity -- whether 50 of rainbow trout die when exposed to effluent for 96 hours. It does not measure impacts on fish growth or reproduction or on fish habitat. No toxicity test on salt water fish is required to meet federal regulations. There are no federal regulations for a number of known harmful substances in pulp effluent, including AOX and phenols so further study is needed before this pipe is installed. We cannot wait for updated PPER legislation slated for publication in 2022. NP lists Alternatives Considered for Final Discharge Location or Method. Discharging into Pictou Harbour is not recommended due to the lack of mixing with the Strait as if mixing with a larger body of water is acceptable, Release into the Middle River upstream was not considered due to expectations that it will increase chlorides in the Middle River and potentially affect the maintenance of the equipment at the Middle River Pumping Station and inside the mill but once again it is o.k. to dump on fishing grounds. The municipal stations and private facilities do not have the capabilities to handle the volume nor is a land based option available because as proposal states: Land application of wastewater effluent has not yet been approved in Nova Scotia small wonders, Trucking or barging the sludge to a different location is not recommended. I found the barging comments interesting: A pier for barge loading would be necessary - assumed to not be at the NPNS mill location. L iquid would have to be either stored and trucked or stored and pumped to a facility to offload to an ocean going barge/tanker to be discharged outside of coastal waters in an approved area, with a large number of tankers. There would be increased industrial vessel movements in the Northumberland Strait, potentially disrupting fisheries. Project specific permits would be required as the effluent does not fall under materials permitted to dispose of offshore. NP is concerned about the increase in traffic in the Strait but not about the effluent that will be pumped there. Why would they need project specific permits if effluent does not fall under material permitted to dispose of offshore but using a pipeline to dump the effluent is allowed? A closed loop system is not economically viable according to Northern Pulp. NP also states: The main problems with the bleach plant effluent recovery are equipment corrosion and accumulation of chloride and non-process elements in the millâ?Ts water systems. Accumulation of chlorides and potassium are especially corrosive for the millâ?Ts boilers and often lead to scale build-up which would require the replacement of the boiler over time. However NP also argues that it would not be economically viable for NP however they are quick to boast of the annual volume of income at $535 million. If the chemicals used are too corrosive for the river and too corrosive to recycle in their own equipment, how can pumping

the effluent into the Northumberland Strait be a viable solution? Surely dispersing sludge over a larger area is not the answer. And what happens if NP sticks around until the end of the lease in 2030. Who is going to clean up the mess then? Who is going to compensa te the fishing and tourist industry? This are too many other stakeholders involved to let this go through without a Federal Assessment. I havent even commented on the state of the health industry in Nova Scotia that could use the money being spent on NP. NP has already received $127 million dollars in tax payerâ?Ts dollars over the years. We have paid for the design process of the proposed effluent process at a cost of $6 million dollars and will be expected to cover the cost of the construction, installation, labour etc. for the proposed pipe estimated at $100 million dollars. How can NP be allowed to pollute the environment as they have in the past and how can we as citizens believe anything that NP puts out in the media about how wonderful they are when history has shown otherwise? I would rather put my tax dollars towards the penalty of breaking the lease if need be. On top of all that, I have now read that there is a conflict of interest from the minister of the environment: As Ecojustice wrote on behalf of Friends of the Northumberland Strait, the minister has a clear financial interest in making sure the environmental assessment process is over and done with as quickly as possible. Our clients also say the ministerâ?Ts ongoing contracts with Northern Pulp give the impression that the minister is not able to make a fair decision about whether or not to approve the project. These conflicts of interest violate the publicâ?Ts right to a thorough and unbiased assessment. That is why we are calling on the minister to step away from the assessment process and make way for a federal environmental assessment.â? In summary, a federal assessment is required. I will accept the outcome of that but nothing less. Until then, NO EXTENTION, NO PIPE. In summary the concerns that need to be addressed are: The waste proposal poses major risk to harming marine life, marine habitat, species at risk/endangered/threatened that include migratory and marine birds, fish, vegetation, reptiles etc. All listed in the submissions via Northern Pulp. The proposal goes through the Pictou town and Caribou water supply. 2 provincial parks and 2 nature preserves are within the effluent pipe footprint Meeting PPER doesnâ?Tt prevent harm to marine life or marine habitat per Environment Canada The characteristics of the proposed effluent is â?ounknownâ? to NP The proposal shows the plan to burn the toxic sludge in the power boiler and air emissions are already an issue today. The spill basin only holds 35 million litres of untreated effluent 10-12 hrs before it goes into the AST system. If a malfunction happens where does it go? They also list temporary and permanent closures for fishermen around the outflow area, creating a no anchor zone and possible compensation that has not been discussed for impacted fishers. The O2 delignification system is not laid out on how or when it will be constructed. The Waste proposal will be pumping effluent into the ocean after only processing it for 8 hours as opposed to the current waste system that takes about 30 days to process and reach the Strait.

Subject: Northern Pulp Pipe Proposal
Date: February 17, 2019 10:28:47 AM

The Honourable Catherine McKenna

I am writing to provide feedback to the Northern Pulp's 1200 page proposal to conduct a new effluent treatment facility at its Abercrombie Point location in respect to whether or not your department should recommend a federal environmental assessment.

Taken from NP proposal:
"The proposed project will consist of building a **new** effluent treatment facility (ETF) on NPNS property including a pipeline to transport treated effluent to Caribou Harbour. Ultimately, the effluent discharge will be into the Northumberland Strait, as has been the case since 1967 via the existing facility. The installation of a modern engineered diffuser provides an improvement in effluent dispersion. The improvement is such that as unlike the visual impact experienced today, it is anticipated that the effluent plume will not be visible when it reaches the water's surface."

This opening statement shows exactly how the rest of the document will read. NP calls it a "new effluent treatment facility" which in itself should trigger the federal assessment. NP then states that the effluent discharge will be into the Northumberland Strait as has been the case since 1967 via the existing facility. We have seen what that has done to Boat Harbour and the surrounding area so why is it o.k. to continue to pollute the Strait in an area where it will not be visible to the majority of the public. How many people other than fishers will be in boats 4 miles off the coastline? Does this make it o.k. to pump the effluent into the Strait because no one can see it happening or because it has been happening for the last 50 years as the proposal states? Just because the new diffuser will supposedly provide an improvement in effluent dispersion doesn't mean that it is better (see comments below) . What about the temperature difference of the effluent? According to NP the area affected will only be 100m from the discharge site. This is based on supposition not scientific fact and will have severe consequences to the fisheries (food over pulp please) for years to come.

Potential environmental effects are identified and predicted for both the construction and the operation and maintenance phases of the project. The residual environmental effects of each project phase are evaluated as either not significant ("NS"), significant ("S"), with the likelihood of occurrence identified in such cases, or positive ("P"). The environmental effects of accidents, malfunctions and unplanned events as well as cumulative environmental effects of the project in combination with other past, present, or reasonably foreseeable future projects or activities are also assessed.

The table that is listed on page xxiv of the proposal summarized the studies, and the effect of the project for the significance of the project related residual environmental

effects of the project. I was amazed to see that all categories were predicted as NS - No Significant Residual Environmental Effects Predicted. However, in reading further into the proposal I have discovered many other areas of concern.

"Detailed design has not been completed for the construction of the marine outfall and pipeline. The preferred method for trenching the marine pipeline will likely be by side-cast excavation methods with re-use of bottom materials without bringing to surface". And comments such as "The treated effluent is anticipated to meet compliance"etc. are littered throughout the document. The whole document is written with "not been completed" or “to be determined”. On numerous items the proposal states that it is not possible to know or needs more assessment due to the pipeline being defined in the fall of 2018. Again another reason for a federal assessment.

Although NP has had 5 years to adjust to the new reality that Boat Harbour was closing, they have submitted a half-baked proposal, at the 11 hour with lots of what if and projections without any scientific data to back them up. This is not the fault of the population of Nova Scotia but we will have to suffer the costs both in air and water quality for NP dragging their feet and now trying to ram their proposal through.

As one writer to the Herald stated “If one lobster from the Northumberland Strait is found to be tainted with chemicals, it will not be recorded as a Northumberland Strait lobster, but a Maritime lobster. The whole Maritime fishing industry is at stake.

I understand that jobs are at stake here but there is more to consider than the economic benefit from one mill. There are other industries that are affected by NP destruction of the environment, notably the fisheries (1 Billion) and tourism (2.7 billion). Together these two industries outstrip the benefits of NP.

The health reasons of dumping 85,000 litres per day of a noxious mixture of dioxins, furans, metals and solids and other contaminates into a water source is inconceivable to me in this day and age of knowledge. Coupled with that, the mill wants to burn the sludge in the power boiler. This is the same boiler that has failed stack emissions tests (Northern Pulp's failed stack test happened the week of June 6 at a reading of 224, 50% over allowable levels) although I understand from NP proposal that "A frequent exceedance is defined as one that occurs more than 1% of the time".

On page 140 under section 8.1.2.2 the proposal states that there have been no exceedances of maximum allowances. This is based on their own assessment. In the proposal NP quotes a recent paper by Hoffman et al. (2017) who evaluated ambient air levels of seven volatile organic compounds (VOCs), based on ambient monitoring data reported from the National Air Pollution Surveillance Network (NAPS). There are two NAPS monitoring stations near the NPNS mill that have historically monitored for VOCs. This paper focused on ambient monitoring data for the following VOCs: chloroform; 1,3-butadiene; vinyl chloride; benzene; carbon tetrachloride; trichloroethylene; and, perchloroethylene. The paper reported that results of the conducted temporal and spatial statistical analyses indicated that 1,3-butadiene,

benzene, and carbon tetrachloride air concentrations routinely exceeded EPA air toxics-associated cancer risk thresholds, and that 1,3-butadiene and perchloroethylene levels in air were significantly higher when the prevailing wind direction blew from the northeast and the NPNS mill towards the Granton NAPS site. Conversely, when prevailing winds originated from the southwest towards the mill, higher median VOC air toxics concentrations at the NAPS site, except carbon tetrachloride, were not observed. These outcomes have not been corroborated by regulatory agencies or other parties at this time. While this study was quick to attribute elevated ambient VOC concentrations to the NPNS mill based on a spatial and temporal evaluation only (i.e., a statistical evaluation of ambient data in correlation with wind direction, without further site specific investigation), it did not attempt to rule out contributions from other potential sources of VOCs in the area (e.g., transportation sources, or other industrial sources like the Michelin tire plant or the Trenton coal-fired power plant, presumably all sources of VOC emissions to some degree). So NP refuses to believe that they could be the source of air pollution but would prefer to blame it on other industries in the area.

As far as the total environment foot print, meeting current PPE regulations does not mean that harm is not happening. Regulations for pulp mills were updated in 1992 and are concerned with biochemical demand and suspended solids. As it stands now, there are no CCME guidelines established for some of the different chemicals and compounds that make up the pulp mill effluent. It is not acceptable to follow 27 year old legislation so once again, a federal assessment should be considered.

The new treatment facility is being touted as better than the old. I have several concerns and comments on this. It is my understanding that the current set up has the discharge going into the Northumberland Strait after a 12 hour primary treatment in the settling ponds, then moves to an aeration basin where effluent is placed in contact with micro-organisms and sits there for 8 days after which the effluent is discharged into Boat Harbour lagoon (basin) where it remains for an additional 20-30 days. Further aeration, settling, cooling, volatilization and breakdown of materials take place during that time. In the proposed new Activated Sludge Treatment (AST) system on the mill site, effluent will move through a primary clarifier to an aeration basin using micro-organisms to break down pollutants, and then to a secondary clarifier. The process will take less than 24 hours. Northern Pulp states that effluent from the new system, including an added oxygen delignification system, will be similar to treated effluent leaving the present system at point C, with some (unspecified) reduction in biochemical oxygen demand (BOD.) However, the effluent being released from the proposed new system directly into the deep waters of the Strait will not benefit from the considerable reduction in BOD, Total Suspended Solids (TSS) and other contaminants including heavy metals which takes place during the 20-30 days that effluent presently remains in the Boat Harbour Basin stabilization lagoon. Northern Pulp has not provided a detailed comparison between the effluent which presently reaches the edge of the Strait and the effluent they propose to release into the fishing grounds with the new system. The present effluent outfall location at the shore edge does not disperse effluent in the Strait in the same way that the proposed new outfall site would. With the proposed new system, 70+million litres of

treated effluent would be pumped directly and continuously into the prime fishing areas of the Strait every day.

Ocean environments are increasingly stressed. The Northumberland Strait Ecosystem Overview Report, prepared for DFO in 2007, documents increasing stresses on the Strait. To state that there are other industries producing stresses does not make it alright for NP to increase this toxicity and to think otherwise is just plain insanity.

In terms of toxicity, my understanding is that there is only one test required to meet federal regulations. This test measures acute toxicity -- whether 50% of rainbow trout die when exposed to effluent for 96 hours. It does not measure impacts on fish growth or reproduction or on fish habitat. No toxicity test on salt water fish is required to meet federal regulations. There are no federal regulations for a number of known harmful substances in pulp effluent, including AOX and phenols so further study is needed before this pipe is installed. We cannot wait for updated PPER legislation slated for publication in 2022.

NP lists Alternatives Considered for Final Discharge Location or Method. Discharging into Pictou Harbour is not recommended due to the lack of mixing with the Strait (as if mixing with a larger body of water is acceptable), Release into the Middle River upstream was not considered due to expectations that it will increase chlorides in the Middle River and potentially affect the maintenance of the equipment at the Middle River Pumping Station and inside the mill (but once again it is o.k. to dump on fishing grounds). The municipal stations and private facilities do not have the capabilities to handle the volume nor is a land based option available because as proposal states: Land application of wastewater effluent has not yet been approved in Nova Scotia (small wonders), Trucking or barging the sludge to a different location is not recommended. I found the barging comments interesting: A pier for barge loading would be necessary - assumed to not be at the NPNS mill location. Liquid would have to be either stored and trucked or stored and pumped to a facility to offload to an ocean going barge/tanker to be discharged outside of coastal waters in an approved area, with a large number of tankers. There would be increased industrial vessel movements in the Northumberland
Strait, potentially disrupting fisheries. Project specific permits would be required as the effluent does not fall under materials permitted to dispose of offshore. NP is concerned about the increase in traffic in the Strait but not about the effluent that will be pumped there. Why would they need project specific permits if effluent does not fall under material permitted to dispose of offshore but using a pipeline to dump the effluent is allowed?

A closed loop system is not economically viable according to Northern Pulp. NP also states: The main problems with the bleach plant effluent recovery are equipment corrosion and accumulation of chloride and non-process elements in the mill's water systems. Accumulation of chlorides and potassium are especially corrosive for the mill's boilers and often lead to scale build-up which would require the replacement of the boiler over time. However NP also argues that it would not be economically viable

for NP however they are quick to boast of the annual volume of income at $535 million. If the chemicals used are too corrosive for the river and too corrosive to recycle in their own equipment, how can pumping the effluent into the Northumberland Strait be a viable solution? Surely dispersing sludge over a larger area is not the answer. And what happens if NP sticks around until the end of the lease in 2030. Who is going to clean up the mess then? Who is going to compensate the fishing and tourist industry? This are too many other stakeholders involved to let this go through without a Federal Assessment.

I haven't even commented on the state of the health industry in Nova Scotia that could use the money being spent on NP. NP has already received $127 million dollars in tax payer's dollars over the years. We have paid for the design process of the proposed effluent process at a cost of $6 million dollars and will be expected to cover the cost of the construction, installation, labour etc. for the proposed pipe estimated at $100 million dollars. How can NP be allowed to pollute the environment as they have in the past and how can we as citizens believe anything that NP puts out in the media about how wonderful they are when history has shown otherwise? I would rather put my tax dollars towards the penalty of breaking the lease if need be.

On top of all that, I have now read that there is a conflict of interest from the minister of the environment: As Ecojustice wrote on behalf of Friends of the Northumberland Strait," the minister has a clear financial interest in making sure the environmental assessment process is over and done with as quickly as possible. Our clients also say the minister's ongoing contracts with Northern Pulp give the impression that the minister is not able to make a fair decision about whether or not to approve the project. These conflicts of interest violate the public's right to a thorough and unbiased assessment. That is why we are calling on the minister to step away from the assessment process and make way for a federal environmental assessment."

In summary, a federal assessment is required. I will accept the outcome of that but nothing less. Until then, NO EXTENTION, NO PIPE.

In summary the concerns that need to be addressed are:

The waste proposal poses major risk to harming marine life, marine habitat, species at risk/endangered/threatened that include migratory and marine birds, fish, vegetation, reptiles etc. All listed in the submissions via Northern Pulp.

The proposal goes through the Pictou town and Caribou water supply.

2 provincial parks and 2 nature preserves are within the effluent pipe footprint

Meeting PPER doesn't prevent harm to marine life or marine habitat per Environment Canada

The characteristics of the proposed effluent is "unknown" to NP

The proposal shows the plan to burn the toxic sludge in the power boiler and air emissions are already an issue today.

The spill basin only holds 35 million litres of untreated effluent (10-12 hrs) before it goes into the AST system. If a malfunction happens where does it go?

They also list temporary and permanent closures for fishermen around the outflow area, creating a no anchor zone and possible compensation (that has not been discussed) for impacted fishers.

The O2 delignification system is not laid out on how or when it will be constructed.

The Waste proposal will be pumping effluent into the ocean after only processing it for 8 hours as opposed to the current waste system that takes about 30 days to process and reach the Strait.

Sincerely,

From:	@smu.ca

Project: replacement_effluent_treatment_facility_project Comments: This project is potentially disasterous from a number of perspectives. As a landowner on Caribou Island, I am concerned for the water quality in the small harbour on the south side of the island, which has limited capacity to flush out hazardous material, which is likely to concentrate in this area where my small children swim. On the larger scale, the effluent will raise water temperature and the chemical composition of the Strait which is likely to have disasterous effects on marine life and threaten the livelihoods of the large number of individuals engaged in fisheries, which will be much worse than the loss of some mill jobs. Our province should be thinking forward and striving for innovative and sustainable solutions for our economy and environment. Supporting this disasterous mill project, which has cost the province millions, destroyed Boat Harbour, and is probably at least partly responsible for higher than average cancer rates, is not the way forward. Who knows what additional damage the proposed effluent pipe will do, and once the damage is done, it is often irremidiable. Why gamble on our childrens future? Is the province in line with Trumpian climate change deniers? Do they not recognize the severity of human impact on the environment and scientists warnings that we must do better or it will be too late? I challenge the province to do better than to save a few jobs today at the cost of our environment for generations to come. Name:

Project: replacement_effluent_treatment_facility_project Comments: Northern Pulp have proven they cannot be trusted. The people of Pictou Landing First Nations are victims of environmental racism at the hands of their own provincial government and a foreign owned pulp and paper mill. Northern Pulp wants to dump billions of liters of treated effluent that will corrode metal pipes, into the delicate eco-sytem of the Morthumberland strait. I do not want the mill to continue operations in any way shape or form because there is not 100 percent guarantee that the effluent will not create a dead zone in the waters and it has not been dis-proven that the mill emissions are not responsible for the high rates of cancer and copd in Picou County and surrounding counties.As a measure of good faith and good corperate citazenship, our provincial government needs to force the mill to be subjected to the most stringent and in depth environmental assessment that exists in Canada, because the citizens of Pictou county know tha mill has a lot to hid e and they would not volunteerily submit to the most rigorous scientific assessment. It is passed time that this archaic mill ceased its poisoning of these lands. Not only do many families rely on the Northumberland strait for a living, we also swim and walk through the waves we sit on the beach and the watch the sunsets and sunrises. If the mill allowed to continue polluting they will be creating an environment that is not condusive for any living creature to survive. Name: Email: @gmail.com Address:

Project: replacement_effluent_treatment_facility_project Comments: I firmly believe that we as citizens of Nova Scotia should strongly oppose the release of any thing into the waters of the Northumberland Strait or any waters around our great province. If there is even the slightest possibility of any form of discharge into these waters that may or may not cause harm to the waters and the life that lives in this water then the answer must be a no to Norther Pulps proposal. We as citizens must protect this province and any waters, land and or air that surround this province not only for ourselves but for the future generations that follow. There is far too many so called accidental discharges put into our surrounding waters, land and air and now must be the time to say no. Name: Email: @hotmail.com Address:

Project: replacement_effluent_treatment_facility_project Comments: The facts indicate the facility will be an improvement over the old system. The fishing industrys claim it will be destroyed, are proven incorrect by the fact that the effluent is currently in the Strait via Boat Harbour. Treating the effluent onsite and then moving out the wastewater is an industry standard. The chemicals washed into the Strait from PEI agriculture is more of a hazard. Project: - Choose - Comments: The potential impacts on Marine species in the Northumberland Strait are well documented. Northern Pulps 1700 page Environmental Assessment also shows them. However, the plan to mitigate the risk is weak at best and meets regulations. Meeting regulations is not good enough when the Strait is at its max threshold for pressures. Be sure to submit your concerns online https://novascotia.ca/nse/ea/comments.asp SEE BELOW FOR INFO DIRECTLY FROM THEIR PROPOSAL Impact Evaluation/Effects Assessment The potential environmental effects of the project and project activities on marine fish and fish habitat are assessed in the following section. Potential Effects Marine fish could be affected by activities and components of the project during the construction phase and operation and maintenance phase. If unmitigated, these changes have the potential to change marine fish populations and fish habitat e.g., adult fish, juveniles, eggs and larvae, invertebrates and marine plants through direct mortality or indirectly through alteration or destruction of habitat. The environmental assessment of marine fish is focused on changes in marine fish populations. For the purposes of this assessment, a change in marine fish populations includes any physical injury or mortality on fish attributable to the project, and any destruction or alteration of habitat from disturbance of the marine environment. Construction Phase During construction, marine fish may experience direct mortality or functional impairment resulting in eventual mortality. The placement of in-water infrastructure would have a direct effect on sessile or slow-moving demersal fish and invertebrates as they would be unlikely to avoid construction activities within the marine PFA and could experience mortality as a result of smothering or crushing. The construction of marine-based infrastructure may affect marine fish populations through a change in available substrate and size distribution, a change in water and sediment quality, or changes to the acoustic qualities of the marine environment. The process of installing marine pipelines has a direct effect on the benthic environment. In-water activities during the construction phase may also result in a change in sediment quality. The disturbance of marine sediments may temporarily increase the concentration of TSS in the water column. Suspended solids can reduce feeding and growth rates and can alter migration of salmon in nearshore habitats Robinson and Cuthbert 1996. Reduced feeding rates, avoidance behaviour and suffocation due to effects on gill function have been observed in herring from suspended sediments Robinson and Cuthbert 1996. There may also be indirect effects on fish through alterations within localized food web structures. The severity of the effect of suspended sediments increases as a function of sediment concentration and duration of exposure Newcombe and Jensen 1996. During the construction phase, vessel noise will be concentrated within the LAA and the majority of anthropogenic sound in the marine environment generated during construction will originate through trenching, pipe laying, and backfilling. There is also the potential for underwater sound if blasting is used during the construction phase. Some marine fish species may be affected when exposed to high intensity sounds Popper 2003. The sound emitted to the marine environment during the construction phase could therefore temporarily reduce the quality of fish habitat in the marine PFA. Operation and Maintenance Phase Potential effects on marine fish and fish habitat during pipeline operation include the discharge of treated effluent from the ETF. These potential effects could result from: an increase in temperature, nutrients nitrogen and phosphorus, or TSS a change in colour, chemical and biochemical oxygen demand, dissolved oxygen DO, or pH or a reduction in salinity from the discharge of treated freshwater effluent into the Northumberland Strait. Lobster harvesters in the Pictou region have expressed

concern about the potential effects of the discharge of treated effluent on lobsters, particularly in the larval stage. Potential effects to fish during the construction phase may also be applicable during the operation and maintenance phase if project maintenance activities require the presence and operation of project vessels or equipment, and in-water activities that include seabed disturbance e.g., for pipeline retrieval Name: Email: @sympatico.ca Address

Project: replacement_effluent_treatment_facility_project Comments: Dear Sir/Madam, Thank you for the opportunity to offer input on this proposed pipe project. As a former resident of Pictou, and frequent visitor to the town, I have a strong objection to the pipe going into the Northumberland Strait at any point, let alone near the PEI ferry terminal. This company and its many previous owners have a very poor environmental track record, and for it to go through the Pictou watershed is just a very dangerous plan in my opinion. I do not think that there is any safe way to dispose of their effluent at all. Boat Harbour is an environmental disaster, and pumping the same effluent, although supposedly filtered, is just not good for our environment, our fishery, our tourism, nor our health. I ask that you please do not approve the proposed pipe if it includes going into any of our waterways. Thank you for your consideration. Yours Truly,

Project: replacement_effluent_treatment_facility_project Comments: In conducting this Environmental Assessment, you bear a serious responsibility to the people and the environment of the Northumberland Strait area, to finally ensure protection of the ocean environment and of the people, indigenous and non-indigenous, whose lives and livelihoods depend on that protection. In fact, your responsibility is to all Canadians, for we all share in the consequences of every decision of this nature. It is appalling that Northern Pulp and the Nova Scotia government have already spent years polluting the waters of Northumberland Strait and ignoring the rights and legitimate concerns of the Pictou Landing First Nation and of other local residents, particularly fish harvesters and people involved in tourism. The concerns about this new proposal are multiple, serious and urgent, as the proposal and the continued delays in promised remedial action pose huge further risks to the environment, public health, and society. They have been fully documented and detailed repeatedly by the Pictou Landing First Nation, by the Northumberland Strait Sportfishing Association and others. Please refer to their submissions, which I wholeheartedly support, and implement their recommendations. Name: Email: @gmail.com Address:

Project: replacement_effluent_treatment_facility_project Comments: Im a Nova Scotia resident, married into a family with long term ties to Caribou Island. Im a zooplankton ecologist by training, and did most of my Ph.D work on zooplankton ecology in estuarine systems. Ive read through the Environmental Assessment, focusing on the sections where I have relevant education and work experience, and have a few comments and questions that I believe warrant some further focus. The project proposes to release the effluent at a depth of ~20 m. The Registration Document Section 8.11.2.2 states that the in situ salinities are above ~28 PSU, with temperatures varying over the annual cycle, from below 0Âº to 3ÂºC in the coldest period to average temperatures of 17-18 ÂºC during the warmest periods. The effluent is warmer 25-37 ÂºC and less saline ~4 PSU than the ambient conditions throughout the year, and will therefore have less density. As a consequence, the effluent and mixing products of effluent and seawater will rise toward the surface until the density of the mixing product equals ambient densities at that depth. Subduction of fresh water is used in other parts of the world to effect transportation of nutrients from depth toward the surface in vertically stratified systems. Vertical stratification in the Northumberland Strait seems weak based on results presented, so the vertical advection set up by the diffuser system will probably have marginal effects in terms of transport of naturally occuring nutrients. It will however very likely lead to an efficient mixing of the effluent with seawater, at higher dilution ratios than used in the calculations below in to order to bring mixing product densities in line with natural densities, the numbers used in the circulation calculations below are therefore conservative. In Appendix E1, p. 16, it is explicitly stated that their baseline water quality, taken from the Pictou Road location, is expected to be â?oworse offâ? than the actual conditions in Pictou Harbour, yet the report uses these same values in estimating dilution ratios to background values p. 24. This is misleading at best i.e. elevated baseline, implying that the calculated dilution ratios of the water quality parameters are â?obest caseâ? scenario values. I also have a question regarding how the dilution ratios were calculated. On page 25 it is stated that the ambient salinity is 28 PSU, vs an effluent salinity of 4 PSU, and that a dilution ratio of 7 is needed to reach background levels of salinity. 7 is indeed the ratio between the effluent and ambient concentrations, but this number has little relevance for when the mixing product reaches ambient concentrations. 1 m3 of effluent contains 4 kg of salts/TDS, the content of 7 m3 of seawater is 7*28 kg. The total content of sa lts in 8 m3 of mixing product is therefore 200 kg of salts/TDS, or a salinity of 25 PSU. This is ~11 lower than the seawater, to reach 5 of seawater salinity a dilution ratio of 16 is needed, to reach within 1 of seawater a dilution ratio of 85 is needed. The QA section in Appendix E2 shows the correct formula for calculations, so why are not the correct dilution ratios applied in this section in Appendix E1? In order to dilute the effluent to the design aim dilution ratio 144:1, Section 5.2.4, a daily average of 9 158 400 m3 of â?odilutantâ? e.g. seawater is needed e.g. 144x average discharge, 63 600 m3, Table 5.2.1, with 12 240 000 m3 needed daily at maximum discharge 144 x 85 000 m3. If dilution is to occur, this consitutes an average inflow to the effective dilution area of 106 m3 s-1 maximum ~141 m3 s-1. To put that in perpective, the annual average discharge rate of the St. Marys river in Nova Scotia is 45.6 m3 s-1, the St. Johns River in New Brunswick ~ 990 m3 s-1 Source Wikipedia. According to modelling studies Galbraith, P.S., ChassÃ©, J., Caverhill, C., Nicot, P., Gilbert, D., Pettigrew, B., Lefaivre, D.,Brickman, D., Devine, L., and Lafleur, C. 2017. Physical Oceanographic Conditions in the Gulf of St. Lawrence in 2016. DFO Can. Sci. Advis. Sec. Res. Doc. 2017/044. v 91 p., the monthly averaged flows through

the Northumberland Strait NS varies over the year, with absolute monthly magnitudes spanning 300 to 7000 m3 s-1, and reversals in direction i.e. general direction westward rather than eastward in some months Galbraith et al. 2017, Fig. 67-70. Compared to the most of the other parts of the GSL, long term averaged current speeds in the vicinity of the effluent outlet are rather low. Im a biologist, not an oceanographer, but based on these numbers and background circulation information I have at least 2 concerns about the pipeline: 1. Will the effluent diffuser set up a new circulation pattern e.g. estuarine circulation that will affect the current flow through the Northumberland Strait? Especially during months of low average flow through NS the necessary inflow to the diffuser is a high proportion of monthly average flow for NS as a whole, suggesting that the diffuser may potentially have a significant effect on larger scale circulation patterns. Has there been any assessment of the effects of the diffuser on the current field outside of the immediate vicinity of the diffuser? What magnitudes of changes in the present average current field is expected in the wider Northumberland Strait? 2. What is the hydraulical residence time of water parcels once they enter the Northumberland Strait, both under existing and modified e.g. post pipeline hydrographic regimes? In other words, will the effluent be diluted by â?ofreshâ? seawater, or will the water in the Northumberland Strait slosh back and forth with the tides, leading to effluent mainly being diluted by already diluted effluent? While the numbers given in Fig. 70 in Galbraith et al. 2017 suggest a reasonable flow through the Northumberland Strait under the present hydrographic regime, the 3-month current vectors in Fig. 67 and 68 suggests sluggish water exchange. According to the documents provided, a dilution factor of ~100 is expected to be reached within 20 meters Table 6.7-1, p. 115. Into this diffusion area an average inflow of ~73 m3 s-1100 x 63 600 m3/ 86 400 s would be needed to reach the stated dilution factor, and an average outflow of ~74 m3 s-1 101 x 63 600 m3/ 86 400 s would be produced. If the diffuser pipe is 50 m long, and we add a perimeter of 20 m around it, the resulting surface projected circumference around the 100:1 diffusion area is about 226 m. I do not have access to detailed bathymetry, but assuming an average depth of 20 m for this circumference, the area through which both out and inflows would have to pass is at most 4512 m2. If one assumes that half this area is taken by the inflow, and half by the outflow, vertically averaged current speeds set up by the dilution process would be on the order of 3.2 cm s-1 at the 100:1 perimeter in the case of isotropic in/out-flow. However, due to the topography surroun ding the diffuser area, anisotropy in the directions of the in- and outflows can be expected, so this is a lower bound estimate, and real current speeds set up by the diffusors are likely to be much higher. For organisms with pelagic larvae meroplankton, such as bivalves and crustaceans, the currents and circulation patterns set up by the diffuser may lead to local changes in recruitment patterns e.g. where will larvae be transported, where is the source of dilutant water. Also fish with pelagic larvae for instance herring may be affected by changes in the current fields may affect local transport/retention and also turbulence levels, which affect encounter rates between prey and predators. In order to assess potential ecological effects knowledge of current patterns for a larger region both prior to and after disturbance are needed. Apart from listing several areas some distance away from the diffusor as areas important to meroplankton, as far as I can see no â?osupply-side ecologyâ? has been evaluated in the environmental assessment, even though recruitment ecology usually has a central position in most marine stock assessments. 3. What is downstream, i.e what is the position of the expected plume of diluted effluent? 4. What is upstream, i.e. where will the water that dilutes the effluent come from? 5. Do either down- or upstream coincide with fish spawning grounds or shellfish banks? While the levels of nutrients e.g P N added by the effluent are relatively small, the effluent has a relatively high chemical oxygen demand. The ratio of COD to BOD suggests that a fairly high proportion of the COD is non-biodegradable. 6. What type of material is it that makes up this COD? Is it dissolved, particulate or colloidal? Is it totally non-biodegradable, or just very slow to

decompose? 7. If COD matter is particulate, what is its density, and it it prone to flocculation? I.e., can we expect it to either settle to the bottom or accumulate at the surface. 8. If particulate or colloidal, is it of a size fraction that can be expected to enter the food-chain, i.e. will it potentially be taken up by filter-feeding animals such as bivalves and plankton? If taken up, is bioaccumulation likely? 9. What is the modelled overlap of the effluent plume with commercially harvested shellfish banks? I assume that being directly downstream of the diffuser may reduce commercial value of shellfish attractiveness to consumers. 10. Based on BOD, currents, modelled effluent plume and bathymetry, what are the probabilities of formation of low oxygen zones dead-zones downstream of the diffuser? While the Environmental Assessment covers a lot of ground and is very voluminous, it seems to me that the potential for effects beyond a very localized area have been largely omitted in the analysis. Overall the zone of influence of the diffusor used in the environmental assessment seems very restricted, at least when looking at ecological rather than physiological effects. To me that seems like a glaring omission in what actually constitutes a large-scale natural experiment. Looking at this from the outside, I would also encourage more inclusion of Nova Scotias excellent marine research institutions, so that they can evaluate and report back on what may either be a triumph of environmental engineering, or a tragedy of the commons. Subject: Northern Pulp"s proposed effluent pipe into Caribou Harbour
Date: February 19, 2019 1:19:47 PM

My name is I have been a fisherman for almost 30 years fishing in and around the area of the proposed Northern Pulp effluent pipe. I fish lobster, rock crab, herring and scallops. This is my comment concerning the effects of the pipe on our fishery.

Caribou Harbour is one of the largest rock crab nurseries in the Eastern Gulf, containing millions of female and juvenile crab. The survival of the lobster industry in this end of the Northumberland Strait depends on the health of this rock crab nursery. Crab is the main food supply for lobster. Northern Pulp's plan to excavate a trench through the centre of this very special eco-system may spell the end of the lobster fishery in this area.

Regards

Subject: Feedback opposing the Northern Pulp Waste Proposal
Date: February 20, 2019 8:48:48 AM
Attachments: petition_comments.pdf
petition_signatures.pdf

Hello Premier McNeil and Minister Miller,

I am attaching signatures and comments from a petition that I started about 1.5 years ago when Northern Pulp made their waste proposal public. You will see 23,000 signatures from people all over NS, the Maritimes, the rest of Canada, and the World. You will see 55 pages of comments that people took the time to leave to express their concerns towards a toxic effluent pipe into the Northumberland Strait.

After reviewing all of the signatures, comments and where people reside, the message is very clear. Our reputation of warm clean ocean water and sandy beaches and our world renown seafood is at risk on THE WORLD STAGE!

We DO NOT want our reputation changing to polluted oceans and beaches and contaminated seafood. The economic fall out would be catastrophic.

Sincerely,

change.org

Recipient: Minister Environment of Nova Scotia, Minister McKenna, Jonathan Wilkinson

Letter:

Greetings,

Minister Miller, Minister Wilkinson and Minister McKenna,

Today we have dozens of rivers that dump into the Northumberland Strait not counting tributaries. The Strait is a main passage for our a lot of marine species including Waterfowl. It is a place for them to feed, rest and live. However all this is at major risk with the proposed 90 million litres of effluent to be pumped into the Strait a day. The effluent at the outflow of the pipe is going to come out at 25c in the Winter and 37c in the summer!! (The natural water temps of the Strait reaches 15C in the summer) These temps will absolutely change the diversity and make up of this sensitive and important marine ecosystem. This will increase the overall temperatures of the Strait over time due to the high volume of effluent being pumped a day.

The Effluent is going to be fresh water. The Strait is comprised of salt water and species that require a specific level of salinity. At a rate of 70-90 Million litres a day, the salinity of the Strait will change as the waste continues to accumulate over time. This will impact Wetlands, all species that use the Strait as well as the food sources within.

The makeup of the toxic chemicals that will be part of the effluent will also pose major threat to marine life. The communications officer for Northern Pulp has said a few times that the current infrastructure of the mill cannot handle the new proposed effluent makeup because it will be to corrosive to their internal setup and that pumping it into the Strait is the most economical option for the Mill. However, there are many scientific documents that show the risk and harm that will come from this.

Furthermore, the effluent would contain chlorines, dioxins, metals, among other toxic constituents and will contain 935kg of solid materials per day. All of these can bioaccumulate, having catastrophic effects on marine life. Laboratory studies using individual chlorinated organic compounds that are commonly discharged from bleached pulp mills have demonstrated effects such as deformities, as well as embryonic and larval mortalities in fish. These chronic effects will jeopardize the future of many fish species and damage the integrity of the ecosystem. It is documented that Dioxins contaminate fish and shellfish because fish act like sponges for Dioxins,

accumulating them at 25,000-50,000 times the concentrations present in their environment. It also is reported that fish species 250 miles away from the source have been impacted.

The other obvious threat to the Strait is the colour of the water will change. The effluent due to its makeup will change the colour at the water at the outflow of the pipe which is positioned a few kms offshore and directly into the Strait. At millions of litres a day, this will impact a very large area and ultimately change the natural state of the ecosystem.

The Strait already has several large dead zones due to nutrient overloading from many sources. It cannot handle any additional pressures. Boat Harbour, once a very healthy estuary and wetlands is an official environmental disaster due to the mills current waste process. The NS Government is mandating that it be stopped by 2020 and cleaned up. However, the option Northern Pulp came up with is to dump it into the Northumberland Strait! We need Federal involvement and a full Environmental Assessment completed to ensure that the proper scientific testing is done and risks highlighted.

These are only a few points of a concern from a very long list that this pipe will cause. Our wetlands and surrounding marine habitat are not the only things at risk here. Atlantic Salmon, Trout, Herring, Gasperaux, Smelt, Eels, Whales, Atlantic dolphins, Tuna, Mackerel, Striped Bass, etc etc etc all will be impacted by high water temps, toxic chemicals, changes in salinty and water clarity.

You can help by submitting feedback on the Environmnetal process by sending your concerns to ea@novascotia.ca

Comments

	Dartmouth, Canada	2018-04-13	I believe this is absolutely not being Good Stewards of the environment.....this should never have been the only option....for that matter an option at all!!
	Canada	2018-04-13	Nothing good can come of this. We need to start caring for our oceans and coastlines.
	Trenton, Canada	2018-04-13	I am 100 1 % for this the plant. They make enough money to billed the best effluent pond on their property and not pipe ont in the harbor or strait they are cheep
	Burlington, Canada	2018-04-13	#nopipe
	porters lake, Canada	2018-04-13	We need to protect our current fishing population that we have or we won't have it for future Generations
	Aspen, Canada	2018-04-13	Concern for freshwater & saltwater fisheries, aquaculture & ecosystem.
	Chester Basin, Canada	2018-04-13	This is a disgrace money hungry corperations cutting corners to line there pockets.
	Bickerton West, Nova Scotia, Canada	2018-04-13	#nopipe
	Toronto, Ontario, Canada	2018-04-13	This mill is destroying habitat with clear cutting, spraying toxins from the air, poisonious air pollution and dumping of toxins in Pictou Harbour. Shut it down.
	New Glasgow, Canada	2018-04-13	NoPIPEDon't Destroy our Fisheries!
	Pictou, Canada	2018-04-13	The dead zone that exists in the strait now that was created from boat harbour outflow is very large and no fish live in that area . We need the Feds to investigate that under section 35 of fishery act. That would be a start . Many criminal charges could be laid already but nothing seems to be happening
	Fall River, Canada	2018-04-13	This is not an environmentally responsible or sustainable way to manage and operate any business. There is a complete disregard and disrespect for our marine environment and everything living within the ecosystem, which concerns me greatly.
	Westminster, Colorado, US	2018-04-13	This is a disgrace. No concern for the future.
	New Glasgow, Canada	2018-04-13	I'm signing this petition because I am fully against the pipe being put into the straight. It will hurt the fisherman, plant workers, buyers, helpers, tourism in the county and destroy sports fishing.

Name	Location	Date	Comment
			Salmon are already at a minimum in our rivers. Let's not ruin it even more.
	Timberlea, Canada	2018-04-13	I been saying this for years we need help��
	New Glasgow, Canada	2018-04-13	Saving our waters for future generations is number one
	New Glasgow, Canada	2018-04-13	It is not the 1960's any longer. We KNOW that marine environments need to be protected for their sustainability, their marine life and marine plants. Professor Oliver (oceanographer) from Dalhousie Univ. recently reported the oceans are warming faster than ever. There is no guarantee what will happen to the Northumberland Strait if 70,000 million litres DAILY of 37C hot, FRESH water effluent is piped into it on a continuous basis year after year. Not another Boat Harbour! #nopipe!
	Halifax, Canada	2018-04-13	There’s a better way to create jobs than killing the Strait. If the Govt doesn’t ruin legal cannabis before it gets off the ground it would be nice to see a pulp mill turned into something more positive.
	Victoria, Canada	2018-04-13	If Northern Pulp cannot safely dispose of the effluent they should not be allowed to produce it. There is no justification whatsoever for putting the interests of Northern Pulp or the Nova Scotia government before the safety, health and reproduction security of all species indigenous to the Northumberland Strait and its tributaries.
	Seaview, Pictou County, Canada	2018-04-13	I signed this petition because the people of Pictou County have been abused for far too long by this mill and government(s) who have allowed excessive toxic emissions and effluent to destroy our land, water and air. Enough is enough, don't let this continue and ruin our fisheries and beaches.
	Stellarton, Canada	2018-04-13	It is a bad Idea to pump that effluent into the strait where there is so much fishing and tourism involved
	Shelburne, Canada	2018-04-13	No pipe - and kick this company out. They are polluting our air - water and destroying entire forests to get their pulp.
	Hunter River, Canada	2018-04-13	I am completely disgusted they would even consider pumping effluent into the strait in this day and age. All the work peop.e do to recycle, stop using poisons, unleaded gas, electric cars etc There are plants that can be built to clean the water instead of disrupting our ecosystem. Has anyone considered what this will do to the beaches? The north shore of Nova Scotia and the south shore are the warmest waters north of the Carolinas with beautiful world class beaches..... will you still want to swim there or let your babies play in that sand?
	Wabush, Canada	2018-04-13	The Northumberland Strait is a rare and precious aquatic environment! Why would we as Canadians allow a foreign owned Forestry company to pump effluient into this pristine environment? Tell them to fix their environmental issues and stop polluting our waters!!

Name	Location	Date	Comment
	Q. Cove, Canada	2018-04-13	Why do we risk our earth with oil at all when there are so many other cleaner solutions at hand....Wind, tidal, solar, geothermal, hemp...take your pick, jobs for many and ahhhh, gotta love the smell of all that fresh air
	Stourbridge, England, UK	2018-04-13	Why are they allowed to keep poisoning people. Do no politicians care.
	Lower Sackville, Canada	2018-04-13	If you cannot pump a sewer into a lake why would government allow this to be done?
	Luxembourg, Luxembourg	2018-04-13	Certains " humains " ne sont pas en dessus de tous! C'es notre devoir de respectez et protegez les animaux et les oceans. Eux, aussi on le droit d'avoirs une vie saine sur ce planéte! Vous, le savez? Prenez, votre responsabiltée ârrêtez et aidez, s.v.p. Civilisez? Bien triste, de signez des pétitions. Merci.

	Dartmouth, Canada	2018-04-14	dumping waste water is not a very environmental idea mr. "environmental" ""minister "" use your head.
	Zdroisko, Poland	2018-04-14	Getekend
	Scotsburn, Canada	2018-04-14	We have to protect our waters
	Dartmouth, NS, Canada	2018-04-14	I think this is the right thing to do!
	Oxford, Canada	2018-04-14	Northern pulp must he stopped. They can do whatever they please
	Westville, Canada	2018-04-14	Concern about all aquatic species in the Strait
	Japan	2018-04-14	賛同
	Pictou county, Canada	2018-04-14	It is insanity to allow pulp mill effluent into spawning, nursing and migratory waters. Protect the environment. Don't destroy it.
	Wolfville, Canada	2018-04-14	Projects like this can't be allowed to ruin our water ways and fisheries!
	Prince, Canada	2018-04-14	It's a scary world when idea's like this are seriously being considered
	Sydney, Canada	2018-04-14	On it's own, this is a bad idea. Given who's proposing it and backing up the "no harm to the environment" claims, and their lying track-record, we'd be masochistic not to fight it.
	Dartmouth, Canada	2018-04-14	This pipe will ruin the environment in the Northumberland Strait. It must be stopped
	Wolfville, Canada	2018-04-14	Tired of this companies disregard of the environment
	timberlea, Canada	2018-04-14	I find it hard to believe that in 2018 I have to sign something like this to force the government to protect our fisheries and ultimately our very own health. Have we learned nothing?
	Belle River, Canada	2018-04-14	Don't want that hot poison water being dumped in the ocean..
	Powell River, Canada	2018-04-14	I grew up with clean clear water, our oceans face terrible challenges already, we need to stop using our planet as a dumping ground for unneeded profit seeking industries.
	Coventry, US	2018-04-14	The environment is globally under attack from special interest groups. Nova Scotia especially needs a break because it still maintains, in many regions, that ability to maintain fragile species. The Northumberland Strait is one of these ecosystems that needs this special consideration.
	Merigomish, Canada	2018-04-14	Do not destroy our beauty and fishery!
	Moncton, Canada	2018-04-14	STAP EET!!

	Celebration, Florida, US	2018-04-14	I own a summer home at Melmerby Beach.
	Mount Uniacke, Canada	2018-04-14	I love my Grandkids.
	France	2018-04-14	I sign
	Hamilton, Canada	2018-04-15	We need to save our fresh Trout and Salmon.
	Montague, Canada	2018-04-15	They must have effluent treatment in place before releasing it into the strait
	Pictou, NS, Canada	2018-04-15	There is no reason good enough to put this area of the ocean at risk. The track record of this mill is historically terrible and has had enough help from the taxpayers of Nova Scotia.
	Mount Stewart, Canada	2018-04-15	I care about what is done to our environment.
	Mount Stewart, Canada	2018-04-15	We need to stand up and take notice of what is being done to our environment!
	North Sydney, Canada	2018-04-15	Our provincial govt has shown time and time again that they can't handle projects at this size appropriately. They allowed Northern Pulp, who is only tested 4 times a year, to exceed emissions for about 4 years because they were 'working towards compliance'. Northern Pulp used that time to set production records instead of reducing their emissions. When the original 'world class treatment facility' was built, they noticed how horribly bad it was after two days after it killed all of the fish and became the worst case of environmental racism in the province. That was 51 years ago and still won't close for another 2 years. If that pipe goes in, I'm sure the same logic will be in place that if we notice that it is a mistake, even after 2 days, we will likely see that pipe continue for 50 years. And if the company has something go on that they need to fix that makes things worse while they 'work towards compliance', I'm sure they'll take that opportunity to break production records over showing any concern
	Pictou, Canada	2018-04-15	I live on this Strait. Our waters need to be protected for our fisheries, our tourism, and our people. In 2018 it is unthinkable to pollute the water (and our air), like a third world country.
	Dartmouth, Canada	2018-04-15	Waste heat dumping will affect the marine ecosystem. Use a cooling tower.
	Petitcodiac, Canada	2018-04-15	our environment is more important than paper

	Halifax , NS, Canada	2018-04-18	Ingnore our environment at our peril!
	Grand Etang, NS, Canada	2018-04-18	Did they hire Scott Pruitt to consult on this, or what? Over-the-top insanity!
	Antigonish, Canada	2018-04-18	Let's keep our waters and fishing industry safe!
	Houston, Texas, US	2018-04-18	#nopipe period. End of story.
	New Glasgow, Canada	2018-04-18	The resource in our waters should be protected from dumping waste of any nature
	Stratford P.E.I., Canada	2018-04-18	Do not even think of this happening we are not Montreal.
	Mabou, Nova Scotia, Canada	2018-04-18	Many fishermen in Atlantic Canada depend on the fisheries for their livelihood. The damage to the ecosystem by this greed is will kill to many already endangered species.
	Mabou, Canada	2018-04-18	As an oysterman in Mabou Harbor, featuring world renowned oysters. The Northern Pipe effluent release is something I will vigorously protest.
	Charlottetown, Canada	2018-04-18	Brought up in a fishing family
	Tatamagouche, Canada	2018-04-18	The combined value of these fisheries is in the Millions of dollars which supports about 7100 fisher persons in the Gulf . Compare this with only about 300 employed by the Pulp Mill .
	vero beach, Florida, US	2018-04-19	Because of the unthinkable,poorly imagined ,and horridly demeaning slap in the face of species that 'dont speak english'...human beings were made,to demonstrate high intelligence; what happened ? Its akin to saying "We dont care about Life!" . The fish,that i kill, to provide sustanence,are dispatched with prayers and blessings...this is wholesale ,Godless greed, for "the Love of money, is at the root of all evil...." Must stop !
	Three Fathom Harbour, Canada	2018-04-19	Northern Pulp must stop polluting, whether that be in Boat Harbour / Pictou Landing, or in the Strait! Enough. #NoPipe
	Donkin, Canada	2018-04-19	I believe that our environment and diversity of fish and wild life is more important than the profits of corporations.
	Wallace, Canada	2018-04-19	I care about protecting our natural environment for future generations!
	Herring Cove, Canada	2018-04-19	What a disgusting thing to do to this beautiful area and the natural environment. Toxic, deplorable.
	Upper Tantallon, Canada	2018-04-19	Stop polluting the waters

Name	Location	Date	Comment
	Edmonton, Alberta, Canada	2018-04-20	I've seen and smelled the damage Northern Pulp is responsible for, and am aware of the health impacts in Pictou Lansing. Stop this now!
	Schomberg, Canada	2018-04-23	The livelihood of fishermen and their or I should out fishing ground are worth more than that plant will ever be , the plant has already destroyed tourism in the area , were they should be swamped with people whating to visit and enjoy thief waterfront
	Antigonish, Canada	2018-04-23	We need to protect our land and water. This is unacceptable.
	Halifax, Canada	2018-04-24	I've seen the destruction to the environment in the bays and inlets this where this company spued their poison. A pipe further into the strait would destroy beaches, our fish,oysters etc and is Unacceptable . They hold jobs as ransom! Never liked their presence or their stink
	Roanoke, Virginia, US	2018-04-25	We MUST save species for future generations!
	Halifax, Canada	2018-04-26	I care
	NEW GLASGOW, Canada	2018-04-26	Northern Pulp has gone too long disrespecting our forests , waters ,&people
	SAntigonish, N.S., Canada	2018-04-26	L
	Berwick, Canada	2018-04-26	I know its a huge subject and this place provides a lot of jobs but we have to start taking a serious look at our environmental impacts rather than just saying yes to money and comfort. NOPIPE
	Kings Head, Canada	2018-04-27	I too am very concerned about the safety and doing everything we can to protect our waters . We have too much at stake to not take this seriously .
	Warsaw, Poland	2018-04-27	I care about my home.
	Halifax, Canada	2018-04-27	Nova Scotia forests should not be a toilet paper farm for China or anywhere. Our water is not a toxic dump. Northern Pulp your day is over.
	Fall River, Canada	2018-04-27	Too much is at risk and the evidence of risk is overwhelming after 51 years. Dead zones and the lack of accountability or real enforcement in Nova Scotia for industries that don't put human life and the environment first.
	trenton, Canada	2018-04-27	I want clean air, water and land free of mill pollution!
	Pictou, Canada	2018-04-27	Because we need to protect our marine environment, the fishery and tourism industries that this effluent pipe will destroy.
	Saint John, Canada	2018-04-27	I am deeply disturbed that such a disasterous option would even be considered!

Name	Location	Date	Comment
	Antigonish, Canada	2018-04-27	We shouldn't be going backwards in how we treat the environment. We have one earth, we shouldn't be taking shortcuts because they cost less. There is always a better way. It's 2018, haven't we learned by now?
	New Glasgow, Canada	2018-04-27	Northern Pulp is an environmental disaster and the worst part is that the government of NS keeps handing them millions and millions of the taxpayers money to keep going. It's absolutely shameful.
	Miramichi, Canada	2018-04-27	We know better. We can do better.
	Sackville, Canada	2018-04-27	Water is life.
	New Glasgow, Canada	2018-04-27	I am very concerned! It just doesn't make sense to dump millions of litres of toxic waste into our ocean. Our ocean will become an environmental disaster! Also my family's livelihood is at stake if the the oceans fish stocks are destroyed. Why are there different rules for different government departments? If I were to do any type of work near a river I would have to install a barrier around the river to protect it! Why not protect our oceans!
	Halifax, Nova Scotia, Nova Scotia, Canada	2018-04-28	This whole idea of pumping pulp mill waste water full of chemicals into a delicate ecosystem that many in the area cherish and rely upon for their livelihoods is absolute insanity. I WANT THIS ENTIRE MILL OPERATION SHUT DOWN IMMEDIATELY!!!!
	Halifax, Canada	2018-04-28	No job is worth ruining our environment!
	Halifax, Canada	2018-04-28	It is fucking ridiculous how all technology changes yet the oil/car industry stays the same. Oil is destroying our planet. Green energy is the only way. Save the planet. And might I add, go vegan!
	Hunter River, Canada	2018-04-28	I 'm opposed to the Northern Pulp's Effluent Pipe being placed in the Northumberland Strait. The water of the gulf, the strait and the the Atlantic are not a limitless dumping ground for corporations. Marine ecosystems and and the species they support are already stressed and threatened.
	Mount Uniacke, Nova Scotia, Canada	2018-04-28	Dumping toxic waste in the Northumberland Strait will create an environmental disaster that will affect fisheries and tourism. Time to realize our environment is precious and make protecting it a priority.
	Halifax, Canada	2018-04-28	To allow the effluent from a NS pulp & paper mill to flow untreated into the Strait is to disregard the forms of life living in this body of water and to say that once again, the economic bottom line of one industry supercedes any other consideration. This is short-sighted thinking. My family has had a summer property for decades on the south shore of PEI, and we have already seen an increase in the water temperature, and a concomitant alteration to the diversity of species, as a result of climate change. The temperatures of the effluent will further affect this. But of course the toxicity of the effluent is another concern. Fish & seafood stocks will be affected, as well as the livelihoods of fishers. I also wonder if the water will be safe to swim in... some days frothy bubbles wash up on shore as

Name	Location	Date	Comment
			a result of who knows what effluent already in the water. Will my nephew's children, 35 years from now, have to swim in a pool rather than the ocean...?
	Halifax, Canada	2018-04-28	This is sociopathic behaviour given our present day understanding of the consequences of these actions.
	Truro, Canada	2018-04-28	I do not trust this government to take adequate precautions to protect our water.
	Mulgrave, Nova Scotia, Canada	2018-04-28	I'm signing because I believe in keeping all our waterways clean which means free of ALL pollutants - pulp mill waste, plastics, pesticide runoff - in short, anything that does not belong in water. I want to eat clean, unadulterated fish and sea plants.
	Kingston, Canada	2018-04-28	Don't let the waters be poisoned for the mill's convenience.
	Pictou, Canada	2018-04-28	It is unacceptable to poison the water, the people,the fish and all other species that live in or depend upon the Northumberland Strait !
	Abbotsford, Canada	2018-04-28	The pipe is The Mills attempt at an inexpensive (cheap) solution to treat their effluent. No pipe/ better waste management on the mill site.
	Halifax, Canada	2018-04-28	it's the responsible thing to do
	Westville, Nova Scotia, Canada	2018-04-28	We all deserve clean air and water. I love my beaches. I don’t believe our government is acting in our best interest; I believe they are acting on money in there pockets!
	Truro, Canada	2018-04-29	I want a clean future for our kids
	Truro, Canada	2018-04-29	We need to stop destroying our planet.
	Nova Scotia, Canada	2018-04-29	A healthy Strait serves all species in this region!
	Sydney, Nova Scotia, Canada	2018-04-29	CBRM must treat all sewage waste (and pay the price to do so) but the big company can dump chemicals which will mix with other toxic chemicals, creating new ones, into the gulf? You're going to kill a lot of fish & people to save money for one industry? Please wake up!
	Guysborough, Canada	2018-04-29	This is wrong on so many levels.
	Canada	2018-04-29	ask them to dump in their own backyard!!!! how many jobs and lives-both human and animal will this KILL.
	N Falls, Canada	2018-04-29	Please stop this from happening!!!
	Truro, Canada	2018-04-29	Let’s hope the petition has some impact.
	Halton Hills, Canada	2018-04-29	Save the North Cumberland Sraight JUST SAY NO

Name	Location	Date	Comment
	Pictou, Canada	2018-04-29	This proposal needs to be rejected if the Provincial government can not do it because their hands are held captive by Northern Pulp then send it to Federal Government. If proper science is looked at and not decision based science than it will be rejected. There is to much at risk and to much harm will be done if this is allowed to proceed.
	pictou, Canada	2018-04-30	I want my kid to grow up and be able to enjoy the beaches, go on fishing trips and boating adventures just like i did and i want him to be able to be safe doing so
	Pictou, Canada	2018-04-30	Pumping industrial discharge into waterways stopped being acceptable back when bell bottoms and disco. That this idea is being considered is a terrible joke.
	Pictou, Canada	2018-04-30	Pumping industrial discharge into waterways stopped being acceptable back when bell bottoms and disco were still in style. This is a terrible joke.
	Trenton Nova Scotia, Canada	2018-04-30	Don't destroy another area with this poisonous waste water coming from the NP Kraft Pulp Mill.We have Boat Harbour to get cleaned up.Isn't that enough toxins to clean up in our little Pictou Co.area???
	Halifax, NS, Nova Scotia, Canada	2018-04-30	I’m signing because I live in Pictou and raised there and see the distraction this plant has caused over the years.
	Hove, England, UK	2018-04-30	This pipe will kill life in the ocean, the livilhood of thousands and our precious environment. Please stop this from happening!
	Dartmouth, Canada	2018-04-30	So tired of the narrative that we have to make this easy for the pulp mill or they will pull out of the county. It is wrong to dump into the waterways. It is wrong to pollute our air. It is wrong to clearcut our forrests. We need to face the fact that this is profit driven and that the company has no loyalty to our county. As soon as theyre done their pillage, they will move on to other unsuspecting places to use them up.
	St. John's, Canada	2018-04-30	I'm signing because paper is not worth the lives of people, the irreversible damage to the environment or the damage to peoples livelihood.
	Wakefield, Massachusetts, US	2018-04-30	It's time to stop the polluting of our precious oceans and waterways by greedy and shortsighted businesses.
	Halifax, NS, Nova Scotia, Canada	2018-04-30	Destruction was the word I meant to type. This has gone on far too long No pipe ever should be filling our straight with toxic waste. Period
	Fortrose, Scotland, UK	2018-04-30	Save the wildlife. Keep wild places wild. No pipeline here.
	Westville, Canada	2018-05-01	To save our community
	New Glasgow, Canada	2018-05-01	If the government isn’t going to do something about this then we have to! What a joke our minister of environment is! We should vote

Name	Location	Date	Comment
			someone in who actually cares about us and our health .They are finally admitting how toxic boat harbour is. But the government is going to let them put it in our ocean? So how can they justify pumping these toxins into our ocean? The rest of the world is trying to reduce emissions and here in Nova Scotia we're living in the Stone Age just going to pump everything into our atmosphere and pristine waters.This pipe is going to ruin our lobster fishery and I don't think the fishermen will stand for it. Nor will I . I talked to an engineer who has done projects at other pulp mills and he said there's definitely other options, they just don't want to spend the money! Don't for one second let them make you believe this is our only option. There's many options, one being block the access to the mill so they can't operate!
	Pictou, Canada	2018-05-01	No pipe in the strait.
	Stellarton, Nova Scotia, Canada	2018-05-01	There are more environmentally friendly ways to dispose of this effluent. I may be very uneducated regarding this topic, but the mill has already destroyed boat harbour, now they want to destroy the ocean and all that lives in it. I say NO. Spend the money to do it right without destroying our waters.
	Pictou County, Canada	2018-05-01	Keep it clean - no pulp waste in our water!
	Amherst, Canada	2018-05-01	One of the the greatest passions I have is fly fishing for trout and salmon. First is the passion and understanding of the fish itself. Without a doubt salmon are facing difficult times due to industry, whether it's fish farmers destroying there breeding and feeding grounds and the cesspools of disease they create or pollution from industry. They do not need to face another road block while swimming to breeding grounds. Keep the pipe out of the strait.
	Pictou, Canada	2018-05-01	I love our environment, our oceans, our air !! Our tress!!
	Inverness, Canada	2018-05-01	
	Pugwash NS, Canada	2018-05-01	This is outrageous. What is our Environment Minister and local politicians doing about this?
	New Glasgow, Nova Scotia, Canada	2018-05-01	Disgusting that the government continues to allow and financially support this pit of poison. No pipe!
	Lower Sackville, Canada	2018-05-01	There's too much at stake ! NO PIPE !
	Berwick, Canada	2018-05-01	Intentional pollution is disgusting. To stand aside and not protest is to enable this!
	Vancouver, Canada	2018-05-01	Keep effluent out of our food chain and waters
	Canada	2018-05-01	NO PIPE

Name	Location	Date	Comment
	Halifax, Canada	2018-05-01	I care about the environment more than I care about employment for the unemployable masses of uneducated workers. Down with the mill!
	Pictou, Canada	2018-05-02	A pipe in the Strait will be an environmental disaster.
	Jolicure, Canada	2018-05-02	I want to help secure a clean future for the Northumberland Stright
	Lockeport, Canada	2018-05-02	Absolutely NOT!
	Truro, Canada	2018-05-02	Fuck the mill!
	Nepean, Ontario, Canada	2018-05-02	These are NOT renewable resources. Put our money into something that is sustainable and healthy for the environment.
	Gatineau, Canada	2018-05-02	Stop destroying our planet... Enough destruction!!!
	RR3 Pictou, Canada	2018-05-02	I'm signing because this pipe will decimate the lobster fishing on the east coast as well as the north Atlantic right wales, salmon, sea turtles, and turn Canada's Ocean playground into Canada's ocean deadzone
	Woodbridge, Canada	2018-05-02	Enough already. Why aren't we responsible by now with our water and eco-systems. The technology is available.
	Mississauga, Ontario, Canada	2018-05-02	will we ever learn how mankind's impact affects all things
	Rimbey, Canada	2018-05-02	This is one more example of liberal hypocrisy. They take the environmental high road when it comes to pipelines to transport our petroleum products and they impose carbon taxes to try to save the planet from climate change which has been occurring since the beginning of time and then Liberal Environment Minister under Chretien admitted that the science concerning climate change was phony. This is proof that these people can care less about the environment. The strongest opponents to the Trans Mountain Pipeline expansion, when they are in the BC capital, poop directly in the Pacific Ocean as Victoria does not treat it's sewage. These same goons just raised their carbon tax, yet many oppose a sewage treatment plant. And Montreal has dumped raw sewage in the St. Lawrence when opposing the Energy East pipeline. And Nova Scotia who was predominantly Liberal red in the 2015 supporting Trudeau who promised the carbon tax now has a proposed disposal pipeline to the Northumberland Strait to dump toxic effluent. Our w
	Walkerton, Canada	2018-05-02	THE NERVE OF THESE COMPANIES. DON'T THEY KNOW THE WATER IS NOT THEIRS TO POLLUTE, AND WHERE IS THE GOVERNMENT IN THIS VERY BAD IDEA.
	Hamilton, Canada	2018-05-02	Please, this is vitally important.
	Antigonish, Canada	2018-05-02	I think it is important for the Minister of Environment to do more studies to consider the long term effects a pipe like this could have on the marine life in the Strait and to consider how that may affect

Name	Location	Date	Comment
			the people and industry who depend on a stable and healthy marine life. Don't hurt one industry to protect another industry.
	Little Current, Canada	2018-05-02	It is 2018 and we shouldn't be dumping anything into the ocean, plastic and especially effluent. Build a water treatment plant for heaven's sake.
	Woodstock, Canada	2018-05-02	No more oil spills. Save our water life from crazy money grabbers!Enough !
	Gander, Canada	2018-05-02	I'm tired of govt stealing tax$$$ and not using the money to help humans sustain life in and off land
	Sudbury, Canada	2018-05-02	How do you spell INSANITY ?.?
	Halifax, Canada	2018-05-02	I love the younger people and we really need to start to care a little about what we are actually doing with the many other choices there are that could be utilized
	Lake Country, Canada	2018-05-02	THIS century includes innovation and technology to better deal with effluent from pulp mills. Take the time to find a better way to deal with it than dump it into the strait. Invest in our future, not our past.
	Lindsay, Canada	2018-05-02	If we don't protect our natural environment there will be no future for our children.
	Assiniboia, Canada	2018-05-02	We have to quit polluting our waters and killing our marine life! There has to be a better solution!
	Brampton, Canada	2018-05-02	We are killing the oceans
	Hamilton, Canada	2018-05-02	I have seen far to much from weak minded politicians that take a quick route to solve a problem. Our waters and oceans are the life blood. Poluting our water is criminal
	Hamilton, Canada	2018-05-02	It’s hard to believe that it is even on the table to pour untreated effluent into a natural water body.
	Edmonton, Canada	2018-05-02	This continuing destruction of Maritime land, clean water & food, is utterly disgusting of government. It has been over decades since pollution wrecked the land & water, more so the citizens are carrying heavy cancer issues. Most of my family & friends have died. Please stop polluting, it needs to end.
	Victoria, Canada	2018-05-02	Because this is the right thing to do
	Edmonton, Canada	2018-05-02	Business owners need to take responsibility for non-polluting options to dispose of their waste, and the government needs to ensure that this is done to ensure healthy ecosystems now and in the future.
	Toronto, Canada	2018-05-02	Other solutions that don't affect the Marine environment should be considered.
	London, Canada	2018-05-02	Thermal pollution is a real threat to fishing ecosystems.

Name	Location	Date	Comment
	Blenheim, Canada	2018-05-02	Once again, we see a company trying to overrule the needs of the environment for it's own profit. Instead, use your employees to help solve the problem and thus keep the company alive (as well as the environment of the Strait). Otherwise. shut the company down until it solves its problem (I'd feel bad for its employees if shutting down was the only solution).
	Banff, Canada	2018-05-02	We have to take a stand to protect out waters and its inhabitants!
	Burnaby, Canada	2018-05-02	
	Winnipeg, Canada	2018-05-02	We need to protect our wildlife on land and in the oceans. Pouring its effluence without it being treated is gross negligence in my book. Gone are the days of simply dumping into Our land or oceans. We now know that there are dire consequences to wildlife when we do. It goes without saying, you can't poison your food and expect to live.
	Vernon, Canada	2018-05-02	Canada is not the only country that needs to smarten up, this disgrace is going on around the whole world and is going to cost us all BIG time if it's not stopped.
	Howell, New Jersey, US	2018-05-02	The water ways of NS need to be free of pollutants that negatively effect the environment
	Regina, Canada	2018-05-02	When exactly are the persons that we elect into government going to figure out that we cannot simply dump our CRAP! into our marine systems and expect it to not have serious, negative consequences!? What year/century are we living in; 1918?
	Gilford, Ont., Canada	2018-05-02	This waterway will become unhealthy for the trout and Atlantic salmon as well as humans with temperature change and the toxic chemicals. Avoid another tragedy please!
	New Glasgow, Canada	2018-05-02	We need to protect our wildlife
	Calgary, Canada	2018-05-02	One more of man's great decisions to destroy more of the environment.
	Beaverton, Oregon, US	2018-05-02	The waters of Northumberland Strair don’t stay there but work their way around the whole earth. To allow this pollution here, and similarly in many other places, is to toxify the waters of the whole planet, to the detriment of all life.
	Dartmouth, Canada	2018-05-02	Could we have a government concerned with making the right long term decision?
	Montreal, Canada	2018-05-02	For our waters and our wildlife!
	North Bay, Canada	2018-05-02	Leave our water system alone! No pipes!
	Sorrento, Canada	2018-05-02	It's the right thing to do!

Name	Location	Date	Comment
	Fredericton, Canada	2018-05-02	We've done enough damage to our environment. It's time to design and implement better solutions.
	erin, Canada	2018-05-02	Hard to believe this is happening in 2018 in Canada ! We continue to use our precious water as a toilet !!!
	Atlanta, Georgia, US	2018-05-02	We have to stop polluting our environment!!!
	Powll River BC, Canada	2018-05-03	Clean up humanity, our waste ..pay the price for a good life on a clean planet .As long as we reproduce as we do our actions will destroy us. We soon reach critical mass of selfdestruction .A few bugs ,beasts,rhinos extinct will be nothing compared to what's looming beyond permafrost meltdown. Who knows really how much methane will be released soon.Even the rich won't have anywhere to escape to.
	Pictou County, Canada	2018-05-03	My husband is a commercial fisherman and this directly impacts our livelihood
	Glen Huron, Canada	2018-05-03	The hidden effluent, exposed by environmentalist groups, conscientious media outlets and sustainable activists has shed a well deserved light on the atrocities committed by these farming operations - increased monitoring and regulation of this must be encouraged and adopted.
	Calgary, Canada	2018-05-03	Our nation should be focusing on renewable, sustainable forms of fuel - wind and solar! These practices of using oil for fuel are outdated and are doing nothing to benefit our environment
	Ottawa, Canada	2018-05-03	Dumping contaminated waste into the ocean is ridiculous and should never be allowed!
	Beaufort, South Carolina, US	2018-05-03	WHAT IS IT ABOUT HUMAN NATURE THAT WE HAVE THE CAPABILITIES TO DESTROY OURSELVES AND ALL LIVING CREATURES AND STILL DO NOTHING TO STOP IF FROM HAPPENING?
	Pictou, Canada	2018-05-03	I don't trust thus company. I believe they will ruin the Northumberland Strait if allowed to pump effluent into it.
	Ottawa, Canada	2018-05-04	This is a travesty!!
	Victor Harbor, Australia	2018-05-04	I oppose all dumping of pollution, more so when the effects are so profound. This shit has to stop!
	Houston, Texas, US	2018-05-04	#nopipe period. End of story.
	Halifax, Nova Scotia, Canada	2018-05-06	In 2018, It only makes sense
	Victoria, Canada	2018-05-06	Pollution by dilution is not a solution
	Salisbury, Maryland, US	2018-05-06	What a truly bad idea!

Name	Location	Date	Comment
	Port George, Canada	2018-05-06	As with our dirty Canadian oil refineries, it's time industry paid for their messes; treaty the stuff!
	Dartmouth, Canada	2018-05-07	I’m sure the chemical engineers would like to get this right and neutralize the effluent and get it to the right tempersture before releasing it to the environment. Don’t destroy 4 indistries and the health of Nova Scotians for the sake of this one industry that we don’t even profit from.
	Coquitlam, Canada	2018-05-07	It's not cheaper to dump this effluent directly into the ocean. The effects from this effluent will cost a billion times more to clean up than the few jobs it will create by dumping... If the effluent can't be disposed of in a positive way to benefit something then the whole project needs to be stopped.
	Halifax, Canada	2018-05-07	I'm concerned about our marine life.
	Charlottetown, Canada	2018-05-08	I come from a fishing family - we need to protect the Northumberland Strait ! NO PIPE
	Elizabethville, Pennsylvania, US	2018-05-08	I grew up crossing that straight. There is a very delicate balance that is important to maintain. Please look at other options.
	charlottetown, Prince Edward Island, Canada	2018-05-08	Far too risky.
	Canada	2018-05-08	Our resources are far too valuable to be destroyed.
	Whitby, Canada	2018-05-08	We've created enough ecological mess. Everyone, and every community, large or small, must deal with their own crap.
	Red Deer, Canada	2018-05-08	Complete your signature Red Deer, Canada I’m signing because... (optional) Display my name and comment on this petition
	Belfast, Canada	2018-05-08	No more pipelines or other pollution .
	Brossard, P.Q., Canada	2018-05-08	Such a rich place for wildlife
	Ottawa. ON, Canada	2018-05-08	Surely the Government has considered the environmental impact
	Ottawa, Canada	2018-05-08	Using the ocean as a dumping ground has to stop.
	Victoria, Canada	2018-05-08	This effluent needs to be properly treated before being released into the environment to reduce negative impact.
	Nanaimo, Canada	2018-05-08	Stop the pipe Dave the sea life
	Ottawa, Canada	2018-05-08	We must prevent the destruction of our waterways. The Great Lakes and St Lawrence Seaway are part of the largest freshwater system in the world. We should preserve it.

Name	Location	Date	Comment
	Ottawa, Canada	2018-05-08	Designing a pipe to dump waste water from a pulp into a productive and remarkably beautiful stretch of Canada’s coastline waters is wrong in so many ways.
	Owen Sound, Canada	2018-05-08	There is no long term future for oil. It is a finite product which will disappear. I do not see any Government programs for long term energy production that does not involve oil. The Federal Government is failing it's promises and ignoring the Canadian people's wishes. The economy does not make a country, the community and the people make a country.
	Moberly Lake, BC, Canada	2018-05-08	Oceans should no longer be used as a sewage pond for human waste.
	Kingston, Canada	2018-05-08	The Gulf of St. Lawrence is not your toilet.
	Chatham-Kent, Canada	2018-05-08	Don’t mess with the oceans. No pipelines in Northumberland.
	Venice, California, US	2018-05-08	We need Marine animals natural waters marine life etc. Think upanother way to deal with to deal with toxic waste. No pipeline.
	London, Canada	2018-05-08	As a former resident of New Brunswick, I understand the delicacy of that ecosystem and would be appalled to see it damaged.
	Edmonton, Canada	2018-05-08	What is the matter with you people?! Haven't you heard of a sewage treatment plant?! Where is all the money that the Feds promised for infrastructure???
	Saint Catharines, Canada	2018-05-08	There is a better solution to the problem.
	Toronto, Canada	2018-05-08	You bet I'm signing this. How can you possibly think that dumping all that crap in the water will not harm or destroy what is there? Canadians love our fresh clean water ways. Don't mess with it.
	Halifax, Nova Scotia, Canada	2018-05-08	Please be reasonable and say no to the environmentally UN-friendly idea of dumping effluent into the Northumberland Strait!
	elora, Canada	2018-05-08	Surely we are smarter than this! Come on engineers! This is our childrens’ future too!
	Dunnville, Canada	2018-05-08	All pipelines fail in time. Stop this senseless destruction. Petro is no longer needed as we now have so many cleaner alternatives.
	Cornwall. ON, Canada	2018-05-08	There are enough problems facing our oceans. We should not be adding to them.
	London, Canada	2018-05-08	It’s essential that we expand our efforts to protect our environment. We have reached a point of no return.
	Ardrossan, Alberta, Canada	2018-05-08	Our water is being destroyed when it needs to be saved

Name	Location	Date	Comment
	Kelowna, British Columbia, Canada	2018-05-08	throwing away effluent is throwing away money. It can be recycled, the water cleaned and released. There is no need to treat the ocean as a toilet.
	Toronto, Canada	2018-05-08	Effluent piped directly into the Strait? What are you thinking?
	Chilliwack, British Columbia, Canada	2018-05-08	In 20 years the world will be off its dependence on oil and onto clean energy, let’s start this change now.
	Victoria BC, Canada	2018-05-08	This is 2018. How can you!!?
	Bethany, Canada	2018-05-08	There has to be a better way to handle this without compromising our oceans.
	Leamington, Canada	2018-05-08	I agree that the risk to the habitat and marine life is too great for the location of this pipeline.
	Bridgewater, Canada	2018-05-08	The long term environmental risks to this proposed plan heavily out way any short term economical benefits.
	Toronto, Canada	2018-05-08	This is dosgraceful
	Victoria, Canada	2018-05-08	The environment is more important than this mill's desire to save money. What a stupendously idiotic idea.
	Penhold, Canada	2018-05-08	Wow leave the oceans alone stop wrecking the planet
	Victoria, Canada	2018-05-08	a fish sent me
	Lincoln, Canada	2018-05-08	Surely, the company involved could consult with experts to come up with a less environmentally damaging disposal of their effluent. It is their moral responsibility to do so, but too often economic expediency is the winner.
	Winnipeg, Canada	2018-05-08	because I care about our oceans and all that live in it. people are the worst enemy to nature.
	Westport, Canada	2018-05-08	This must not happen.
	Aylesford, Canada	2018-05-08	is that the best we can do in 2018!!!? Raw sewage poured into the ocean...."out of sight out of mind" mentally has got to stop!
	Brighton, Canada	2018-05-08	Respect for Nature - Respect for LIFE
	Ariss, Canada	2018-05-08	Treat the effluent so it is non toxic and has a neutral effect on the environment prior to dumping. It is the cost of doing business. The ocean is not a garbage dump.
	Stratford, Canada	2018-05-08	You don't pump toxic chemicals into Straits.
	Pender Island, Canada	2018-05-08	We need to protect our environment, for its own sake, and for future generations.

Name	Location	Date	Comment
N A	Mount Stewart, Canada	2018-05-08	What year is this that we are still considering a long pipe the solution?
	Nanaimo, Canada	2018-05-08	Once again, politicians are faced with making the RIGHT decision and flying in the face of their «friends» and moneybags. There is NO LIMIT to the greed of WorldCorp Kapitalists whose agenda is PROFIT and the environmental and social costs be damned. Just one more example of the massive destruction perpetrated in the name of «progress» where that «progress» is the advancement of the 1% world slavery agenda.
	Azilda, Canada	2018-05-08	Sewage should be treated in lagoons before disposed of in oceans.
	Toronto, Canada	2018-05-08	Its the right thing to fight for safe waters For Canada's Fish!!
	Brampton, Canada	2018-05-08	This would be a disaster for the environment.
	Invermere, Canada	2018-05-08	I thought us Canadians had such educated views now, but to pipe garbage into the ocean is so backward and selfish!
	Gabriola, Canada	2018-05-08	To put all the marine life at risk by proposed pumping of 90 million litres of effluent would be an rresponsible act especially when the oceans are already threatened and when this is where they get energized and feed before entering the rivers. Do not go ahead with this plan.
	Millarville, Canada	2018-05-08	This is as bad as Victoria B.C. stop this
	Leduc County, Canada	2018-05-08	We need clean solutions to continue living together on this planet with the life that gives us all life.
	London, Canada	2018-05-08	We are killing the oceans.
	bc, Canada	2018-05-08	enough is enough.
	Cheltenham, Canada	2018-05-08	I love the maritimes and have visited many time as a tourist over my lifetime. Please help keep this region diverse and pristine!
	West Vancouver, Canada	2018-05-08	Please consider how important this area is to the planet. Do not rush into development simply for economic reasons. There are vast economic benefits that exist based on the feeding grounds of the fish. Do not pollute this sensitive area!
	Chelsea, QC, Canada	2018-05-08	If our politicians continue to place profit above planet they should be made to pay. First at the ballot box and then in the courts.
	Mt. Albert, Canada	2018-05-08	We need to stop polluting our rivers and oceans if we want to survive.
	Abbotsford, Canada	2018-05-08	I am signing because there must be another way for this mill to operatebecause I am from the West Coast and Canada does not need further fishing destruction.
	Peterborough, Canada	2018-05-08	Life should be a priority over money and the environment sustains us all. Especially the oceans.

	Toronto, Canada	2018-05-08	It is very disturbing that industry can still be allowed to dump effluent into waterways that will damage the ecosystem.
	Maple Ridge, Canada	2018-05-08	The environment needs to come first. Ahead of money.
	Gibsons, Canada	2018-05-08	Stop the insanity of polluting our earth and expecting the environment to absorb our greed!!
	Medicine Hat, Canada	2018-05-08	Is there no end to perverted corporate greed and political appeasement? For God's sake, think of everyone, not just the tiny minority!
	Stouffville, Canada	2018-05-08	This is my ocean location & I wish to continue to enjoy its beauty & protect our marine life for now & generations to come.
	Delta, Canada	2018-05-08	
	Saskatoon, SK, Canada	2018-05-08	This is the only EARTH we have.Keep it clean for people & ALL species!

Name	Location	Date	Comment
	Chilliwack, Canada	2018-05-08	People running these companies need to find solutions to these issues before engaging an a process.
	Kemptville, Canada	2018-05-08	There must be another way. They must find a better solution.
	Quadra Island, Canada	2018-05-08	The environment, the foundation of our [and all other species'] well being and very survival, is dying by "a thousand cuts". We must become far more careful about what we do to it. NO more dumping into fresh or marine waters as if they were a large toilet! Perhaps waters could take "another hit" before, but now they are under multiple assaults and can no longer.
	Whitehorse, Canada	2018-05-08	We need to do better!
	Lakefield, Ontario, Canada	2018-05-08	I can’t believe this is considered a viable option in this day and age. For gawds sake, think about what you’re doing. Thank you.
	Fredericton New Brunswick, Canada	2018-05-08	I am worried about the abuse of our planet and want to preserve it for future generations.
	Revelstoke, Canada	2018-05-08	Why are we still allowing companies to dump waste into our oceans???
	Ottawa, Canada	2018-05-08	Polluting the environment should not be allowed for economic reasons ever!!!
	Toronto, Ontario, Canada	2018-05-08	It’s not acceptable to treat our oceans as a garbage dump!
	Ottawa, Canada	2018-05-08	If the effluent is too corrosive to the infrastructure of the mill, how can it possibly be acceptable to dump it into the environment? Dear Minister, I urge you to protect the marine environment by preventing the effluent dump. The marine emviroemnt is iinvaluable and irreplaceable..
	Trenton, Canada	2018-05-08	Also, a great deal of the coastline of the Northumberland Strait is designated as a Maritime Protected Area by the Government of Canada, and that the proposed area for effluent discharge is also the location of several federal marine refuges.
	Canada	2018-05-08	Polluting valuable Marine ecosystems is unconscionable! Find a better solution to the pulp waste problem!
	Boutiliers point, Canada	2018-05-08	My major concern are the effluent chemicals; proper waste management can reduce the chemical output!
	Toronto, Ontario, Canada	2018-05-08	One more nail in our collective coffin...
	Oakville, Canada	2018-05-08	Isn,t this waste treated first??
	Barrie, Ontario, Canada	2018-05-08	There has to be another option, we cannot poison the waters around us.

Name	Location	Date	Comment
	Montréal, Canada	2018-05-08	We need the ocean to be save for all marine life.
	Delta, Canada	2018-05-08	For the safety of marine life
	Shelburne, Canada	2018-05-08	enough is enough STOP destroying our home planet. People who allow this are Ecological terrorists and are committing crimes against humanity.
	Strathroy, Canada	2018-05-08	we only have one planet, don't destroy it or anything that lives here
	Saskatoon, Canada	2018-05-08	There is a better way.
	Edmonton, Alberta, Canada	2018-05-08	WTF Nova Scotia, how could you not possibly know how disastrous this will be?
	Toronto, Canada	2018-05-08	As consumers, we need to demand less bleaching - tissue, toilet paper, paper towels, all involve bleach. Read this FAQ, and decide for yourself:<a href="https://sites.google.com/dillon.ca/northernpulpetf/frequently-asked-ques rel="nofollow">https://sites.google.com/dillon.ca/northernpulpetf/frequently-as
	kamloops, British Columbia, Canada	2018-05-08	the government are stupid assholes who don't care about anything but themselves and their lobbiests...go to hell
	Smithville, Canada	2018-05-08	OH PLEASE save the future of the Northumberland Strait
	Salt Spring Island, Canada	2018-05-08	I am finding increasingly difficult to understand any reasoning that would have a person put in charge of protecting the environment maaking a damaging decision like this. What the hell is going on????
	Toronto, Canada	2018-05-08	Any kind of effluent should NEVEr be dumped into our oceans or lakes. No exceptions.
	Penetanguishene, Canada	2018-05-08	Are we insane or just crazy?? Don't put marine life & water at risk! We're supposed to REDUCE our dependency on fossil fuels; not increase it!
	London, Canada	2018-05-08	Has the Pulp & Paper industry learned nothing over the last 100 years about the effects of their pollution in the air and water around them? The oceans and connected waterways are NOT dumping grounds for effluent they, the industry, produce, and do not want to be responsible for dealing with in a environmentally sensitive fashion. If that cannot be done, perhaps they should not be in business! Absolutely NO to the effluent pipe pumping toxic chemicals etc. into the Northumberland Strait !
	Dorval, Qc, Quebec, Canada	2018-05-08	We must stop polluting the world we live in.
	Ottawa, Ontario, Canada	2018-05-08	Our water systems and marine life are way more important than more oil coroporation profits. Thid insanity has to stop.
	Dunstaffnage, PEI, Canada	2018-05-08	Seriously, there has to be a better way.

Name	Location	Date	Comment
	Chilliwack, Canada	2018-05-08	Why do we keep trying to destroy our beautiful planet and all the wonderful creatures in it!!! Shameful!!
	Grande Prairie, Canada	2018-05-08	This has nothing to do with oil!
	Grande Prairie, Canada	2018-05-08	This has nothing to do with oil!
	Rothesay, Canada	2018-05-08	Stop polluting our waters!
	Toronto, Ontario, Canada	2018-05-08	Much concerned, and very alarming.....
	Ottawa, Canada	2018-05-08	Please support an ecologically wise and responsible solution.
	Winnipeg, Canada	2018-05-08	Process your waste into something neutral or useful. Don't just dump it out of sight/out of mind, because someone will ultimately have to pay for your convenience.
	Saint Marys, Canada	2018-05-08	This is unacceptable! It is time that we made protecting our waterways a priority.
	Vancouver, Canada	2018-05-08	We need to protect our eco system.
	Saanichton, Canada	2018-05-08	We need to protect both east and west sides of Canada. Stand up for each other.
	Toronto, Ontario, Canada	2018-05-08	NO PIPELINE EVER!! Get off oil dependency and begin investing in non toxic energy!
	Vancouver, Canada	2018-05-08	We don't need any more pipelines, why can't the Liberal government stand strong for the environment?
	Trochu, Canada	2018-05-08	To bad they love shit but hate oil...
	Bowmanville, Canada	2018-05-08	There has to be another way that doesn’t forever change our water ways.
	Vancouver, Canada	2018-05-08	The truth of this petition is common sense.
	Malahat, Canada	2018-05-08	What are you thinking? Stop it!
	Surrey, Canada	2018-05-08	the environment isn't worth the chance. if there ever a spill, it never gets all cleaned up.
	Montréal, Canada	2018-05-08	You have a very worthy cause. My petition also has great merit. Would you present my petition concerning the risk that airline passengers will face and the countless deaths of birds and animals in two protected forest from an ill-placed odorous compost plant that is in violation of the regulations of Montreal-Trudeau airport. My petition is located at https://chn.ge/2HJXHvg Good luck with your petition. Anne

	Galiano Island, Canada	2018-05-08	Toxins must be liscensed and regulated.
	Brampton, Ontario, Canada	2018-05-08	There are new energy sources out there, namely Oro Blanc why is this not being developed?
	Belleville, Canada	2018-05-08	There is no excuse for industry dumping their effluent into the environment. This is the 21st century.
	Edmonton, Canada	2018-05-08	I love to eat wild fish and think that our oceans and its' creatures are already struggling enough as it is.
	Terrace, Canada	2018-05-08	Time to stop these idiots from treating the ocean like one big garbage dump.
	Napanee, Ontario, Canada	2018-05-08	I cannot believe in this day and age, with the concern for our environment as heightened as it is, and with the knowledge we now have, that THIS is even A REMOTE consideration by the MINISTER OF THE ENVIRONMENT, no less!!!!!!! It's absolutely shameful and it impacts not just Nova Scotians, but the whole world!!! Our marine ecosystems MUST be protected at all costs - they are the source of life one this planet!! I sincerely hope, Minister, that you will see the dangers inherent in allowing piped effluent into marine ecosystems, and Stand Up as a Protector of the Environment as your title implies.
ux	Montreal, Quebec, Canada	2018-05-08	The mill has to come forward with a better solution.
	Halifax, Canada	2018-05-08	DO I REALLY NEED TO EXPLAIN WHY ITS A DANGEROUS GAME TO DUMP EFFLUENT INTO THE NORTH UMBERLAND STRAIT
	Ladysmith, B.C., British Columbia, Canada	2018-05-08	We have trouble out here on the West Coast re fishing too, so wishing you good luck!!!
	Victoria, B.C., Canada	2018-05-08	Sewage Treatment Plants can be built to be self sustaining.
	Port Alberni, Canada	2018-05-08	Our marine life is struggling as it is with plastics in the oceans, fishing gear and pollution. If we lose our oceans, we lose ourselves. We must be smarter and care more. "The most dangerous breed - humans."
	Copenhagen, Denmark	2018-05-08	Canada needs to wake up and halt all new investments in oil and gas, as a minimum effort in the global fight for our climate.
	Stettler, Canada	2018-05-08	It's time the federal government took as much interest in fixing raw sewage dumping as they do in putting endless roadblocks in building new pipelines in Canada?
	Duncan, Canada	2018-05-08	Canadians need to work together to rid ourselves of the negative forces at work trying to exploit resources regardless of the impact on nature and humanity

Name	Location	Date	Comment
	Vancouver, Canada	2018-05-08	I absolutely cannot believe at this day and age, with all we know about how badly we are destroying our marine environments, that we are still engaging in this kind of practice!
	Surrey, Canada	2018-05-08	We Can not get away from fossil fuel use fast enough. Love nature.
	Ladysmith, Canada	2018-05-08	we need to end our dependence on fossil fuel. we need to protect our oceans and everything that lives there.
	Brampton, Canada	2018-05-08	Taking care of our environment and our wildlife helps to take care of us. When are we going to understand this, its almost too late!
	Victoria, Canada	2018-05-08	The danger to the local environment is too great.
	salt spring island, Canada	2018-05-08	It is the right thing to do...ethics. Ever read any history of on the pillaging of saline and birdlife thats happened over the last 200 or so years? Humans have destroyed and driven life to extinction so will human pollution.
	victoria, Canada	2018-05-08	Protect the fish please!
	Westport, Canada	2018-05-08	Sounds like a bad idea to me.
	Cobourg, Canada	2018-05-08	If we don't protect our food sources, then all the oil in the world will be useless. Food needs priority.
	Toronto, Canada	2018-05-08	Once the water is polluted and the fish are dead, it's too late...
	Canada	2018-05-08	Just to be clear, this is an effluent pipe (waste liquids) from a pulp mill, not a fossil fuel pipeline. :-)
	Mississauga, Ontario, Canada	2018-05-08	No pipe!!!!!!
	Winnipeg, Canada	2018-05-08	Take care off the environmental system. Help the plant , give our children a future.
	Canada	2018-05-08	Just to be clear, this is an effluent pipe (waste liquids) from a pulp mill, not a fossil fuel pipeline. :-) (I totally agree, we need to protect our oceans from every form of humanity's trash and industrial waste. City's such as New York dumping their garbage offshore; Montreal pumping its sewage into the St Lawrence ... are disgusting !!)
	Hagensborg, Canada	2018-05-08	I'm all for jobs and mills create work and good products. There's got to be a way to deal with this that doesn't destroy our food and our health.
	Kelowna, B.C., Canada	2018-05-08	we all need to ban together and keep our oceans clean and safe for all living creatures.
	Halifax, Canada	2018-05-08	we have enough water problems now without creating new ones. we cant even fish Atlantic salmon because there are so few and now a mill wants to destroy the rest and many other fish we depend on for various reasons. Ones this affluent gets into the ocean it

Name	Location	Date	Comment
			will remain there for ever as it has no where else to go. Are we really debating whether or not this is ok, so, a company who cares nothing about the Maritime's or its people can make more money by destroying our natural resources which are connected to our food sources
	Fort Worth, Texas, US	2018-05-08	This region is important to our global health.
	ottawa, Canada	2018-05-08	There has to be an environmentally sound way of treating the effluent and if it is not economically feasible, the mill ownership is not looking hard enough!
	Ottawa, Canada	2018-05-08	Without the environment and clean water to drink and replenishable resources we have nothing , all these companies care about is money , they don't care about the devistation left behind for further generations
	Cranbrook, British Columbia, Canada	2018-05-08	Our oceans are failing. We are losing species at an alarming rate. Until we look at the cumulative effects of what is happening globally, we must stop dumping toxins into our waterways and on the land. We are jeopardizing all that sustains us and future generations by our careless regard for the earth and all the creatures that live on it.
	Brampton, Canada	2018-05-08	Because its about time th Bearing Straight gets its fair share of the pollution!
	Toronto, Canada	2018-05-08	Please pursue other options for pulp waste!
	St-Zénon, Canada	2018-05-08	C’est Vital de sauver les espèces animal de l’extinction !
	manitoba, Canada	2018-05-08	I want environmental respect in my life and the lives of my children!!! And for Canada!!!! We need to lead this!! Look at what Mother Nature has accomplished in Chernobyl ���
	Maple Ridge, Canada	2018-05-08	Are you kidding, it’s 2018.
	Maple Ridge, Canada	2018-05-08	This is NOT the place to be dumping toxic and harmful waste. Our Canadian Marine Life are already under terrible stress with other environmental factors impacting their survival. Please come up with another solution that will not have such dire consequences on such an important food source.
